

# British Pharmacopoeia 2022

## Volume IV

The British Pharmacopoeia Commission has caused this British Pharmacopoeia 2022 to be prepared under regulation 317(1) of the Human Medicines Regulations 2012 and, in accordance with regulation 317(4), the Ministers have arranged for it to be published.

The monographs of the Tenth Edition of the European Pharmacopoeia (2019), as amended by Supplements 10.1 to 10.5, published by the Council of Europe are reproduced either in this edition of the British Pharmacopoeia or in the associated edition of the British Pharmacopoeia (Veterinary).

# Notices

Monographs of the European Pharmacopoeia are distinguished by a chapter of stars against the title. The term European Pharmacopoeia, used without qualification, means the Tenth Edition of the European Pharmacopoeia comprising, unless otherwise stated, the main volume, published in 2019, as amended by any subsequent supplements and revisions.

**Patents** In this Pharmacopoeia certain drugs and preparations have been included notwithstanding the existence of actual or potential patent rights. In so far as such substances are protected by Letters Patent their inclusion in this Pharmacopoeia neither conveys, nor implies, licence to manufacture.

**Effective dates** New and revised monographs of national origin enter into force on 1 January 2022. The monographs are brought into effect under regulation 320(2) of the Human Medicines Regulations 2012.

Monographs of the European Pharmacopoeia have previously been published by the European Directorate for the Quality of Medicines & HealthCare, in accordance with the Convention on the Elaboration of a European Pharmacopoeia, and have been brought into effect under the Human Medicines Regulations 2012, as amended, and the Veterinary Medicines Regulations 2013, as amended.

Notes

# Part I

*The British Pharmacopoeia comprises the entire text within this publication. The word 'official' is used in the Pharmacopoeia to signify 'of the Pharmacopoeia'. It applies to any title, substance, preparation, method or statement included in the general notices, monographs and appendices of the Pharmacopoeia. The abbreviation for British Pharmacopoeia is BP.*

## European Pharmacopoeia

Monographs of the European Pharmacopoeia are reproduced in this edition of the British Pharmacopoeia by incorporation of the text published under the direction of the Council of Europe (Partial Agreement) in accordance with the Convention on the Elaboration of a European Pharmacopoeia (Treaty Series No. 32 (1974) CMND 5763) as amended by the Protocol to the Convention (Treaty Series No. MISC16 (1990) CMND 1133). They are included for the convenience of users of the British Pharmacopoeia. In cases of doubt or dispute reference should be made to the Council of Europe text.

\*\*\*\* Monographs of the European Pharmacopoeia are distinguished by a  
\* \* \* \* \* chaplet of stars against the title and by reference to the European  
\* \* \* \* \* Pharmacopoeia monograph number included immediately below the  
title in italics. The beginning and end of text from the European  
Pharmacopoeia are denoted by means of horizontal lines with the symbol  
'Ph Eur' ranged left and right, respectively.

The general provisions of the European Pharmacopoeia relating to different types of dosage form are included in the appropriate general monograph in that section of the British Pharmacopoeia entitled Monographs: Formulated Preparations. These general provisions apply to all dosage forms of the type defined, whether or not an individual monograph is included in the British Pharmacopoeia. In addition, the provisions of the European Pharmacopoeia General Monograph for Pharmaceutical Preparations apply to all dosage forms, whether or not an individual monograph is included in the British Pharmacopoeia.

Texts of the European Pharmacopoeia are governed by the General Notices of the European Pharmacopoeia. These are reproduced as Part III of these notices.

## Part II

*The following general notices apply to the statements made in the monographs of the British Pharmacopoeia other than those reproduced from the European Pharmacopoeia and to the statements made in the Appendices of the British Pharmacopoeia other than when a method, test or other matter described in an appendix is invoked in a monograph reproduced from the European Pharmacopoeia.*

**Official Standards** The requirements stated in the monographs of the Pharmacopoeia apply to articles that are intended for medicinal use but not necessarily to articles that may be sold under the same name for other purposes. An article intended for medicinal use that is described by means of an official title must comply with the requirements of the relevant monograph. A formulated preparation must comply throughout its assigned shelf-life (period of validity). The subject of any other monograph must comply throughout its period of use.

A monograph is to be construed in accordance with any general monograph or notice or any appendix, note or other explanatory material that is contained in this edition and that is applicable to that monograph. All statements contained in the monographs, except where a specific general notice indicates otherwise and with the exceptions given below, constitute standards for the official articles. An article is not of pharmacopoeial quality unless it complies with all of the requirements stated. This does not imply that a manufacturer is obliged to perform all the tests in a monograph in order to assess compliance with the Pharmacopoeia before release of a product. The manufacturer may assure himself that a product is of pharmacopoeial quality by other means, for example, from data derived from validation studies of the manufacturing process, from in-process controls or from a combination of the two. Parametric release in appropriate circumstances is thus not precluded by the need to comply with the Pharmacopoeia. The general notice on Assays and Tests indicates that analytical methods other than those described in the Pharmacopoeia may be employed for routine purposes.

Requirements in monographs have been framed to provide appropriate limitation of potential impurities rather than to provide against all possible impurities. Material found to contain an impurity not detectable by means of the prescribed tests is not of pharmacopoeial quality if the nature or amount of the impurity found is incompatible with good pharmaceutical practice.

The status of any statement given under the headings Definition, Production, Characteristics, Storage, Labelling or Action and use is defined within the general notice relating to the relevant heading. In addition to any exceptions indicated by one of the general notices referred to above, the following parts of a monograph do not constitute standards: (a) a graphic or molecular formula given at the beginning of a monograph; (b) a molecular weight; (c) a Chemical Abstracts Service Registry Number; (d) any information given at the end of a monograph concerning impurities known to be limited by that monograph; (e) information in any annex to a

monograph. Any statement containing the word 'should' constitutes non-mandatory advice or recommendation.

The expression 'unless otherwise justified and authorised' means that the requirement in question has to be met, unless a competent authority authorises a modification or exemption where justified in a particular case. The term 'competent authority' means the national, supranational or international body or organisation vested with the authority for making decisions concerning the issue in question. It may, for example, be a licensing authority or an official control laboratory. For a formulated preparation that is the subject of monograph in the British Pharmacopoeia any justified and authorised modification to, or exemption from, the requirements of the relevant general monograph of the European Pharmacopoeia is stated in the individual monograph. For example, the general monograph for Tablets requires that Uncoated Tablets, except for chewable tablets, disintegrate within 15 minutes; for Calcium Lactate Tablets a time of 30 minutes is permitted.

Many of the general monographs for formulated preparations include statements and requirements additional to those of the European Pharmacopoeia that are applicable to the individual monographs of the British Pharmacopoeia. Such statements and requirements apply to all monographs for that dosage form included in the Pharmacopoeia unless otherwise indicated in the individual monograph.

Where a monograph on a biological substance or preparation refers to a strain, a test, a method, a substance, etc., using the qualifications 'suitable' or 'appropriate' without further definition in the text, the choice of such strain, test, method, substance, etc., is made in accordance with any international agreements or national regulations affecting the subject concerned.

### Definition of Terms

Where the term 'about' is included in a monograph or test it should be taken to mean approximately (fairly correct or accurate; near to the actual value).

Where the term 'corresponds' is included in a monograph or test it should be taken to mean similar or equivalent in character or quantity.

Where the term 'similar' is included in a monograph or test it should be taken to mean alike though not necessarily identical.

Further qualifiers (such as numerical acceptance criteria) for the above terms are not included in the BP. The acceptance criteria for any individual case is set based on the range of results obtained from known reference samples, the level of precision of the equipment or apparatus used and the level of accuracy required for the particular application. The user should determine the variability seen in his/her own laboratory and set in-house acceptance criteria that he/she judges to be appropriate based on the local operating conditions.

### Expression of Standards

Where the standard for the content of a substance described in a monograph is expressed in terms of the chemical formula for that substance an upper limit exceeding 100% may be stated. Such an upper limit applies to the result of the assay calculated in terms of the equivalent content of the specified chemical formula. For example, the statement 'contains not less than 99.0% and not more than 101.0% of  $C_{20}H_{24}N_2O_2 \cdot HCl$ ' implies that the result of the assay is not less than 99.0% and not more than 101.0%, calculated in terms of the equivalent content of  $C_{20}H_{24}N_2O_2 \cdot HCl$ .

Where the result of an assay or test is required to be calculated with reference to the dried, anhydrous or ignited substance, the substance free from a specified solvent or to the peptide content, the determination of loss on drying, water content, loss on ignition, content of the specified solvent or peptide content is carried out by the method prescribed in the relevant test in the monograph.

- Temperature** The Celsius thermometric scale is used in expressing temperatures.
- Weights and Measures** The metric system of weights and measures is employed; SI Units have generally been adopted. Metric measures are required to have been graduated at 20° and all measurements involved in the analytical operations of the Pharmacopoeia are intended, unless otherwise stated, to be made at that temperature. Graduated glass apparatus used in analytical operations should comply with Class A requirements of the appropriate International Standard issued by the International Organization for Standardization. The abbreviation for litre is 'L' throughout the Pharmacopoeia.
- Atomic Weights** The atomic weights adopted are the values given in the Table of Relative Atomic Weights 2001 published by the International Union of Pure and Applied Chemistry (Appendix XXV).
- Constant Weight** The term 'constant weight', used in relation to the process of drying or the process of ignition, means that two consecutive weighings do not differ by more than 0.5 mg, the second weighing being made after an additional period of drying or ignition under the specified conditions appropriate to the nature and quantity of the residue (1 hour is usually suitable).
- Expression of Concentrations** The term 'per cent' or more usually the symbol '%' is used with one of four different meanings in the expression of concentrations according to circumstances. In order that the meaning to be attached to the expression in each instance is clear, the following notation is used:
- Per cent w/w (% w/w) (percentage weight in weight) expresses the number of grams of solute in 100 g of product.
  - Per cent w/v (% w/v) (percentage weight in volume) expresses the number of grams of solute in 100 mL of product.
  - Per cent v/v (% v/v) (percentage volume in volume) expresses the number of millilitres of solute in 100 mL of product.
  - Per cent v/w (% v/w) (percentage volume in weight) expresses the number of millilitres of solute in 100 g of product.
- Usually the strength of solutions of solids in liquids is expressed as percentage weight in volume, of liquids in liquids as percentage volume in volume and of gases in liquids as percentage weight in weight.
- When the concentration of a solution is expressed as parts per million (ppm), it means weight in weight, unless otherwise specified.
- When the concentration of a solution is expressed as parts of dissolved substance in parts of the solution, it means parts by weight (g) of a solid in parts by volume (mL) of the final solution; or parts by volume (mL) of a liquid in parts by volume (mL) of the final solution; or parts by weight (g) of a gas in parts by weight (g) of the final solution.
- When the concentration of a solution is expressed in molarity designated by the symbol M preceded by a number, it denotes the number of moles of

the stated solute contained in sufficient Purified Water (unless otherwise stated) to produce 1 litre of solution.

**Water Bath** The term 'water bath' means a bath of boiling water, unless water at some other temperature is indicated in the text. An alternative form of heating may be employed providing that the required temperature is approximately maintained but not exceeded.

**Reagents** The reagents required for the assays and tests of the Pharmacopoeia are defined in appendices. The descriptions set out in the appendices do not imply that the materials are suitable for use in medicine.

**Indicators** Indicators, the colours of which change over approximately the same range of pH, may be substituted for one another but in the event of doubt or dispute as to the equivalence of indicators for a particular purpose, the indicator specified in the text is alone authoritative.

The quantity of an indicator solution appropriate for use in acid-base titrations described in assays or tests is 0.1 mL unless otherwise stated in the text.

Any solvent required in an assay or test in which an indicator is specified is previously neutralised to the indicator, unless a blank test is prescribed.

**Caution Statements** A number of materials described in the monographs and some of the reagents specified for use in the assays and tests of the Pharmacopoeia may be injurious to health unless adequate precautions are taken. The principles of good laboratory practice and the provisions of any appropriate regulations such as those issued in the United Kingdom in accordance with the Health and Safety at Work *etc.* Act 1974 should be observed at all times in carrying out the assays and tests of the Pharmacopoeia.

Attention is drawn to particular hazards in certain monographs by means of an italicised statement; the absence of such a statement should not however be taken to mean that no hazard exists.

**Titles** Subsidiary titles, where included, have the same significance as the main titles. An abbreviated title constructed in accordance with the directions given in Appendix XXI A has the same significance as the main title.

Titles that are derived by the suitable inversion of words of a main or subsidiary title, with the addition of a preposition if appropriate, are also official titles. Thus, the following are all official titles: Aspirin Tablets, Tablets of Aspirin; Atropine Injection, Injection of Atropine.

A title of a formulated preparation that includes the full nonproprietary name of the active ingredient or ingredients, where this is not included in the title of the monograph, is also an official title. For example, the title Promethazine Hydrochloride Oral Solution has the same significance as Promethazine Oral Solution and the title Brompheniramine Maleate Tablets has the same significance as Brompheniramine Tablets.

Where the English title at the head of a monograph in the European Pharmacopoeia is different from that at the head of the text incorporated into the British Pharmacopoeia, an Approved Synonym has been created on the recommendation of the British Pharmacopoeia Commission. Approved Synonyms have the same significance as the main title and are thus official titles. A cumulative list of such Approved Synonyms is provided in Appendix XXI B.

Where the names of pharmacopoeial substances, preparations and other materials occur in the text they are printed with capital initial letters and this indicates that materials of Pharmacopoeial quality must be used. Words in the text that name a reagent or other material, a physical characteristic or a process that is described or defined in an appendix are printed in italic type, for example, *methanol*, *absorbance*, *gas chromatography*, and these imply compliance with the requirements specified in the appropriate appendix.

**Chemical Formulae** When the chemical composition of an official substance is known or generally accepted, the graphic and molecular formulae, the molecular weight and the Chemical Abstracts Service Registry Number are normally given at the beginning of the monograph for information. This information refers to the chemically pure substance and is not to be regarded as an indication of the purity of the official material. Elsewhere, in statements of standards of purity and strength and in descriptions of processes of assay, it is evident from the context that the formulae denote the chemically pure substances.

Where the absolute stereochemical configuration is specified, the International Union of Pure and Applied Chemistry (IUPAC) *R/S* and *E/Z* systems of designation have been used. If the substance is an enantiomer of unknown absolute stereochemistry the sign of the optical rotation, as determined in the solvent and under the conditions specified in the monograph, has been attached to the systematic name. An indication of sign of rotation has also been given where this is incorporated in a trivial name that appears on an IUPAC preferred list.

All amino acids, except glycine, have the L-configuration unless otherwise indicated. The three-letter and one-letter symbols used for amino acids in peptide and protein sequences are those recommended by the Joint Commission on Biochemical Nomenclature of the International Union of Pure and Applied Chemistry and the International Union of Biochemistry and Molecular Biology.

In the graphic formulae the following abbreviations are used:

Me	-CH <sub>3</sub>	Bu'	-CH(CH <sub>3</sub> )CH <sub>2</sub> CH <sub>3</sub>
Et	-CH <sub>2</sub> CH <sub>3</sub>	Bu''	-CH <sub>2</sub> CH <sub>2</sub> CH <sub>2</sub> CH <sub>3</sub>
Pr'	-CH(CH <sub>3</sub> ) <sub>2</sub>	Bu'''	-C(CH <sub>3</sub> ) <sub>3</sub>
Pr''	-CH <sub>2</sub> CH <sub>2</sub> CH <sub>3</sub>	Ph	-C <sub>6</sub> H <sub>5</sub>
Bu'	-CH <sub>2</sub> CH(CH <sub>3</sub> ) <sub>2</sub>	Ac	-COCH <sub>3</sub>

**Definition** Statements given under the heading Definition constitute an official definition of the substance, preparation or other article that is the subject of the monograph. They constitute instructions or requirements and are mandatory in nature.

Certain medicinal or pharmaceutical substances and other articles are defined by reference to a particular method of manufacture. A statement that a substance or article is prepared or obtained by a certain method constitutes part of the official definition and implies that other methods are not permitted. A statement that a substance *may be* prepared or obtained by a certain method, however, indicates that this is one possible method and does not imply that other methods are proscribed.

Additional statements concerning the definition of formulated preparations are given in the general notice on Manufacture of Formulated Preparations.

**Production** Statements given under the heading Production draw attention to particular aspects of the manufacturing process but are not necessarily comprehensive. They constitute mandatory instructions to manufacturers. They may relate, for example, to source materials, to the manufacturing process itself and its validation and control, to in-process testing or to testing that is to be carried out by the manufacturer on the final product (bulk material or dosage form) either on selected batches or on each batch prior to release. These statements cannot necessarily be verified on a sample of the final product by an independent analyst. The competent authority may establish that the instructions have been followed, for example, by examination of data received from the manufacturer, by inspection or by testing appropriate samples.

The absence of a section on Production does not imply that attention to features such as those referred to above is not required. A substance, preparation or article described in a monograph of the Pharmacopoeia is to be manufactured in accordance with the principles of good manufacturing practice and in accordance with relevant international agreements and supranational and national regulations governing medicinal products.

