## 7 <br> Flow in Closed Conduits (Pipes)

### 7.0 PARAMETERS INVOLVED IN THE STUDY OF FLOW THROUGH CLOSED CONDUITS

In the previous chapter, the energy level changes along the flow was discussed. The losses due to wall friction in flows was not discussed. In this chapter the determination of drop in pressure in pipe flow systems due to friction is attempted.

Fluids are conveyed (transported) through closed conduits in numerous industrial processes. It is found necessary to design the pipe system to carry a specified quantity of fluid between specified locations with minimum pressure loss. It is also necessary to consider the initial cost of the piping system.

The flow may be laminar with fluid flowing in an orderly way, with layers not mixing macroscopically. The momentum transfer and consequent shear induced is at the molecular level by pure diffusion. Such flow is encountered with very viscous fluids. Blood flow through the arteries and veins is generally laminar. Laminar condition prevails upto a certain velocity in fluids flowing in pipes.

The flow turns turbulent under certain conditions with macroscopic mixing of fluid layers in the flow. At any location the velocity varies about a mean value. Air flow and water flow in pipes are generally turbulent.

The flow is controlled by (i) pressure gradient (ii) the pipe diameter or hydraulic mean diameter (iii) the fluid properties like viscosity and density and (iv) the pipe roughness. The velocity distribution in the flow and the state of the flow namely laminar or turbulent also influence the design. Pressure drop for a given flow rate through a duct for a specified fluid is the main quantity to be calculated. The inverse-namely the quantity flow for a specified pressure drop is to be also worked out on occasions.

The basic laws involved in the study of incompressible flow are (i) Law of conservation of mass and (ii) Newton's laws of motion.

Besides these laws, modified Bernoulli equation is applicable in these flows.

### 7.1 BOUNDARY LAYER CONCEPT IN THE STUDY OF FLUID FLOW

When fluids flow over surfaces, the molecules near the surface are brought to rest due to the viscosity of the fluid. The adjacent layers also slow down, but to a lower and lower extent. This slowing down is found limited to a thin layer near the surface. The fluid beyond this layer is not affected by the presence of the surface. The fluid layer near the surface in which there is a general slowing down is defined as boundary layer. The velocity of flow in this layer increases from zero at the surface to free stream velocity at the edge of the boundary layer. The development of the boundary layer in flow over a flat plate and the velocity distribution in the layer are shown in Fig. 7.1.1.

Pressure drop in fluid flow is to overcome the viscous shear force which depends on the velocity gradient at the surface. Velocity gradient exists only in the boundary layer. The study thus involves mainly the study of the boundary layer. The boundary conditions are $(i)$ at the wall surface, (zero thickness) the velocity is zero. (ii) at full thickness the velocity equals the free stream velocity (iii) The velocity gradient is zero at the full thickness. Use of the concept is that the main analysis can be limited to this layer.

Figure 7.1.1 Boundary Layer Development (flat-plate)

### 7.2 BOUNDARY LAYER DEVELOPMENT OVER A FLAT PLATE

The situation when a uniform flow meets with a plane surface parallel to the flow is shown in Fig. 7.1.1. At the plane of entry (leading edge) the velocity is uniform and equals free stream velocity. Beyond this point, the fluid near the surface comes to rest and adjacent layers are retarded to a larger and larger depth as the flow proceeds.

The thickness of the boundary layer increases due to the continuous retardation of flow. The flow initially is laminar. There is no intermingling of layers. Momentum transfer is at the molecular level, mainly by diffusion. The viscous forces predominate over inertia forces. Small disturbances are damped out. Beyond a certain distance, the flow in the boundary layer becomes
turbulent with macroscopic mixing of layers. Inertia forces become predominant. This change occurs at a value of Reynolds number (given $\operatorname{Re}=u x / v$, where $v$ is the kinematic viscosity) of about $5 \times 10^{5}$ in the case of flow over flat plates. Reynolds number is the ratio of inertia and viscous forces. In the turbulent region momentum transfer and consequently the shear forces increase at a more rapid rate.

### 7.3 DEVELOPMENT OF BOUNDARY LAYER IN CLOSED CONDUITS (PIPES)

In this case the boundary layer develops all over the circumference. The initial development of the boundary layer is similar to that over the flat plate. At some distance from the entrance, the boundary layers merge and further changes in velocity distribution becomes impossible. The velocity profile beyond this point remains unchanged. The distance upto this point is known as entry length. It is about $0.04 \mathrm{Re} \times D$. The flow beyond is said to be fully developed. The velocity profiles in the entry region and fully developed region are shown in Fig. 7.3.1a. The laminar or turbulent nature of the flow was first investigated by Osborn Reynolds in honour of

Figure 7.3.1 Boundary layer development (pipe flow)
whom the dimensionless ratio of inertia to viscous forces is named. The flow was observed to be laminar till a Reynolds number value of about 2300. The Reynolds number is calculated on the basis of diameter ( $u d / v$ ). In pipe flow it is not a function of length. As long as the diameter
is constant, the Reynolds number depends on the velocity for a given flow. Hence the value of velocity determines the nature of flow in pipes for a given fluid. The value of the flow Reynolds number is decided by the diameter and the velocity and hence it is decided at the entry itself. The development of boundary layer in the turbulent range is shown in Fig. 7.3.1b. In this case, there is a very short length in which the flow is laminar. This length, $x$, can be calculated using the relation $u x / v=2000$. After this length the flow in the boundary layer turns turbulent. A very thin laminar sublayer near the wall in which the velocity gradient is linear is present all through. After some length the boundary layers merge and the flow becomes fully developed. The entry length in turbulent flow is about 10 to 60 times the diameter.

The velocity profile in the fully developed flow remains constant and is generally more flat compared to laminar flow in which it is parabolic.

### 7.4 FEATURES OF LAMINAR AND TURBULENT FLOWS

In laminar region the flow is smooth and regular. The fluid layers do not mix macroscopically (more than a molecule at a time). If a dye is injected into the flow, the dye will travel along a straight line. Laminar flow will be maintained till the value of Reynolds number is less than of the critical value ( 2300 in conduits and $5 \times 10^{5}$ in flow over plates). In this region the viscous forces are able to damp out any disturbance.

The friction factor, $f$ for pipe flow defined as $4 \tau_{s} /\left(\rho u^{2} / 2 g_{0}\right)$ is obtainable as $f=64 / \mathrm{Re}$ where $\tau_{\mathrm{s}}$ is the wall shear stress, $u$ is the average velocity and $R e$ is the Reynolds number. In the case of flow through pipes, the average velocity is used to calculate Reynolds number. The dye path is shown in Fig. 7.4.1.

Figure 7.4.1 Reynolds Experiment
In turbulent flow there is considerable mixing between layers. A dye injected into the flow will quickly mix with the fluid. Most of the air and water flow in conduits will be turbulent. Turbulence leads to higher frictional losses leading to higher pressure drop. The friction factor is given by the following empirical relations.

$$
\begin{array}{ll}
f=0.316 / \operatorname{Re}^{0.25} & \text { for } \mathrm{Re}<2 \times 10^{4} \\
f=0.186 / \mathrm{Re}^{0.2} & \text { for } \mathrm{Re}>2 \times 10^{4} \tag{7.4.2}
\end{array}
$$

These expressions apply for smooth pipes. In rough pipes, the flow may turn turbulent below the critical Reynolds number itself. The friction factor in rough pipe of diameter $D$, with a roughness height of $\varepsilon$, is given by

$$
\begin{equation*}
f=1.325 /\left[\ln \left\{(\varepsilon / 3.7 D)+5.74 / \operatorname{Re}^{0.9}\right\}\right]^{2} \tag{7.4.3}
\end{equation*}
$$

### 7.5 HYDRAULICALLY "ROUGH" AND "SMOOTH" PIPES

In turbulent flow, a thin layer near the surface is found to be laminar. As no fluid can flow up from the surface causing mixing, the laminar nature of flow near the surface is an acceptable assumption. The thickness of the layer $\delta_{l}$ is estimated as

$$
\begin{equation*}
\delta_{l}=32.8 v / u \sqrt{f} \tag{7.5.1}
\end{equation*}
$$

If the roughness height is $\varepsilon$ and if $\delta_{1}>6 \varepsilon$, then the pipe is considered as hydraulically smooth. Any disturbance caused by the roughness is within the laminar layer and is smoothed out by the viscous forces. So the pipe is hydraulically smooth. If $\delta_{l}<6 \varepsilon$, then the pipe is said to be hydraulically rough. The disturbance now extends beyond the laminar layer. Here the inertial forces are predominant. So the disturbance due to the roughness cannot be damped out. Hence the pipe is hydraulically rough.

It may be noted that the relative value of the roughness determines whether the surface is hydraulically rough or smooth.

### 7.6 CONCEPT OF "HYDRAULIC DIAMETER": ( $\mathrm{D}_{\mathrm{h}}$ )

The frictional force is observed to depend on the area of contact between the fluid and the surface. For flow in pipes the surface area is not a direct function of the flow. The flow is a direct function of the sectional area which is proportional to the square of a length parameter. The surface area is proportional to the perimeter. So for a given section, the hydraulic diameter which determines the flow characteristics is defined by equation 7.6.1 and is used in the calculation of Reynolds number.

$$
\begin{equation*}
D_{h}=4 A / P \tag{7.6.1}
\end{equation*}
$$

where $D_{h}$ is the hydraulic diameter, $A$ is the area of flow and $P$ is the perimeter of the section. This definition is applicable for any cross section. For circular section $D_{h}=D$, as the equals $\left(4 \pi D^{2} / 4 \pi D\right)$. For flow through ducts the length parameter in Reynolds number is the hydraulic diameter. i.e.,

$$
\begin{equation*}
\operatorname{Re}=D_{h} \times u / v \tag{7.6.2}
\end{equation*}
$$

Example 7.1 In model testing, similarity in flow through pipes will exist if Reynolds numbers are equal. Discuss how the factors can be adjusted to obtain equal Reynolds numbers.
Reynolds number is defined as $R e=u D \rho / \mu$. For two different flows

$$
\frac{u_{1} D_{1} \rho_{1}}{\mu_{1}}=\frac{u_{2} D_{2} \rho_{2}}{\mu_{2}} \text { or } \frac{u_{1} D_{1}}{v_{1}}=\frac{u_{2} D_{2}}{v_{2}}
$$

As the kinematic viscosities $v_{1}$ and $v_{2}$ are fluid properties and cannot be changed easily (except by changing the temperature) the situation is achieved by manipulating $u_{2} D_{2}$ and $u_{1} D_{1}$

$$
\begin{equation*}
\frac{v_{2}}{v_{1}}=\frac{u_{2} D_{2}}{u_{1} D_{1}} \tag{A}
\end{equation*}
$$

this condition should be satisfied for flow similarity in ducts. Reynolds number will increase directly as the velocity, diameter and density. It will vary inversely with the dynamic viscosity of the fluid. Reynolds number can be expressed also by $\mathbf{R e}=\mathbf{G} . \mathbf{D} / \mu$ where $G$ is the mass velocity in $\mathrm{kg} / \mathrm{m}^{2} \mathrm{~s}$. So Reynolds number in a given pipe and fluid can be increased by increasing mass velocity. For example if flow similarity between water and air is to be achieved at $20^{\circ} \mathrm{C}$ then (using $v$ values in eqn. $A$ )

$$
\frac{1.006 \times 10^{-6}}{15.06 \times 10^{-6}}=\frac{\text { Velocity of water } \times \text { diameter in water flow }}{\text { Velocity of air } \times \text { diameter of air flow }}
$$

If diameters are the same, the air velocity should be about 15 times the velocity of water for flow similarity. If velocities should be the same, the diameter should be 15 times that for water. For experiments generally both are altered by smaller ratios to keep $u \times D$ constant.

### 7.7 VELOCITY VARIATION WITH RADIUS FOR FULLY DEVELOPED LAMINAR FLOW IN PIPES

In pipe flow, the velocity at the wall is zero due to viscosity and the value increases as the centre is approached. The variation if established will provide the flow rate as well as an average velocity.

Consider an annular element of fluid in the flow as shown in Fig. 7.7.1a. The dimensions are: inside radius $=r$; outside radius $=r+d r$, length $=d x$.

Surface area $=2 \pi r d x$
Assuming steady fully developed flow, and using the relationship for force balance, the velocity being a function of radius only.

Figure 7.7.1

Net pressure force $=d p 2 \pi r d r$
Net shear force $\quad=\frac{d}{d r}\left(\mu \frac{d u}{d r} 2 \pi r d x\right) d r$, Equating the forces and reordering

$$
\frac{d}{d r}\left(r \frac{d u}{d r}\right)=\frac{1}{\mu} \frac{d p}{d x} r
$$

Integrating $\quad r \frac{d u}{d r}=\frac{1}{\mu} \frac{d p}{d x} \frac{r^{2}}{2}+C$, at $r=0 \quad \therefore \quad C=0$
Integrating again and after simplification,

$$
u=\frac{1}{\mu} \frac{d p}{d x} \frac{r^{2}}{4}+B
$$

at $r=R, u=0$ (at the wall)

$$
\begin{array}{ll}
\therefore & B=-\frac{1}{\mu} \frac{d p}{d x} \frac{R^{2}}{4} \\
\therefore & u=-\frac{1}{\mu} \frac{d p}{d x} \frac{R^{2}}{4}\left[1-\left(\frac{r}{R}\right)^{2}\right] \tag{7.7.1}
\end{array}
$$

The velocity is maximum at $r=0$,

$$
\begin{equation*}
\therefore \quad u_{\max }=-\frac{1}{\mu} \frac{d p}{d x} \frac{R^{2}}{4} \tag{7.72}
\end{equation*}
$$

At a given radius, dividing 7.7.1 by (7.7.2), we get 7.7.3, which represents parabolic distribution.

$$
\begin{equation*}
\therefore \quad \frac{u}{u_{\max }}=1-\left(\frac{r}{R}\right)^{2} \tag{7.7.3}
\end{equation*}
$$

If the average velocity is $u_{\text {mean }}$ then the flow is given by $Q=\pi R^{2} u_{\text {mean }}$
The flow $Q$ is also given by the integration of small annular flow streams as in the element considered

$$
Q=\int_{0}^{R} 2 \pi u r d r \text { but } u=u_{\max }\left[1-\left(\frac{r}{R}\right)^{2}\right]
$$

Substituting and integrating between the limits 0 to $R$, and using equation $A$

$$
Q=\frac{\pi R^{2}}{u} u_{\max }=\pi R^{2} u_{\text {mean }} \quad \therefore \quad 2 u_{\text {mean }}=u_{\max }
$$

The average velocity is half of the maximum velocity

$$
\begin{equation*}
\therefore \quad \frac{u}{u_{\text {mean }}}=2\left[1-\left(\frac{r}{R}\right)^{2}\right] \tag{7.7.4}
\end{equation*}
$$

In turbulent flow the velocity profile is generally represented by the equation

$$
\frac{u}{u_{\max }}=\left(1-\frac{r}{R}\right)^{(1 / n)} \text {, where } n \text { varies with Reynolds number. }
$$

The average velocity is $0.79 u_{\text {max }}$ for $n=6$ and $0.87 u_{\max }$ for $n=10$.

### 7.8 DARCY-WEISBACH EQUATION FOR CALCULATING PRESSURE DROP

In the design of piping systems the choice falls between the selection of diameter and the pressure drop. The selection of a larger diameter leads to higher initial cost. But the pressure drop is lower in such a case which leads to lower operating cost. So in the process of design of piping systems it becomes necessary to investigate the pressure drop for various diameters of pipe for a given flow rate. Another factor which affects the pressure drop is the pipe roughness. It is easily seen that the pressure drop will depend directly upon the length and inversely upon the diameter. The velocity will also be a factor and in this case the pressure drop will depend in the square of the velocity (refer Bernoulli equation).

Hence we can say that

$$
\begin{equation*}
\Delta p \propto \frac{L V^{2}}{2 D} \tag{7.8.1}
\end{equation*}
$$

The proportionality constant is found to depend on other factors. In the process of such determination Darcy defined or friction factor $f$ as

$$
\begin{equation*}
f=4 \tau_{0} /\left(\rho u_{m}{ }^{2} / 2 g_{0}\right) \tag{7.8.2}
\end{equation*}
$$

This quantity is dimensionless which may be checked.
Extensive investigations have been made to determine the factors influencing the friction factor.

It is established that in laminar flow $f$ depends only on the Reynolds number and it is given by

$$
\begin{equation*}
f=\frac{64}{\mathrm{Re}} \tag{7.8.3}
\end{equation*}
$$

In the turbulent region the friction factor is found to depend on Reynolds number for smooth pipes and both on Reynolds number and roughness for rough pipes. Some empirical equations are given in section 7.4 and also under discussions on turbulent flow. The value of friction factor with Reynolds number with roughness as parameter is available in Moody diagram, given in the appendix. Using the definition of Darcy friction factor and conditions of equilibrium, expression for pressure drop in pipes is derived in this section. Consider an elemental length $L$ in the pipe. The pressures at sections 1 and 2 are $P_{1}$ and $P_{2}$.

