# Biomechanical engineering of textiles and clothing

(This book is collected by Kazi Md. Yakub,  
student of Bangladesh College of Textile Engineering and Technology,  
34th batch.)

## **Related titles:**

*Effect of mechanical and physical properties on fabric hand*  
(ISBN-13: 978-1-85573-918-5; ISBN-10: 1-85573-918-6)

This new multi-authored collection addresses the effect of mechanical and physical properties on the way a fabric feels. It begins with concepts and understanding of fabric hand, covering development of fabric hand evaluation, the effect of fibre, yarn and fabric factors as well as finishing on hand, including the mechanical and physical properties. The latter part of the book goes on to cover statistical methods in evaluating hand and a comparison of hand evaluation in different cultures.

*Friction in textiles*  
(ISBN-13: 978-1-85573-920-8; ISBN-10: 1-85573-920-8)

The action of friction in fibres and textiles plays a major role in product performance, from the generation of the fibre through to the way a garment responds to wear. This book addresses both the beneficial and detrimental processes of friction, with chapters on fibre structure, measurement techniques, static electrification, shrink proofing and felting, surface modification treatments, friction in fabrics and fibres and its role in textile processing.

*Clothing appearance and fit; Science and technology*  
(ISBN-13: 978-1-85573-745-7; ISBN-10: 1-85573-745-0)

This comprehensive book provides a critical appreciation of the technological developments and scientific understanding related to clothing appearance and fit. It bridges recent active research and development in beauty and fashion design with garment evaluation technology, drape and human anthropometrics and sizing. It includes many industrial standards, techniques and practices that will make it an essential reference for researchers, academics, professionals and students in clothing and textile academia and industry.

*Clothing biosensory engineering*  
(ISBN-13: 978-1-85573-925-3; ISBN-10: 1-85573-925-9)

Clothing biosensory engineering is a systematic and integrative way of translating consumers' biological and sensory responses and psychological feelings and preferences about clothing into the perceptual elements of design. It is a link between scientific experimentation and commercial application to develop economic solutions to practical technical problems. This book quantifies the decision-making processes through which physics, mathematics, and neurophysiological and engineering techniques are applied to optimally convert resources to meet various sensory requirements. It includes theoretical and experimental observations, computer simulations, test methods and examples of actual product development.