Where in the section under the heading Production a monograph on a vaccine defines the characteristics of the vaccine strain to be used, any test methods given for confirming these characteristics are provided as examples of suitable methods. The use of these methods is not mandatory.

Additional statements concerning the production of formulated preparations are given in the general notice on Manufacture of Formulated Preparations.

**Manufacture of Formulated Preparations** Attention is drawn to the need to observe adequate hygienic precautions in the preparation and dispensing of pharmaceutical formulations. The principles of good pharmaceutical manufacturing practice should be observed.

The Definition in certain monographs for pharmaceutical preparations is given in terms of the principal ingredients only. Any ingredient, other than those included in the Definition, must comply with the general notice on Excipients and the product must conform with the Pharmacopoeial requirements.

The Definition in other monographs for pharmaceutical preparations is presented as a full formula. No deviation from the stated formula is permitted except those allowed by the general notices on Colouring Agents and Antimicrobial Preservatives. Where additionally directions are given under the heading Extemporaneous Preparation these are intended for the extemporaneous preparation of relatively small quantities for short-term supply and use. When so prepared, no deviation from the stated directions is permitted. If, however, such a pharmaceutical preparation is manufactured on a larger scale with the intention that it may be stored, deviations from the stated directions are permitted provided that the final product meets the following criteria:

(1) compliance with all of the requirements stated in the monograph;

- (2) retention of the essential characteristics of the preparation made strictly in accordance with the directions of the Pharmacopoeia.

Monographs for yet other pharmaceutical preparations include both a Definition in terms of the principal ingredients and, under the side-heading Extemporaneous Preparation, a full formula together with, in some cases, directions for their preparation. Such full formulae and directions are intended for the extemporaneous preparation of relatively small quantities for short-term supply and use. When so prepared, no deviation from the stated formula and directions is permitted. If, however, such a pharmaceutical preparation is manufactured on a larger scale with the intention that it may be stored, deviations from the formula and directions stated under the heading Extemporaneous Preparation are permitted provided that any ingredient, other than those included in the Definition, complies with the general notice on Excipients and that the final product meets the following criteria:

- (1) accordance with the Definition stated in the monograph;
- (2) compliance with all of the requirements stated in the monograph;
- (3) retention of the essential characteristics of the preparation made strictly in accordance with the formula and directions of the Pharmacopoeia.

In the manufacture of any official preparation on a large scale with the intention that it should be stored, in addition to following any instruction under the heading Production, it is necessary to ascertain that the product is satisfactory with respect to its physical and chemical stability and its state of preservation over the claimed shelf-life. This applies irrespective of whether the formula of the Pharmacopoeia and any instructions given under the heading Extemporaneous Preparation are followed precisely or modified. Provided that the preparation has been shown to be stable in other respects, deterioration due to microbial contamination may be inhibited by the incorporation of a suitable antimicrobial preservative. In such circumstances the label states appropriate storage conditions, the date after which the product should not be used and the identity and concentration of the antimicrobial preservative.

**Freshly and Recently Prepared**

The direction, given under the heading Extemporaneous Preparation, that a preparation must be freshly prepared indicates that it must be made not more than 24 hours before it is issued for use. The direction that a preparation should be recently prepared indicates that deterioration is likely if the preparation is stored for longer than about 4 weeks at 15° to 25°.

**Methods of Sterilisation**

The methods of sterilisation used in preparing the sterile materials described in the Pharmacopoeia are given in Appendix XVIII. For aqueous preparations, steam sterilisation (heating in an autoclave) is the method of choice wherever it is known to be suitable. Any method of sterilisation must be validated with respect to both the assurance of sterility and the integrity of the product and to ensure that the final product complies with the requirements of the monograph.

**Water**

The term water used without qualification in formulae for formulated preparations means either potable water freshly drawn direct from the public supply and suitable for drinking or freshly boiled and cooled Purified Water. The latter should be used if the public supply is from a local storage tank or if the potable water is unsuitable for a particular preparation.

**Excipients** Where an excipient for which there is a pharmacopoeial monograph is used in preparing an official preparation it shall comply with that monograph. Any substance added in preparing an official preparation shall be innocuous, shall have no adverse influence on the therapeutic efficacy of the active ingredients and shall not interfere with the assays and tests of the Pharmacopoeia. Particular care should be taken to ensure that such substances are free from harmful organisms.

**Colouring Agents** If in a monograph for a formulated preparation defined by means of a full formula a specific colouring agent or agents is prescribed, suitable alternatives approved in the country concerned may be substituted.

**Antimicrobial Preservatives** When the term 'suitable antimicrobial preservative' is used it is implied that the preparation concerned will be effectively preserved according to the appropriate criteria applied and interpreted as described in the test for *efficacy of antimicrobial preservation* (Appendix XVI C). In certain monographs for formulated preparations defined by means of a full formula, a specific antimicrobial agent or agents may be prescribed; suitable alternatives may be substituted provided that their identity and concentration are stated on the label.

**Characteristics** Statements given under the heading Characteristics are not to be interpreted in a strict sense and are not to be regarded as official requirements. Statements on taste are provided only in cases where this property is a guide to the acceptability of the material (for example, a material used primarily for flavouring). The status of statements on solubility is given in the general notice on Solubility.

**Solubility** Statements on solubility given under the heading Characteristics are intended as information on the approximate solubility at a temperature between 15° and 25°, unless otherwise stated, and are not to be considered as official requirements.

Statements given under headings such as Solubility in ethanol express exact requirements and constitute part of the standards for the substances under which they occur.

The following table indicates the meanings of the terms used in statements of approximate solubilities.

Descriptive term	Approximate volume of solvent in millilitres per gram of solute
very soluble	less than 1
freely soluble	from 1 to 10
soluble	from 10 to 30
sparingly soluble	from 30 to 100
slightly soluble	from 100 to 1000
very slightly soluble	from 1000 to 10 000
practically insoluble	more than 10 000

The term 'partly soluble' is used to describe a mixture of which only some of the components dissolve.

**Identification** The tests described or referred to under the heading Identification are not necessarily sufficient to establish absolute proof of identity. They provide a means of verifying that the identity of the material being examined is in accordance with the label on the container.

Unless otherwise prescribed, identification tests are carried out at a temperature between 15° and 25°.

**Reference spectra** Where a monograph refers to an infrared reference spectrum, this spectrum is provided in a separate section of the Pharmacopoeia. A sample spectrum is considered to be concordant with a reference spectrum if the transmission minima (absorption maxima) of the principal bands in the sample correspond in position, relative intensities and shape to those of the reference. Instrumentation software may be used to calculate concordance with a previously recorded reference spectrum.

When tests for infrared absorption are applied to material extracted from formulated preparations, strict concordance with the specified reference spectrum may not always be possible, but nevertheless a close resemblance between the spectrum of the extracted material and the specified reference spectrum should be achieved.

**Assays and Tests** The assays and tests described are the official methods upon which the standards of the Pharmacopoeia depend. The analyst is not precluded from employing alternative methods, including methods of micro-analysis, in any assay or test if it is known that the method used will give a result of equivalent accuracy. Local reference materials may be used for routine analysis, provided that these are calibrated against the official reference materials. In the event of doubt or dispute, the methods of analysis, the reference materials and the reference spectra of the Pharmacopoeia are alone authoritative.

Where the solvent used for a solution is not named, the solvent is Purified Water.

Unless otherwise prescribed, the assays and tests are carried out at a temperature between 15° and 25°.

A temperature in a test for Loss on drying, where no temperature range is given, implies a range of  $\pm 2^\circ$  about the stated value.

Visual comparative tests, unless otherwise prescribed, are carried out using identical tubes of colourless, transparent, neutral glass with a flat base. The volumes of liquid prescribed are for use with tubes 16 mm in internal diameter; tubes with a larger internal diameter may be used but the volume of liquid examined must be increased so that the depth of liquid in the tubes is not less than that obtained when the prescribed volume of liquid and tubes 16 mm in internal diameter are used. Equal volumes of the liquids to be compared are examined down the vertical axis of the tubes against a white background or, if necessary, against a black background. The examination is carried out in diffuse light.

Where a direction is given that an analytical operation is to be carried out 'in subdued light', precautions should be taken to avoid exposure to direct sunlight or other strong light. Where a direction is given that an analytical operation is to be carried out 'protected from light', precautions should be taken to exclude actinic light by the use of low-actinic glassware, working in a dark room or similar procedures.

For preparations other than those of fixed strength, the quantity to be taken for an assay or test is usually expressed in terms of the active ingredient. This means that the quantity of the active ingredient expected to

be present and the quantity of the preparation to be taken are calculated from the strength stated on the label.

In assays the approximate quantity to be taken for examination is indicated but the quantity actually used must not deviate by more than 10% from that stated. The quantity taken is accurately weighed or measured and the result of the assay is calculated from this exact quantity. Reagents are measured and the procedures are carried out with an accuracy commensurate with the degree of precision implied by the standard stated for the assay.

In tests the stated quantity to be taken for examination must be used unless any divergence can be taken into account in conducting the test and calculating the result. The quantity taken is accurately weighed or measured with the degree of precision implied by the standard or, where the standard is not stated numerically (for example, in tests for Clarity and colour of solution), with the degree of precision implied by the number of significant figures stated. Reagents are measured and the procedures are carried out with an accuracy commensurate with this degree of precision.

The limits stated in monographs are based on data obtained in normal analytical practice; they take account of normal analytical errors, of acceptable variations in manufacture and of deterioration to an extent considered acceptable. No further tolerances are to be applied to the limits prescribed to determine whether the article being examined complies with the requirements of the monograph.

In determining compliance with a numerical limit, the calculated result of a test or assay is first rounded to the number of significant figures stated, unless otherwise prescribed. The last figure is increased by 1 when the part rejected is equal to or exceeds one half-unit, whereas it is not modified when the part rejected is less than a half-unit.

In certain tests, the concentration of impurity is given in parentheses either as a percentage or in parts per million by weight (ppm). In chromatographic tests such concentrations are stated as a percentage irrespective of the limit. In other tests they are usually stated in ppm unless the limit exceeds 500 ppm. In those chromatographic tests in which a secondary spot or peak in a chromatogram obtained with a solution of the substance being examined is described as corresponding to a named impurity and is compared with a spot or peak in a chromatogram obtained with a reference solution of the same impurity, the percentage given in parentheses indicates the limit for that impurity. In those chromatographic tests in which a spot or peak in a chromatogram obtained with a solution of the substance being examined is described in terms other than as corresponding to a named impurity (commonly, for example, as any (other) *secondary spot* or *peak*) but is compared with a spot or peak in a chromatogram obtained with a reference solution of a named impurity, the percentage given in parentheses indicates an impurity limit expressed in terms of a nominal concentration of the named impurity. In chromatographic tests in which a comparison is made between spots or peaks in chromatograms obtained with solutions of different concentrations of the substance being examined, the percentage given in parentheses indicates an impurity limit expressed in terms of a nominal concentration of the medicinal substance itself. In some monographs, in particular those for certain formulated preparations, the impurity limit is expressed in terms of a nominal concentration of the active moiety rather than of the medicinal

substance itself. Where necessary for clarification the terms in which the limit is expressed are stated within the monograph.

In all cases where an impurity limit is given in parentheses, the figures given are approximations for information only; conformity with the requirements is determined on the basis of compliance or otherwise with the stated test.

The use of a proprietary designation to identify a material used in an assay or test does not imply that another equally suitable material may not be used.

### **Biological Assays and Tests**

Methods of assay described as Suggested methods are not obligatory, but when another method is used its precision must be not less than that required for the Suggested method.

For those antibiotics for which the monograph specifies a microbiological assay the potency requirement is expressed in the monograph in International Units (IU) per milligram. The material is not of pharmacopoeial quality if the upper fiducial limit of error is less than the stated potency. For such antibiotics the required precision of the assay is stated in the monograph in terms of the fiducial limits of error about the estimated potency.

For other substances and preparations for which the monograph specifies a biological assay, unless otherwise stated, the precision of the assay is such that the fiducial limits of error, expressed as a percentage of the estimated potency, are within a range not wider than that obtained by multiplying by a factor of 10 the square roots of the limits given in the monograph for the fiducial limits of error about the stated potency.

In all cases fiducial limits of error are based on a probability of 95% ( $P = 0.95$ ).

Where the biological assay is being used to ascertain the purity of the material, the stated potency means the potency stated on the label in terms of International Units (IU) or other Units per gram, per milligram or per millilitre. When no such statement appears on the label, the stated potency means the fixed or minimum potency required in the monograph. This interpretation of stated potency applies in all cases except where the monograph specifically directs otherwise.

Where the biological assay is being used to determine the total activity in the container, the stated potency means the total number of International Units (IU) or other Units stated on the label or, if no such statement appears, the total activity calculated in accordance with the instructions in the monograph.

Wherever possible the primary standard used in an assay or test is the respective International Standard or Reference Preparation established by the World Health Organization for international use and the biological activity is expressed in International Units (IU).

In other cases, where Units are referred to in an assay or test, the Unit for a particular substance or preparation is, for the United Kingdom, the specific biological activity contained in such an amount of the respective primary standard as the appropriate international or national organisation indicates. The necessary information is provided with the primary standard.

Unless otherwise directed, animals used in an assay or a test are healthy animals, drawn from a uniform stock, that have not previously been treated with any material that will interfere with the assay or test. Unless otherwise stated, guinea-pigs weigh not less than 250 g or, when used in systemic

toxicity tests, not less than 350 g. When used in skin tests they are white or light coloured. Unless otherwise stated, mice weigh not less than 17 g and not more than 22 g.

Certain of the biological assays and tests of the Pharmacopoeia are such that in the United Kingdom they may be carried out only in accordance with the Animals (Scientific Procedures) Act 1986. Instructions included in such assays and tests in the Pharmacopoeia, with respect to the handling of animals, are therefore confined to those concerned with the accuracy and reproducibility of the assay or test.

**Reference  
Substances and  
Reference  
Preparations**

Certain monographs require the use of a reference substance, a reference preparation or a reference spectrum. These are chosen with regard to their intended use as prescribed in the monographs of the Pharmacopoeia and are not necessarily suitable in other circumstances.

Any information necessary for proper use of the reference substance or reference preparation is given on the label or in the accompanying leaflet or brochure. Where no drying conditions are stated in the leaflet or on the label, the substance is to be used as received. No certificate of analysis or other data not relevant to the prescribed use of the product are provided. The products are guaranteed to be suitable for use for a period of three months from dispatch when stored under the appropriate conditions. The stability of the contents of opened containers cannot be guaranteed. The current lot is listed in the BP Laboratory website catalogue. Additional information is provided in Supplementary Chapter III E.

**Chemical Reference Substances** The abbreviation BPCRS indicates a Chemical Reference Substance established by the British Pharmacopoeia Commission. The abbreviation CRS or BPCRS indicates a Chemical Reference Substance established by the European Pharmacopoeia Commission. Some Chemical Reference Substances are used for the microbiological assay of antibiotics and their activity is stated, in International Units, on the label or on the accompanying leaflet and defined in the same manner as for Biological Reference Preparations.

**Biological Reference Preparations** The majority of the primary biological reference preparations referred to are the appropriate International Standards and Reference Preparations established by the World Health Organisation. Because these reference materials are usually available only in limited quantities, the European Pharmacopoeia has established Biological Reference Preparations (indicated by the abbreviation BRP or EPBRP) where appropriate. Where applicable, the potency of the Biological Reference Preparations is expressed in International Units. For some Biological Reference Preparations, where an international standard or reference preparation does not exist, the potency is expressed in European Pharmacopoeia Units.

**Storage**

Statements under the side-heading Storage constitute non-mandatory advice. The substances and preparations described in the Pharmacopoeia are to be stored under conditions that prevent contamination and, as far as possible, deterioration. Unless otherwise stated in the monograph, the substances and preparations described in the Pharmacopoeia are kept in well-closed containers and stored at a temperature not exceeding 25°. Precautions that should be taken in relation to the effects of the atmosphere, moisture, heat and light are indicated, where appropriate, in

the monographs. Further precautions may be necessary when some materials are stored in tropical climates or under other severe conditions.

The expression 'protected from moisture' means that the product is to be stored in an airtight container. Care is to be taken when the container is opened in a damp atmosphere. A low moisture content may be maintained, if necessary, by the use of a desiccant in the container provided that direct contact with the product is avoided.

The expression 'protected from light' means that the product is to be stored either in a container made of a material that absorbs actinic light sufficiently to protect the contents from change induced by such light or in a container enclosed in an outer cover that provides such protection or stored in a place from which all such light is excluded.

The expression 'tamper-evident container' means a closed container fitted with a device that reveals irreversibly whether the container has been opened.

**Labelling** The labelling requirements of the Pharmacopoeia are not comprehensive, and the provisions of regulations issued in accordance with the requirements of the territory in which the medicinal product is to be used should be met.