Figure 7.8.1

The other force involved on the element is the wall shear $\tau_{0}$.
Net pressure force in the element is ( $P_{1}-P_{2}$ )
Net shear force in the element is $\tau_{0} \pi D L$
Force balance for equilibrium yields

$$
\begin{equation*}
\left(P_{1}-P_{2}\right) \frac{\pi D^{2}}{4}=\tau_{0} \pi D L \tag{7.8.4}
\end{equation*}
$$

From the definition friction factor

$$
\begin{aligned}
f & =4 \tau_{0} /\left(\rho u_{m}{ }^{2} / 2 g_{0}\right) \\
\tau_{0} & =\frac{f \rho u_{m}{ }^{2}}{8 g_{0}}
\end{aligned}
$$

Substituting and letting $\left(P_{1}-P_{2}\right)$ to be $\Delta P$.

$$
\begin{align*}
& \qquad \Delta P \cdot \frac{\pi D^{2}}{4}=\frac{f \rho u_{m}{ }^{2}}{8 g_{0}} \cdot \pi D L \\
& \text { This reduces to } \quad \Delta P=\frac{f L u_{m}{ }^{2} \rho}{2 g_{0} D} \tag{7.8.5}
\end{align*}
$$

This equation known as Darcy-Weisbach equation and is generally applicable in most of the pipe flow problems. As mentioned earlier, the value of $f$ is to be obtained either from equations or from Moody diagram. The diameter for circular tubes will be the hydraulic diameter $D_{h}$ defined earlier in the text.

It is found desirable to express the pressure drop as head of the flowing fluid.

$$
\text { In this case as } \quad \begin{align*}
\quad h & =\frac{P}{\gamma}=\frac{P g_{0}}{\rho g} \\
\Delta h & =h_{f}=\frac{f L u_{m}{ }^{2}}{2 g D} \tag{7.8.6}
\end{align*}
$$

The velocity term can be replaced in terms of volume flow and the equation obtained is found useful in designs as $Q$ is generally specified in designs.

$$
u_{m}=\frac{4 Q}{\pi D^{2}}, u_{m}{ }^{2}=\frac{16 Q^{2}}{\pi^{2} D^{4}}
$$

Substituting in (7.8.6), we get

$$
\begin{equation*}
h_{f}=\frac{8 f L Q^{2}}{\pi^{2} g D^{5}} \tag{7.8.7}
\end{equation*}
$$

It is found that $h_{f} \propto \frac{Q^{2}}{D^{5}}$
Another coefficient of friction $C_{f}$ is defined as $C_{f}=f / 4$

$$
\begin{equation*}
\text { In this case } \quad h_{f}=\frac{4 C_{f} L u_{m}{ }^{2}}{2 g D} \tag{7.8.8}
\end{equation*}
$$

Now a days equation 7.8 .5 are more popularly used as value of $f$ is easily available.

### 7.9 HAGEN-POISEUILLE EQUATION FOR FRICTION DROP

In the case of laminar flow in pipes another equation is available for the calculation of pressure drop. The equation is derived in this section.

Refer to section (7.7) equation (7.7.1)

$$
u=-\frac{1}{\mu} \frac{d p}{d L} \frac{R^{2}}{4}\left[1-\left(\frac{r}{R}\right)^{2}\right]
$$

$\frac{d P}{d L}$ can be approximated to $\Delta P / L$ as the pressure drop is uniform along the length $L$ under steady laminar flow

$$
\begin{align*}
& \text { Using eqn (7.7.2), } u_{\max }=-\frac{d P}{d L} \frac{1}{\mu} \cdot \frac{R^{2}}{4}=2 u_{m} \\
& \therefore \quad-\frac{d P}{d L}=\frac{8 u_{m} \mu}{R^{2}} \\
& \begin{aligned}
\therefore \quad-\frac{d P}{d L} & =\frac{8 u_{m} \mu}{R^{2}}=\frac{32 u_{m} \mu}{D^{2}}, \text { Substituting for }-\frac{d P}{d L} \text { as } \frac{\Delta P}{L} \\
\Delta P & =\frac{32 \mu u_{m} L}{D^{2}}
\end{aligned}
\end{align*}
$$

This can also be expressed in terms of volume flow rate $Q$ as

$$
\begin{array}{cc} 
& Q=\frac{\pi D^{2}}{4} \cdot u_{m} \\
\therefore \quad u_{m}=4 \mathrm{Q} / \pi D^{2}, \text { substituting } \\
& \Delta P=128 \mu L Q / \pi D^{4} \tag{7.9.2}
\end{array}
$$

Converting $\Delta P$ as head of fluid

$$
\begin{equation*}
h_{f}=\frac{32 v u_{m} L g_{0}}{g D^{2}} \tag{7.9.3}
\end{equation*}
$$

This equation is known as Hagen-Poiseuille equation $g_{0}$ is the force conversion factor having a value of unity in the SI system of unit. Also $(\mu / \rho)=v$.

Equations 7.9.1, 7.9.2 and 7.9.3 are applicable for laminar flow only whereas DarcyWeisbach equation (7.8.6) is applicable for all flows

Example 7.2 Using the Darcy-Weisbach equation and the Hagen Poiseuille equation obtain an expression for friction factor $f$, in terms of Reynolds number in laminar region.

The equation are $\quad h_{f}=\frac{f L u_{m}{ }^{2}}{2 g D}$ and $h_{f}=\frac{32 u_{m} v L}{g D^{2}}$
equating and simplifying a very useful relationship is obtained, namely

$$
f=\frac{2 \times 32 v}{u_{m} D}=\frac{64}{\operatorname{Re}}, \text { as }\left(\frac{u_{m} D}{v}\right)=\operatorname{Re}
$$

In the laminar flow region the friction factor can be determined directly in terms of Reynolds number.

### 7.10 SIGNIFICANCE OF REYNOLDS NUMBER IN PIPE FLOW

Reynolds number is the ratio of inertia force to viscous force. The inertia force is proportional to the mass flow and velocity i.e., ( $\rho u . u$ ). The viscous force is proportional to $\mu(d u / d y)$ or $\mu u / D$, dividing

$$
\frac{\text { inertia force }}{\text { viscous force }}=\frac{\rho u u D}{\mu u}=\frac{\rho u D}{\mu}=\frac{u D}{v}
$$

Viscous force tends to keep the layers moving smoothly one over the other. Inertia forces tend to move the particles away from the layer. When viscous force are sufficiently high so that any disturbance is smoothed down, laminar flow prevails in pipes. When velocity increases, inertia forces increase and particles are pushed upwards out of the smoother path. As long as Reynolds number is below 2,300, laminar flow prevails in pipes. The friction factor in flow is also found to be a function of Reynolds number (in laminar flow, $f=64 / \mathrm{Re}$ ).

Example 7.3. Lubricating Oil at a velocity of $1 \mathrm{~m} / \mathrm{s}$ (average) flows through a pipe of 100 mm ID. Determine whether the flow is laminar or turbulent. Also determine the friction factor and the pressure drop over 10 m length. What should be the velocity for the flow to turn turbulent? Density $=930 \mathrm{~kg} / \mathrm{m}^{3}$. Dynamic viscosity $\mu=0.1 \mathrm{Ns} / \mathrm{m}^{2}$ (as $\mathrm{N} / \mathrm{m}^{2}$ is call Pascal, $\mu$ can be also expressed as Pa.s).

$$
\operatorname{Re}=\frac{u D \rho}{\mu}=\frac{1 \times 0.1 \times 930}{1 \times 0.1}=930, \text { so the flow is laminar }
$$

Friction factor, $\mathbf{f}=64 / 930=\mathbf{0 . 0 6 8 8 2}$

$$
\begin{aligned}
\mathbf{h}_{\mathbf{f}} & =f L u_{m}^{2} / 2 g D=(64 / 930) \times 10 \times 1^{2} /(2 \times 9.81 \times 0.1) \\
& =\mathbf{0 . 3 5 1} \mathbf{~ m} \text { head of oil. }
\end{aligned}
$$

or

$$
\Delta P=0.351 \times 0.93 \times 9810=3200 \mathbf{N} / \mathbf{m}^{2}
$$

At transition $\mathrm{Re}=2000$ (can be taken as 2300 also)
Using (7.9.1) (Hagen-Poiseuille eqn.)

$$
\begin{aligned}
\Delta \mathbf{P} & =\frac{32 \times \mu \times u_{m} \times L}{D^{2}}=\frac{32 \times 0.1 \times 1 \times 10}{0.1^{2}} \\
& =3200 \mathrm{~N} / \mathrm{m}^{2} .(\text { same as by the other equation })
\end{aligned}
$$

To determine velocity on critical condition

$$
2300=4 m \times 0.1 \times 930 / 0.1
$$

$$
\therefore \quad u_{m}=2.47 \mathrm{~m} / \mathrm{s}
$$

### 7.11 VELOCITY DISTRIBUTION AND FRICTION FACTOR FOR TURBULENT FLOW IN PIPES

The velocity profile and relation between the mean and maximum velocity are different in the two types of flow. In laminar flow the velocity profile is parabolic and the mean velocity is half of the maximum velocity. Such a relation is more complex in turbulent flow. For example one such available relation is given by

$$
\begin{equation*}
\frac{u_{m}}{u_{\max }}=\frac{1}{1+1.33 \sqrt{f}} \tag{7.11.1}
\end{equation*}
$$

The friction factor $f$ is a complex function of Reynolds number.
A sample velocity variation is given in equation (7.12.2).

$$
\begin{equation*}
u=(1+1.33 \sqrt{f}) u_{m}-2.04 \sqrt{f} u_{m} \log (R /(R-1)) \tag{7.11.2}
\end{equation*}
$$

For higher values of $f$ the velocity variation will be well rounded at the centre compared to low values of $f$.

A new reference velocity called shear velocity is defined as below.

$$
\begin{equation*}
u^{*}=\sqrt{\frac{\tau_{0} g_{0}}{\rho}} \tag{7.11.3}
\end{equation*}
$$

Several other correlation using the reference velocity are listed below.

$$
\begin{equation*}
\frac{u}{u^{*}}=5.75 \log \frac{R u^{*}}{v}+5.5 \tag{7.11.4}
\end{equation*}
$$

For rough pipes,

$$
\begin{equation*}
\frac{u}{u^{*}}=5.75 \ln \frac{(R-r)}{\varepsilon}+8.5 \tag{7.11.5}
\end{equation*}
$$

where $\varepsilon$ is the roughness dimension.
The mean velocity $u_{m}$ is obtained for smooth and rough pipes as
and

$$
\begin{equation*}
\frac{u_{m}}{u^{*}}=5.75 \log \frac{(R-r) u^{*}}{v}+7.5 \tag{7.11.6}
\end{equation*}
$$

$$
\begin{equation*}
\frac{u_{m}}{u^{*}}=5.75 \log \frac{R}{\varepsilon}+4.75 \tag{7.11.7}
\end{equation*}
$$

The laminar sublayer thickness is used for defining smooth pipe. The thickness of this layer is given by

$$
\begin{equation*}
\delta_{t}=11.6 \mathrm{v} / u^{*} \tag{7.11.8}
\end{equation*}
$$

In the case of turbulent show the wall shear force is given by the following equation.

$$
\begin{equation*}
\tau_{0}=\frac{f}{4} \cdot \frac{\rho u_{m}{ }^{2}}{2} \tag{7.11.9}
\end{equation*}
$$

Similar to velocity profile, several correlations are available for friction factor. These correlations together with correlations for velocity profile are useful in numerical methods of solution.

The friction factor for very smooth pipes can be calculated by assuming one seventh power law leading to,

$$
\begin{equation*}
f=0.316 / \mathrm{Re}^{0.25} \text { for } \mathrm{Re}<2 \times 10^{4} \tag{7.11.10}
\end{equation*}
$$

For all ranges either of the following relations can be used

$$
\begin{array}{r}
f=0.0032+\left(0.221 / \operatorname{Re}^{0.237}\right) \\
1 / \sqrt{f}=1.8 \log \operatorname{Re}-1.5186 \tag{7.11.12}
\end{array}
$$

For rough pipes of radius $R$

$$
\begin{equation*}
\frac{1}{\sqrt{f}}=2 \log \frac{R}{\varepsilon}+1.74 \tag{7.11.13}
\end{equation*}
$$

Charts connecting $f, \operatorname{Re}$ and $\varepsilon / D$ are also available and can be used without appreciable error. As in laminar flow the frictional loss of head is given by

$$
\begin{equation*}
h_{f}=f L u_{m}^{2} / 2 g D_{h} \tag{7.11.14}
\end{equation*}
$$

Also

$$
\begin{equation*}
h_{f}=\frac{8 f L}{g \pi^{2}} \frac{Q^{2}}{D^{5}} \tag{7.11.15}
\end{equation*}
$$

The value of $f$ is to be determined using the approximate relations or the chart.

### 7.12 MINOR LOSSES IN PIPE FLOW

Additional frictional losses occur at pipe entry, valves and fittings, sudden decrease or increase in flow area or where direction of flow changes.

The frictional losses other than pipe friction are called minor losses. In a pipe system design, it is necessary to take into account all such losses.

These losses are generally expressed as $h_{f}=C u_{m}{ }^{2} / 2 g$ where $C$ is constant, the value of which will depend on the situation and is called the loss coefficient. The expression is applicable both for laminar and turbulent flows.
(i) Loss of head at entrance: At the entrance from the reservoir into the pipe, losses take place due to the turbulence created downstream of the entrance. Three types of entrances are known.
(a) Bell mouthed: This is a smooth entrance and turbulence is suppressed to a great extent and $C=0.04$ for this situation.
(b) Square edged entrance: Though it is desirable to provide a bell mouthed entrance it will not be always practicable. Square edged entrance is used more popularly. The loss coefficient, $C=0.5$ in this case.
(c) Reentrant inlet: The pipe may sometimes protrude from the wall into the liquid. Such an arrangement is called reentrant inlet. The loss coefficient in this case is about 0.8.

Bell mouthed

Square edge

Reentrant

Figure 7.12.1 Types of entrance
(ii) Loss of head at submerged discharge: When a pipe with submerged outlet discharges into a liquid which is still (not moving) whole of the dynamic head $u^{2} / 2 g$ will be lost. The loss coefficient is 1.0 . The discharge from reaction turbines into the tail race water is an example. The loss is reduced by providing a diverging pipe to reduce the exit velocity.
(iii) Sudden contraction: When the pipe section is suddenly reduced, loss coefficient depends on the diameter ratio. The value is 0.33 for $D_{2} / D_{1}=0.5$. The values are generally available in a tabular statement connecting $D_{2} / D_{1}$ and loss coefficient. Gradual contraction will reduce the loss. For gradual contraction it varies with the angle of the transition section from 0.05 to 0.08 for angles of $10^{\circ}$ to $60^{\circ}$.
(iv) Sudden expansion: Here the sudden expansion creates pockets of eddying turbulence leading to losses. The loss of head $h_{f}$ is given by

$$
\begin{equation*}
\text { Loss of head }=\left(u_{1}-u_{2}\right)^{2} / 2 \mathrm{~g} . \tag{7.12.1}
\end{equation*}
$$

where $u_{1}$ and $u_{2}$ are the velocities in the smaller and larger sections. Gradual expansion will reduce the losses.
(v) Valves and fittings : Losses in flow through valves and fittings is expressed in terms of an equivalent length of straight pipe.

For gate valves $L=8 D$, and for globe valves it is $340 D$. For $90^{\circ}$ bends it is about $30 D$.

### 7.13 EXPRESSION FOR THE LOSS OF HEAD AT SUDDEN EXPANSION IN PIPE FLOW

The situation is shown in Fig 7.13.1.
Using Bernoulli equation and denoting the ideal pressure at section 2 as $P_{2}$ (without losses), datum remaining unaltered,

$$
\begin{equation*}
\frac{P_{2}}{\rho g}=\frac{P_{1}}{\rho g}+\frac{u_{1}{ }^{2}}{2 g}-\frac{u_{2}{ }^{2}}{2 g} \quad \text { or } \quad \frac{P_{2}}{\rho}=\frac{P_{1}}{\rho}+\frac{u_{1}{ }^{2}}{2}-\frac{u_{2}{ }^{2}}{2} \tag{1}
\end{equation*}
$$

Figure 7.13.1 Sudden Expansion
Applying conservation of momentum principle to the fluid between section 1 and 2 , and denoting the actual pressure at section 2 as $P_{2}$,

The pressure forces are (here the pressure on the annular section of fluid at 1 is assumed as $P_{1}$ )

$$
\left(P_{1} A_{1}-P_{2}^{\prime} A_{2}\right) .
$$

The change in momentum is given by

$$
\left(\rho A_{2} u_{2} u_{2}-\rho A_{1} u_{1} u_{1}\right)
$$

noting $A_{1} u_{1}=A_{2} u_{2}$, replacing $A_{1} u_{1}$ by $A_{2} u_{2}$ and equating the net forces on the element to the momentum change,

$$
P_{1} A_{1}-P_{2}^{\prime} A_{2}=\rho A_{2} u_{2}^{2}-\rho A_{2} u_{2} u_{1}
$$

Dividing by $\rho$ and $A_{2}$ allthrough
or

$$
\frac{P_{1}}{\rho}-\frac{P_{2}^{\prime}}{\rho}=u_{2}{ }^{2}-u_{1} u_{2}
$$

$$
\begin{equation*}
\frac{P_{2}^{\prime}}{\rho}=\frac{P_{1}}{\rho}-\left(u_{2}^{2}-u_{1} u_{2}\right) \tag{2}
\end{equation*}
$$

Subtracting on either side of equations 1 and 2 (ideal and real)

$$
\begin{aligned}
& \frac{P_{2}-P_{2}{ }^{\prime}}{\rho}=\frac{P_{1}}{\rho}+\frac{u_{1}{ }^{2}}{2}-\frac{u_{2}{ }^{2}}{2}-\frac{P_{1}}{\rho}-\left(u_{2}{ }^{2}-u_{1} u_{2}\right) \\
\therefore & \frac{P_{2}-P_{2}{ }^{\prime}}{\rho}=\frac{u_{1}{ }^{2}}{2}-\frac{u_{2}{ }^{2}}{2}+\left(u_{2}{ }^{2}-u_{1} u_{2}\right)
\end{aligned}
$$

Multiplying both sides by 2

$$
\frac{2\left(P_{2}-P_{2}^{\prime}\right)}{\rho}=u_{1}^{2}-u_{2}^{2}+2 u_{2}^{2}-2 u_{1} u_{2}=\left(u_{1}-u_{2}\right)^{2}
$$

Dividing the both sides by $g$ and simplifying

$$
\begin{array}{rlrl} 
& \frac{P_{2}-P_{2}^{\prime}}{\rho g} & =\frac{\left(u_{2}-u_{2}\right)^{2}}{2 g} \\
\text { But } & \frac{P_{2}-P_{2}^{\prime}}{\rho g} & =h_{f}(\text { head loss }) \\
\therefore & & h_{f} & =\frac{\left(u_{1}-u_{2}\right)^{2}}{2 g} .
\end{array}
$$

### 7.14 LOSSES IN ELBOWS, BENDS AND OTHER PIPE FITTINGS

Fittings like valves, elbows etc. introduce frictional losses either by obstruction or due to secondary flows. The losses may be accounted for by a term equivalent length which will depend on the type of fitting or in terms of ( $u^{2} / 2 g$ ) or dynamic head. In the case of bends, the loss is due to the variation of centrifugal force along different stream lines which causes secondary flows. In large bends fitting curved vanes will reduce the loss. The loss will vary with radius of the bend. Globe valves are poorer compared to gate valves with regard to pressure drop.