Licensed medicines intended for use within the United Kingdom must comply with the requirements of the Human Medicines Regulations 2012, as amended, in respect of their labelling and packaging leaflets, together with those regulations for the labelling of hazardous materials.

Best practice guidance on the labelling and packaging of medicines for use in the United Kingdom advises that certain items of information are deemed critical for the safe use of the medicine (see "Best Practice Guidance on the Labelling and Packaging of Medicines" issued by the MHRA, 2012). Further information and guidance on the labelling of medicinal products can be found in Supplementary Chapter I G.

Such matters as the exact form of wording to be used and whether a particular item of information should appear on the primary label and additionally, or alternatively, on the package or exceptionally in a leaflet are, in general, outside the scope of the Pharmacopoeia. When the term 'label' is used in Labelling statements of the Pharmacopoeia, decisions as to where the particular statement should appear should therefore be made in accordance with relevant legislation.

The label of every official formulated preparation other than those of fixed strength also states the content of the active ingredient or ingredients expressed in the terms required by the monograph. Where the content of active ingredient is required to be expressed in terms other than the weight of the official medicinal substance used in making the formulation, this is specifically stated under the heading Labelling. Unless otherwise stated in the monograph, the content of the active ingredient is expressed in terms of the official medicinal substance used in making the formulation.

These requirements do not necessarily apply to unlicensed preparations supplied in accordance with a prescription. For requirements for unlicensed medicines see the general monograph on Unlicensed Medicines.

**Action and Use** The statements given under this heading in monographs are intended only as information on the principal pharmacological actions or the uses of the materials in medicine or pharmacy. It should not be assumed that the

substance has no other action or use. The statements are not intended to be binding on prescribers or to limit their discretion.

**Crude Drugs;  
Traditional Herbal  
and Complementary  
Medicines**

*Herbal and complementary medicines are classed as medicines under the Human Medicines Regulations 2012, as amended. It is emphasised that, although requirements for the quality of the material are provided in the monograph to assist the registration scheme by the UK Licensing Authority, the British Pharmacopoeia Commission has not assessed the safety or efficacy of the material in traditional use.*

**Monograph Title** For traditional herbal medicines, the monograph title is a combination of the binomial name together with a description of use. Monographs for the material that has not been processed (the herbal drug) and the processed material (the herbal drug preparation) are published where possible. To distinguish between the two, the word 'Processed' is included in the relevant monograph title.

**Definition** Under the heading Definition, the botanical name together with any synonym is given. Where appropriate, for material that has not been processed, information on the collection/harvesting and/or treatment/drying of the whole herbal drug may be given. For processed materials, the method of processing, where appropriate, will normally be given in a separate section.

**Characteristics** References to odour are included only where this is highly characteristic. References to taste are not included.

**Control methods** Where applicable, the control methods to be used in monographs are:

- (a) macroscopical and microscopical descriptions and chemical/ chromatographic tests for identification
- (b) tests for absence of any related species
- (c) microbial test to assure microbial quality
- (d) tests for inorganic impurities and non-specific purity tests, including extractive tests, Sulfated ash and Heavy metals, where appropriate
- (e) test for Loss on drying or Water
- (f) wherever possible, a method for assaying the active constituent(s) or suitable marker constituent(s).

The macroscopical characteristics include those features that can be seen by the unaided eye or by the use of a hand lens. When two species/ subspecies of the same plant are included in the Definition, individual differences between the two are indicated where possible.

The description of the microscopical characteristics of the powdered drug includes information on the dominant or the most specific characters. Where it is considered to be an aid to identification, illustrations of the powdered drug may be provided.

The following aspects are controlled by the general monograph for Herbal Drugs: they are required to be free from moulds, insects, decay, animal matter and animal excreta. Unless otherwise prescribed the amount of foreign matter is not more than 2% w/w. Microbial contamination should be minimal.

In determining the content of the active constituents or the suitable marker substances measurements are made with reference to the dried or anhydrous herbal drug. In the tests for Acid-insoluble ash, Ash, Extractive soluble in ethanol, Loss on drying, Sulfated ash, Water, Water-soluble ash and Water-soluble extractive of herbal drugs, the calculations are made with

reference to the herbal drug that has not been specifically dried unless otherwise prescribed in the monograph.

### **Homoeopathic Medicines**

*Homoeopathic medicines are classed as medicines under the Human Medicines Regulations 2012, as amended. It is emphasised that, although requirements for the quality of the material are provided in the relevant monograph in order to assist the simplified registration scheme by the UK Licensing Authority, the British Pharmacopoeia Commission has not assessed the safety or efficacy of the material in use.*

All materials used for the production of homoeopathic medicines, including excipients, must comply with European Pharmacopoeia or British Pharmacopoeia monographs for those materials. Where such European Pharmacopoeia or British Pharmacopoeia monographs do not exist, each material used for the production of homoeopathic medicines must comply with an official national pharmacopoeia of a Member State.

British Pharmacopoeia monographs for homoeopathic medicines apply to homoeopathic stocks and mother tinctures only, but may be prefaced by a section which details the quality requirements applicable to the principle component where there is no European Pharmacopoeia or British Pharmacopoeia monograph for the material. These monographs also include either general statements on the methods of preparation or refer to specific methods of preparation given in the European Pharmacopoeia. Homoeopathic stocks and mother tinctures undergo the further process referred to as potentisation. Potentisation is a term specific to homoeopathic medicine and is a process of dilution of stocks and mother tinctures to produce the final product.

Identification tests are established for the components in homoeopathic stocks and usually relate to those applied to the materials used in the production of the homoeopathic stocks. An assay is included for the principal component(s) where possible. For mother tinctures, an identification test, usually chromatographic, is established and, where applicable, an assay for the principle component(s); where appropriate, other tests, related to the solvent, dry matter or known adulterants, are included.

Specifications have not been set for final homoeopathic products due to the high dilution used in their preparation and the subsequent difficulty in applying analytical methodology.

Statements under Crude Drugs; Traditional Herbal and Complementary Medicines also apply to homoeopathic stocks and mother tinctures, when appropriate.

### **Unlicensed Medicines**

The General Monograph for Unlicensed Medicines applies to those formulations used in human medicine that are prepared under a Manufacturer's 'Specials' Licence or prepared extemporaneously under the supervision of a pharmacist, whether or not there is a published monograph for the specific dosage form.

An article intended for medicinal use that is described by means of an official title must comply with the requirements of the relevant monograph. A formulated preparation must comply throughout its assigned shelf-life (period of validity). The subject of any other monograph must comply throughout its period of use.

Unlicensed medicines that are prepared under a Manufacturer's 'Specials' Licence comply with the requirements of the General Monograph

for Pharmaceutical Preparations, the requirements of the General Monograph for Unlicensed Medicines and, where applicable, the requirements of the individual monograph for the specific dosage form.

Unlicensed medicines prepared extemporaneously under the supervision of a pharmacist comply with the requirements of the General Monograph for Pharmaceutical Preparations, the requirements of the General Monograph for Unlicensed Medicines and, where applicable, the requirements of the individual monograph for the specific dosage form. While it is expected that extemporaneous preparations will demonstrate pharmacopoeial compliance when tested, it is recognised that it might not be practicable to carry out the pharmacopoeial tests routinely on such formulations. In the event of doubt or dispute, the methods of analysis, the reference materials and the reference spectra of the Pharmacopoeia are alone authoritative.

## Part III

*Monographs and other texts of the European Pharmacopoeia that are incorporated in this edition of the British Pharmacopoeia are governed by the general notices of the European Pharmacopoeia; these are reproduced below.*

### GENERAL NOTICES OF THE EUROPEAN PHARMACOPOEIA

#### 1.1. GENERAL STATEMENTS

The General Notices apply to all monographs and other texts of the European Pharmacopoeia.

The official texts of the European Pharmacopoeia are published in English and French. Translations in other languages may be prepared by the signatory States of the European Pharmacopoeia Convention. In case of doubt or dispute, the English and French versions are alone authoritative.

In the texts of the European Pharmacopoeia, the word 'Pharmacopoeia' without qualification means the European Pharmacopoeia. The official abbreviation Ph. Eur. may be used to indicate the European Pharmacopoeia.

The use of the title or the subtitle of a monograph implies that the article complies with the requirements of the relevant monograph. Such references to monographs in the texts of the Pharmacopoeia are shown using the monograph title and reference number in *italics*.

A preparation must comply throughout its period of validity; a distinct period of validity and/or specifications for opened or broached containers may be decided by the competent authority. The subject of any other monograph must comply throughout its period of use. The period of validity that is assigned to any given article and the time from which that period is to be calculated are decided by the competent authority in light of experimental results of stability studies.

Unless otherwise indicated in the General Notices or in the monographs, statements in monographs constitute mandatory requirements. General chapters become mandatory when referred to in a monograph, unless such reference is made in a way that indicates that it is not the intention to make the text referred to mandatory but rather to cite it for information.

The active substances, excipients, pharmaceutical preparations and other articles described in the monographs are intended for human and veterinary use (unless explicitly restricted to one of these uses).

#### Quality systems

The quality standards represented by monographs are valid only where the articles in question are produced within the framework of a suitable quality system. The quality system must assure that the articles consistently meet the requirements of the Pharmacopoeia.

#### Alternative methods

The tests and assays described are the official methods upon which the standards of the Pharmacopoeia are based. With the agreement of the competent authority, alternative methods of analysis may be used for control purposes, provided that the methods used enable an unequivocal decision to be made as to whether compliance with the standards of the

monographs would be achieved if the official methods were used. In the event of doubt or dispute, the methods of analysis of the Pharmacopoeia are alone authoritative.

**Demonstration of compliance with the Pharmacopoeia**

- (1) An article is not of Pharmacopoeia quality unless it complies with all the requirements stated in the monograph. This does not imply that performance of all the tests in a monograph is necessarily a prerequisite for a manufacturer in assessing compliance with the Pharmacopoeia before release of a product. The manufacturer may obtain assurance that a product is of Pharmacopoeia quality on the basis of its design, together with its control strategy and data derived, for example, from validation studies of the manufacturing process.
- (2) An enhanced approach to quality control could utilise process analytical technology (PAT) and/or real-time release testing (including parametric release) strategies as alternatives to end-product testing alone. Real-time release testing in circumstances deemed appropriate by the competent authority is thus not precluded by the need to comply with the Pharmacopoeia.
- (3) Reduction of animal testing: the European Pharmacopoeia is dedicated to phasing out the use of animals for test purposes, in accordance with the 3Rs (Replacement, Reduction, Refinement) set out in the European Convention for the Protection of Vertebrate Animals used for Experimental and Other Scientific Purposes. In demonstrating compliance with the Pharmacopoeia as indicated above (1), manufacturers may consider establishing additional systems to monitor consistency of production. With the agreement of the competent authority, the choice of tests performed to assess compliance with the Pharmacopoeia when animal tests are prescribed is established in such a way that animal usage is minimised as much as possible.

**Grade of materials**

Certain materials that are the subject of a pharmacopoeial monograph may exist in different grades suitable for different purposes. Unless otherwise indicated in the monograph, the requirements apply to all grades of the material. In some monographs, particularly those on excipients, a list of functionality-related characteristics that are relevant to the use of the substance may be appended to the monograph for information. Test methods for determination of one or more of these characteristics may be given, also for information.

**General monographs**

Substances and preparations that are the subject of an individual monograph are also required to comply with relevant, applicable general monographs. Cross-references to applicable general monographs are not normally given in individual monographs.

General monographs apply to all substances and preparations within the scope of the Definition section of the general monograph, except where a preamble limits the application, for example to substances and preparations that are the subject of a monograph of the Pharmacopoeia.

General monographs on dosage forms apply to all preparations of the type defined. The requirements are not necessarily comprehensive for a given specific preparation and requirements additional to those prescribed in the general monograph may be imposed by the competent authority.

General monographs and individual monographs are complementary. If the provisions of a general monograph do not apply to a particular product, this is expressly stated in the individual monograph.

**Validation of pharmacopoeial methods**

The test methods given in monographs and general chapters have been validated in accordance with accepted scientific practice and current recommendations on analytical validation. Unless otherwise stated in the monograph or general chapter, validation of the test methods by the analyst is not required.

**Implementation of pharmacopoeial methods**

When implementing a pharmacopoeial method, the user must assess whether and to what extent the suitability of the method under the actual conditions of use needs to be demonstrated according to relevant monographs, general chapters and quality systems.

**Conventional terms**

The term 'competent authority' means the national, supranational or international body or organisation vested with the authority for making decisions concerning the issue in question. It may, for example, be a national pharmacopoeia authority, a licensing authority or an official control laboratory.

The expression 'unless otherwise justified and authorised' means that the requirements have to be met, unless the competent authority authorises a modification or an exemption where justified in a particular case.

Statements containing the word 'should' are informative or advisory.

In certain monographs or other texts, the terms 'suitable' and 'appropriate' are used to describe a reagent, micro-organism, test method etc.; if criteria for suitability are not described in the monograph, suitability is demonstrated to the satisfaction of the competent authority.

**Medicinal product** (a) Any substance or combination of substances presented as having properties for treating or preventing disease in human beings and/or animals; or (b) any substance or combination of substances that may be used in or administered to human beings and/or animals with a view either to restoring, correcting or modifying physiological functions by exerting a pharmacological, immunological or metabolic action, or to making a medical diagnosis.

**Herbal medicinal product** Any medicinal product, exclusively containing as active ingredients one or more herbal drugs or one or more herbal drug preparations, or one or more such herbal drugs in combination with one or more such herbal drug preparations.

**Active substance** Any substance intended to be used in the manufacture of a medicinal product and that, when so used, becomes an active ingredient of the medicinal product. Such substances are intended to furnish a pharmacological activity or other direct effect in the diagnosis, cure, mitigation, treatment or prevention of disease, or to affect the structure and function of the body.

**Excipient** (auxiliary substance). Any constituent of a medicinal product that is not an active substance. Adjuvants, stabilisers, antimicrobial preservatives, diluents, antioxidants, for example, are excipients.

**Interchangeable methods**

Certain general chapters contain a statement that the text in question is harmonised with the corresponding text of the Japanese Pharmacopoeia and/or the United States Pharmacopoeia and that these texts are interchangeable. This implies that if a substance or preparation is found to

comply with a requirement using an interchangeable method from one of these pharmacopoeias it complies with the requirements of the European Pharmacopoeia. In the event of doubt or dispute, the text of the European Pharmacopoeia is alone authoritative.

**References to regulatory documents** Monographs and general chapters may contain references to documents issued by regulatory authorities for medicines, for example directives and notes for guidance of the European Union. These references are provided for information for users for the Pharmacopoeia. Inclusion of such a reference does not modify the status of the documents referred to, which may be mandatory or for guidance.

## 1.2. OTHER PROVISIONS APPLYING TO GENERAL CHAPTERS AND MONOGRAPHS

**Quantities** In tests with numerical limits and assays, the quantity stated to be taken for examination is approximate. The amount actually used, which may deviate by not more than 10 per cent from that stated, is accurately weighed or measured and the result is calculated from this exact quantity. In tests where the limit is not numerical, but usually depends upon comparison with the behaviour of a reference substance in the same conditions, the stated quantity is taken for examination. Reagents are used in the prescribed amounts.

Quantities are weighed or measured with an accuracy commensurate with the indicated degree of precision. For weighings, the precision corresponds to plus or minus 5 units after the last figure stated (for example, 0.25 g is to be interpreted as 0.245 g to 0.255 g). For the measurement of volumes, if the figure after the decimal point is a zero or ends in a zero (for example, 10.0 mL or 0.50 mL), the volume is measured using a pipette, a volumetric flask or a burette, as appropriate; otherwise, a graduated measuring cylinder or a graduated pipette may be used. Volumes stated in microlitres are measured using a micropipette or microsyringe.

It is recognised, however, that in certain cases the precision with which quantities are stated does not correspond to the number of significant figures stated in a specified numerical limit. The weighings and measurements are then carried out with a sufficiently improved accuracy.

**Apparatus and procedures** Volumetric glassware complies with Class A requirements of the appropriate International Standard issued by the International Organisation for Standardisation.

Unless otherwise prescribed, analytical procedures are carried out at a temperature between 15 °C and 25 °C.

Unless otherwise prescribed, comparative tests are carried out using identical tubes of colourless, transparent, neutral glass with a flat base; the volumes of liquid prescribed are for use with tubes having an internal diameter of 16 mm, but tubes with a larger internal diameter may be used provided the volume of liquid used is adjusted (2.1.5). Equal volumes of the liquids to be compared are examined down the vertical axis of the tubes against a white background, or if necessary against a black background. The examination is carried out in diffuse light.

Any solvent required in a test or assay in which an indicator is to be used is previously neutralised to the indicator, unless a blank test is prescribed.

- Water-bath** The term 'water-bath' means a bath of boiling water unless water at another temperature is indicated. Other methods of heating may be substituted provided the temperature is near to but not higher than 100 °C or the indicated temperature.
- Drying and ignition to constant mass** The terms 'dried to constant mass' and 'ignited to constant mass' mean that 2 consecutive weighings do not differ by more than 0.5 mg, the 2<sup>nd</sup> weighing following an additional period of drying or of ignition respectively appropriate to the nature and quantity of the residue.  
Where drying is prescribed using one of the expressions 'in a desiccator' or 'in vacuo', it is carried out using the conditions described in chapter 2.2.32. *Loss on drying*.
- Reagents** The proper conduct of the analytical procedures described in the Pharmacopoeia and the reliability of the results depend, in part, upon the quality of the reagents used. The reagents are described in general chapter 4. It is assumed that reagents of analytical grade are used; for some reagents, tests to determine suitability are included in the specifications.
- Solvents** Where the name of the solvent is not stated, the term 'solution' implies a solution in water.  
Where the use of water is specified or implied in the analytical procedures described in the Pharmacopoeia or for the preparation of reagents, water complying with the requirements of the monograph *Purified water (0008)* is used, except that for many purposes the requirements for bacterial endotoxins (*Purified water in bulk*) and microbial contamination (*Purified water in containers*) are not relevant. The term 'distilled water' indicates purified water prepared by distillation.  
The term 'ethanol' without qualification means anhydrous ethanol. The term 'alcohol' without qualification means ethanol (96 per cent). Other dilutions of ethanol are indicated by the term 'ethanol' or 'alcohol' followed by a statement of the percentage by volume of ethanol (C<sub>2</sub>H<sub>6</sub>O) required.
- Expression of content** In defining content, the expression 'per cent' is used according to circumstances with one of 2 meanings:  
— per cent *m/m* (percentage, mass in mass) expresses the number of grams of substance in 100 g of final product;  
— per cent *V/V* (percentage, volume in volume) expresses the number of millilitres of substance in 100 mL of final product.  
The expression 'parts per million' (or ppm) refers to mass in mass, unless otherwise specified.
- Temperature** Where an analytical procedure describes temperature without a figure, the general terms used have the following meaning:  
— in a deep-freeze: below -15 °C;  
— in a refrigerator: 2 °C to 8 °C;  
— cold or cool: 8 °C to 15 °C;  
— room temperature: 15 °C to 25 °C.

### 1.3. GENERAL CHAPTERS

- Containers** Materials used for containers are described in general chapter 3.1. General names used for materials, particularly plastic materials, each cover a range

of products varying not only in the properties of the principal constituent but also in the additives used. The test methods and limits for materials depend on the formulation and are therefore applicable only for materials whose formulation is covered by the preamble to the specification. The use of materials with different formulations, and the test methods and limits applied to them, are subject to agreement by the competent authority.

The specifications for containers in general chapter 3.2 have been developed for general application to containers of the stated category, but in view of the wide variety of containers available and possible new developments, the publication of a specification does not exclude the use, in justified circumstances, of containers that comply with other specifications, subject to agreement by the competent authority.

Reference may be made within the monographs of the Pharmacopoeia to the definitions and specifications for containers provided in chapter 3.2.

*Containers.* The general monographs for pharmaceutical dosage forms may, under the heading Definition/Production, require the use of certain types of container; certain other monographs may, under the heading Storage, indicate the type of container that is recommended for use.

#### 1.4. MONOGRAPHS

<b>Titles</b>	Monograph titles are in English and French in the respective versions and there is a Latin subtitle.
<b>Relative Atomic And Molecular Masses</b>	The relative atomic mass ( $A_r$ ) or the relative molecular mass ( $M_r$ ) is shown, as and where appropriate, at the beginning of each monograph. The relative atomic and molecular masses and the molecular and graphic formulae do not constitute analytical standards for the substances described.
<b>Chemical Abstracts Service (CAS) Registry Number</b>	CAS registry numbers are included for information in monographs, where applicable, to provide convenient access to useful information for users. CAS Registry Number <sup>®</sup> is a registered trademark of the American Chemical Society.
<b>Definition</b>	Statements under the heading Definition constitute an official definition of the substance, preparation or other article that is the subject of the monograph. <i>Limits of content</i> Where limits of content are prescribed, they are those determined by the method described under Assay. <i>Herbal drugs</i> In monographs on herbal drugs, the definition indicates whether the subject of the monograph is, for example, the whole drug or the drug in powdered form. Where a monograph applies to the drug in several states, for example both to the whole drug and the drug in powdered form, the definition states this.
<b>Production</b>	Statements under the heading Production draw attention to particular aspects of the manufacturing process but are not necessarily comprehensive. They constitute mandatory requirements for manufacturers, unless otherwise stated. They may relate, for example, to source materials; to the manufacturing process itself and its validation and control; to in-process testing; or to testing that is to be carried out by the manufacturer on the final article, either on selected batches or on each batch prior to release. These statements cannot necessarily be verified on a sample of the final article by an independent analyst. The competent authority may establish

that the instructions have been followed, for example, by examination of data received from the manufacturer, by inspection of manufacture or by testing appropriate samples.

The absence of a Production section does not imply that attention to features such as those referred to above is not required.

**Choice of vaccine strain, Choice of vaccine composition** The Production section of a monograph may define the characteristics of a vaccine strain or vaccine composition. Unless otherwise stated, test methods given for verification of these characteristics are provided for information as examples of suitable methods. Subject to approval by the competent authority, other test methods may be used without validation against the method shown in the monograph.

### Potential Adulteration

Due to the increasing number of fraudulent activities and cases of adulteration, information may be made available to Ph. Eur. users to help detect adulterated materials (i.e. active substances, excipients, intermediate products, bulk products and finished products).

To this purpose, a method for the detection of potential adulterants and relevant limits, together with a reminder that all stages of production and sourcing are subjected to a suitable quality system, may be included in this section of monographs on substances for which an incident has occurred or that present a risk of deliberate contamination. The frequency of testing by manufacturers or by users (e.g. manufacturers of intermediate products, bulk products and finished products, where relevant) depends on a risk assessment, taking into account the level of knowledge of the whole supply chain and national requirements.

This section constitutes requirements for the whole supply chain, from manufacturers to users (e.g. manufacturers of intermediate products, bulk products and finished products, where relevant). The absence of this section does not imply that attention to features such as those referred to above is not required.

### Characters

The statements under the heading Characters are not to be interpreted in a strict sense and are not requirements.

**Solubility** In statements of solubility in the Characters section, the terms used have the following significance, referred to a temperature between 15 °C and 25 °C.

Descriptive term	Approximate volume of solvent in millilitres per gram of solute			
Very soluble	less than	1		
Freely soluble	from	1	to	10
Soluble	from	10	to	30
Sparingly soluble	from	30	to	100
Slightly soluble	from	100	to	1000
Very slightly soluble	from	1000	to	10 000
Practically insoluble	more than			10 000

The term 'partly soluble' is used to describe a mixture where only some of the components dissolve. The term 'miscible' is used to describe a liquid that is miscible in all proportions with the stated solvent.

**Identification** *Scope* The tests given in the Identification section are not designed to give a full confirmation of the chemical structure or composition of the product; they are intended to give confirmation, with an acceptable degree of assurance, that the article conforms to the description on the label.

*First and second identifications* Certain monographs have subdivisions entitled 'First identification' and 'Second identification'. The test or tests that constitute the 'First identification' may be used in all circumstances. The test or tests that constitute the 'Second identification' may be used in pharmacies provided it can be demonstrated that the substance or preparation is fully traceable to a batch certified to comply with all the other requirements of the monograph.

Certain monographs give two or more sets of tests for the purpose of the first identification, which are equivalent and may be used independently. One or more of these sets usually contain a cross-reference to a test prescribed in the Tests section of the monograph. It may be used to simplify the work of the analyst carrying out the identification and the prescribed tests. For example, one identification set cross-refers to a test for enantiomeric purity while the other set gives a test for specific optical rotation: the intended purpose of the two is the same, that is, verification that the correct enantiomer is present.

*Powdered herbal drugs* Monographs on herbal drugs may contain schematic drawings of the powdered drug. These drawings complement the description given in the relevant identification test.

**Tests And Assays** *Scope* The requirements are not framed to take account of all possible impurities. It is not to be presumed, for example, that an impurity that is not detectable by means of the prescribed tests is tolerated if common sense and good pharmaceutical practice require that it be absent. See also below under Impurities.

*Calculation* Where the result of a test or assay is required to be calculated with reference to the dried or anhydrous substance or on some other specified basis, the determination of loss on drying, water content or other property is carried out by the method prescribed in the relevant test in the monograph. The words 'dried substance' or 'anhydrous substance' etc. appear in parentheses after the result. Where a quantitative determination of a residual solvent is carried out and a test for loss on drying is not carried out, the content of residual solvent is taken into account for the calculation of the assay content of the substance, the specific optical rotation and the specific absorbance. No further indication is given in the specific monograph.

*Limits* The limits prescribed are based on data obtained in normal analytical practice; they take account of normal analytical errors, of acceptable variations in manufacture and compounding and of deterioration to an extent considered acceptable. No further tolerances are to be applied to the limits prescribed to determine whether the article being examined complies with the requirements of the monograph.

In determining compliance with a numerical limit, the calculated result of a test or assay is first rounded to the number of significant figures stated, unless otherwise prescribed. The limits, regardless of whether the values are expressed as percentages or as absolute values, are considered significant to the last digit shown (for example 140 indicates 3 significant figures). The last figure of the result is increased by one when the part rejected is equal to

or exceeds one half-unit, whereas it is not modified when the part rejected is less than a half-unit.

**Indication of permitted limit of impurities** The acceptance criteria for related substances are expressed in monographs either in terms of comparison of peak areas (comparative tests) or as numerical values. For comparative tests, the approximate content of impurity tolerated, or the sum of impurities, may be indicated in brackets for information only. Acceptance or rejection is determined on the basis of compliance or non-compliance with the stated test. If the use of a reference substance for the named impurity is not prescribed, this content may be expressed as a nominal concentration of the substance used to prepare the reference solution specified in the monograph, unless otherwise described.

**Herbal Drugs** For herbal drugs, the sulfated ash, total ash, water-soluble matter, alcohol-soluble matter, water content, content of essential oil and content of active principle are calculated with reference to the drug that has not been specially dried, unless otherwise prescribed in the monograph.

**Equivalents** Where an equivalent is given, for the purposes of the Pharmacopoeia only the figures shown are to be used in applying the requirements of the monograph.

**Culture media** The culture media described in monographs and general chapters have been found to be satisfactory for the intended purpose. However, the components of media, particularly those of biological origin, are of variable quality, and it may be necessary for optimal performance to modulate the concentration of some ingredients, notably:

- peptones and meat or yeast extracts, with respect to their nutritive properties;
- buffering substances;
- bile salts, bile extract, deoxycholate, and colouring matter, depending on their selective properties;
- antibiotics, with respect to their activity.

**Storage** The information and recommendations given under the heading Storage do not constitute a pharmacopoeial requirement but the competent authority may specify particular storage conditions that must be met.

The articles described in the Pharmacopoeia are stored in such a way as to prevent contamination and, as far as possible, deterioration. Where special conditions of storage are recommended, including the type of container (see section 1.3. General chapters) and limits of temperature, they are stated in the monograph.

The following expressions are used in monographs under Storage with the meaning shown.

**In an airtight container** Means that the product is stored in an airtight container (3.2). Care is to be taken when the container is opened in a damp atmosphere. A low moisture content may be maintained, if necessary, by the use of a desiccant in the container provided that direct contact with the product is avoided.

**Protected from light** Means that the product is stored either in a container made of a material that absorbs actinic light sufficiently to protect the contents from change induced by such light, or in a container enclosed in an outer cover that provides such protection, or is stored in a place from which all such light is excluded.

- Labelling** In general, labelling of medicines is subject to supranational and national regulation and to international agreements. The statements under the heading Labelling are not therefore comprehensive and, moreover, for the purposes of the Pharmacopoeia only those statements that are necessary to demonstrate compliance or non-compliance with the monograph are mandatory. Any other labelling statements are included as recommendations. When the term 'label' is used in the Pharmacopoeia, the labelling statements may appear on the container, the package, a leaflet accompanying the package, or a certificate of analysis accompanying the article, as decided by the competent authority.
- Warnings** Materials described in monographs and reagents specified for use in the Pharmacopoeia may be injurious to health unless adequate precautions are taken. The principles of good quality control laboratory practice and the provisions of any appropriate regulations are to be observed at all times. Attention is drawn to particular hazards in certain monographs by means of a warning statement; absence of such a statement is not to be taken to mean that no hazard exists.
- Impurities** A list of all known and potential impurities that have been shown to be detected by the tests in a monograph may be given. See also chapter 5.10. *Control of impurities in substances for pharmaceutical use*. The impurities are designated by a letter or letters of the alphabet. Where a letter appears to be missing, the impurity designated by this letter has been deleted from the list during monograph development prior to publication or during monograph revision.
- Functionality-related Characteristics of Excipients** Monographs on excipients may have a section on functionality-related characteristics. The characteristics, any test methods for determination and any tolerances are not mandatory requirements; they may nevertheless be relevant for use of the excipient and are given for information (see also section 1.1. General statements).
- Reference Standards** Certain monographs require the use of reference standards (chemical reference substances, herbal reference standards, biological reference preparations, reference spectra). See also chapter 5.12. *Reference standards*. The European Pharmacopoeia Commission establishes the official reference standards, which are alone authoritative in case of arbitration. These reference standards are available from the European Directorate for the Quality of Medicines & HealthCare (EDQM). Information on the available reference standards and a batch validity statement can be obtained via the EDQM website.

## 1.5. ABBREVIATIONS AND SYMBOLS

$A$	Absorbance	mp	Melting point
$A_{1\text{ cm}}^{1\text{ per cent}}$	Specific absorbance	$n_D^{20}$	Refractive index
$A_r$	Relative atomic mass	Ph. Eur. U.	European Pharmacopoeia Unit
$[\alpha]_D^{20}$	Specific optical rotation	ppb	Parts per billion (micrograms per kilogram)
bp	Boiling point	ppm	Parts per million (milligrams per kilogram)
BRP	Biological reference preparation	R	Substance or solution defined under 4. <i>Reagents</i>
CRS	Chemical reference substance	$R_F$	Retardation factor (see chapter 2.2.46)
$d_{20}^{20}$	Relative density	$R_{it}$	Used in chromatography to indicate the ratio of the distance travelled by a substance to the distance travelled by a reference substance
$\lambda$	Wavelength	RV	Substance used as a primary standard in volumetric analysis (chapter 4.2.1)
HRS	Herbal reference standard		
IU	International Unit		
M	Molarity		
$M_r$	Relative molecular mass		

## Abbreviations used in the monographs on immunoglobulins, immunosera and vaccines

CFU	Colony-forming units	Lo/10 dose	The largest quantity of a toxin that, in the conditions of the test, when mixed with 0.1 IU of antitoxin and administered by the specified route, does not cause symptoms of toxicity in the test animals within a given period
LD <sub>50</sub>	The statistically determined quantity of a substance that, when administered by the specified route, may be expected to cause the death of 50 per cent of the test animals within a given period	Lf dose	The quantity of toxin or toxoid that flocculates in the shortest time with 1 IU of antitoxin
MLD	Minimum lethal dose	CCID <sub>50</sub>	The statistically determined quantity of virus that may be expected to infect 50 per cent of the cell cultures to which it is added
L+/10 dose	The smallest quantity of a toxin that, in the conditions of the test, when mixed with 0.1 IU of antitoxin and administered by the specified route, causes the death of the test animals within a given period	BID <sub>50</sub>	The statistically determined quantity of virus that may be expected to infect 50 per cent of the fertilised eggs into which it is inoculated
L+ dose	The smallest quantity of a toxin that, in the conditions of the test, when mixed with 1 IU of antitoxin and administered by the specified route, causes the death of the test animals within a given period	ID <sub>50</sub>	The statistically determined quantity of a virus that may be expected to infect 50 per cent of the animals into which it is inoculated
Ir/100 dose	The smallest quantity of a toxin that, in the conditions of the test, when mixed with 0.01 IU of antitoxin and injected intracutaneously causes a characteristic reaction at the site of injection within a given period	PD <sub>50</sub>	The statistically determined dose of a vaccine that, in the conditions of the test, may be expected to protect 50 per cent of the animals against a challenge dose of the micro-organisms or toxins against which it is active
Lp/10 dose	The smallest quantity of toxin that, in the conditions of the test, when mixed with 0.1 IU of antitoxin and administered by the specified route, causes paralysis in the test animals within a given period	ED <sub>50</sub>	The statistically determined dose of a vaccine that, in the conditions of the test, may be expected to induce specific antibodies in 50 per cent of the animals for the relevant vaccine antigens
		PFU	Pock-forming units or plaque-forming units
		SPF	Specified pathogen-free

### 1.6. UNITS OF THE INTERNATIONAL SYSTEM (SI) USED IN THE PHARMACOPOEIA AND EQUIVALENCE WITH OTHER UNITS

#### International System Of Units (SI)

The International System of Units comprises 2 main classes of units, namely base units and derived units<sup>1</sup>. The base units are the metre, the kilogram, the second, the ampère, the kelvin, the mole and the candela.