### 7.15 ENERGY LINE AND HYDRAULIC GRADE LINE IN CONDUIT FLOW

The plot of the sum of pressure head and dynamic head along the flow path is known as energy line. This refers to the total available energy of the system at the location. The line will dip due to losses. For example in straight constant area pipe the line will slope proportional to the head drop per $m$ length. There will be sudden dips if there are minor losses due to expansions, fittings etc.

Hydraulic grade line is the plot of pressure head along the flow path. Hydraulic grade line will be at a lower level and the difference between the ordinates will equal the dynamic head $i . e ., u^{2} / 2 g$. This line will dip sharply if velocity increases and will slope upwards if velocity decreases. This line will also dip due to frictional losses. Flow will be governed by hydraulic grade line.

Introduction of a pump in the line will push up both the lines. Specimen plot is given in Fig. 7.15.1 (pump is not indicated in figure).

Figure 7.15.1 Energy and Hydraulic grade lines

Example 7.4. A pump takes in water from a level 5 m below its centre line and delivers it at a height of 30 m above the centre line, the rate of flow being $3 \mathrm{~m}^{3} / \mathrm{hr}$. The diameter of the pipe line allthrough is 50 mm (ID). The fittings introduce losses equal to 10 m length of pipe in addition to the actual length of 45 m of pipe used. Determine the head to be developed by the pump.
The head to be developed will equal the static head, friction head and the dynamic head.

$$
\begin{aligned}
& \text { Static head }=30+5=35 \mathrm{~m} \text {, Friction head }=f L u_{m}{ }^{2} / 2 \mathrm{~g} D \\
& \qquad \begin{aligned}
L & =45+10=55 \mathrm{~m}, D=0.05 \mathrm{~m} \\
u_{m} & =(3 / 3600) 4 / \pi \times 0.05^{2}=0.4244 \mathrm{~m} / \mathrm{s}
\end{aligned}
\end{aligned}
$$

Assuming the temperature as $20^{\circ} \mathrm{C}$,

$$
v=1.006 \times 10^{-6} \mathrm{~m}^{2} / \mathrm{s} .
$$

$\therefore \quad \operatorname{Re}=u_{m} D / v=0.05 \times 0.4244 / 1.006 \times 10^{-6}=21093$
$\therefore$ The flow is turbulent
Assuming smooth pipe, $\quad f=0.316 / \operatorname{Re}^{0.25}=0.316 / 21093^{0.25}=0.02622$

$$
\text { (check } f=0.0032+0.221 / \mathrm{Re}^{0.237}=0.0241 \text { ), using the value } 0.02622
$$

Frictional loss of head $\quad=0.02622 \times 55 \times 0.4244^{2} / 2 \times 9.81 \times 0.05=0.265 \mathrm{~m}$
Dynamic head $\quad=u_{m}{ }^{2} / 2 g=\frac{0.4244^{2}}{2 \times 9.81}=0.0092 \mathrm{~m}$
$\therefore$ Total head $\quad=35+0.265+0.0092=35.2562 \mathrm{~m}$.
Head to be developed by the pump $=\mathbf{3 5 . 2 5 6 2} \mathbf{~ m}$ head of water.
Example 7.5 A pipe 250 mm dia, 4000 m long with $f=0.021$ discharges water from a reservoir at a level 5.2 m below the water reservoir level. Determine the rate of discharge.
The head available should equal the sum of frictional loss and the dynamic head.
Frictional Head $=f L u_{m}{ }^{2} / 2 g D$, Dynamic Head $=u_{m}{ }^{2} / 2 g$
When long pipes are involved, minor losses may often be neglected.

$$
\begin{array}{rlrl} 
& 5.2 & =\left[\left(0.021 \times 4000 \times u_{m}^{2}\right) /(2 \times 9.81 \times 0.25)\right]+\left[u_{m}^{2} /(2 \times 9.81)\right] \\
& =17.176 u_{m}{ }^{2} \\
\therefore & u_{m} & =0.55 \mathrm{~m} / \mathrm{s} . \\
\therefore & \text { Flow rate } & =\left(\pi \times 0.25^{2} / 4\right) \times 0.55=0.027 \mathrm{~m}^{3} / \mathrm{s} . \text { or } \mathbf{9 7 . 2 3} \mathbf{~ m}^{3} / \mathbf{h r} .
\end{array}
$$

$$
\therefore \quad u_{m}=0.55 \mathrm{~m} / \mathrm{s}
$$

### 7.16 CONCEPT OF EQUIVALENT LENGTH

For calculation of minor losses it is more convenient to express the pressure drop in fittings, expansion-contraction and at entry in terms of a length of pipe which will at that discharge rate lead to the same pressure drop. This length is known as equivalent length, $L_{e}$. From the relation knowing $C, f$ and $D$.

$$
L_{e} u_{m}^{2 / 2 g} D=C u_{m}^{2 / 2 g} \quad \therefore \quad L_{e} \text { can be calculated }
$$

As a number of fittings at various positions may be involved causing minor losses in a pipe system, this is a convienent way to estimate minor losses.

### 7.17 CONCEPT OF EQUIVALENT PIPE OR EQUIVALENT LENGTH

When pipes of different friction factors are connected in series (or in parallel) it is convenient to express the losses in terms of one of the pipes (Refer to 7.11.15). The friction loss $h_{f}$ for pipe 1 with $L_{1}$ and $f_{1}$ is given by

$$
h_{f 1}=8 f_{1} L_{1} Q^{2} / g \pi^{2} D_{1}^{5}
$$

For the same pressure loss and flow rate $Q$ and discharge through another pipe of diameter $D_{2}$ with $f_{2}$, the equivalent pipe will have a length $L_{2}$. Hence

$$
h_{f 2}=8 f_{2} L_{2} Q^{2} / g \pi^{2} D_{2}{ }^{5}
$$

Cancelling common terms

$$
\begin{equation*}
\frac{f_{1} L_{1}}{D_{1}{ }^{5}}=\frac{f_{2} L_{2}}{D_{2}{ }^{5}} \quad \text { or } \quad L_{2}=L_{1} \frac{f_{1}}{f_{2}} \frac{D_{2}{ }^{5}}{D_{1}{ }^{5}} \tag{7.17.1}
\end{equation*}
$$

If pipes are in series a common diameter can be chosen and the equivalent length concept can be used conveniently to obtain the solution.

In parallel arrangement, as the pressure loss is the same, then

$$
\begin{align*}
\frac{8 f_{1} L_{1}{Q_{1}}^{2}}{g \pi^{2} D_{1}^{5}} & =\frac{8 f_{2} L_{2}{Q_{2}^{2}}^{g \pi^{2} D_{2}^{5}}}{\therefore} \quad & \frac{Q_{2}}{Q_{1}} & =\left[\frac{f_{1}}{f_{2}} \frac{L_{1}}{L_{2}}\left(\frac{D_{2}}{D_{1}}\right)^{5}\right]^{0.5}
\end{align*}
$$

The idea of using equivalent length thus helps to reduce tediusness in calculations.
Example 7.6. Three pipes of $400 \mathrm{~mm}, 350 \mathrm{~mm}$ and 300 mm diameter are connected in series between two reservoirs with a difference in level of 12 m . The friction factors are 0.024, 0.021 and 0.019 respectively. The lengths are $200 \mathrm{~m}, 300 \mathrm{~m}$ and 250 m respectively. Determine the flow rate neglecting minor losses.
This problem can be solved using

$$
12=\frac{8 f_{1} L_{1} Q^{2}}{\pi^{2} g D_{1}{ }^{5}}+\frac{8 f_{2} L_{2} Q^{2}}{\pi^{2} g D_{2}{ }^{5}}+\frac{8 f_{3} L_{3} Q^{2}}{\pi^{2} g D_{3}{ }^{5}}
$$

Solving

$$
Q^{2}=0.04 \quad \therefore \quad \mathbf{Q}=\mathbf{0 . 2} \mathbf{~ m}^{3} / \mathbf{s}
$$

Using equivalent length concept and choosing 0.4 m pipe as the base.
Refer 7.17.1

$$
\begin{aligned}
L_{2 e} & =300(0.021 / 0.024) \times(0.4 / 0.35)^{5}=511.79 \mathrm{~m} \\
L_{3 e} & =250(0.019 / 0.024) \times(0.4 / 0.3)^{5}=834.02 \mathrm{~m} \\
& =200+511.79+834.02=1545.81 \mathrm{~m} \\
12 & =\left(8 \times 0.024 \times 1545.81 \times Q^{2}\right) /\left(9.81 \times \pi^{2} \times 0.4^{5}\right) \\
Q^{2} & =0.04 ; \mathbf{Q}=\mathbf{0 . 2} \mathbf{~ m}^{2} / \mathbf{s} .
\end{aligned}
$$

$$
\text { Total length } \quad=200+511.79+834.02=1545.81 \mathrm{~m}
$$

Example 7.7. Two reservoirs are connected by three pipes in parallel with the following details of pipes:

| Pipe No. | Length, $m$ | Diameter, $m$ | Friction factor |
| :---: | :---: | :---: | :---: |
| 1 | 600 | 0.25 | 0.021 |
| 2 | 800 | 0.30 | 0.019 |
| 3 | 400 | 0.35 | 0.024 |

The total flow is $24,000 \mathrm{l} / \mathrm{min}$. Determine the flow in each pipe and also the level difference between the reservoirs.

Let the flows be designated as $Q_{1}, Q_{2}, Q_{3}$
Then

$$
Q_{1}+Q_{2}+Q_{3}=24000 /(60 \times 1000)=0.4 \mathrm{~m}^{3} / \mathrm{s}
$$

Using equation (7.17.2), Considering pipe 1 as base

$$
\begin{aligned}
& \frac{Q_{2}}{Q_{1}} & =\left[\frac{f_{1}}{f_{2}} \frac{L_{1}}{L_{2}}\left(\frac{D_{2}}{D_{1}}\right)^{5}\right]^{0.5}=\left[\frac{0.021}{0.019} \times \frac{600}{800} \times\left(\frac{0.3}{0.25}\right)^{5}\right]^{0.5}=1.4362 \\
\therefore & Q_{2} & =1.4362 Q_{1} \\
\therefore & \frac{Q_{3}}{Q_{1}} & =\left[\frac{f_{1}}{f_{3}} \frac{L_{1}}{L_{3}}\left(\frac{D_{3}}{D_{1}}\right)^{5}\right]^{0.5}=\left[\frac{0.021}{0.024} \times \frac{600}{400} \times\left(\frac{0.35}{0.25}\right)^{5}\right]^{0.5}=2.6569 \\
\therefore & Q_{3} & =2.6569 Q_{1} \\
\therefore & \text { Total flow } & =0.4=Q_{1}+1.4362 Q_{1}+2.6569 Q_{1}=5.0931 Q_{1} \\
\therefore & \mathbf{Q}_{1} & =\mathbf{0 . 0 7 8 5 4} \mathbf{~ m}^{3} / \mathbf{s} \\
& \mathbf{Q}_{2} & =\mathbf{1 . 4 3 6 2} \mathbf{Q}_{1}=\mathbf{0 . 1 1 2 8 0} \mathbf{~ m}^{3} / \mathbf{s} \\
& \mathbf{Q}_{3} & =\mathbf{2 . 6 5 6 9} \mathbf{Q}_{1}=\mathbf{0 . 2 0 8 6 7} \mathbf{~ m}^{3} / \mathrm{s} \\
& \text { Total } & =0.4001 \mathrm{~m}^{3} / \mathrm{s}
\end{aligned}
$$

Head loss or level difference (Ref para 7.11, eqn 7.11.15
Pipe $1 \mathbf{h}_{\mathbf{f}}=8 f L Q^{2} / \pi^{2} g D^{5}$

$$
8 \times 0.021 \times 600 \times 0.07854^{2} / \pi^{2} \times 9.81 \times 0.25^{5}=\mathbf{6 . 5 7 6} \mathbf{~ m}
$$

Check with other pipes
Pipe $2, h_{f}=8 \times 0.019 \times 800 \times 0.1128^{2} / \pi^{2} \times 9.81 \times 0.3^{5}=6.576 \mathbf{~ m}$
Example 7.8. Water is drawn from two reservoirs at the same water level through pipe 1 and 2 which join at a common point. $D_{1}=0.4 \mathrm{~m}, L_{1}=2000 \mathrm{~m}, f_{1}=0.024, D_{2}=0.35 \mathrm{~m}, L_{2}=1500 \mathrm{~m}, f_{2}=$ 0.021. The water from the common point is drawn through pipe 3 of 0.55 m dia over a length of 1600 $m$ to the supply location. The total head available is 25.43 m . Determine the flow rate through the system. The value of $f_{3}=0.019$.
Pipes 1 and 2 meet at a common location. The two reservoir levels are equal. So, the head drops are equal (refer para 7.17, eqn. 7.17.2. Let the flow in pipe 1 be $Q_{1}$ and that in pipe 2 be $Q_{2}$.

Then

$$
\frac{Q_{2}}{Q_{1}}=\left[\frac{f_{1}}{f_{2}} \frac{L_{1}}{L_{2}}\left(\frac{D_{2}}{D_{1}}\right)^{5}\right]^{0.5}
$$

Here $f_{1}=0.024, f_{2}=0.021, L_{1}=2000 \mathrm{~m}, L_{2}=1500 \mathrm{~m}, D_{1}=0.4 \mathrm{~m}, D_{2}=0.35 \mathrm{~m}$

$$
\begin{array}{ll}
\therefore & Q_{2}=Q_{1}\left[\frac{0.024}{0.021} \times \frac{2000}{1500} \times\left(\frac{0.35}{0.4}\right)^{5}\right]^{0.5}=0.8841 Q_{1} \\
\therefore & Q_{1}+Q_{2}=1.8841 Q_{1}
\end{array}
$$

This flow goes through pipe 3. The total head drop equals the sum of the drops in pipe 1 and in pipe 3.

$$
\begin{aligned}
25.43 & =\frac{8 \times 0.024 \times 2000{Q_{1}{ }^{2}}_{\pi^{2} \times 9.81 \times 0.4^{5}}+\frac{8 \times 0.019 \times 1600 \times 1.8841^{2} Q_{1}{ }^{2}}{\pi^{2} \times 9.81 \times 0.55^{5}}}{} \\
& =387.31{Q_{1}{ }^{2}+177.17 Q_{1}{ }^{2}=564.48 Q_{1}{ }^{2}}^{\therefore \quad \mathbf{Q}_{1}}=\mathbf{0 . 2 1 2 3 \mathbf { ~ m } ^ { 3 } / \mathbf { s } , \mathbf { Q } _ { 2 } = \mathbf { 0 . 1 8 7 7 } \mathrm { m } ^ { 3 } / \mathbf { s }} \\
\mathbf{Q}_{3} & =Q_{1}+Q_{2}=\mathbf{0 . 4} \mathbf{m}^{3} / \mathbf{s}, \text { check for pressure at common point } \\
\mathbf{h}_{\mathbf{f} 1} & =\frac{8 \times 0.024 \times 2000 \times 0.2123^{2}}{\pi^{2} \times 9.81 \times 0.4^{5}}=\mathbf{1 7 . 4 6 ~ m} \\
\mathbf{h}_{\mathrm{f} 2} & =\frac{8 \times 0.021 \times 1500 \times 0.1877^{2}}{\pi^{2} \times 9.81 \times 0.35^{5}}=\mathbf{1 7 . 4 6 ~ m}
\end{aligned}
$$

both are equal as required. Check for drop in the third pipe

$$
h_{f 3}=\frac{8 \times 0.019 \times 1600 \times 0.4^{2}}{\pi^{2} \times 9.81 \times 0.55^{5}}=7.99 \mathrm{~m}
$$

Total head $=7.99+17.46=\mathbf{2 5 . 4 5} \mathbf{~ m}$, checks.