The derived units are formed as products of powers of the base units according to the algebraic relationships linking the corresponding quantities. Some of these derived units have special names and symbols. The derived units used in the Pharmacopoeia are shown in Table 1.6.-1.

Some important and widely used units outside the International System are shown in Table 1.6.-2.

The prefixes shown in Table 1.6.-3 are used to form the names and symbols of the decimal multiples and submultiples of SI units.

Table 1.6.-1. – Derived units used in the European Pharmacopoeia and equivalence with other units

Quantity		Unit				Conversion of other units into SI units
Name	Symbol	Name	Symbol	Expression in SI base units	Expression in other SI units	
Wave number	$\nu$	one per metre	1/m	$\text{m}^{-1}$		
Wavelength	$\lambda$	micrometre nanometre	$\mu\text{m}$ $\text{nm}$	$10^{-6}\text{m}$ $10^{-9}\text{m}$		
Area	$A, S$	square metre	$\text{m}^2$	$\text{m}^2$		
Volume	$V$	cubic metre	$\text{m}^3$	$\text{m}^3$		1 mL = 1 cm <sup>3</sup> = 10 <sup>-6</sup> m <sup>3</sup>
Frequency	$\nu$	hertz	Hz	$\text{s}^{-1}$		
Density	$\rho$	kilogram per cubic metre	$\text{kg}/\text{m}^3$	$\text{kg}\cdot\text{m}^{-3}$		1 g/mL = 1 g/cm <sup>3</sup> = 10 <sup>3</sup> kg·m <sup>-3</sup>
Velocity, speed	$v$	metre per second	m/s	$\text{m}\cdot\text{s}^{-1}$		
Force	$F$	newton	N	$\text{m}\cdot\text{kg}\cdot\text{s}^{-2}$		1 dyne = 1 g·cm·s <sup>-2</sup> = 10 <sup>-5</sup> N 1 kp = 9.806 65 N
Pressure, stress	$p$	pascal	Pa	$\text{m}^{-1}\cdot\text{kg}\cdot\text{s}^{-2}$	$\text{N}\cdot\text{m}^{-2}$	1 dyne/cm <sup>2</sup> = 10 <sup>-1</sup> Pa = 10 <sup>-1</sup> N·m <sup>-2</sup> 1 atm = 101 325 Pa = 101.325 kPa 1 bar = 10 <sup>5</sup> Pa = 0.1 MPa 1 mm Hg = 133.322 387 Pa 1 Torr = 133.322 368 Pa 1 psi = 6.894 757 kPa
Dynamic viscosity	$\eta$	pascal second	Pa·s	$\text{m}^{-1}\cdot\text{kg}\cdot\text{s}^{-1}$	$\text{N}\cdot\text{s}\cdot\text{m}^{-2}$	1 P = 10 <sup>-1</sup> Pa·s = 10 <sup>-1</sup> N·s·m <sup>-2</sup> 1 cP = 1 mPa·s
Kinematic viscosity	$\nu$	square metre per second	$\text{m}^2/\text{s}$	$\text{m}^2\cdot\text{s}^{-1}$	$\text{Pa}\cdot\text{s}\cdot\text{m}^3\cdot\text{kg}^{-1}$ $\text{N}\cdot\text{m}\cdot\text{s}\cdot\text{kg}^{-1}$	1 St = 1 cm <sup>2</sup> ·s <sup>-1</sup> = 10 <sup>-4</sup> m <sup>2</sup> ·s <sup>-1</sup>

<sup>1</sup> The definitions of the units used in the International System are given in the booklet 'Le Système International d'Unités (SI)', published by the Bureau International des Poids et Mesures, Pavillon de Breteuil, F-92310 Sèvres.

Quantity		Unit				Conversion of other units into SI units
Name	Symbol	Name	Symbol	Expression in SI base units	Expression in other SI units	
Energy	$W$	joule	J	$\text{m}^2 \cdot \text{kg} \cdot \text{s}^{-2}$	N·m	1 erg = $1 \text{ cm}^2 \cdot \text{g} \cdot \text{s}^{-2} = 1 \text{ dyne} \cdot \text{cm} = 10^{-7} \text{ J}$ 1 cal = 4.1868 J

10 <sup>1</sup>	deca	da	10 <sup>-18</sup>	atto	a

- Notes** 1. In the Pharmacopoeia, the Celsius temperature is used (symbol  $t$ ). This is defined by the following equation:

$$t = T - T_0$$

where  $T_0 = 273,15$  K by definition. The Celsius or centigrade temperature is expressed in degrees Celsius (symbol  $^{\circ}\text{C}$ ). The unit 'degree Celsius' is equal to the unit 'kelvin'.

2. The practical expressions of concentrations used in the Pharmacopoeia are defined in the General Notices.
3. The radian is the plane angle between two radii of a circle that cut off on the circumference an arc equal in length to the radius.
4. In the Pharmacopoeia, conditions of centrifugation are defined by reference to the acceleration due to gravity ( $g$ ):

$$g = 9.806\ 65\ \text{m}\cdot\text{s}^{-2}$$

5. Certain quantities without dimensions are used in the Pharmacopoeia: relative density (2.2.5), absorbance (2.2.25), specific absorbance (2.2.25) and refractive index (2.2.6).
6. The microkatal is defined as the enzymic activity that, under defined conditions, produces the transformation (e.g. hydrolysis) of 1 micromole of the substrate per second.

## **Formulated Preparations: General Monographs**

## Pharmaceutical Preparations

(Ph. Eur. monograph 2619)

Ph Eur

### INTRODUCTION

This monograph is intended to be a reference source of standards in the European Pharmacopoeia on active substances, excipients and dosage forms, which are to be applied in the manufacture/preparation of pharmaceuticals, but not a guide on how to manufacture as there is specific guidance available covering methods of manufacture and associated controls.

It does not cover investigational medicinal products, but competent authorities may refer to pharmacopoeial standards when authorising clinical trials using investigational medicinal products.

### DEFINITION

Pharmaceutical preparations are medicinal products generally consisting of active substances that may be combined with excipients, formulated into a dosage form suitable for the intended use, where necessary after reconstitution, presented in a suitable and appropriately labelled container.

Pharmaceutical preparations may be licensed by the competent authority, or unlicensed and made to the specific needs of patients according to legislation. There are 2 categories of unlicensed pharmaceutical preparations:

- extemporaneous preparations, i.e. pharmaceutical preparations individually prepared for a specific patient or patient group, supplied after preparation;
- stock preparations, i.e. pharmaceutical preparations prepared in advance and stored until a request for a supply is received.

In addition to this monograph, pharmaceutical preparations also comply with the General Notices and with the relevant general chapters of the Pharmacopoeia. General chapters are normally given for information and become mandatory when referred to in a general or specific monograph, unless such reference is made in a way that indicates that it is not the intention to make the text referred to mandatory but rather to cite it for information.

Where relevant, pharmaceutical preparations also comply with the dosage form monographs (e.g. *Capsules (0016)*, *Tablets (0478)*) and general monographs relating to pharmaceutical preparations (e.g. *Allergen products (1063)*, *Herbal teas (1435)*, *Homoeopathic preparations (1038)*, *Homoeopathic pillules, coated (2786)*, *Homoeopathic pillules, impregnated (2079)*, *Immunosera for human use, animal (0084)*, *Immunosera for veterinary use (0030)*, *Live biotherapeutic products for human use (3053)*, *Monoclonal antibodies for human use (2031)*, *Radiopharmaceutical preparations (0125)*, *Vaccines for human use (0153)*, *Vaccines for veterinary use (0062)*).

### ETHICAL CONSIDERATIONS AND GUIDANCE IN THE PREPARATION OF UNLICENSED PHARMACEUTICAL PREPARATIONS

The underlying principle of legislation for pharmaceutical preparations is that, subject to specific exemptions, no pharmaceutical preparation may be placed on the market without an appropriate marketing authorisation.

The exemptions from the formal licensing requirement allow the supply of unlicensed products to meet the special needs of individual patients. However, when deciding to use an unlicensed preparation all health professionals involved (e.g. the prescribing practitioners and/or the preparing

pharmacists) have, within their area of responsibilities, a duty of care to the patient receiving the pharmaceutical preparation.

In considering the preparation of an unlicensed pharmaceutical preparation, a suitable level of risk assessment is undertaken.

The risk assessment identifies:

- the criticality of different parameters (e.g. quality of active substances, excipients and containers; design of the preparation process; extent and significance of testing; stability of the preparation) to the quality of the preparation; and
- the risk that the preparation may present to a particular patient group.

Based on the risk assessment, the person responsible for the preparation must ensure, with a suitable level of assurance, that the pharmaceutical preparation is, throughout its shelf-life, of an appropriate quality and suitable and fit for its purpose. For stock preparations, storage conditions and shelf-life have to be justified on the basis of, for example, analytical data or professional judgement, which may be based on literature references.

### PRODUCTION

Manufacture/preparation must take place within the framework of a suitable quality system and be compliant with the standards relevant to the type of product being made. Licensed products must comply with the requirements of their licence. For unlicensed products a risk assessment as outlined in the section 'Ethical considerations and guidance in the preparation of unlicensed pharmaceutical preparations' is of special importance, as these products are not previously assessed by the competent authority.

Where pharmaceutical preparations are manufactured/prepared using materials of human or animal origin, the general requirements of general chapters 5.1.7. *Viral safety* and 5.2.6. *Evaluation of safety of veterinary vaccines and immunosera* and of the general monograph *Products with risk of transmitting agents of animal spongiform encephalopathies (1483)* apply, where appropriate.

### Formulation

During pharmaceutical development or prior to manufacture/preparation, suitable ingredients, processes, tests and specifications are identified and justified in order to ensure the suitability of the product for the intended purpose. This includes consideration of the properties required in order to identify whether specific ingredient properties or process steps are critical to the required quality of the pharmaceutical preparation.

### Active substances and excipients

Active substances and excipients used in the formulation of pharmaceutical preparations comply with the requirements of the relevant general monographs, e.g. *Substances for pharmaceutical use (2034)*, *Essential oils (2098)*, *Herbal drug extracts (0765)*, *Herbal drugs (1433)*, *Herbal drug preparations (1434)*, *Herbal drugs for homoeopathic preparations (2045)*, *Mother tinctures for homoeopathic preparations (2029)*, *Methods of preparation of homoeopathic stocks and potentiation (2371)*, *Products of fermentation (1468)*, *Products of recombinant DNA technology (0784)*, *Vegetable fatty oils (1579)*.

In addition, where specific monographs exist, the quality of the active substances and excipients used complies with the corresponding monographs.

Where no specific monographs exist, the required quality must be defined, taking into account the intended use and the involved risk.

When physicochemical characteristics of active substances and functionality-related characteristics (FRCs) of excipients (e.g. particle-size distribution, viscosity, polymorphism) are critical in relation to their role in the manufacturing process and quality attributes of the pharmaceutical preparation, they must be identified and controlled.

Detailed information on FRCs is given in general chapter 5.15. *Functionality-related characteristics of excipients*.

#### Microbiological quality

The formulation of the pharmaceutical preparation and its container must ensure that the microbiological quality is suitable for the intended use.

During development, it shall be demonstrated that the antimicrobial activity of the preparation as such or, if necessary, with the addition of a suitable preservative or preservatives, or by the selection of an appropriate container, provides adequate protection from adverse effects that may arise from microbial contamination or proliferation during the storage and use of the preparation. A suitable test method together with criteria for evaluating the preservative properties of the formulation are provided in general chapter 5.1.3. *Efficacy of antimicrobial preservation*.

If preparations do not have adequate antimicrobial efficacy and do not contain antimicrobial preservatives they are supplied in single-dose containers, or in multidose containers that prevent microbial contamination of the contents after opening.

In the manufacture/preparation of non-sterile pharmaceutical preparations, suitable measures are taken to ensure their microbial quality; recommendations on this aspect are provided in general chapters 5.1.4. *Microbiological quality of non-sterile pharmaceutical preparations and substances for pharmaceutical use* and 5.1.8. *Microbiological quality of herbal medicinal products for oral use and extracts used in their preparation*.

Sterile preparations are manufactured/prepared using materials and methods designed to ensure sterility and to avoid the introduction of contaminants and the growth of micro-organisms; recommendations on this aspect are provided in general chapter 5.1.1. *Methods of preparation of sterile products*.

#### Containers

A suitable container is selected. Consideration is given to the intended use of the preparation, the properties of the container, the required shelf-life, and product/container incompatibilities. Where applicable, containers for pharmaceutical preparations comply with the requirements for containers (3.2 and subsections) and materials used for the manufacture of containers (3.1 and subsections).

#### Stability

Stability requirements of pharmaceutical preparations are dependent on their intended use and on the desired storage time.

Where applicable, the probability and criticality of possible degradation products of the active substance(s) and/or reaction products of the active substance(s) with an excipient and/or the immediate container must be assessed. Depending on the result of this assessment, limits of degradation and/or reaction products are set and monitored in the pharmaceutical preparation. Licensed products require a stability exercise.

Methods used for the purpose of stability testing for all relevant characteristics of the preparation are validated as stability indicating, i.e. the methods allow the quantification of the relevant degradation products and physical characteristic changes.

#### TESTS

Relevant tests to apply in order to ensure the appropriate quality of a particular dosage form are described in the specific dosage form monographs.

Where it is not practical, for unlicensed pharmaceutical preparations, to carry out the tests (e.g. batch size, time restraints), other suitable methods are implemented to ensure that the appropriate quality is achieved in accordance with the risk assessment carried out and any local guidance or legal requirements.

Stock preparations are normally tested to a greater extent than extemporaneous preparations.

The following tests are applicable to many preparations and are therefore listed here.

#### Appearance

The appearance (e.g. size, shape and colour) of the pharmaceutical preparation is controlled.

#### Identity and purity tests

Where applicable, the following tests are carried out on the pharmaceutical preparation:

- identification of the active substance(s);
- identification of specific excipient(s), such as preservatives;
- purity tests (e.g. investigation of degradation products, residual solvents (2.4.24) or other related impurities, sterility (2.6.1));
- safety tests (e.g. safety tests for biological products).

#### Elemental impurities

General chapter 5.20. *Elemental impurities* applies to pharmaceutical preparations except products for veterinary use, unlicensed preparations and other products that are excluded from the scope of this chapter.

For pharmaceutical preparations outside the scope of general chapter 5.20, manufacturers of these products remain responsible for controlling the levels of elemental impurities using the principles of risk management.

If appropriate, testing is performed using suitable analytical procedures according to general chapter 2.4.20. *Determination of elemental impurities*.

#### Uniformity (2.9.40 or 2.9.5/2.9.6)

Pharmaceutical preparations presented in single-dose units comply with the test(s) as prescribed in the relevant specific dosage form monograph. If justified and authorised, general chapter 2.9.40 can be applicable only at the time of release.

Special uniformity requirements apply in the following cases:

- for herbal drugs and herbal drug preparations, compliance with general chapter 2.9.40 is not required;
- for homoeopathic preparations, the provisions of general chapters 2.9.6 and 2.9.40 are normally not appropriate, however in certain circumstances compliance with these chapters may be required by the competent authority;
- for single- and multivitamin and trace-element preparations, compliance with general chapters 2.9.6 and 2.9.40 (*content uniformity only*) is not required;
- in justified and authorised circumstances, for other preparations, compliance with general chapters 2.9.6 and 2.9.40 may not be required by the competent authority.

**Reference standards**

Reference standards may be needed at various stages for quality control of pharmaceutical preparations. They are established and monitored taking due account of general chapter 5.12. *Reference standards*.

**ASSAY**

Unless otherwise justified and authorised, contents of active substances and specific excipients such as preservatives are determined in pharmaceutical preparations. Limits must be defined and justified.

Suitable and validated methods are used. If assay methods prescribed in the respective active substance monographs are used, it must be demonstrated that they are not affected by the presence of the excipients and/or by the formulation.

**Reference standards**

See Tests.

**LABELLING AND STORAGE**

The relevant labelling requirements given in the general dosage form monographs apply. In addition, relevant European Union or other applicable regulations apply.

**GLOSSARY****Formulation**

The designing of an appropriate formula (including materials, processes, etc.) that will ensure that the patient receives the suitable pharmaceutical preparation in an appropriate form that has the required quality and that will be stable and effective for the required length of time.

**Licensed pharmaceutical preparation**

A medicinal product that has been granted a marketing authorisation by a competent authority. Synonym: authorised pharmaceutical preparation.

**Manufacture**

All operations of purchase of materials and products, Production, Quality Control, release, storage, distribution of medicinal products and the related controls.

**Preparation (of an unlicensed pharmaceutical preparation)**

The 'manufacture' of unlicensed pharmaceutical preparations by or at the request of pharmacies or other healthcare establishments (the term 'preparation' is used instead of 'manufacture' in order clearly to distinguish it from the industrial manufacture of licensed pharmaceutical preparations).

**Reconstitution**

Manipulation to enable the use or application of a medicinal product with a marketing authorisation in accordance with the instructions given in the summary of product characteristics or the patient information leaflet.