### 7.18 FLUID POWER TRANSMISSION THROUGH PIPES

High head and medium head hydal plants convey water from a high level to the power house through pressure pipe called penstock pipes. The choices of the pipe diameter depends on the expected efficiency of transmission and also on the economical aspect of the cost of pipe. Higher efficiencies can be obtained by the use of larger diameter pipes, but this will prove to be costly. It is desirable to maximise the power transmitted as compared to an attempt to increase efficiency. Applications are also there in hydraulic drives and control equipments.

### 7.18.1 Condition for Maximum Power Transmission

Consider that the head available is $h$ and the frictional loss is $h_{f}$ (neglecting minor losses) left the pipe diameter be $D$ and the flow velocity be $u$.

Net head available $=h-h_{f}$ Quantity flow $=\pi D^{2} u / 4$

$$
h_{f}=f L u^{2} / 2 g D \text {, Power }=\text { mass flow } \times \text { net head }
$$

Power,

$$
P=\frac{\pi D^{2}}{4} u \rho\left[h-\left(f L u^{2} / 2 g D\right)\right]=\frac{\pi D^{2}}{4} \rho\left[u h-\frac{f L u^{3}}{2 g D}\right]
$$

Differetiating $P$ with respect to $u$, for maximum power,

$$
\frac{d P}{d u}=\frac{\pi D^{2} \rho}{4}\left[h-3\left(f L u^{2} / 2 g D\right)\right]=\frac{\pi D^{2} \rho}{4}\left[h-3 h_{f}\right]
$$

Equating to zero

$$
\begin{equation*}
h_{f}=h / 3 \tag{7.18.1}
\end{equation*}
$$

For maximum power generation frictional loss will equal one third of available head and the corresponding transmission efficiency is $66.67 \%$. If the available rate of flow is known the velocity and then the diameter can be determined or if the diameter is fixed the flow rate can be obtained. The friction factor for the pipe can be fixed as this is nearly constant above a
certain value of Reynolds number. For maximum power when flow rate is specified, pipe diameter is fixed and when diameter is specified the flow rate will be fixed.

Example 7.9 In a hydroelectric plant the head available is 450 m of water. 25 cm penstock pipe with friction factor of 0.014 is used. Determine the maximum power that can be developed. The length of the pipe line is 3600 m .
Using equation 7.18.1, $\quad h_{f}=h / 3=450 / 3=150 \mathrm{~m}$

$$
150=\left(0.014 \times 3600 \times u^{2}\right) /(2 \times 9.81 \times 0.25)
$$

solving, $u=3.82 \mathrm{~m} / \mathrm{s}$, flow rate $=\left(\pi D^{2} / 4\right) \times u=0.18755 \mathrm{~m}^{3} / \mathrm{s}$
Power developed $\quad=Q \rho g \times\left(h-h_{f}\right)=0.18755 \times 1000 \times 9.81(450-150)=551963 \mathrm{~W}$

$$
=551.963 \mathrm{~kW}
$$

Example 7.10. Determine for the data in example 7.9 the power transmitted for $\boldsymbol{u}=4.5 \mathrm{~m} / \mathrm{s}$ and $u=3 \mathrm{~m} / \mathrm{s}$.
(i) $u=4.5 \mathrm{~m} / \mathrm{s}, h_{f}=\left(0.014 \times 3600 \times 4.5^{2}\right) /(2 \times 9.81 \times 0.25)=208.07 \mathrm{~m}$

Power $=\left(\pi \times 0.25^{2} / 4\right) \times 4.5 \times 1000 \times 9.81(450-208.07)=524246 \mathbf{W}=\mathbf{5 2 4 . 2 5} \mathbf{k W}$
(ii) $u=3 \mathrm{~m} / \mathrm{s}, h_{f}=\left(0.014 \times 3600 \times 3^{2}\right) /(2 \times 9.81 \times 0.25)=92.48 \mathrm{~m}$

Power $=\left(\pi \times 0.25^{2} / 4\right) \times 3 \times 1000 \times 9.81(450-92.48)=516493 \mathrm{~W}=\mathbf{5 1 6 . 4 9} \mathbf{k W}$
This brings out clearly that the maximum power for a given diameter and head is when the frictional drop equals one third of available head.
Example 7.11 In a hydrosystem the flow availability was estimated as $86.4 \times 10^{3} \mathrm{~m}^{3} /$ day. The head of fall was estimated as 600 m . The distance from the dam to the power house considering the topography was estimated as 3000 m . The available pipes have friction factor 0.014. Determine the pipe diameter for transmitting maximum power, and also calculate the velocity and power transmitted.
Refer Eqn 7.18.1. The frictional drop is equal to one third of available head.

$$
\begin{array}{llrl}
\therefore & & h_{f} & =600 / 3=200 \mathrm{~m} \\
& h_{f} & =f L u^{2} / 2 g D, \text { Here both } u \text { and } D \text { are not specified. } \\
& \text { But } & & =\operatorname{area} \times \text { velocity } \\
\therefore & u & =4 Q / \pi D^{2} \quad \therefore \quad u^{2}=16 Q^{2} / \pi^{2} D^{4} \\
\therefore & h_{f} & =\frac{f L 16 Q^{2}}{2 \pi^{2} g D^{5}}=200, Q=86.4 \times 10^{3} /(24 \times 3600)=1 \mathrm{~m}^{3 /} \mathrm{s} \\
& 200 & =\left(0.014 \times 3000 \times 16 \times 1^{2}\right) /\left(2 \pi^{2} \times 9.81\right) D^{5}, \\
& D^{5} & =0.01735, \mathbf{D}=\mathbf{0 . 4 4 4 5} \mathbf{~ m} \\
& \text { Velocity } & =4 \times 1 /\left(\pi \times 0.4445^{2}\right)=\mathbf{6 . 4 4 4} \mathbf{~ m} / \mathbf{s} \\
& \text { Power } & =1000 \times 9.81 \times 400=\mathbf{3 . 9 2 4} \times \mathbf{1 0}^{\mathbf{6}} \mathbf{W} \text { or } \mathbf{3 . 9 2 4} \mathbf{M W}
\end{array}
$$

Check for frictional loss

$$
h_{f}=\left(0.014 \times 3000 \times 6.444^{2}\right) /(2 \times 9.81 \times 0.4445)=200 \mathrm{~m}(\text { checks })
$$

### 7.19 NETWORK OF PIPES

Complex connections of pipes are used in city water supply as well as in industrial systems. Some of these are discussed in the para.

### 7.19.1 Pipes in Series—Electrical Analogy

Series flow problem can also be solved by use of resistance network. Consider equation 7.11.15. For given pipe specification the equation can be simplified as

$$
h_{f}=8 f L Q^{2} / \pi^{2} g D^{5}=R Q^{2}
$$

Note: The dimension for $R$ is $s^{2} / m^{5}$. For flow in series $Q$ is the same through all pipes. This leads to the relation

$$
h_{f 1}+h_{f 2}+h_{f 3}+\ldots \ldots \ldots . . h_{f n}=h_{f}=\left(R_{1}+R_{2}+R_{3}+\ldots .+R_{n}\right) Q^{2}
$$

The $R$ values for the pipe can be calculated. As the total head is also known $Q$ can be evaluated. The length $L$ should include minor losses in terms of equivalent lengths. The circuit is shown in Fig. 7.19.1.

Figure 7.19.1 Equivalent circuit for series flow
Example 7.12. A reservoir at a level with respect to datum of 16 m supplies water to a ground level reservoir at a level of 4 m . Due to constraints pipes of different diameters were to be used. Determine the flow rate.

| No. | Diameter, $\mathbf{m}$ | Length including <br> minor losses, $\mathbf{m}$ | $\mathbf{f}$ |
| :---: | :---: | :---: | :---: |
| 1 | 0.30 | 220 | 0.02 |
| 2 | 0.35 | 410 | 0.018 |
| 3 | 0.45 | 300 | 0.013 |
| 4 | 0.40 | 600 | 0.015 |

The resistance values are calculated using Eqn. 7.11.15
Pipe 1.

$$
\mathbf{R}_{1}=\frac{8 \times 0.02 \times 220}{\pi^{2} \times 9.81 \times 0.3^{5}}=\mathbf{1 4 9 . 6 1}, \text { Pipe } 2 . \mathbf{R}_{2}=\frac{8 \times 0.018 \times 410}{\pi^{2} \times 9.81 \times 0.35^{5}}=\mathbf{1 1 6 . 1}
$$

Pipe 3.

$$
\mathbf{R}_{3}=\frac{8 \times 0.013 \times 300}{\pi^{2} \times 9.81 \times 0.45^{5}}=\mathbf{1 7 . 4 6 3}, \text { Pipe 4. } \mathbf{R}_{4}=\frac{8 \times 0.015 \times 600}{\pi^{2} \times 9.81 \times 0.4^{5}}=\mathbf{7 2 . 6 2}
$$

$$
h=\left[R_{1}+R_{2}+R_{3}+R_{4}\right] Q^{2}
$$

$$
(16-4)=(149.61+17.463+72.62) Q^{2}=355.793 Q^{2}
$$

```
\therefore Q = 0.18365 m}\mp@subsup{\mathbf{m}}{}{3}/\mathbf{s
Check \Sigmah=\Sigma( }\mp@subsup{R}{1}{}\mp@subsup{Q}{1}{2}\mp@subsup{}{}{2})=5.046+3.916+0.589+2.449=12 
```

### 7.19.2 Pipes in Parallel

Such a system is shown in Fig. 7.19.2

Figure 7.19.2
Case (i) The head drop between locations 1 and 2 are specified: The total flow can be determined using

$$
h_{f}=\frac{8 f_{1} L_{1} Q_{1}{ }^{2}}{\pi^{2} g D_{1}{ }^{5}}=\frac{8 f_{2} L_{2} Q_{2}{ }^{2}}{\pi^{2} g D_{2}{ }^{5}}=\frac{8 f_{3} L_{3} Q_{3}{ }^{2}}{\pi^{2} g D_{3}{ }^{5}}
$$

As $h_{f}$ and all other details except flow rates $Q_{1}, Q_{2}$ and $Q_{3}$ are specified, these flow rates can be determined.

Total flow

$$
Q=Q_{1}+Q_{2}+Q_{3}
$$

The process can be extended to any number of connections.
Case (ii) Total flow and pipe details specified. One of the methods uses the following steps:

1. Assume by proper judgement the flow rate in pipe 1 as $Q_{1}$.
2. Determine the frictional loss.
3. Using the value find $Q_{2}$ and $Q_{3}$.
4. Divide the total $Q$ in the proportion $Q_{1}: Q_{2}: Q_{3}$ to obtain the actual flow rates.

Case (iii) Electrical analogy is illustrated or in problem Ex. 7.13 and Ex. 7.14.

Example 7.13 The details of a parallel pipe system for water flow are given below.

| No. | length, $\mathbf{m}$ | Diameter, $\mathbf{m}$ | Friction factor |
| :---: | :---: | :---: | :---: |
| 1 | 800 | 0.2 | 0.022 |
| 2 | 1200 | 0.3 | 0.02 |
| 3 | 900 | 0.4 | 0.019 |

1. If the frictional drop between the junctions is 15 m of water, determine the total flow rate
2. If the total flow rate is $0.66 \mathrm{~m}^{3} / \mathrm{s}$, determine the individual flow and the friction drop.

The system is shown in Fig. Ex. 7.13.
Case (i) Let the flows be $Q_{1}, Q_{2}$ and $Q_{3}$. Total flow $Q=Q_{1}+Q_{2}+Q_{3}$, using equation 7.11.15

Figure Ex. 7.13
The flow rates are calculated individually with $h_{f}=15 \mathrm{~m}$ and totalled.

$$
\begin{aligned}
& 15=\frac{8 f_{1} L_{1}{Q_{1}}^{2}}{\pi^{2} g D_{1}{ }^{5}}=\frac{8 \times 0.022 \times 800 \times{Q_{1}}^{2}}{\pi^{2} \times 9.81 \times 0.2^{5}} \text { solving } \mathbf{Q}_{1}=0.05745 \mathrm{~m}^{3} / \mathrm{s} \\
& 15=\frac{8 f_{2} L_{2}{Q_{2}}^{2}}{\pi^{2} g D_{2}{ }^{5}}=\frac{8 \times 0.02 \times 1200 \times{Q_{2}}^{2}}{\pi^{2} \times 9.81 \times 0.3^{5}} \text { solving } \mathbf{Q}_{2}=\mathbf{0 . 1 3 5 5} \mathrm{m}^{3} / \mathrm{s} \\
& 15=\frac{8 f_{3} L_{3} Q_{3}{ }^{2}}{\pi^{2} g D_{3}{ }^{5}}=\frac{8 \times 0.019 \times 900 \times{Q_{3}}^{2}}{\pi^{2} \times 9.81 \times 0.4^{5}} \text { solving } \mathbf{Q}_{3}=\mathbf{0 . 3 2 9 7 1} \mathrm{m}^{3} / \mathrm{s} \\
& \mathbf{Q}=Q_{1}+Q_{2}+Q_{3}=\mathbf{0 . 5 2 2} \mathbf{m}^{3} / \mathbf{s}
\end{aligned}
$$

Case (ii) Total flow is $0.66 \mathrm{~m}^{3} / \mathrm{s}$. Already for 15 m head individual flows are available. Adopting method 2 the total flow is divided in the ratio of $Q_{1}: Q_{2}: Q_{3}$ as calculated above.

$$
\begin{aligned}
& Q_{1}=\frac{0.66 \times 0.05745}{0.52274}=0.07254 \mathrm{~m}^{3} / \mathrm{s} \\
& Q_{2}=\frac{0.66 \times 0.13558}{0.52274}=0.17117 \mathrm{~m}^{3 / \mathrm{s}} \\
& Q_{3}=\frac{0.66 \times 0.32971}{0.52274}=0.41629 \mathrm{~m}^{3} / \mathrm{s}
\end{aligned}
$$

Calculation for frictional loss.

Pipe 1

$$
h_{f}=\frac{8 \times 0.022 \times 800 \times 0.07254^{2}}{\pi^{2} \times 9.81 \times 0.2^{5}}=23.91 \mathrm{~m}
$$

Pipe 2

$$
h_{f}=\frac{8 \times 0.02 \times 1200 \times 0.17117^{2}}{\pi^{2} \times 9.81 \times 0.3^{5}}=23.91 \mathrm{~m}
$$

Pipe 3

$$
h_{f}=\frac{8 \times 0.019 \times 900 \times 0.41629^{2}}{\pi^{2} \times 9.81 \times 0.4^{5}}=23.91 \mathrm{~m}
$$

Electrical analogy : For parallel pipe network also electrical analogy can be used. In the case of parallel flow as the pressure drop is the same

$$
\begin{aligned}
& h_{f}=R_{1} Q_{1}{ }^{2}=R_{2} Q_{2}{ }^{2}=R_{3} Q_{3}{ }^{2} \ldots \ldots \ldots \ldots \ldots \ldots . . \text { or } \\
& Q_{1}=\sqrt{h_{f} / R_{1}}, \text { Total flow equals } Q_{1}+Q_{2}+Q_{3} \ldots \ldots \ldots \ldots . . \\
& Q=\sqrt{h_{f}}\left[\frac{1}{\sqrt{R_{1}}}+\frac{1}{\sqrt{R_{2}}}+\ldots \ldots \ldots\right]
\end{aligned}
$$

An equivalent resistance $R$ can be obtained by

$$
\frac{1}{\sqrt{R}}=\frac{1}{\sqrt{R_{1}}}+\frac{1}{\sqrt{R_{2}}}+\ldots \ldots \ldots . . \text { and } Q^{2}=h_{f} / R
$$

Example 7.14. Work out problem 7.13 by analogy method.
Case 1.

$$
\boldsymbol{R}_{1}=\frac{8 \times 0.022 \times 800}{\pi^{2} \times 9.81 \times 0.2^{5}}=\mathbf{4 5 4 4 . 4 8}, \boldsymbol{R}_{2}=\frac{8 \times 0.02 \times 1200}{\pi^{2} \times 9.81 \times 0.3^{5}}=\mathbf{8 1 6 . 0 7}
$$

$$
\boldsymbol{R}_{3}=\frac{8 \times 0.019 \times 900}{\pi^{2} \times 9.81 \times 0.4^{5}}=137.98, \frac{1}{\sqrt{R}}=\frac{1}{\sqrt{4544.48}}+\frac{1}{\sqrt{816.07}}+\frac{1}{\sqrt{137.98}}
$$

$$
\therefore \quad \mathbf{R}=\left(\frac{1}{0.13497}\right)^{2}=\mathbf{5 4 . 8 9 3} \quad \therefore \quad Q^{2}=15 / 54.893=0.2733
$$

$$
\therefore \quad Q=\mathbf{0 . 5 2 2 7 4} \text { (checks with the previous case) }
$$

Case 2.

$$
\begin{aligned}
Q & =0.66, R=54.893 \\
h_{f} & =R Q^{2}=54.893 \times 0.52274^{2}=23.91 \mathrm{~m} \\
Q_{1}{ }^{2} & =h_{f} / R_{1}=23.91 / 4544.48, Q_{1}=0.07254 \mathrm{~m}^{3} / \mathrm{s} \\
Q_{2}{ }^{2} & =h_{f} / R_{2}=23.91 / 816.07, Q_{2}=0.17117 \mathrm{~m}^{3} / \mathrm{s} \\
Q_{3}{ }^{2} & =h_{f} / R_{3}=23.91 / 137.98, Q_{3}=0.41629 \mathrm{~m}^{3} / \mathrm{s}
\end{aligned}
$$

Note: Checks in all cases.

### 7.19.3 Branching Pipes

The simplest case is a three reservoir system interconnected by three pipes (Ref. Fig. 7.19.3). The conditions to be satisfied are (i) The net flow at any junction should be zero due to continuity principle. (ii) The Darcy-Weisbach equation should be satisfied for each pipe. If flows are $Q_{1}, Q_{2}, Q_{3}$, then the algebraic sum of $Q_{1}+Q_{2}+Q_{3}=0$. If one of the flow rate is specified the solution is direct. If none are specified, trial solution becomes necessary. The flow may be from the higher reservoir to the others or it may be from both high level reservoirs to the low level one. The hydraulic grade line controls the situation. If the head at the junction is above both the lower reservoirs, both of these will receive the flow. If the head
at the junction is below the middle one, the total flow will be received by the lowest level reservoir. This is shown in Fig 7.19.3.

Figure 7.19.3
The method of solution requires iteration.
(i) A value for the head at the junction is assumed and the flow rates are calculated from pipe details.
(ii) The sum of these (algebraic) should be zero. But at the first attempt, the sum may have a positive value or negative value.
(iii) If it is positive, inflow to the junction is more. So increase the value of head assumed at the junction.
(iv) If it is negative, the outflow is more. So reduce the value of head assumed. Such iteration can be also programmed for P.C.

Example 7.15 Three reservoirs $A, B$ and $C$ at water levels of $25 m, 12 m$ and $8 m$ are connected by a pipe network. 1200 m length pipe of diameter 0.5 m and $f=0.013$ draws water from $A$. 1000 m length pipe of diameter 0.4 m and $f=0.015$ draws water from $B$ and joins the pipe end from $A$. The reservoir $C$ is connected to this junction by 900 m length of pipe 0.6 m diameter with $f=0.011$. Determine the flow from / to each reservoir.
Using the equation 7.11 .15

$$
\begin{aligned}
& h_{f}=\frac{8 f L Q^{2}}{\pi^{2} g D^{5}}, \text { and writing this } h_{f}=R Q^{2} \\
& \mathbf{R}_{\mathbf{A}}=\frac{8 \times 0.013 \times 1200}{\pi^{2} \times 9.81 \times 0.5^{5}}=\mathbf{4 1 . 2 4 7 3}, \\
& \mathbf{R}_{\mathbf{B}}=\frac{8 \times 0.015 \times 1000}{\pi^{2} \times 9.81 \times 0.4^{5}}=\mathbf{1 2 1 . 0 3 5 4} \\
& \mathbf{R}_{\mathrm{C}}=\frac{8 \times 0.011 \times 900}{\pi^{2} \times 9.81 \times 0.6^{5}}=\mathbf{1 0 . 5 1 9 6}
\end{aligned}
$$

Considering flow from $A,\left(25-Z_{J}\right) / 41.2473=Q_{A}{ }^{2}$,
where $Z_{J}$ level at junction $J$. Similarly for flow from $B$ and $C$,

$$
\left(12-\mathrm{Z}_{\mathrm{J}}\right) / 121.0354=\mathbf{Q}_{\mathrm{B}}{ }^{2},\left(8-\mathrm{Z}_{\mathrm{J}}\right) / 10.5196=\mathbf{Q}_{\mathrm{C}}{ }^{2}
$$

| Assumed value of $\mathbf{Z}_{\mathbf{J}}$ | $\mathbf{Q}_{\mathbf{A}}$ | $\mathbf{Q}_{\mathbf{B}}$ | $\mathbf{Q}_{\mathbf{C}}$ | $\mathbf{Q}_{\mathbf{A}}+\mathbf{Q}_{\mathbf{B}}+\mathbf{Q}_{\mathbf{C}}$ |
| :---: | :---: | :---: | :---: | :---: |
| 10 | 0.6030 | 0.1286 | -0.4360 | 0.2556 |
| 13.0 | 0.5394 | -0.0909 | -0.6894 | -0.2409 |
| 11.5 | 0.5721 | 0.06423 | -0.5768 | 0.0596 |
| $\mathbf{1 1 . 8}$ | $\mathbf{0 . 5 6 5 7}$ | $\mathbf{0 . 0 4 0 6}$ | $\mathbf{- 0 . 6 0 1 0}$ | $\mathbf{0 . 0 0 5 3}$ |

This is sufficient for the trial. The flow rates in the last column can be used.

$$
Z_{J}=11.825 \mathrm{~m} \text { gives a residue of } 0.00019 .
$$

Considering the value, the flows are

$$
Q_{A}=0.56517 \mathrm{~m}^{3} / \mathrm{s}, Q_{B}=0.03802 \mathrm{~m}^{3} / \mathrm{s} \text { and } Q_{C}=-0.603 \mathrm{~m}^{3} / \mathrm{s}
$$

### 7.19.4 Pipe Network

More complex network of pipes exist in practice. A sample is shown in Fig. 7.12
For analysis of the system the following conditions are used.

1. The algebraic sum of the pressure drop around each circuit must be zero.
2. The flow into the junction should equal the flow out of the junction.
3. For each pipe the proper relation between head loss and discharge should be maintained. Analytical solution to such a problem is more involved. Methods of successive approximation are used. With the use of computers, it is now possible to solve any number of simultaneous equations rather easily. Use of the above conditions leads to a set of simultaneous equations. This set can be solved using computers.

Figure 7.19.4 Pipe network

## SOLVED PROBLEMS

Problem. 7.1. An oil of specific gravity 0.82 and kinematic viscosity $16 \times 10^{-6} \mathrm{~m}^{2} /$ s flows in a smooth pipe of 8 cm diameter at a rate of $2 l / s$. Determine whether the flow is laminar or turbulent. Also calculate the velocity at the centre line and the velocity at a radius of 2.5 cm . What is head loss for a length of 10 m . What will be the entry length? Also determine the wall shear.

Average flow velocity $=$ volume flow/area $=4 \times 0.002 / \pi \times 0.08^{2}=0.4 \mathrm{~m} / \mathrm{s}$

$$
\operatorname{Re}=\frac{u D}{v}=\frac{0.4 \times 0.08}{16 \times 10^{-6}}=2000
$$

This value is very close to transition value. However for smooth pipes the flow may be taken as laminar.

Centre line velocity $=2 \times$ average velocity $=0.8 \mathrm{~m} / \mathrm{s}$
For velocity at 2.5 cm radius
as

$$
\begin{aligned}
\frac{u}{u_{\max }} & =1-\left(\frac{r}{R}\right)^{2} \quad \therefore \quad \mathbf{u}=0.8\left[1-\left(\frac{2.5}{4}\right)^{2}\right]=\mathbf{0 . 4 8 7 5} \mathbf{~ m} / \mathbf{s} \\
\mathbf{f} & =64 / \mathrm{Re}=64 / 2000=\mathbf{0 . 0 3 2} \\
\mathbf{h}_{\mathbf{f}} & =f L u^{2} / 2 g d=\left(0.032 \times 10 \times 0.4^{4}\right) /(2 \times 9.81 \times 0.08) \\
& =\mathbf{0 . 0 3 2 6 2} \mathbf{~ m} \text { of oil } \\
\Delta \mathbf{p} & =h_{f} \gamma=0.03262 \times 9810 \times 0.82=\mathbf{2 6 2 . 4} \mathrm{N} / \mathrm{m}^{2} \\
\text { Entry length } & =0.058 \mathrm{Re} . D .=0.058 \times 2000 \times 0.08=\mathbf{9 . 2 8} \mathbf{~ m}
\end{aligned}
$$

For highly viscous fluid entry length will be long. Wall shear is found from the definition of $f$.

$$
\tau_{o}=\frac{f}{4} \frac{\rho}{g_{o}} \frac{u_{m}{ }^{2}}{2}=\frac{0.032}{4} \times \frac{820}{1} \times \frac{0.4^{2}}{2}=0.5248 \mathrm{~N} / \mathrm{m}^{2}
$$

Wall shear can also be found using, $\tau_{o}=-\rho v \frac{d u}{d r}$

$$
u=u_{\max }\left[1-\frac{r^{2}}{R^{2}}\right], \frac{d u}{d r}=-\frac{U_{\max } 2 r}{R^{2}}, \text { at } r=R, \frac{d u}{d r}=-u_{\max } \frac{2}{R}
$$

Substituting, $\quad \tau_{0}=820 \times 16 \times 10^{-6} \times 0.8 \times 2 / 0.04=0.5248 \mathrm{~N} / \mathrm{m}^{2}$.
Problem 7.2. A circular and a square pipe are of equal sectional area. For the same flow rate, determine which section will lead to a higher value of Reynolds number.
$\operatorname{Re}=u D_{h} / v$, For the same section and same flow rate of a specified fluid, $R_{e} \propto D_{h}$ hydraulic Diameter.

Circular Pipe : $\quad D_{h}=D$
Square Pipe of side $a$ : $D_{h}=4 a^{2} / 4 a=a$
as areas are equal,

$$
a^{2}=\pi D^{2} / 4, \quad \therefore \quad a=0.886 D
$$

The hydraulic diameter of a square section of the same area is lower by about $\mathbf{1 1 . 4 \%}$. So the Reynolds number in this case will be lower by about $11.4 \%$ and hence for the same flow rate $f$ will be higher for the square section.

Problem 7.3. The kinematic viscosity of water at $30^{\circ} \mathrm{C}$ is $0.832 \times 10^{-6} \mathrm{~m}^{2} / \mathrm{s}$. Determine the maximum flow rate through a 10 cm dia pipe for the flow to be laminar. Assume smooth pipe. Also determine the head loss/m at this flow condition.

The condition is that Reynolds number should be about 2000 .

$$
\begin{aligned}
& & 2000 & =(0.1 \times u) /\left(0.832 \times 10^{-6}\right) \\
& \therefore & \mathbf{u} & =\mathbf{0 . 0 1 6 6 4} \mathbf{~ m} / \mathbf{s} .
\end{aligned}
$$

The flow rate will be $=\left(\pi \times 0.1^{2} / 4\right) \times 0.01664=\mathbf{1 . 3 0 7} \times \mathbf{1 0}^{-4} \mathbf{m}^{3} / \mathbf{s}=\mathbf{0 . 1 3 0 7} \mathbf{1} / \mathbf{s}$.

$$
f=64 / 2000=0.032
$$

Head of water, $\quad h_{f}=0.032 \times 1 \times 0.01664^{2} /(2 \times 9.81 \times 0.1)=4.516 \times 10^{-6} \mathbf{~ m} / \mathbf{m}$.
Note: The flow turns turbulent even at a low flow velocity as the kinematic viscosity is low.
Problem 7.4. Air at 1 atm and $30^{\circ} \mathrm{C}$ flows through a pipe of 30 cm dia. The kinematic viscosity at this condition is $16 \times 10^{-6} \mathrm{~m}^{2} / \mathrm{s}$. The density is $1.165 \mathrm{~kg} / \mathrm{m}^{3}$. Determine the maximum average velocity for the flow to remain laminar. What will be the volume and mass flow rates at this condition? Also determine the head loss/m due to friction.

The condition is that Reynolds number should equal 2000.

$$
\begin{aligned}
\therefore \quad 2000 & =\left(u_{m} \times 0.3\right) / 16 \times 10^{-6} \quad \therefore \quad u_{m}=0.107 \mathrm{~m} / \mathrm{s} \\
\text { Volume flow rate } & =u A=0.107 \times \pi \times 0.3^{2} / 4=\mathbf{7 . 5 4} \times \mathbf{1 0}^{-3} \mathbf{m}^{3} / \mathbf{s} \text { or } \mathbf{7 . 5 4} \mathbf{1 / s} \\
\text { Mass flow } & =\text { volume flow } \times \text { density }=7.54 \times 10^{-3} \times 1.165 \\
& =\mathbf{8 . 7 8 4} \times \mathbf{1 0}^{-\mathbf{3}} \mathbf{~ k g} / \mathbf{s} \\
f & =64 / \mathrm{Re}=64 / 2000=0.032 \\
h_{f} & =\left(0.032 \times 0.107^{2} \times 1\right) /(2 \times 9.81 \times 0.3) \\
& \left.=62.2 \times 10^{-6} \mathrm{~m} / \mathrm{m} \text { (head of air }\right)
\end{aligned}
$$

Problem 7.5. Oil with a kinematic viscosity of $241 \times 10^{-6} \mathrm{~m}^{2} / \mathrm{s}$ and density of $945 \mathrm{~kg} / \mathrm{m}^{3}$ flows through a pipe of 5 cm dia. and 300 m length with a velocity of $2 \mathrm{~m} / \mathrm{s}$. Determine the pump power, assuming an overall pump efficiency of $45 \%$, to overcome friction.

$$
\begin{aligned}
\operatorname{Re} & =u D / v=2 \times 0.05 / 241 \times 10^{-6}=415 . \text { So the flow is laminar. } \\
h_{f} & =(64 / 415) \times\left[\left(2^{2} \times 300\right) /(2 \times 9.81 \times 0.05)\right]=188.67 \mathrm{~m} \text { head of oil } \\
\text { Mass flow } & =\left(\pi \times 0.05^{2} / 4\right) 2 \times 945 \mathrm{~kg} / \mathrm{s}=3.711 \mathrm{~kg} / \mathrm{s} \\
\text { Power required } & =m g \mathrm{H} / \eta=3.711 \times 9.81 \times 188.67 / 0.45 \mathrm{~W} \\
& =15,263 \mathrm{~W} \text { or } \mathbf{1 5 . 2 6 3} \mathbf{k W} .
\end{aligned}
$$

Problem 7.6. If, in problem P.7.5. the power available was 10 kW , what will be the pumping rate?

Power available to overcome friction $P=$ power $\times$ pump efficiency

$$
=10 \times 0.45=4.5 \mathrm{~kW} \text { or } 4500 \mathrm{~W}
$$

$$
\text { Mass flow } \quad=\left(\pi D^{2 / 4}\right) u \rho
$$

Frictional loss in head of fluid $=(64 / R e) \times\left(u^{2} L / 2 g D\right)$

$$
=(64 v / u D) \times\left(u^{2} L / 2 g D\right)
$$

$\therefore \quad$ Power $=$ mass flow $\times g \times$ frictional head

$$
=\left(\pi D^{2} / 4\right) u \rho g\left(64 v u^{2} L / u D 2 g D\right)=8 \pi \rho v L u^{2}
$$

$$
4500=8 \times \pi \times 945 \times 241 \times 10^{-6} \times 300 u^{2}
$$

$$
\therefore \quad u=1.619 \mathrm{~m} / \mathrm{s}
$$

Flow rate

$$
=\left(\pi \times 0.05^{2} / 4\right) \times 1.619 \times 945=3 \mathrm{~kg} / \mathbf{s}
$$

Problem 7.7. Oil of specific gravity 0.92 flows at a rate of 4.5 litres/s through a pipe of 5 cm dia, the pressure drop over 100 m horizontal length being $15 \mathrm{~N} / \mathrm{cm}^{2}$. Determine the dynamic viscosity of the oil.