**Risk assessment**

The identification of hazards and the analysis and evaluation of risks associated with exposure to those hazards.

**Unlicensed pharmaceutical preparation**

A medicinal product that is exempt from the need of having a marketing authorisation issued by a competent authority but is made for specific patients' needs according to legislation.

# Monographs

## Herbal Drugs, Herbal Drug Preparations and Herbal Medicinal Products

## Herbal Drugs

(Ph. Eur. monograph 1433)

Herbal Drugs comply with the requirements of the European Pharmacopoeia. These requirements are reproduced below.

Ph Eur

### DEFINITION

Herbal drugs are mainly whole, fragmented or broken plants or parts of plants in an unprocessed state, usually in dried form but sometimes fresh. In this general monograph, the word 'plant' is used in the broader sense to also include algae, fungi and lichens. Certain exudates that have not been subjected to a specific treatment are also considered to be herbal drugs. Herbal drugs are precisely defined by the botanical scientific name according to the binominal system (genus, species, variety and author).

**Whole** Describes a herbal drug that has not been reduced in size and is presented, dried or undried, as harvested; for example: dog rose, bitter fennel or sweet fennel, Roman chamomile flower.

**Fragmented** Describes a herbal drug that has been reduced in size after harvesting to permit ease of handling, drying and/or packaging; for example: cinchona bark, rhubarb, passion flower.

**Broken** Describes a herbal drug in which the more-fragile parts of the plant have broken during drying, packaging or transportation; for example: belladonna leaf, matricaria flower, hop strobile.

**Cut** Describes a herbal drug that has been reduced in size, other than by powdering, to the extent that the macroscopic description in the monograph of the herbal drug can no longer be applied. When a herbal drug is cut for a specific purpose that results in the cut herbal drug being homogeneous, for example when cut for herbal teas, it is a herbal drug preparation. Certain cut herbal drugs processed in this way may be the subject of an individual monograph.

A herbal drug that complies with its monograph and is subsequently cut for extraction shall comply in its cut form, except for its macroscopic description, with the monograph for that herbal drug, unless otherwise justified.

The term *herbal drug* is synonymous with the term *herbal substance* used in European Community legislation on herbal medicinal products.

### DRIED HERBAL DRUGS

#### PRODUCTION

Dried herbal drugs are obtained from cultivated or wild plants. Suitable collection, cultivation, harvesting, drying, fragmentation and storage conditions are essential to guarantee their quality.

Dried herbal drugs are, as far as possible, free from impurities such as soil, dust, dirt and other contaminants such as fungal, insect and other animal contaminations. They are not rotten.

If a decontaminating treatment has been used, it is necessary to demonstrate that the constituents of the herbal drug are not affected and that no harmful residues remain. The use of ethylene oxide is prohibited for the decontamination of herbal drugs.

#### IDENTIFICATION

Dried herbal drugs are identified using their macroscopic and microscopic descriptions and any further tests that may be required (for example, thin-layer chromatography).

### TESTS

#### Foreign matter (2.8.2)

Carry out a test for foreign matter, unless otherwise prescribed or justified and authorised. The content of foreign matter is not more than 2 per cent *m/m*, unless otherwise prescribed or justified and authorised. An appropriate specific test may apply to dried herbal drugs liable to be adulterated. It may not be possible to perform the test for foreign matter on a dried herbal drug that is cut, as described under Definition, for either a specific purpose or for extraction. Under these circumstances the cut material is presumed to comply with the test for foreign matter providing that the dried herbal drug prior to cutting was compliant with this test.

#### Loss on drying (2.2.32)

Carry out a test for loss on drying, unless otherwise prescribed or justified and authorised.

#### Water (2.2.13)

A determination of water may be carried out instead of a test for loss on drying for dried herbal drugs with a high essential-oil content.

#### Pesticides (2.8.13)

Dried herbal drugs comply with the requirements for pesticide residues. The requirements take into account the nature of the plant, where necessary the preparation in which the plant might be used, and where available the knowledge of the complete treatment record of the batch of the plant.

#### Heavy metals (2.4.27)

Unless otherwise stated in an individual monograph or unless otherwise justified and authorised:

- *cadmium*: maximum 1.0 ppm;
- *lead*: maximum 5.0 ppm;
- *mercury*: maximum 0.1 ppm.

Where necessary, limits for other heavy metals may be required.

Where necessary, dried herbal drugs comply with other tests, such as the following, for example.

#### Total ash (2.4.16)

#### Ash insoluble in hydrochloric acid (2.8.1)

#### Extractable matter

#### Swelling index (2.8.4)

#### Bitterness value (2.8.15)

#### Aflatoxin B<sub>1</sub> (2.8.18)

Where necessary, limits for aflatoxins may be required.

#### Ochratoxin A (2.8.22)

Where necessary, a limit for ochratoxin A may be required.

#### Radioactive contamination

In some specific circumstances, the risk of radioactive contamination is to be considered.

#### Microbial contamination

Where a dried herbal drug is used whole, cut or powdered as an ingredient in a medicinal product, the microbial contamination is controlled (5.1.8. *Microbiological quality of herbal medicinal products for oral use and extracts used in their preparation* or 5.1.4. *Microbiological quality of non-sterile pharmaceutical preparations and substances for pharmaceutical use* (e.g. for cutaneous use)).

#### ASSAY

Unless otherwise prescribed or justified and authorised, dried herbal drugs are assayed by an appropriate method.

**STORAGE**

Protected from light.

Where used for the production of essential oils, some of the tests prescribed for dried herbal drugs may no longer be necessary. This is considered on a case-by-case basis depending on the provenance of the dried herbal drug and the production process. The need for testing (e.g. for potential contaminants) and the stage of testing (herbal drug/essential oil) is to be considered.

**FRESH HERBAL DRUGS**

A fresh herbal drug is one that is intended to be processed into a herbal drug preparation (e.g. essential oil, juice, tincture) within a relatively short period of time after harvesting. Under these circumstances, the extensive analysis prescribed for dried herbal drugs is not appropriate and the following analytical requirements, based on the provenance of the fresh herbal drug, are considered suitable, provided that processing to the herbal drug preparation takes place within a validated time period after harvesting.

(1) For a fresh herbal drug that has been cultivated from seeds, cuttings, etc., whose origin and traceability can be demonstrated, and where the complete history of the herbal drug from planting to harvesting is documented:

- macroscopic identification of the plant and plant parts to be processed;
- compliance with a suitable limit test for foreign matter.

(2) For a cultivated fresh herbal drug where the information on life cycle from seed to harvesting, as described under (1), is incomplete, the same analytical requirements as described under (1) apply, as well as any additional tests that may be necessary depending on the information available on the herbal drug to be processed and any potential or known quality issues.

(3) For a fresh herbal drug that is wild-crafted, the analytical requirements should be assessed on a case-by-case basis and will depend on the ease of identification or characterisation of the herbal drug/herbal drug preparation and potential adulterants, and the method of processing or type of herbal drug preparation to be manufactured. For example, in the case of essential oils, the majority of the oil composition is determined when it is analysed, whereas for a juice or a tincture, such analytical capabilities are limited. For the processing of plant parts, a wild-crafted fresh flower, easily identifiable by its distinctive appearance and colour, would be expected to require fewer analytical control parameters than a wild-crafted fresh root with few, if any, visually distinctive features. Analytical requirements as described under (1) may be acceptable when fully justified.

For fresh herbal drugs, where the extensive analysis described for dried herbal drugs is not feasible prior to processing into the herbal drug preparation, appropriate tests (e.g. for contaminants) are performed on a suitable retained sample of the fresh herbal drug or on the herbal drug preparation.

Fresh herbal drugs may be frozen for storage purposes. Defined processes for freezing and thawing are required to ensure the quality of the herbal drug. Appropriate testing of the herbal drug, justified on the basis of the freezing and manufacturing processes, is put in place and may include testing prior to freezing and at the time of use.

When handling and processing fresh herbal drugs, it is necessary to ensure, by visual inspection or other suitable means, the absence of unwanted fermentation, the presence

of which may alter the quality of the herbal drug preparation, including possible mycotoxin production.

Ph Eur

**Processed Herbal Drugs****DEFINITION**

Processed Herbal Drugs are obtained by subjecting Herbal Drugs to traditional processing methods.

Processed Herbal Drugs are defined precisely by the botanical scientific name according to the binomial system (genus, species, subspecies, variety, and author) and plant part. Monographs for Processed Herbal Drugs may refer to the relevant monograph for the unprocessed material where the binomial name is given.

**PRODUCTION**

Processed Herbal Drugs are obtained by subjecting Herbal Drugs to specific types of processing according to traditional processing methods. These traditional processing methods have the potential to alter the physical characteristics and/or chemical constituents of a Herbal Drug. Traditional processing methods may require the addition of processing aids to the herbal drug, for example, honey, vinegar, wine, milk and salt. The additional processing aids used should be of a suitable quality or of pharmacopoeial quality where a monograph exists. The method of traditional processing is provided under the Production section in individual monographs.

**IDENTIFICATION**

Processed Herbal Drugs are identified using their macroscopical and, where appropriate, microscopical descriptions and any further tests that may be required.

**TESTS**

A test for *foreign matter*, Appendix XI D, is carried out, unless otherwise prescribed in the individual monographs.

A specific appropriate test may be prescribed to detect potential contaminants in processed herbal drugs.

If appropriate, the Processed Herbal Drugs comply with other tests, for example, *total ash*, Appendix XI J, Method II, *ash insoluble in hydrochloric acid*, Appendix XI K, Method II, *extractable matter*, *swelling index*, Appendix XI C and *bitterness value*, Appendix XI N.

The test for *loss on drying*, Appendix IX D, is carried out on Processed Herbal Drugs, unless otherwise prescribed in the individual monographs. A *determination of water by distillation*, Appendix IX C, Method II, is carried out for Processed Herbal Drugs with a high essential oil content.

Processed Herbal Drugs comply with the requirements for *pesticide residues*, Appendix XI L. The requirements take into account the nature of the Processed Herbal Drugs, where necessary the preparation in which the plant might be used, and where available, the knowledge of the complete record of treatment of the batch of the Processed Herbal Drugs during cultivation, harvesting and processing. The content of pesticide residues may be determined by the method described in the annex to the general method.

The risk of contamination of Processed Herbal Drugs by heavy metals must be considered. In an individual monograph either a general limit for heavy metals or specific limits for individual heavy metal may be required.

Where necessary limits for specific toxins, for example aflatoxins or ochratoxins, may be applied.

Where processing is carried out to remove or limit specific constituents from the herbal drug a suitable limit test should be carried out.

In some specific circumstances, the risk of radioactive contamination is to be considered.

#### ASSAY

Unless otherwise justified and authorised Processed Herbal Drugs are assayed by an appropriate method.

## Herbal Drug Preparations

(Ph. Eur. monograph 1434)

Herbal Drug Preparations comply with the requirements of the European Pharmacopoeia. These requirements are reproduced below.

Ph Eur

#### DEFINITION

Herbal drug preparations are homogeneous products obtained by subjecting herbal drugs to treatments such as extraction, distillation, expression, fractionation, purification, concentration or fermentation.

Herbal drug preparations include, for example, extracts, essential oils, expressed juices, processed exudates, and herbal drugs that have been subjected to size reduction for specific applications, for example herbal drugs cut for herbal teas or powdered for encapsulation.

Herbal teas comply with the monograph *Herbal teas (1435)*.

**NOTE** The term *comminuted* used in European Community legislation on herbal medicinal products describes a herbal drug that has been either cut or powdered.

The term *herbal drug preparation* is synonymous with the term *herbal preparation* used in European Community legislation on herbal medicinal products.

Ph Eur

## Essential Oils

(Ph. Eur. monograph 2098)

Essential Oils comply with the requirements of the European Pharmacopoeia. These requirements are reproduced below.

Ph Eur

The statements in this monograph are intended to be read in conjunction with individual monographs on essential oils in the European Pharmacopoeia. Application of the monograph to other essential oils may be decided by the competent authority.

#### DEFINITION

Odorous product, usually of complex composition, obtained from a botanically defined plant raw material by steam distillation, dry distillation, or a suitable mechanical process without heating. Essential oils are usually separated from the aqueous phase by a physical process that does not significantly affect their composition.

Essential oils may be subjected to a suitable subsequent treatment. Thus an essential oil may be commercially known as being *deterpenated*, *desesquiterpenated*, *rectified* or *'x'-free*.

- A *deterpenated essential oil* is an essential oil from which monoterpene hydrocarbons have been removed, partially or totally.
- A *deterpenated and desesquiterpenated essential oil* is an essential oil from which mono- and sesquiterpene hydrocarbons have been removed, partially or totally.
- A *rectified essential oil* is an essential oil that has been subjected to fractional distillation to remove certain constituents or modify the content.
- An *'x'-free essential oil* is an essential oil that has been subjected to partial or complete removal of one or more constituents.

#### PRODUCTION

Depending on the monograph, the plant raw material may be fresh, wilted, dried, whole, broken or ground.

**Steam distillation** The essential oil is produced by the passage of steam through the plant raw material in a suitable apparatus. The steam may be introduced from an external source or generated by boiling water below the raw material or by boiling water in which the raw material is immersed. The steam and oil vapours are condensed. The water and essential oil are separated by decantation.

**Dry distillation** The essential oil is produced by high-temperature heating of stems or barks in a suitable apparatus without the addition of water or steam.

**Mechanical process** The essential oil, usually known as 'cold-pressed', is produced by a mechanical process without any heating. It is mainly applied to *Citrus* fruit and involves expression of the oil from the pericarp and subsequent separation by physical means.

In certain cases, a suitable antioxidant may be added to the essential oil.

#### CHARACTERS

The appearance and the odour of the essential oil is determined.

#### IDENTIFICATION

Essential oils are identified by their gas chromatographic profile, or failing this, by any other test that may be required (for example, a test by thin-layer chromatography).

#### TESTS

##### GENERAL TESTS

The essential oil complies with the prescribed limits for the following tests.

Relative density (2.2.5)

Refractive index (2.2.6)

Optical rotation (2.2.7)

Fatty oils and resinified essential oils (2.8.7)

##### SUPPLEMENTARY TESTS

If necessary, the essential oil complies with the prescribed limits for the following tests.

Freezing point (2.2.18)

Acid value (2.5.1)

Peroxide value (2.5.5)

Foreign esters (2.8.6)

Residue on evaporation (2.8.9)

Water (2.8.5)

Solubility in alcohol (2.8.10)

##### Falsification

If appropriate, a test for one or more falsifications may be carried out by thin-layer chromatography (2.2.27), by gas

Figure 2098.-1. – Chromatogram for the test for chromatographic profile of essential oils

chromatography (2.2.28) using a chiral column if necessary, or by any other suitable method.

#### Chromatographic profile

Gas chromatography (2.2.28): use the normalisation procedure.

In addition to the system suitability test given in the specific monograph, it is necessary to check the suitability of the chromatographic system using the following test, which is to be carried out periodically within the framework of performance qualification.

The chromatogram shown in Figure 2098.-1 is given as an example.

**Reference solution** essential oil CRS. If necessary, the reference solution can be diluted with heptane R.

#### Column:

- material: fused silica;
- size:  $l = 60$  m,  $\varnothing = 0.25$  mm;
- stationary phase: macrogol 20 000 R (0.25  $\mu$ m).

**Carrier gas** helium for chromatography R.

**Flow rate** 1.5 mL/min.

**Split ratio** 1:500. The split ratio/injection volume can be adjusted in order to fit the specific equipment used, provided that the column load stays the same.

#### Temperature:

	Time (min)	Temperature (°C)
Column	0 - 15	70
	15 - 100	70 → 240
	100 - 105	240
Injection port		250
Detector		270

**Detection** Flame ionisation.

**Injection** 1  $\mu$ L.

**Identification of components** Use the chromatogram supplied with essential oil CRS.

**System suitability** Reference solution:

- resolution: minimum 1.5 between the peaks due to linalol and linalyl acetate;
- signal-to-noise ratio: minimum 100 for the peak due to decanal;
- limits: the percentage content of each of the 9 components is within the limits stated on the leaflet provided with essential oil CRS.

#### STORAGE

In a well-filled, airtight container, protected from light.

**LABELLING**

The label states:

- the scientific name of the plant raw material used;
- where applicable, the type and/or the chemotype of the essential oil;
- where applicable, the method of production;
- where applicable, the name and concentration of any added antioxidant;
- where applicable, additional processing steps that are not specified under Definition.

Ph Eur

**Herbal Drug Extracts**

Extracts

(Ph. Eur. monograph 0765)

*Herbal Drug Extracts comply with the requirements of the European Pharmacopoeia. These requirements are reproduced below.*

Ph Eur

**DEFINITION**

Herbal drug extracts are liquid (liquid extraction preparations), semi-solid (soft extracts and oleoresins) or solid (dry extracts) preparations obtained from *Herbal drugs (1433)* using suitable solvents.

An extract is essentially defined by the quality of the herbal drug, by its production process (extraction solvent(s), method of processing, etc.) and by its specifications.

European Pharmacopoeia monographs for extracts cover the genuine (native) extract and, where present, excipients.

Different types of extract may be distinguished.

**Standardised extracts**

Are adjusted to a defined content of one or more constituents with known therapeutic activity. This is achieved by adjustment of the extract with inert excipients or by blending batches of the extract.

**Quantified extracts**

Are adjusted to one or more active markers, the content of which is controlled within a limited, specified range.

Adjustments are made by blending batches of the extract.

**Other extracts**

Are not adjusted to a particular content of constituents.

For control purposes, one or more constituents are used as analytical markers. The minimum content for these analytical markers is given in an individual monograph.

**PRODUCTION**

Herbal drugs, solvents and other materials used for the preparation of extracts are of suitable quality and where applicable comply with the requirements of any relevant monograph in the European Pharmacopoeia. Where justified, herbal drugs used for the production of extracts may exceed the limits for heavy metals specified in the monograph *Herbal drugs (1433)* provided that the resulting extract satisfies the requirements for heavy metals (see Tests).

Different batches of the herbal drug which are compliant with the relevant monograph, or in the absence of an individual monograph with other suitable specifications, may be combined prior to extraction, for example for the purpose of achieving the quantity of herbal drug required for the production process or, in the case of standardised and quantified extracts, to achieve a certain range of content for

one or more constituents in the herbal drug to be extracted. The herbal drug may also undergo a preliminary treatment, for example, grinding, inactivation of enzymes or defatting. In addition, unwanted constituents (e.g. toxic constituents) or unwanted matter (e.g. insoluble matter) may be removed at a suitable stage in the production process.

Where solvents are recovered from the production process, such recovered or recycled solvents may be used, provided that the recovery procedures are controlled and monitored to ensure that solvents meet appropriate standards before re-use or admixture with other approved materials. Water used for the production of extracts complies with the requirements of the monograph *Water for preparation of extracts (2249)*.

Where applicable, miscella (extraction liquors) are concentrated to the intended consistency using suitable methods, usually under reduced pressure and at a temperature at which deterioration of the constituents is reduced to a minimum. Essential oils that have been separated during processing may be restored to the extracts at an appropriate stage in the production process. Suitable excipients may be added at various stages of the production process for technological reasons (for example, as part of the drying process or to improve the homogeneity or consistency of an extract). For standardised extracts, suitable inert excipients may also be added to adjust one or more constituents to a defined content. For quantified extracts and 'other' extracts, the addition of inert excipients to adjust the content of assayed constituents is not permitted. Excipients are included for technological reasons only, and the manufacturer must declare the content of such excipients as a fixed percentage. In some applications, an excipient may be added in a narrow percentage range (e.g. silicon dioxide between 0.1-0.5 per cent, to improve flowability of the extract). The proposed range must be justified by the manufacturer. Suitable stabilisers, antioxidants and antimicrobial preservatives may be added to extracts where justified and authorised.

Extraction with a given solvent leads to a typical content of selected constituents in the extracted dry matter; during production of standardised and quantified extracts, purification procedures may be applied that increase the content of these selected constituents with respect to the expected values; such extracts are referred to as 'refined'.

**IDENTIFICATION**

Extracts are identified using suitable methods.

**TESTS**

Where applicable, as a result of analysis of the herbal drug used for production and in view of the production process, tests for microbiological quality (5.1.4 or 5.1.8), heavy metals (2.4.27), aflatoxins (2.8.18), ochratoxin A (2.8.22) and pesticide residues (2.8.13) in the extracts may be necessary. Where a test for heavy metals is carried out, the same limits for heavy metals as those given in the monograph *Herbal drugs (1433)* are applicable to extracts unless otherwise stated in an individual extract monograph or unless otherwise justified and authorised.

**ASSAY**

Extracts are assayed by a suitable method, unless otherwise justified.

**Standardised extracts**

The Definition section of an individual monograph on a standardised extract states the content of the assayed constituents as either a defined single content or within a defined range of content.

**Defined single content** For example, in the monograph *Ipecacuanha liquid extract, standardised (1875)*, the content of assayed constituents is stated as 1.80 per cent to 2.20 per cent. In this case, the declaration is based on a defined single content of 2.0 per cent with a tolerance of  $\pm 10$  per cent. The acceptable tolerance is usually within the range  $\pm 5$  per cent to  $\pm 10$  per cent taking into account the nature of the extract and the method of assay.

**Defined range of content** For example, in the monograph *Frangula bark dry extract, standardised (1214)*, the content of assayed constituents is stated as 15.0 per cent to 30.0 per cent. In this case, it is intended that an extract will consistently be produced to a defined single content selected from within the defined range taking into account an acceptable tolerance. Where there is an individual monograph in the pharmacopoeia for a standardised extract with a defined range of content, the acceptable tolerance will be stated in the individual monograph (for example, for *Frangula bark dry extract, standardised (1214)*, the acceptable tolerance is stated as  $\pm 10$  per cent relative to the declared content).

#### Quantified extracts

The content of assayed constituents must be within the values given in the Definition section of an individual monograph.

#### Other extracts

The content of assayed constituents must not be lower than the minimum value given in the Definition section of an individual monograph. Where justified and authorised, this does not preclude the selection of alternative constituents as a basis for assay using a corresponding validated analytical method, which may be more appropriate to the physical and/or chemical properties of the medicinal product into which the extract is to be incorporated. Where alternative constituents are selected for assay, a suitable minimum value for such constituents must be established.

#### LABELLING

The label states:

- the herbal drug used;
- where applicable, that fresh herbal drug has been used;
- the form of the extract (for example, liquid, tincture, soft, oleoresin or dry);
- where applicable, that the extract is standardised or quantified;
- for standardised extracts, the defined content of constituents with known therapeutic activity;
- for quantified extracts, the specified range of content of active markers;
- where applicable, that the extract is 'refined';
- the first solvent or solvents used for extraction (for example, ethanol 60 per cent *V/V*);
- the name and amount of any excipients present in the extract (for example, diluents, stabilisers, antimicrobial preservatives, antioxidants);
- for quantified extracts and 'other' extracts, the ratio of the quantity of herbal drug to the quantity of genuine (native) extract (*DER<sub>genuine</sub>*) expressed on a mass/mass basis for soft extracts, oleoresins and dry extracts, and on either a mass/mass or a mass/volume basis for liquid extraction preparations;
- where applicable, the percentage of dry residue;
- the storage conditions.

## LIQUID EXTRACTION PREPARATIONS - PRAEPARATIONES FLUIDAE AB EXTRACTIONE

Liquid extraction preparations are liquid preparations consisting of a diverse range of products which are described by their extraction solvents, methods of production and drug solvent ratios or drug extract ratios. Included in this range are products obtained using ethanol, water, glycerol, propylene glycol and fatty oils as extraction solvents. Liquid (fluid) extracts and tinctures belong to this category and are described below.

### LIQUID (FLUID) EXTRACTS - EXTRACTA FLUIDA DEFINITION

Quantified liquid (fluid) extracts and 'other' liquid (fluid) extracts are liquid extraction preparations of which, in general, 1 part by mass or volume is equivalent to 1 part by mass of the dried herbal drug.

Standardised liquid (fluid) extracts are only defined by their content of constituents with known therapeutic activity.

### PRODUCTION

Liquid extracts are prepared using ethanol of a suitable concentration and/or water together with, where necessary, other substances (e.g. glycerol or ammonia solution) to extract the herbal drug, or by dissolving a soft or dry extract of the herbal drug (which has been produced using the same extraction solvent as would be used to prepare the liquid extract by direct extraction) in either ethanol of the required concentration or water.

Where the liquid extract contains ethanol, it is tested for 2-propanol (2.9.11), with a maximum of 0.05 per cent *V/V*, unless assurance of compliance with this limit is provided by a detailed knowledge of the ethanol supply chain and the extract manufacturing process.

Except for standardised liquid extracts, liquid extracts produced from soft or dry extracts do not contain any excipients other than those that would be present in the liquid extract prepared by direct extraction. However, exceptions may be justified in certain cases such as when the soft extract used to produce the liquid extract contains stabilisers, antioxidants or antimicrobial preservatives that have been added to ensure its stability.

Liquid extracts are adjusted, if necessary, so that they satisfy the requirements for content of solvent. Liquid extracts may be filtered, if necessary.

A slight sediment may form on standing.

### TESTS

#### Relative density (2.2.5)

Where applicable, the liquid extract complies with the limits prescribed.

#### Ethanol (2.9.10)

For ethanolic liquid extracts, carry out the determination of ethanol content. The ethanol content complies with the limits prescribed.

#### Methanol (2.9.11)

Maximum 0.05 per cent *V/V* for ethanolic liquid extracts, unless otherwise prescribed or justified and authorised.

#### Dry residue (2.8.16)

Where applicable, the liquid extract complies with the limits prescribed.

### STORAGE

Protected from light.

**LABELLING**

The label states in addition to the requirements listed above, the ethanol content in per cent *V/V*, where applicable.

**TINCTURES – TINCTURAE****DEFINITION**

Quantified tinctures and 'other' tinctures are liquid extraction preparations that are obtained using either 1 part by mass of herbal drug and 10 parts by mass or volume of extraction solvent, or 1 part by mass of herbal drug and 5 parts by mass or volume of extraction solvent. Alternatively, they may be obtained using either 1 part by mass of herbal drug and sufficient extraction solvent to produce 10 parts by mass or volume of tincture or 1 part by mass of herbal drug and sufficient extraction solvent to produce 5 parts by mass or volume of tincture. Other ratios of herbal drug to extraction solvent may be used.

Standardised tinctures are only defined by their content of constituents with known therapeutic activity.

**PRODUCTION**

Tinctures are usually prepared by either maceration or percolation, using ethanol of a suitable concentration to extract the herbal drug, or by dissolving a soft or dry extract of the herbal drug (which has been produced using the same extraction solvent as would be used to prepare the tincture by direct extraction) in ethanol of the required concentration.

The tincture is tested for 2-propanol (2.9.11), with a maximum of 0.05 per cent *V/V*, unless assurance of compliance with this limit is provided by a detailed knowledge of the ethanol supply chain and the tincture manufacturing process.

Except for standardised tinctures, tinctures produced from soft or dry extracts do not contain any excipients other than those that would be present in the tincture prepared by direct extraction. However, exceptions may be justified in certain cases such as when the soft extract used to produce the tincture contains stabilisers, antioxidants or antimicrobial preservatives that have been added to ensure its stability.

Tinctures are adjusted, if necessary so that they satisfy the requirements for content of solvent. Tinctures may be filtered if necessary.

Tinctures are usually clear. A slight sediment may form on standing.

**TESTS****Relative density (2.2.5)**

Where applicable, the tincture complies with the limits prescribed.

**Ethanol (2.9.10)**

The ethanol content complies with the limits prescribed.

**Methanol (2.9.11)**

Maximum 0.05 per cent *V/V*, unless otherwise prescribed or justified and authorised.

**Dry residue (2.8.16)**

Where applicable, the tincture complies with the limits prescribed.

**STORAGE**

Protected from light.

**LABELLING**

The label states, in addition to the requirements listed above, the ethanol content in per cent *V/V*.

**SOFT EXTRACTS – EXTRACTA SPISSA****DEFINITION**

Soft extracts are semi-solid preparations obtained by evaporation or partial evaporation of the solvent used for production.

**TESTS****Dry residue (2.8.16)**

The soft extract complies with the limits prescribed.

**Solvents**

Residual solvents are controlled as described in chapter 5.4, unless otherwise prescribed or justified and authorised.

**STORAGE**

In an airtight container, protected from light.

**OLEORESINS – OLEORESINA****DEFINITION**

Oleoresins are semi-solid extracts composed of a resin in solution in an essential and/or fatty oil and are obtained by evaporation of the solvent(s) used for their production.

This monograph applies to oleoresins produced by extraction and not to natural oleoresins.

**TESTS****Water (2.2.13)**

The oleoresin complies with the limits prescribed.

**Solvents**

Residual solvents are controlled as described in chapter 5.4, unless otherwise prescribed or justified and authorised.

**STORAGE**

In an airtight container, protected from light.

**DRY EXTRACTS – EXTRACTA SICCA****DEFINITION**

Dry extracts are solid preparations obtained by evaporation of the solvent used for their production.

Dry extracts usually have a loss on drying of not greater than 5 per cent *m/m*. Where justified and authorised, a loss on drying with a different limit or a test for water may be prescribed.

**TESTS****Loss on drying (2.8.17)**

Where applicable, the dry extract complies with the limits prescribed.

**Water (2.5.12)**

Where a test for loss on drying is not applicable, the dry extract complies with the limits prescribed.

**Solvents**

Residual solvents are controlled as described in chapter 5.4, unless otherwise prescribed or justified and authorised.

**STORAGE**

In an airtight container, protected from light.

**GLOSSARY - GLOSSA****Constituents with known therapeutic activity**

Chemically defined substances or groups of substances which are generally accepted to contribute substantially to the therapeutic activity of a herbal drug, a herbal drug preparation or a herbal medicinal product.

**Drug extract ratio (DER)**

The ratio between the quantity of herbal drug used in the manufacture of an extract and the quantity of extract obtained. The number (given as the actual range) written before the colon is the relative quantity of the herbal drug; the number written after the colon is the relative quantity of the extract obtained. Two DERs can be differentiated:

— **Genuine (native) drug extract ratio ( $DER_{genuine}$ ).**

The ratio between the quantity of herbal drug used in the manufacture of an extract and the quantity of genuine (native) extract obtained.

— **Total drug extract ratio ( $DER_{total}$ ).** The ratio between the quantity of herbal drug used in the manufacture of an extract and the quantity of whole extract (including excipients) obtained.

For example,  $DER_{genuine}$  2.5-4.5:1 means that between 2.5 and 4.5 parts of herbal drug are required to produce 1 part of genuine (native) extract. Where processing aids are added to the genuine (native) extract to produce, for example, a dry extract, the  $DER_{total}$  and the  $DER_{genuine}$  will have different values; where a dry extract is produced without the need for any processing aids, the  $DER_{total}$  and the  $DER_{genuine}$  will be identical. Oleoresins are usually produced without the need to include processing aids, therefore the  $DER_{total}$  and the  $DER_{genuine}$  are usually identical. For soft extracts and liquid extraction preparations, where the genuine (native) extract does not exist without excipients and/or processing aids (e.g. usually 20-30 per cent of water in soft extracts, ethanolic extraction solvent in tinctures), the  $DER_{total}$  and the  $DER_{genuine}$  are identical.

**Drug solvent ratio (DSR)**

The ratio between the quantity of herbal drug, expressed in mass, used in the manufacture of an extract and the quantity of the first extraction solvent, expressed in mass or volume.

**Extraction solvents**

Solvents which are used for the extraction process.

**Genuine (native) herbal drug extract**

Refers to the extract without excipients, even if for technological reasons the genuine extract is not available. However, for soft extracts and liquid extraction preparations the genuine extract may contain variable amounts of (extraction) solvent.

**Markers**

Chemically defined constituents or groups of constituents of a herbal drug, a herbal drug preparation or a herbal medicinal product which are of interest for control purposes independent of whether they have any therapeutic activity. Markers serve to calculate the quantity of herbal drug(s) or herbal drug preparation(s) in the herbal medicinal product if the marker has been quantitatively determined in the herbal drug or herbal drug preparation.

There are 2 categories of markers:

- *active markers* are constituents or groups of constituents which are generally accepted to contribute to the therapeutic activity;
- *analytical markers* are constituents or groups of constituents that serve solely for analytical purposes, irrespective of any pharmacological or therapeutic activity which they may be reported to possess.

**Miscella (extraction liquor)**

Liquid obtained from the extraction process.

**Production of tinctures by maceration**

A process whereby, unless otherwise prescribed, the herbal drug to be extracted is reduced to pieces of suitable size,

mixed thoroughly with the prescribed extraction solvent and allowed to stand in a closed container for an appropriate time, with agitation where required. The residue is separated from the extraction solvent and, if necessary, pressed out. If the residue is pressed, the 2 liquids are combined.

**Production of tinctures by percolation**

A process whereby, unless otherwise prescribed, the herbal drug to be extracted is reduced to pieces of suitable size and mixed thoroughly with a portion of the prescribed extraction solvent and allowed to stand for an appropriate time. The mixture is transferred to a percolator and more extraction solvent is added until the herbal drug is covered with a layer of extraction solvent. The percolate is allowed to flow slowly from the base of the percolator while extraction solvent is slowly added to the top of the percolator, ensuring that the herbal drug to be extracted is constantly covered with extraction solvent, until all the extraction solvent has been added. Percolation continues until the percolate is recovered. If the residue is pressed, the 2 liquids are combined.

Ph Eur

**Tinctures of the British Pharmacopoeia**

*In addition to the requirements for Tinctures of the European Pharmacopoeia (stated under Extracts), the following statements apply to those tinctures that are the subject of an individual monograph in the British Pharmacopoeia.*

**DEFINITION**

Certain preparations of the British Pharmacopoeia entitled Tinctures do not conform strictly to the definition of the European Pharmacopoeia and consequently application of some of the above requirements is inappropriate. Any necessary exceptions are stated in the relevant individual monographs.