Using the equation 7.9.2 - Hagen-Poiseuille eqn. $\Delta p=128 \mu L Q / \pi D^{4}$

$$
\begin{aligned}
\mu & =\Delta p \cdot \pi . D^{4} / 128 L Q \\
& =15 \times 10^{4} \times \pi \times 0.05^{4} / 128 \times 100 \times 0.0045=\mathbf{0 . 0 5 1 1 3} \mathbf{N s} / \mathbf{m}^{2}(\mathrm{~Pa} . \mathrm{s})
\end{aligned}
$$

(Note: $\mathrm{N} / \mathrm{cm}^{2} \rightarrow 10^{4} \mathrm{~N} / \mathrm{m}^{2}$, litre $=0.001 \mathrm{~m}^{3}$ )
Reynolds number $\quad=u D \rho / \mu, u=Q \times 4 / \pi D^{2}$

$$
\begin{aligned}
\therefore \quad \operatorname{Re} & =\left(4 Q / \pi D^{2}\right) \times(D \rho / \mu)=(0.0045 \times 920 \times 4) /(\pi \times 0.05 \times 0.05113) \\
& =2061.6
\end{aligned}
$$

$\therefore$ Flow is laminar but just on the verge of turning turbulent
(Note: $\operatorname{Re}=4 \mathrm{Q} / \boldsymbol{\pi} \mathrm{Dv}$ )
Problem 7.8. In a capillary viscometer the tube is of 2 mm dia and 0.5 m length. If 60 $\mathrm{cm}^{3}$ of liquid is collected during 10 min with a constant pressure difference of $5000 \mathrm{~N} / \mathrm{m}^{2}$, determine the viscosity of the oil.

$$
\begin{array}{lrl}
\text { Using } & & \Delta p \\
& =128 \mu L Q / \pi D^{4} \text { (Hagen Poiseuille equation } 7.9 .2 \text { ) } \\
\mu & =\Delta p . \pi D^{4} / 128 L Q \text { where } Q \text { is the discharge in } \mathrm{m}^{3} \text { per second. } \\
& \therefore \quad \text { Discharge } & =60 \times 10^{-6} \mathrm{~m}^{3} / 600 \mathrm{sec}=10^{-7} \mathrm{~m}^{3} / \mathrm{s} \\
\therefore & \mu & =5000 \times \pi \times 0.002^{4} / 128 \times 0.5 \times 10^{-7}=\mathbf{0 . 0 3 9 3} \mathbf{N s} / \mathbf{m}^{2} \quad \text { (or Pa.s) }
\end{array}
$$

Problem 7.9. If an oil of viscosity of $0.05 \mathrm{Ns} / \mathrm{m}^{2}$ is used in the experiment of problem P.7.8 calculate how long it will take to collect $\mathbf{6 0}$ cc. Assume that the other conditions remain unaltered.

$$
\begin{array}{rlrl} 
& \Delta p & =128 \mu L Q / \pi D^{4} \\
& Q & =\Delta p \times \pi D^{4} / 128 \mu L \quad \text { where } Q \text { is in } \mathrm{m}^{3} / \mathrm{s} \\
Q & =5000 \times \pi \times 0.002^{4} / 128 \times 0.05 \times 0.5=7.854 \times 10^{-8} \mathrm{~m}^{3} / \mathrm{s}
\end{array}
$$

or $\quad 7.854 \times 10^{-2} \mathrm{cc} / \mathrm{s}$
$\therefore$ Time for $\quad 60 \mathrm{cc}=60 / 7.854 \times 10^{-2} \mathrm{~s}=763.94 \mathrm{~s}$ or $\mathbf{1 2 . 7 3} \mathbf{~ m i n}$
Problem 7.10. Oil of viscosity $0.1 \mathrm{Ns} / \mathrm{m}^{2}$ is to flow through an inclined pipe by gravity. The pipe diameter is 25 mm and the density of the oil is $930 \mathrm{~kg} / \mathrm{m}^{3}$. If the flow rate is to be 0.25 l/s determine the pipe inclination with horizontal.

The inclination of the pipe should be such that the drop in head should equal the friction drop along the length or

$$
h_{f}=L \sin \theta, \Delta h=f L u^{2} / 2 g D, f=64 / \operatorname{Re}, h=\Delta p / \gamma
$$

Using Darcy-Weisbach equation and substituting for $f$ in terms of $\operatorname{Re}$

$$
\begin{aligned}
h_{f} & =\frac{64}{\operatorname{Re}} \frac{u^{2} L}{2 g D}=L \sin \theta \text { or } \sin \theta=\frac{64 u^{2}}{2 \operatorname{Re} g D} \\
u & =4 Q / \pi D^{2}=4 \times 0.25 /\left(\pi \times 0.025^{2}\right) 1000=0.5093 \mathrm{~m} / \mathrm{s} \\
\therefore \quad \operatorname{Re} & =\frac{u D \rho}{\mu}=0.5093 \times 0.025 \times 930 / 0.1=118.41
\end{aligned}
$$

$\therefore \quad$ Flow is laminar

$$
\begin{array}{rlrl} 
& & \sin \theta & =\left(64 \times 0.5093^{2}\right) /(2 \times 118.41 \times 9.81 \times 0.025)=0.28582 \\
\therefore & \theta & =\mathbf{1 6 . 6 ^ { \circ }} \text { with horizontal }
\end{array}
$$

Problem 7.11. In a double pipe heat exchanger (to obtain chilled water) water at $10^{\circ} \mathrm{C}$ flows in the annular area between 30 mm OD inside pipe and the 50 mm ID outer pipe. The kinematic viscosity at this temperature is $1.4 \times 10^{-6} \mathrm{~m}^{2} / \mathrm{s}$. Determine the maximum flow rate if the flow should be laminar.

The sectional area for flow $=(\pi / 4)\left(D^{2}-d^{2}\right)$ where $D=$ out side dia, $d=$ inside dia. of the annular area. Wetted perimeter $=\pi(D+d)$

$$
\therefore \quad \mathbf{D}_{\mathbf{h}}=4 \times(\pi / 4)\left(D^{2}-d^{2}\right) / \pi(D+d)=D-d=0.05-0.03=\mathbf{0 . 0 2} \mathbf{~ m}
$$

For laminar conditions Re should be less than 2000.

$$
\begin{array}{rlrl}
\operatorname{Re} & =2000=(0.02 \times u) /\left(1.4 \times 10^{-6}\right) \quad \therefore \quad u=0.14 \mathrm{~m} / \mathrm{s} \\
\therefore \quad & \quad \text { flow rate } & =(\pi / 4)\left(0.05^{2}-0.03^{2}\right) 0.14 \\
& & =\mathbf{1 . 7 6} \times \mathbf{1 0}^{-4} \mathbf{m}^{3} / \mathbf{s} \text { or } \mathbf{0 . 1 7 6} \mathbf{1 / s} \text { or } \mathbf{6 3 3 . 3} \mathbf{1 / h r} .
\end{array}
$$

The friction factor and friction drop in head and power required for a flow rate etc can be determined as in problem P. 7.5. taking care to use $D_{h}$ in place of $D$.

Problem 7.12. Water flows in an experimental 50 mm square pipe at a temperature of $10^{\circ} \mathrm{C}$. The flow velocity is $0.012 \mathrm{~m} / \mathrm{s}$. Determine the head drop over a length of 10 m . Compare the same with circular section of the same area, $v=1.4 \times 10^{-6} \mathrm{~m}^{2} / \mathrm{s}$.

As the section is square, the hydraulic diameter is to be used.

$$
\begin{aligned}
& D_{h}=4 \text { area/perimeter }=4 a^{2} / 4 a=a=0.05 \mathrm{~m} \\
& \mathrm{Re}=D_{h} u / v=0.05 \times 0.012 / 1.4 \times 10^{-6}=428.6
\end{aligned}
$$

$\therefore$ The flow is laminar.

$$
\begin{aligned}
f & =64 / \mathrm{Re}=64 / 428.6 \\
h_{f} & =f L u^{2} / 2 g D_{h}=(64 / 428.6) \times 10 \times 0.012^{2} /(2 \times 9.81 \times 0.05) \\
& =\mathbf{2 . 1 9} \times \mathbf{1 0}^{-4} \mathbf{m} \text { head of water } .
\end{aligned}
$$

Circular section: $\pi D^{2} / 4=0.05^{2} \quad \therefore \quad D=0.05642 \mathrm{~m}$

$$
\begin{aligned}
R e & =0.05642 \times 0.012 / 1.4 \times 10^{-6}=483.6, \text { laminar }, \\
f & =64 / 483.6=0.1323 \\
\mathbf{h}_{\mathrm{f}} & =0.1323 \times 10 \times 0.012^{2} / 2 \times 9.81 \times 0.05642 \\
& =\mathbf{1 . 7 2 2} \times \mathbf{1 0}^{-4} \mathbf{m} \quad \therefore \quad \text { Lower by: } 21.4 \%
\end{aligned}
$$

Problem 7.13. If in the place of square a rectangular section of $100 \mathrm{~mm} \times 25 \mathrm{~mm}$ is used for the data of P. 7.12 determine the head drop over a length of 10 m .

Hydraulic diameter $=4 A / P=4 \times 0.025 \times 0.1 / 2(0.1+0.025)=0.04 \mathrm{~m}$

$$
\operatorname{Re}=D_{h} u / v=0.4 \times 0.012 / 1.4 \times 10^{-6}=342.86
$$

Frictional drop in head $=f . L . u^{2} / 2 g D_{h}=(64 / 342.86) \times 10 \times 0.012^{2} / 2 \times 9.81 \times 0.04$

$$
=3.425 \times 10^{-4} \mathrm{~m} \text { head of water }
$$

For the same flow area as compared to $1.722 \times 10^{-4} \mathrm{~m}$ head of water for the circular section there is an increase of $\mathbf{1 0 0 \%}$ in friction drop for the rectangular section.

Problem 7.14. Water flows out from a storage tank through a pipe of 50 mm dia. at a rate of $9.82 \mathrm{l} / \mathrm{s}$. Determine the loss of head at entrance if it is (i) bell mounted (ii) square edged and (iii) reentrant.

Refer section 7.12
(i) In this case the loss coefficient is 0.04

$$
\begin{array}{rlrl} 
& & u & =4 Q / \pi D^{2}=4 \times 9.82 /\left(1000 \times \pi \times 0.05^{2}\right)=5 \mathrm{~m} / \mathrm{s} \\
\therefore & h_{f} & =0.04 \times 5^{2} / 2 \times 9.81=\mathbf{0 . 0 5 1} \mathbf{m} .
\end{array}
$$

(ii) In this case loss coeffcient is $0.5 . \quad \therefore \quad \mathbf{h}_{\mathbf{f}}=0.5 \times 5^{2} / 2 \times 9.81=\mathbf{0 . 6 3 7} \mathbf{~ m}$
(iii) The loss coefficient in this case $=0.8 \quad \therefore \quad \mathbf{h}_{\mathbf{f}}=0.8 \times 5^{2} / 2 \times 9.81=\mathbf{1 . 0 1 9} \mathbf{~ m}$

Problem 7.15. Water flowing in a pipe of 500 mm dia suddenly passes into a pipe of 750 mm dia. Determine the loss of head if the initial velocity was $2 \mathrm{~m} / \mathrm{s}$.

Ref. eqn 7.12.1. In this case,

$$
\begin{array}{ll} 
& h_{f}=\left(u_{2}-u_{1}\right)^{2} / 2 g, u_{1}=2 \mathrm{~m} / \mathrm{s}, u_{2}=2 \times(0.5 / 0.75)^{2}=0.889 \mathrm{~m} / \mathrm{s} . \\
\therefore & \mathbf{h}_{\mathbf{f}}=(2-0.889)^{2} / 2 \times 9.81=\mathbf{0 . 0 6 2 9} \mathbf{~ m .}
\end{array}
$$

Problem 7.16. A 30 cm pipe with friction factor $f=0.024$ carries water to a turbine at the rate of $0.25 \mathrm{~m}^{3} / \mathrm{s}$ over a distance of 160 m . The difference in levels between the water inlet and turbine inlet is 36 m . Determine the efficiency of transmission. The turbine outlet delivery is submerged into the tailrace and the velocity at the exit is 0.4 times the velocity in the pipe.

The efficiency of transmission $=\frac{\text { Available head for conversion to work }}{\text { Difference in datum }}$
The losses in this case are the friction head and the dynamic head at exit.
Flow rate $=0.25 \mathrm{~m}^{3} / \mathrm{s}$,
$\therefore \quad u_{m}=0.25 \times 4 / \pi \times 0.3^{2}=3.54 \mathrm{~m} / \mathrm{s}$.
Friction head $\quad=f L u^{2} / 2 g D=\left[0.024 \times 160 \times 3.54^{2} /(2 \times 9.81 \times 0.3)\right]=8.176 \mathrm{~m}$
Dynamic head: Exit velocity $=0.4 \times 3.54 \mathrm{~m} / \mathrm{s}$.
$\therefore$ Dynamic head $\quad=(0.4 \times 3.54)^{2} / 2 \times 9.81=0.102 \mathrm{~m}$
Total losses $\quad=8.176+0.102=8.28 \mathrm{~m}$
Efficiency is high but the power delivered is not maximum.
$\therefore \quad$ Efficiency of transmission $=(36-8.28) / 36=\mathbf{0 . 7 7}$ or $\mathbf{7 7 \%}$
Problem 7.17. The flow in a pipe of 100 mm dia with Reynolds number value of $10^{5}$ is found to have a friction factor $f=0.032$. Determine the thickness of laminar sublayer. Also indicate whether the pipe is hyraulicaly smooth or not if the roughness height is 0.4 mm .

Ref. section 7.5.

$$
\begin{array}{ll} 
& \delta_{l}=32.8 v / u_{m} \sqrt{f}, R e=u_{m} D / v=10^{5} \\
\therefore & v / u_{m}=D / 10^{5}, \text { substituting for } v / u_{m} \\
\therefore & \delta_{l}=(32.8 \times D) /\left(10^{5} \times \sqrt{f}\right)=32.8 \times 0.1 / 10^{5} \sqrt{0.032}
\end{array}
$$

$$
\begin{aligned}
& =1.83 \times 10^{-4} \mathrm{~m}=0.183 \mathrm{~mm} \\
\varepsilon & =0.4 \mathrm{~mm} \quad 0.3 \varepsilon=0.12 \mathrm{~mm}, 6 \varepsilon=1.098 \mathrm{~mm}
\end{aligned}
$$

The sublayer thickness is larger than $0.3 \varepsilon$ but less than $6 \varepsilon$.

## The pipe cannot be classified definitely as smooth or rough.

Problem 7.18. Petrol of sp. gravity 0.7 and kinematic viscosity of $0.417 \times 10^{-6} \mathrm{~m}^{2} / \mathrm{s}$ flows through a smooth pipe of 250 mm ID. The pipe is 800 m long. The pressure difference between the ends is 0.95 bar. Determine the flow rate.

In this case the determination off involves the velocity as the Reynolds number depends on velocity. The flow rate depends on velocity. A trial solution is necessary. So a value of $f=$ 0.02 is first assumed.

Pressure difference $=0.95$ bar or $0.95 \times 10^{5} \mathrm{~N} / \mathrm{m}^{2}$. Converting the same to head of fluid, $0.95 \times 10^{5} / 700 \times 9.81=13.834 \mathrm{~m}$ of petrol column.

$$
\begin{aligned}
& 13.834=\left(f L u^{2} / 2 g D\right)+\left(u^{2} / 2 g\right) \\
&=\left[\left(0.02 \times 800 \times u^{2}\right) /(2 \times 9.81 \times 0.25)\right]+u^{2} / 2 \times 9.81 \\
&=(3.26+0.051) u^{2} \\
& \therefore \quad u=2.045 \mathrm{~m} / \mathrm{s} . \\
& \\
& \text { Now } \quad R e=u D / v=2.045 \times 0.25 / 0.417 \times 10^{-6}=1.226 \times 10^{6} \\
& \text { Ref. section 7.11, eqn } 7.11 .12, f=0.0032+\left(0.221 / \operatorname{Re}^{0.237}\right)=0.01117
\end{aligned}
$$

or

$$
1 / \sqrt{f}=1.8 . \log \operatorname{Re}-1.5186 \quad \therefore \quad f=0.01122
$$

so the value 0.02 is on the higher side. Now using the value 0.01117 ,

$$
\begin{aligned}
13.834 & \left.=\left[0.01117 \times 800 \times u^{2}\right) /(2 \times 9.81 \times 0.25)\right]+\left[u^{2} /(2 \times 9.81)\right] \\
& =1.8727 u^{2} \\
\therefore \quad u & =2.7185 \mathrm{~m} / \mathrm{s}, \quad \operatorname{Re}=2.7185 \times 0.25 / 0.417 \times 10^{-6}=1.63 \times 10^{6} \\
f & =0.1065
\end{aligned}
$$

This is nearer the assumed value and further refinements can be made by repeating the procedure.

Flow rate $\quad=2.7185 \times \pi \times 0.25^{2} / 4=0.1334 \mathrm{~m}^{3} / \mathrm{s}=93.4 \mathrm{~kg} / \mathrm{s}$
Problem 7.19. Determine the diameter of the pipe (smooth) required to convey $150 l$ of kerosene over a length 1000 m with the loss of head by friction limited to 10 m of kerosene. Density $=810 \mathrm{~kg} / \mathrm{m}^{3}$, kinematic viscosity $=2.37 \times 10^{-6} \mathrm{~m}^{2} / \mathrm{s}$

In this problem also as in P. 7.18, trial is necessary. Assume $f=0.012$
Neglecting dynamic head, As $u=Q / A$,

$$
\begin{array}{rlrl}
\therefore & 10 & =[(0.012 \times 1000) /(2 \times 9.81 \times D)] \times\left[(0.15 \times 4) /\left(\pi D^{2}\right)\right]^{2} \\
u & =(4 \times 0.15) / \pi D^{2}, \text { Simplifying } \\
D^{5} & =[(0.012 \times 1000) /(2 \times 9.81 \times 10)] \times\left[\left(0.15^{2} \times 4^{2}\right) / \pi^{2}\right] \\
& =2.231 \times 10^{-3} \\
\therefore \quad & \mathbf{D} & =\mathbf{0 . 2 9 5} \mathbf{~ m} \text { and } \mathbf{u}=\mathbf{2 . 1 9 5} \mathbf{~ m} / \mathbf{s}
\end{array}
$$

$$
\begin{aligned}
\mathrm{Re} & =0.295 \times 2.195 / 2.37 \times 10^{-6}=0.273 \times 10^{6} \\
\text { Refer eqn. 7.11.11, } \quad f & =0.0032+\left(0.221 / \operatorname{Re}^{0.0237}\right)=0.0146
\end{aligned}
$$

Assuming $\mathbf{f}=\mathbf{0 . 0 1 4}$, to repeat the procedure

$$
\therefore \quad \begin{aligned}
10 & =[(0.014 \times 10000) /(2 \times 9.81 \times D)] \times\left[(0.15 \times 4) / \pi D^{2}\right]^{2} \\
D^{5} & =[(0.014 \times 1000) /(2 \times 9.82 \times 10)]\left[\left(0.15^{2} \times 4^{2}\right) / \pi^{2}\right]=2.6 \times 10^{-3} \\
\mathbf{D} & =\mathbf{0 . 3 0 4} \mathbf{~ m}, \quad u=0.15 \times 4 / \pi \times 0.304^{2}=2.065 \mathrm{~m} / \mathrm{s} \\
\operatorname{Re} & =2.065 \times 0.304 / 2.37 \times 10^{-6}=0.265 \times 10^{6} \\
f & =0.0032+0.221 /\left(0.265 \times 10^{6}\right)^{0.237}=0.01466
\end{aligned}
$$

The answer can be refined further using this value of $f$ and reworking on the same lines.
Problem 7.20. Two pipes of 0.35 m and 0.25 m dia and length 2000 m and 1500 m with $f$ values 0.021 and 0.018 connected is series carry water from a reservoir to a supply system, the head available being 8 m . Determine the flow quantity neglecting minor losses.

The head available should be equal to the sum of the frictional losses in the two pipes. Neglecting loss at sudden contraction

$$
\begin{aligned}
& \delta=\left[\left(0.021 \times 2000 \times u_{1}^{2}\right) /(2 \times 9.81 \times 0.35)\right] \\
&+\left[\left(0.018 \times 1500 \times u_{2}^{2}\right) /(2 \times 9.81 \times 0.25)\right]
\end{aligned}
$$

From continuity equation, we get

$$
\begin{array}{rlrlrl} 
& & {\left[\left(\pi \times 0.35^{2}\right) / 4\right] \times u_{1}} & =\left[\left(\pi \times 0.25^{2}\right) / 4\right] u_{2} \\
\therefore & u_{2} & =(0.35 / 0.25)^{2} u_{1} \quad \text { or } \quad u_{2}^{2}=(0.35 / 0.25)^{4} u_{1}^{2}
\end{array}
$$

Substituting, and simplifying and solving,
flow rate

$$
\begin{aligned}
u_{1} & =0.542 \mathrm{~m} / \mathrm{s}, u_{2}=1.062 \mathrm{~m} / \mathrm{s} \\
& =\left(0.542 \times \pi \times 0.35^{2}\right) / 4=\mathbf{0 . 0 5 2 1} \mathbf{~ m}^{3} / \mathbf{s} \text { or } \mathbf{1 8 7 . 7} \mathbf{~ m}^{3} / \mathbf{h r}
\end{aligned}
$$

check the frictional drop:

$$
\begin{aligned}
h_{f}= & {\left[\left(0.021 \times 2000 \times 0.542^{2}\right) /(2 \times 9.81 \times 0.35)\right] } \\
& \quad+\left[\left(0.018 \times 1500 \times 1.062^{2}\right) /(2 \times 9.81 \times 0.25)\right] \\
h_{f}= & 1.8+6.2=8 \mathrm{~m}
\end{aligned}
$$

Problem 7.21. A 300 mm dia pipe carries kerosene at a rate of $200 \mathrm{l} / \mathrm{s}$. The roughness is 0.2 mm . Determine the frictional drop over 100 m length of pipe.
using equation (7.11.13). $\frac{1}{\sqrt{f}}=2 \log \frac{R}{\varepsilon}+1.74=2 \log \frac{0.15}{0.2 \times 10^{-3}}+1.74=7.49$

$$
\begin{aligned}
\therefore \quad f & =0.01782 \mathrm{~m} \quad u=4 \times 0.2 / \pi \times 0.3^{2}=2.829 \mathrm{~m} / \mathrm{s} \\
h_{f} & =\frac{0.01782 \times 1000 \times u^{2}}{2 \times 9.81 \times 0.3}+\frac{u^{2}}{2 \times 9.81}=3.0785 u^{2}
\end{aligned}
$$

substituting the value of $u, \mathbf{h}_{\mathbf{f}}=\mathbf{2 4 . 6 5} \mathbf{m}$ (head of kerosene)
Problem 7.22. Water is drawn from a reservoir through a pipe of diameter $D$ and $a$ constant friction factor $f$. Along the length water is drawn off at the rate of $\mathrm{Km}^{3} / \mathrm{s}$ per unit length and the length is L. There is no flow at the end. Derive an expression for the loss of head.

Figure P. 7.22
Consider a length $d x$ at location $x$, using the equation, the drop $d h$ over length $d x$ is

$$
\begin{equation*}
h_{f}=\frac{f L u^{2}}{2 g D} \quad \therefore \quad d h=\frac{f d x}{D} \frac{u^{2}}{2 g} \tag{1}
\end{equation*}
$$

At this location, the flow rate $Q$ can be obtained as

$$
\begin{aligned}
& Q=K(L-x), \text { as total flow is } K L \text { and draw off upto } x \text { is } K x . \\
& u=\frac{4 Q}{\pi D^{2}}, u^{2}=\frac{16 Q^{2}}{\pi^{2} D^{4}}=\frac{16 K^{2}(L-x)^{2}}{\pi^{2} D^{4}}
\end{aligned}
$$

Substituting in eqn. (1)

$$
d h=\frac{f d x}{2 g} \frac{16 K^{2}(L-x)^{2}}{\pi^{2} D^{5}}=\frac{8 f K^{2}}{g \pi^{2} D^{5}}(L-x)^{2} d x
$$

Integrating from $x=0$ to $L$

$$
\begin{aligned}
& h_{2}-h_{1}
\end{aligned}=h_{\mathrm{f}}=\frac{8 f K^{2}}{g \pi^{2} D^{5}} \int_{0}^{L}\left[L^{2}-2 L x+x^{2}\right] d x=\frac{8 f K^{2}}{g \pi^{2} D^{5}}\left[L^{3}-L^{3}+\frac{L^{3}}{3}\right]
$$

## for the following data,

$$
\begin{aligned}
f & =0.024, K=7.5 \mathrm{l} / \mathrm{hr} / \mathrm{m}=2.085 \times 10^{-6} \mathrm{~m}^{3} / \mathrm{s} / \mathrm{m}, \\
D & =0.1 \mathrm{~m}, L=4.8 \times 10^{3} \mathrm{~m}, \\
\mathbf{h}_{\mathrm{f}} & =\frac{8 \times 0.024 \times\left(4.8 \times 10^{3}\right)^{3}\left(2.085 \times 10^{-6}\right)^{2}}{3 \times 9.81 \times \pi^{2} \times 0.1^{5}}=\mathbf{3 1 . 7 3 ~ m}
\end{aligned}
$$

The head drop between lengths $L_{1}$ and $L_{2}$ can be determined by difference i.e., $\left(h_{f 2}-h_{f 1}\right)$
Problem 7.23. A pipe line 200 mm dia. and 4000 m long connects two reservoirs with a difference in level of 60 m . Water is drawn at 1500 m point at a rate of $50 \mathrm{l} / \mathrm{s}$. Friction coefficient $f=0.024$. Determine the flow rates in the two sections. Neglect minor losses

$$
h_{f}=\frac{f L u^{2}}{2 g D}, u=\frac{4 Q}{\pi D^{2}}, u^{2}=\frac{16 Q^{2}}{\pi^{2} D^{2}}, h_{f}=\frac{8 f L Q^{2}}{\pi^{2} g D^{5}}
$$

Considering the two sections, (total drop)

$$
\begin{aligned}
60 & =\frac{8 \times 0.024 \times 1500 \times Q_{1}{ }^{2}}{\pi^{2} g \times 0.2^{5}}+\frac{8 \times 0.024 \times 2500 \times Q_{2}{ }^{2}}{\pi^{2} g \times 0.25} \\
& =9295.5{Q_{1}{ }^{2}+15492.54 Q_{2}{ }^{2}}
\end{aligned}
$$

but

$$
\begin{aligned}
Q_{2}{ }^{2}= & \left(Q_{1}-0.05\right)^{2}, \text { Substituting and simplifying } \\
60= & 9295.52{Q_{1}{ }^{2}+1549.25\left(Q_{1}{ }^{2}+0.05^{2}-2 Q_{1} \times 0.05\right)} \begin{aligned}
& 24788.05 Q_{1}{ }^{2}-1549.25 Q_{1}-21.268=0 \\
& Q_{1}=\frac{1549.25 \pm\left[(-1549.25)^{2}+4 \times 21.268 \times 24788.05\right]^{0.5}}{2 \times 24788.05} \\
&==\frac{1549.25 \pm 2123.45}{2 \times 24788.05}=\mathbf{0 . 0 7 4 0 8 2} \mathbf{~ m}^{3} / \mathbf{s}, \\
& \therefore \quad \mathbf{Q}_{2}=\mathbf{0 . 0 2 4 0 8 2} \mathbf{~ m}^{3} / \mathbf{s}
\end{aligned}
\end{aligned}
$$

or

The other solution is negative.
Check: For the first section

$$
h_{f}=\frac{8 \times 0.024 \times 1500 \times 0.074082^{2}}{\pi^{2} \times 9.81 \times 0.2^{5}}=51.015 \mathrm{~m}
$$

For the second section

$$
h_{f}=\frac{8 \times 0.024 \times 2500 \times 0.024082^{2}}{\pi^{2} \times 9.81 \times 0.2^{5}}=8.985 \mathrm{~m}, \quad \text { Total head }=60 \mathrm{~m}
$$

Problem 7.24. Two adjacent city centres $B$ and $D$ receive water from separate sources $A$ and $C$. The water level in $A$ is 4 m above that in C. Reservoir A supplies city centre B by 0.4 m diameter pipe of 3000 m length with a level difference of 10 m . City centre D's is supplied by reservoir C through a 4000 m long pipe of 0.45 m diameter, with a level difference of 15 m . After sometime it is found that centre $B$ has excess water while centre $D$ is staraved. So it is proposed to interconnect these lines and draw $100 \mathrm{l} / \mathrm{s}$ from the line $A$ to $B$. The junction on $A B$ is at a distance of 2000 m from A. The junction CD is at 3000 m from C. Determine the original supply rates and supply rates with interconnection to centres $B$ and D. Also determine the diameter of the interconnecting pipe, if the length is 1500 m Friction factor, $f=0.01$ in all cases.

The arrangement is shown in Fig. P. 7.24

Figure P. 7.24
(i) Without interconnection : using equation 7.11.15

$$
h_{f}=\frac{8 f L Q^{2}}{\pi^{2} g D^{5}}
$$

Drop in Line $A B$ is 10 m

$$
\begin{aligned}
& 10 \\
\therefore \quad & =\frac{8 \times 0.01 \times 3000 \times Q^{2}}{\pi^{2} \times 9.81 \times 0.4^{5}} \\
\therefore \quad \mathbf{Q}_{\mathrm{AB}} & =0.20325 \mathrm{~m}^{3} / \mathrm{s} \text { or } 203.25 \mathrm{l} / \mathrm{s}
\end{aligned}
$$

Drop in line $C D$ is 15 m

$$
\begin{array}{rlrl} 
& & 15 & =\frac{8 \times 0.01 \times 4000 \times Q^{2}}{\pi^{2} \times 9.81 \times 0.45^{5}} \\
\therefore & \mathbf{Q}_{\mathrm{CD}} & =0.2894 \mathrm{~m}^{3} / \mathrm{s} \text { or } 289.4 \mathrm{l} / \mathrm{s}
\end{array}
$$

After interconnection: line $A B$ :
Let the flow up to $R$ be $Q$ and then in $R B(Q-0.1)$
Total frictional loss $\quad=10=\frac{8 \times 0.01 \times 2000 \times Q^{2}}{\pi^{2} \times 9.81 \times 0.4^{0.5}}+\frac{8 \times 0.01 \times 1000(Q-0.1)^{2}}{\pi^{2} \times 9.81 \times 0.4^{5}}$
This reduces to $3 Q^{2}-0.2 Q-0.11393=0$. Solving $\mathbf{Q}=\mathbf{0 . 2 3 1} \mathbf{m}^{3} / \mathbf{s}$ or $231 \mathrm{I} / \mathbf{s}$
Now the centre $B$ will receive $131 \mathrm{l} / \mathrm{s}$ (previous $203 \mathrm{l} / \mathrm{s}$ )
Line $C D$ : Let the flow upto $S$ be $Q$ and then $(Q+0.1)$ upto $D$
Total head loss $\quad=15=\frac{8 \times 0.01 \times 3000 \times Q^{2}}{\pi^{2} \times 9.81 \times 0.45^{0.5}}+\frac{8 \times 0.01 \times 1000(Q+0.1)^{2}}{\pi^{2} \times 9.81 \times 0.45^{5}}$
This reduces to $4 Q^{2}+0.2 Q-0.32499=0$
Solving $\quad Q=0.261 \mathrm{~m}^{3} / \mathrm{s}$ or $261 \mathrm{I} / \mathrm{s}$
Now the city center $C$ will receive $361 \mathrm{l} / \mathrm{s}$ (previous $289.4 \mathrm{l} / \mathrm{s}$ )
To determine the diameter of the connecting pipe $R S$ :
Head drop from $A$ to $R$

$$
h_{f 1}=\frac{8 \times 0.01 \times 2000 \times 0.231^{2}}{\pi^{2} \times 9.81 \times 0.4^{5}}=8.61 \mathrm{~m}
$$

Head drop from $S$ to $E$

$$
h_{f 2}=\frac{8 \times 0.01 \times 1000 \times 0.361^{2}}{\pi^{2} \times 9.81 \times 0.45^{5}}=5.84 \mathrm{~m}
$$

Head drop from $A$ to $E=4+15=19 \mathrm{~m}$
$\therefore \quad$ Head available between

$$
R S=19-8.61-5.84=4.55 \mathrm{~m}
$$

Considering Pipe $R S$

$$
4.55=\frac{8 \times 0.01 \times 1500 \times 0.1^{2}}{\pi^{2} \times 9.81 \times D^{5}} \text { Solving } \mathbf{D}=0.307 \mathrm{~m}
$$

## OBJECTIVE QUESTIONS

## O Q. 7.1. Fill in the blanks:

1. In fully developed laminar flow in pipes the velocity distribution with radius is $\qquad$
2. In fully developed laminar flow in pipes the shear stress variation with radius is
3. A dye injected into laminar stream will travel $\qquad$
4. Momentum transfer in laminar flow is at level.
5. For laminar flow to prevail in a duct the value of Reynolds number should be $\qquad$
6. The friction factor is defined as $\qquad$
7. The friction factor in laminar flow is pipes in given by $\qquad$
8. In laminar flow in a pipe the shear stress is maximum at $\qquad$
9. Reynolds number is the ratio between —— and forces.
10. The energy line represents $\qquad$
11. The hydraulic line represents $\qquad$
Answers
(1) Parabolic (2) Linear (3) along a line without mixing (4) Microscopic, molecular (5) less than 2000. (6) $4 \tau_{0} g_{0} /\left(\rho u_{m}^{2} / 2\right)$, (7) 64/Re (8) The wall (9) inertia, viscous (10) Total energy at each location (11) The pressure energy at the location.

## $O$ Q. 7.2. Fill in the blanks

1. In laminar flow is through a pipe the average velocity is $\quad$ of the maximum velocity.
2. In flow through pipes, the flow _- change from laminar to turbulent condition.
3. Hydraulic diameter is defined as $\qquad$
4. Hydraulic radius is defined as
5. Entrance length is defined as
6. In laminar flow the entrance length is approximately $\qquad$
7. A pipe is hydraulically smooth when $6 \varepsilon$ is $\qquad$
8. A pipe is hydraulically rough when
9. Chart relating friction factor, Reynolds number and pipe roughness is known as $\qquad$
10. For flow in non circular pipes, the length parameter used in Reynolds number calculation is -
11. In a network of pipes the algebraic sum of the frictional losses around any circuit will be $\qquad$
12. In a network of pipes at any node the algebraic sum of flows will be $\qquad$

## Answers

(1) One half of (2) does not (3) $4 \mathrm{~A} / \mathrm{P}$, A-Area P-Perimeter (4) $A / P$ (5) the length above which the velocity profile becomes constant (6) 0.58 Re $\mathrm{D}(7)$ less than $\delta_{i}(8) \delta_{1}<6 \varepsilon$, (9) Moody diagram (10) Hydraulic diameter (11) zero (12) zero

## O. Q. 7.3. Fill in the blanks

1. The entrance head loss for square edged entrance is $\qquad$
2. The head loss due to sudden expansion is $\qquad$
3. The frictional loss in globe valve is compared to that in gate valve.
4. To reduce losses in large bends — can be used.
5. Minor losses are losses due to $\qquad$
6. The very thin layer adjacent to the wall in turbulent flow is callecl $\qquad$
7. The velocity variation is $\qquad$ in laminar sublayer.
8. Equivalent length of pipe fitting is $\qquad$
9. Equivalent length of a pipe as referred to another pipe is $\qquad$
10. For the same flow area and flow rate, a square section will give a $\qquad$ pressure drop.
11. For a given available head, maximum power will be transmitted when the frictional loss of head equals $\qquad$ of the total head.

## Answers

(1) $0.5 u^{2} / 2 g(2)\left(u_{1}-u_{2}\right)^{2} / 2 g(3)$ larger (4) vanes (5) changes in section and fittings (6) laminar sublayer (7) linear (8) pipe length with the same frictional drop (9) the length to produce the same frictional drop for the same flow (10) higher (11) $1 / 3$

## $O$ Q. 7.4. Choose the correct answer

1. Reynolds number is given by
(a) $\rho u \mu / D$,
(b) $\mu D \rho / u$,
(c) $\rho u / \mu D$
(d) $\rho u D / \mu$.
2. Reynolds number signifies the ratio of
(a) gravity forces top viscous forces
(b) inertial forces to viscous forces
(c) inertia forces to gravity forces
(d) buoyant forces to inertia forces.
3. In pipe flow the critical Reynolds number is about
(a) 640
(b) $5 \times 10^{5}$
(c) 2000
(d) 64000
4. The entry length in pipe flow will be higher for
(a) highly viscous fluids
(b) low viscosity fluid
(c) high velocity of flow
(d) small diameters
5. A pipe is said to be hydraulically rough if the laminar sublayer thickness $\delta_{L}$ as compared to physical roughness $\varepsilon$ is
(a) $\delta_{L}>\varepsilon$
(b) $\delta_{L}<\varepsilon$
(c) $\delta_{L}>6 \varepsilon$
(d) $\delta_{L}<6 \varepsilon$.
6. With constant flow rate if the diameter is doubled in laminar flow in pipes, the frictional drop will change by a factor of
(a) 2
(b) 0.5
(c) $1 / 32$
(d) $1 / 16$.
7. In laminar fully developed flow in a pipe the ratio, average velocity/maximum velocity is
(a) 2
(b) 0.5
(c) $\sqrt{2}$
(d) $1 / \sqrt{2}$.
8. In fully developed turbulent flow, if the diameter is halved without changing the flow rate, the frictional drop will change by the factor
(a) 32 times
(b) 16 times
(c) 8 times
(d) 4 times.
9. In laminar pipe flow for a given flow rate $Q$, the power required to overcome friction will be proportional to
(a) $Q$
(b) $Q^{2}$
(c) $\sqrt{\boldsymbol{Q}}$
(d) $Q^{3 / 2}$.
10. In turbulent flow in a pipe with flow rate $Q$ the power required to overcome frictional losses is proportional to
(a) $Q$
(b) $Q^{2}$
(c) $Q^{3}$
(d) $Q^{4}$
11. The shear stress at the wall of a 16 cm da pipe in laminar flow is $36 \mathrm{~N} / \mathrm{m}^{2}$. The shear stress at a radius of 4 cm in $\mathrm{N} / \mathrm{m}^{2}$ is
(a) 9
(b) 18
(c) 6
(d) 72
12. The velocity along the centre line in laminar flow through a pipe of 8 cm dia is $2 \mathrm{~m} / \mathrm{s}$. The velocity at a radius of 2 cm in $\mathrm{m} / \mathrm{s}$ is
(a) 1
(b) 1.5
(c) 1.414
(d) 1/1.414.
13. The friction factor in pipe flow at near critical conditions is around
(a) 0.064
(b) 0.025
(c) 0.64
(d) 0.032 .
14. The friction factor in laminar flow in a pipe was measured as 0.05 . The Reynolds number should be around
(a) 1280
(b) 1000
(c) 640
(d) 2000 .
15. An oil with a density of $800 \mathrm{~kg} / \mathrm{m}^{3}$ and dynamic viscosity of $8 \times 10^{-3} \mathrm{Ns} / \mathrm{m}^{2}$ flows through a smooth pipe of 100 mm dia. The maximum velocity for laminar flow to prevail will be (in $\mathrm{m} / \mathrm{s}$.)
(a) 0.4
(b) 0.2
(c) 1.0
(d) 4.0 .
16. The velocity profile in turbulent flow is
(a) parabolic
(b) logarithmic
(c) $2^{\text {nd }}$ degree polynomial
(d) $4^{\text {th }}$ degree polynomial.

## Answers

1. (d) 2. (b) 3. (c)
2. (a) 5. (d)
3. (d)
4. (b)
5. (a)
6. (b)
7. (c)
8. (b) 12. (b)
9. (d) 14. (a) (15). (b) 16. (b).
$O$ Q. 7.5. Indicate whether the statements are correct or incorrect
10. Friction factor will be higher in laminar flow.
11. In the household pipe system the flow of water is laminar.
12. Blood flow in blood vessels is turbulent.
13. Pipes of equal diameter and equal roughness will have the same friction factor.
14. The development of flow over a flat plate and entry section of a pipe will be similar.
15. The velocity profile after the entry section in a pipe will remain the same.
16. For the same total sectional area two equal diameter pipes will deliver more than a single pipe for the same pressure drop.
17. In turbulent flow for the same diameter and friction factor the pressure drop for a given length will vary as the square of flow rate.
18. If velocity is doubled the pressure drop will reduce to half the value.
19. A bell mouthed inlet is desirable.
20. For the same sectional area and flow rate, square section will have a lower Reynolds Number.
21. For the same sectional area and flow rate square section will lead to lower frictional drop.

## Answers

Correct 1, 5, 6, 8, 10, 11 . Incorrect: 2, 3, 4, 7, 9, 12

## O Q.7.6. Fill in the blanks with "increases", "decreases" for "remains constant".

1. In flow over a flat plate, the boundary layer thickness $\qquad$ with distance.
2. In flow through pipes, after the entry length the velocity profile $\qquad$
3. As Reynolds number decreases in laminar flow in pipes, the friction factor $\qquad$
4. For a specified flow of fluid in a pipe, (i.e., with fixed mass velocity) the Reynolds number will _ as the dynamic viscosity of the fluid increases.
5. For the same flow rate and friction factor, the pressure drop in turbulent flow will as the diameter increases.
6. For a specified roughness, beyond a certain Reynolds number the friction factor
7. Minor losses will $\qquad$ as velocity increases.
8. When a pipe of smaller diameter is converted to an equivalent pipe of larger diameter, the length
9. When a pipe with a lower friction factor is converted to an equivalent pipe with higher friction factor, the length
10. When two pipes in parallel flow are replaced by a single pipe with its area equal to the sum of the areas of the two pipes, the flow rate will

## EXERCISE PROBLEMS

E 7.1. An oil with specific gravity of 0.85 flows in a pipe of 100 mm dia., the flow rate being $0.5 \mathrm{l} / \mathrm{s}$. The kinematic viscosity at this condition is $1.8 \times 10^{-5} \mathrm{~m}^{2} / \mathrm{s}$. Determine whether flow is laminar or turbulent.
( $\mathrm{Re}=54$, Laminar)
E 7.2. Show that the velocity profile in laminar flow through a circular pipe is parabolic. Find the average velocity in terms of maximum velocity.
E 7.3. Show that the wall shear in laminar flow through a pipe $\tau_{0}=\frac{f}{4} \frac{\rho u^{2}}{2 g}$.
E 7.4. Show that in laminar flow through a pipe $f=64 / \mathrm{Re}$.
E 7.5. For the data in problem E 7.1, determine
(a) centre line velocity,
(b) velocity at $r=2 \mathrm{~cm}$,
(c) friction factor,
(d) wall shear and
(e) head loss/m.
$\left(0.127 \mathrm{~m} / \mathrm{s}, 0.107 \mathrm{~m} / \mathrm{s}, 0.18,0.077 \mathrm{~N} / \mathrm{m}^{2}, 0.37 \times 10^{-3} \mathrm{~m} / \mathrm{m}\right)$

E 7.6. Oil of specific gravity 0.9 and dynamic viscosity $5.992 \times 10^{-3} \mathrm{Ns} / \mathrm{m}^{2}$ flows in a pipe of 15 cm dia. at a rate of $0.06 \mathrm{~m}^{3} / \mathrm{s}$. The head loss over a length of 120 m was found to be 16 m . Determine the value of friction factor. Is the flow laminar or turbulent?

$$
\text { (0.034, Re }=11475, \text { turbulent })
$$

E 7.7. Water at $20^{\circ} \mathrm{C}$ flows through a 50 cm dia. pipe with roughness $\varepsilon / \mathrm{R}=0.00018$. If the energy gradient $\left(h_{f} / L\right)$ is 0.006 , determine the flow rate $v=1 \times 10^{-6} \mathrm{~m}^{2} / \mathrm{s}$.
( $0.42 \mathrm{~m}^{3} / \mathrm{s}$ )
E 7.8. Three pipes in series connect two water reservoirs with a level difference of 10 m . The pipe diameters are $30 \mathrm{~cm}, 20 \mathrm{~cm}$ and 25 cm , the lengths being $300 \mathrm{~m}, 150 \mathrm{~m}$ and 250 m respectively. The friction factors are $0.019,0.021$ and 0.02 respectively. Neglecting minor losses, determine the flow rate.
( $0.083 \mathrm{~m}^{3} / \mathrm{s}$ )
E 7.9. Pipe lines as shown in Fig. E. 7.9 provide water supply from a reservoir. Determine the flow rates in lines $C, A$ and $B$.
( $0.055 \mathrm{~m}^{3} / \mathrm{s}, 0.042,0.013 \mathrm{~m}^{3} / \mathrm{s}$ )

Figure E. 7.9
E 7.10. A pipeline 1.2 m dia. and 720 m length having a friction factor of 0.04 connects two reservoirs with a difference in level of 6 m . The pipe line rises to a level of 3 m above the level of the upper reservoir at a distance of 240 m . Determine the flow rate and the pressure at the highest point.
( $2.51 \mathrm{~m}^{3} / \mathrm{s},-5.6 \mathrm{~cm}$ of water)
E 7.11. A riveted steel pipe of 300 mm dia. carries water over a length of 300 m , the head available being 6 m . Determine the flow rate if the roughness height is 3 mm .
( $0.124 \mathrm{~m}^{3} / \mathrm{s}$ )
E 7.12. Determine the diameter of the pipe to convey $250 \mathrm{l} / \mathrm{s}$ of oil over 3000 m length with a loss of 25 m. $v=1 \times 10^{-5} \mathrm{~m}^{2} / \mathrm{s}$.
( 413 mm )
E. 7.13. Show from basics that in sudden contraction, the loss of head equals $\left(V_{2}-V_{1}\right)^{2} / 2 g$. In the case of formation of vena contracta show that the loss equals $\left[\left(1 / C_{c}\right)-1\right]^{2} / 2 g$, where $C_{c}=A_{c} / A_{2}$.
E 7.14. Show using the expression in E 7.13, the pressure difference across a sudden contraction is given by

$$
\left(P_{1}-P_{2}\right) / \gamma=\frac{V_{2}^{2}}{2 g}\left[1+\left\{\left(\frac{1}{C_{c}}\right)-1\right\}^{2}\right]-\frac{V_{2}^{2}}{2 g} .
$$

E 7.15. A pipe carries $56 \mathrm{l} / \mathrm{s}$ of water and there is a sudden change in diameter, the coefficient of contraction has a value of 0.62 . Determine in the following cases the loss of head (Hint, see problem E 9.13 and 14).
(i) Contraction from 0.2 m to 0.15 m .
(ii) Contraction from 0.3 m to 0.5 m .
(iii) Contraction from 0.45 m to 0.15 m .

Calculate the pressure difference between sections.
( 0.192 m in all cases, $0.54 \mathrm{~m}, \mathbf{0 . 6 7 3} \mathrm{~m}, 0.699 \mathrm{~m}$ )

E 7.16. Derive the following expression the loss of head due to sudden expansion. $h_{f}=\left(V_{1}-V_{2}{ }^{2}\right) / 2 g$. Show that it can be reduced to the form $k V_{1}^{2} / 2 g$ where $k=\left[1-\left(A_{1} / A_{2}\right)\right]^{2}$.
E 7.17. A pipe line of total length 3000 m is made up of two diameters, 200 mm for the first run and 150 mm for the second run, connects two reservoirs. The first run ends at a level 1.5 m below the level of the higher reservoir and the total difference in levels is 13.5 m . The friction coefficient for both sections is 0.02 m . Determine the maximum length of the run so that the pressure at this point does not go more than 3 m below atmosphere. Also calculate the flow rate. Neglect minor losses.
( $2034 \mathbf{~ m}, \mathbf{0 . 0 2 0 7} \mathrm{~m}^{3} / \mathrm{s}$ )
E 7.18. Water is conveyed by a pipe line of 1.2 m dia. and 720 m length from a reservoir whose level is 6 m above the level of down stream reservoir. The pipe line due to the terrain has to be laid such that its level is 3 m above that of the first reservoir level at a distance of 240 m from the entry. Determine the pressure at this point and also the flow rate. $f=0.04$
( $2.51 \mathrm{~m}^{3} / \mathrm{s}, 5.6 \mathrm{~m}$ of water)
E 7.19. A pipe line of two sections, the first of 50 mm dia. and 15 m length and the second of 75 mm dia and 24 m length connected in series empties a reservoir at the rate of $168 \mathrm{l} / \mathrm{min}$. The entry is sharp edged. The enlargement is sudden. Discharge is to atmosphere. The values of friction factor are 0.0192 and 0.0232 for the pipes. Determine the difference in height between the reservoir level and the discharge point.
( 0.852 m )
E 7.20. Supply is drawn uniformly at the rate of $7.5 \mathrm{l} / \mathrm{hr}$ per m length along the length of 4800 m pipe. Assuming $f=0.024$, For a head loss of m 31 m determine the diameter of the pipe to provide the flow.
( 0.1 m )
E 7.21. Two reservoirs are connected in parallel by two pipes. One pipe is 5000 m long and the diameter is $100 \mathrm{~mm} . f_{1}=0.02$ and the other pipe is 4000 m long and its diameter is 120 mm . The friction factor is 0.025 . If the flow rate through the first pipe is $60 \mathrm{l} / \mathrm{s}$, determine the flow rate through the second pipe.
( $94.65 \mathrm{l} / \mathrm{s}$ )
E 7.22. Determine the discharge through a pipe system described below connecting two reservoirs with a difference in level of 6 m . A single pipe of 0.6 m dia. of 3000 m length takes off from the higher reservoir and feeds to a junction from which, two pipes of 0.3 m dia. and 3000 m length each feed the water in parallel to the lower reservoir. $f=0.04$.
(72.3 1/s)

E 7.23. If in the problem E 7.22 , one of the pipes downstream is closed for maintenance, determine the flow rate.
( $37.76 \mathrm{l} / \mathrm{s}$ )
E 7.24. Water is transported from reservoir $A$ to reservoirs $B$ and $C$ by pipe line system shown in Fig. E. 7.24. Determine the flow to reservoirs $B$ and $C . f=0.04 . \quad\left(\mathbf{Q}_{\mathbf{B}}=\mathbf{2 8 . 3} \mathbf{1 / s}, \mathbf{Q}_{\mathbf{c}}=\mathbf{9 0 . 7} \mathbf{1 / s}\right)$

Figure E. 7.24
E 7.25. Water is drawn from a reservoir through two pipes of 900 mm dia. and 1500 m length to a common junction from where a pipe of 1200 mm diameter and 2400 m length carries it to the lower reservoir. If the difference in water levels is 10 m , determine the flow rate. $f=0.02$, neglect other losses.
( $0.973 \mathrm{~m}^{3} / \mathrm{s}$ )

E 7.26. If in the problem E 7.25, one inlet branch is shut off for maintenance, calculate the flow rate.

E 7.27. Two reservoirs with a difference in level of 6 m are connected by a pipe system. 3000 m length of 0.6 m dia. pipe takes off from the reservoir. At this point $36 \mathrm{l} / \mathrm{s}$ water is drawn off and the diameter is reduced to 0.3 m for the next 3000 m . Determine the flow rate in the first branch. $f=0.04$.
(72.16 1/s)

E 7.28. A ridge interposes between two reservoirs whose level difference is 30 m . The distance upto the ridge is 300 m . The total length of the pipe is 3000 m . The pipe diameter is 600 mm . Determine the maximum height of the ridge that the line can cross if the pressure at this point should not go below 3 m of water (absolute). Also determine the flow rate. $f=0.03$.
( $\mathbf{5 m , 0 . 5 6 ~ m} \mathrm{m}^{3} / \mathrm{s}$ )
E 7.29. A fire hose of 75 mm dia. and 180 m length ends in a nozzle of 25 mm dia. The discharge coefficient of the nozzle is 0.94 . The tip of the nozzle is 9 m above pump outlet. Calculate the head to be developed by the pump for a flow rate of $480 \mathrm{l} / \mathrm{min}, f=0.048$.
( 43.425 m )
E 7.30. A smooth concrete duct of square section of side 1.5 m is 40 m long. Determine the head loss required for a flow rate of $9 \mathrm{~m}^{3} / \mathrm{s} . f=0.02$. Express the head loss as slope. ( $\mathbf{0 . 4 4} \mathbf{~ m}, \mathbf{1 . 1 / 1 0 0}$ )
E 7.31. Two reservoirs with a level difference of 40 m are connected by a 3 km long, 0.9 m dia. pipe with friction factor $f=0.021$. Determine the flow rate. If the middle 1 km pipe is replaced by two pipes of 0.64 m dia. determine the flow rate. If one of the pipes in the middle section is blocked, calculate the flow rate.
( $2.13 \mathrm{~m}^{3} / \mathrm{s}, 2.008 \mathrm{~m}^{3} / \mathrm{s}, 1.347 \mathrm{~m}^{3} / \mathrm{s}$ )