**Herbal Teas**

(Ph. Eur. monograph 1435)

*Herbal Teas comply with the requirements of the European Pharmacopoeia. These requirements are reproduced below.*

Ph Eur

**DEFINITION**

Herbal teas consist exclusively of one or more herbal drugs intended for oral aqueous preparations by means of decoction, infusion or maceration. The preparation is prepared immediately before use.

Herbal teas are usually supplied in bulk form or in bags for single use.

The herbal drugs used comply with the appropriate individual European Pharmacopoeia monographs or in their absence with the general monograph *Herbal drugs (1433)*.

**IDENTIFICATION**

The identity of herbal drugs present in herbal teas is checked by suitable methods such as botanical examinations and/or chromatographic profiles.

**TESTS**

Recommendations on the microbiological quality of herbal teas (5.1.8) take into account the prescribed preparation method (use of boiling or non-boiling water).

The proportion of herbal drugs present in herbal teas is checked by appropriate methods.

Herbal teas in bags comply with the following test:

**Uniformity of mass**

Determine the individual and the average mass of the contents of 20 randomly chosen units as follows: weigh a single full bag of herbal tea, open it without losing any fragments. Empty it completely using a brush. Weigh the empty bag and calculate the mass of the contents by subtraction. Repeat the operation on the 19 remaining bags and calculate the average mass of the contents of the 20 units. Unless otherwise justified, not more than 2 of the 20 individual masses deviate from the average mass by more than the percentage deviation shown in the table below and none deviates by more than twice that percentage.

Average mass	Percentage deviation
less than 1.5 g	15 per cent
1.5 g to 2.0 g included	10 per cent
more than 2.0 g	7.5 per cent

**STORAGE**

Protected from light.

Ph Eur

**Instant Herbal Teas**

(Ph. Eur. monograph 2620)

Ph Eur

**DEFINITION**

Instant herbal teas consist of 1 or more herbal drug preparations (primarily extracts with or without added essential oils), and are intended for the preparation of an oral solution immediately before use.

Instant herbal teas may also contain, in addition to herbal drug preparations, suitable excipients such as maltodextrin and added flavourings.

Instant herbal teas are presented as a powder or granules and are usually supplied in bulk form or in sachets.

The herbal drug preparations used comply with the appropriate individual European Pharmacopoeia monographs or, in the absence of such individual monographs, with the general monograph *Herbal drug preparations (1434)* and with other appropriate general monographs, for example *Herbal drug extracts (0765)* or *Essential oils (2098)*.

**IDENTIFICATION**

The identity of herbal drug preparations present in instant herbal teas is checked by suitable methods.

**TESTS**

General chapter 5.1.8 contains recommendations on the microbiological quality of extract-containing herbal medicinal products such as instant herbal teas.

The proportion of herbal drug preparations present in instant herbal teas is checked by suitable methods.

Instant herbal teas in sachets comply with the following test.

**Uniformity of mass**

Determine the individual and the average mass of the contents of 20 randomly chosen units as follows: weigh a single full sachet of instant herbal tea, open it without losing any fragments. Empty it completely using a brush. Weigh the empty sachet and calculate the mass of the contents by subtraction. Repeat the operation on the 19 remaining sachets and calculate the average mass of the contents of the 20 units. Unless otherwise justified, not more than 2 of the individual masses deviate from the average mass by more than the percentage deviation shown in the table below and none deviates by more than twice that percentage.

Average mass	Percentage deviation
less than 1.5 g	15 per cent
1.5 g to 2.0 g included	10 per cent
more than 2.0 g	7.5 per cent

**STORAGE**

Protected from light.

Ph Eur

**Abelmoschus Flower**

(*Abelmoschi Corolla*, Ph. Eur. monograph 2827)

Ph Eur

**DEFINITION**

Dried corolla of *Abelmoschus manihot* (L.) Medik.

**Content**

Minimum 1.0 per cent of hibifolin (C<sub>21</sub>H<sub>18</sub>O<sub>14</sub>; M<sub>r</sub> 494.4) (dried drug).

**IDENTIFICATION**

A. The corolla is often crumpled and fragmented, and when whole, consists of 5 petals slightly fused at their base. Each petal is triangular and broadly obovate, with slightly sinuous margins, about 7-20 cm long and 7-12 cm wide. They are yellow or pale yellow, with a dark violet or brown unguis at the base. The outer surface shows numerous pale green radial longitudinal striations, and stamens united by their filaments into a tube about 1.5-2.5 cm long bearing numerous sessile anthers. At the centre of the stamen tube is the style, ending in a dark violet or black stigma, with 5 lobes rolled outwards.

B. Microscopic examination (2.8.23). The powder is yellow or yellowish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2827.-1): fragments of the epidermis of the distal part of the corolla (surface view [B], transverse section [F]) with papillose cells [Ba, Fa] and long glandular trichomes, up to 800 µm long, with a stalk composed of 1 [Bc] to 4 cells [H] and a multicellular head whose diameter does not exceed that of the stalk, composed of cells with slightly granular contents [Bb]; epidermal cells surrounding each glandular trichome that are not papillose [Bd]; fragments of the epidermis of the base of the corolla [A], often pink or violet, with elongated epidermal cells [Aa], unicellular covering trichomes either isolated [Ab] or paired [Ac], up to 200 µm long, and glandular trichomes with a club-shaped secretory head [E]; fragments of the characteristic layer of the pollen sac of the anthers with polyhedral cells, whose walls show thickened parallel striations [G], accompanied by oil droplets [Ga]; spherical

pollen grains [D] with finely pitted walls, exceeding 100  $\mu\text{m}$  in diameter, spiny and with numerous germinal pores [Da]; numerous annular or spiral vascular bundles [C]; fragments of parenchyma consisting of polyhedral cells, some of which contain cluster crystals of calcium oxalate about 20  $\mu\text{m}$  in diameter [J].

Figure 2827.-1. – Illustration for identification test B of powdered herbal drug of *abelmoschi* corolla

### C. High-performance thin-layer chromatography (2.8.25).

Prepare the solutions immediately before use.

**Test solution** To 0.25 g of the powdered herbal drug (1000) (2.9.12) add 10 mL of a mixture of 4 volumes of water R and 6 volumes of acetonitrile R, and sonicate for 15 min. Centrifuge the solution for 15 min and filter the supernatant through a membrane filter (nominal pore size 0.45  $\mu\text{m}$ ).

**Reference solution (a)** Dissolve 4.0 mg of rutoside trihydrate R and 5.0 mg of hibifolin R in methanol R and dilute to 5.0 mL with the same solvent.

**Reference solution (b)** Dilute 2.5 mL of reference solution (a) to 10.0 mL with methanol R.

**Reference solution (c)** Dissolve 2.5 mg of hibifolin R and 2.5 mg of hyperoside R in methanol R and dilute to 5 mL with the same solvent.

**Intensity marker** Hibifolin.

**Plate** TLC silica gel F<sub>254</sub> plate R (2–10  $\mu\text{m}$ ) [or TLC silica gel F<sub>254</sub> plate R (5–40  $\mu\text{m}$ )].

**Mobile phase** anhydrous formic acid R, acetic acid R, water R, ethyl acetate R (11:11:27:100 V/V/V/V).

**Application** 3  $\mu\text{L}$  as bands of 8 mm.

**Development** 70 mm from the lower edge of the plate (or 120 mm).

**Drying** In air.

**Detection** Heat at 100–105 °C for 3–4 min; spray the warm plate with a 10 g/L solution of diphenylboric acid aminoethyl ester R in methanol R and then with a 50 g/L solution of macrogol 400 R in methanol R; allow to dry in air and examine in ultraviolet light at 366 nm.

**System suitability** Reference solution (c):

— the chromatogram shows 2 distinct zones in the middle third; both the lower zone (hibifolin) and the upper zone (hyperoside) show a yellow fluorescence.

**Results** See below the sequence of fluorescent zones present in the chromatograms obtained with reference solution (a) and the test solution. Furthermore, in the chromatogram obtained with the test solution, other faint fluorescent zones may be present.

Top of the plate	
	A blue zone, equivalent
	A yellow zone, equivalent
	A yellow zone, equivalent (hyperoside)
Hibifolin: a yellow zone	A yellow zone, equivalent (hibifolin)
Rutoside: a yellow zone	A yellowish zone, faint (rutoside)
	A yellowish zone, very faint
	A blue zone, equivalent
Reference solution (a)	Test solution

### TESTS

#### Loss on drying (2.2.32)

Maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (1000) (2.9.12) by drying in an oven at 105 °C for 4 h.

#### Total ash (2.4.16)

Maximum 8 per cent.

### ASSAY

Liquid chromatography (2.2.29). Prepare the solutions immediately before use.

**Solvent mixture A** water R, acetonitrile R (40:60 V/V).

**Solvent mixture B** acetonitrile R, water R (10:90 V/V).

**Test solution** Reduce the herbal drug to a powder (1000) (2.9.12) using a refrigerated blade grinder. To 0.500 g add 20 mL of solvent mixture A and homogenise using a shaker. Sonicate for 30 min. Centrifuge for 15 min and transfer the supernatant to a 50 mL volumetric flask. Change the water in the ultrasonic bath every 30 min to prevent heating and repeat the extraction twice, adding to the residue 15 mL of solvent mixture A. Combine the supernatants, cool, and

dilute to 50.0 mL with solvent mixture A. Dilute 2.0 mL of the solution to 5.0 mL with solvent mixture B. Filter through a membrane filter (nominal pore size 0.45 µm).

**Reference solution (a)** Dissolve 6.0 mg of *hibifolin CRS* in solvent mixture A and dilute to 10.0 mL with solvent mixture A.

**Reference solution (b)** Dissolve 2.5 mg of *quercitrin R* in solvent mixture A and dilute to 5 mL with solvent mixture A.

**Reference solution (c)** Mix 0.4 mL of reference solution (b) and 0.5 mL of reference solution (a), and dilute to 5 mL with solvent mixture B.

**Reference solution (d)** Dilute 0.70 mL of reference solution (a) to 5.0 mL with solvent mixture B.

**Column:**

— *size:*  $l = 0.25$  m,  $\varnothing = 4.6$  mm;

— *stationary phase:* phenylsilyl silica gel for chromatography R (5 µm);

— *temperature:* 40 °C.

**Mobile phase:**

— *mobile phase A:* acetonitrile R, 0.07 per cent *V/V* solution of phosphoric acid R (5:95 *V/V*);

— *mobile phase B:* 0.07 per cent *V/V* solution of phosphoric acid R, acetonitrile R (5:95 *V/V*);

Time (min)	Mobile phase A (per cent <i>V/V</i> )	Mobile phase B (per cent <i>V/V</i> )
0 - 10	89	11
10 - 15	89 → 87	11 → 13
15 - 25	87 → 75	13 → 25
25 - 30	75 → 60	25 → 40
30 - 33	60	40

**Flow rate** 1.0 mL/min.

**Detection** Spectrophotometer at 360 nm.

**Autosampler** Set at 10 °C.

**Injection** 10 µL of the test solution and reference solutions (c) and (d).

**Retention time** Hibifolin = about 22 min; quercitrin = about 23 min.

**System suitability** Reference solution (c):

— *resolution:* minimum 2.5 between the peaks due to hibifolin and quercitrin.

Calculate the percentage content of hibifolin using the following expression:

$$\frac{A_1 \times m_2 \times p \times 1.75}{A_2 \times m_1}$$

- $A_1$  = area of the peak due to hibifolin in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to hibifolin in the chromatogram obtained with reference solution (d);
- $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;
- $m_2$  = mass of *hibifolin CRS* used to prepare reference solution (a), in grams;
- $p$  = percentage content of hibifolin in *hibifolin CRS*.

Ph Eur

## Acanthopanax Bark

(Ph. Eur. monograph 2432)

Ph Eur

### DEFINITION

Dried root bark of *Eleutherococcus nodiflorus* (Dunn) S.Y.Hu (syn. *Acanthopanax gracilistylus* W.W.Sm.) collected in summer and autumn.

### IDENTIFICATION

**A.** The bark occurs in irregular quills, 5-15 cm long, 0.4-1.4 cm in diameter, about 2 mm thick. The outer surface is greyish-brown, with slightly twisted longitudinal wrinkles and transverse lenticel-like scars. The inner surface is pale yellow or greyish-yellow, with fine longitudinal striations. The texture is light, fragile, easily broken. The fracture is irregular, greyish-white.

Figure 2432.-1. – Illustration for identification test B of powdered herbal drug of acanthopanax bark

**B.** Microscopic examination (2.8.23). The powder is greyish-white. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2432.-1): cluster crystals of calcium oxalate, 8-64 µm in diameter, free [F] or included in parenchyma cells [A, Ea, Ha] sometimes forming crystal sheaths [J]; cork cells, rectangular or polygonal, thin-walled (surface view [B], transverse section [E]), sometimes walls of cork cells of older barks unevenly thickened, slightly pitted [K]; fragments of secretory canals [H] consisting of thin-walled cells [Hb] containing colourless or pale yellow secretions; phloem fibres, free [C] or in bundles of 2-4 fibres [D] present in older barks. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows numerous starch granules, simple,

polygonal or subspherical, 2-8 µm in diameter, or 2-10 compound, free or included in cells [G].

C. Examine the chromatogram obtained in the test for *Periploca sepium*.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Thymol: an orange zone	A broad pink zone
Borneol: a brown zone	
Reference solution	Test solution

### TESTS

#### *Periploca sepium*

Thin-layer chromatography (2.2.27).

**Test solution** To 0.3 g of the powdered herbal drug (355) (2.9.12) add 3 mL of *methanol R*, heat in a water-bath at 60 °C for 1 min and filter.

**Reference solution** Dissolve 5 mg of *thymol R* and 8 mg of *borneol R* in 5 mL of *methanol R*.

**Plate** TLC silica gel plate R (5-40 µm) [or TLC silica gel plate R (2-10 µm)].

**Mobile phase** ethyl acetate R, methylene chloride R (2:98 V/V).

**Application** 20 µL [or 1 µL] as bands of 10 mm [or 8 mm].

**Development** Over a path of 10 cm [or 6 cm].

**Drying** In air.

**Detection** Treat with *anisaldehyde solution R*, heat at 105 °C for 5 min and examine in daylight.

**Results** The chromatogram obtained with the test solution shows no intense coloured zones above the zone due to borneol in the chromatogram obtained with the reference solution.

#### *Acanthopanax giraldii*

The presence of scaly covering trichomes on the outer surface of the root bark indicates adulteration by *Acanthopanax giraldii*.

#### Loss on drying (2.2.32)

Maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

#### Total ash (2.4.16)

Maximum 12.0 per cent.

#### Ash insoluble in hydrochloric acid (2.8.1)

Maximum 2.0 per cent.

#### Extractable matter

Minimum 16.0 per cent.

To 2.00 g of the powdered herbal drug (250) (2.9.12) add a mixture of 8 g of *water R* and 12 g of *ethanol (96 per cent) R* and allow to macerate for 2 h, shaking frequently. Filter, evaporate the filtrate to dryness on a water-bath *in vacuo* and dry in an oven at 100-105 °C for 2 h. The residue weighs a minimum of 320 mg.

Ph Eur

## *Achyranthes Bidentata* Root

(Ph. Eur. monograph 2999)

Ph Eur

### DEFINITION

Whole or fragmented, dried principal root of *Achyranthes bidentata* Blume with secondary roots removed.

### Content

Minimum 0.1 per cent of total sterones, expressed as β-ecdysterone (C<sub>27</sub>H<sub>44</sub>O<sub>7</sub>; M<sub>r</sub> 480.6) (dried drug).

### IDENTIFICATION

**A. Whole drug.** The whole root is slender, cylindrical, straight or slightly curved, 13-90 cm long and 4-10 mm in diameter. The outer surface is greyish-yellow to greyish-brown or pale brown to pale yellowish-brown with fine longitudinal wrinkles, slightly twisted; transverse lenticels and sparse protruding rootlet scars are present. The root is easily broken and has a hard, fragile texture. The fracture is pale yellowish-brown, slightly horny. Numerous small vascular bundles appear as dots arranged in 2-4 whorls surrounding 2-3 larger central bundles; the xylem vessels are yellowish-white.

**Fragmented drug** The fragmented drug occurs as short cylindrical pieces or as oblique slices, 3-10 mm in diameter. The outer surface is greyish-yellow to greyish-brown or pale brown to pale yellowish-brown with fine longitudinal wrinkles, slightly twisted; transverse lenticels and sparse protruding rootlet scars may be visible. The texture is hard. The cut surface is pale yellowish-brown, yellowish-brown or brown, slightly horny. Numerous small vascular bundles appear as dots arranged in 2-4 whorls surrounding 2-3 larger central bundles; the xylem vessels are yellowish-white.

**B. Microscopic examination (2.8.23).** The powder is pale brown or whitish-grey. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2999.-1): numerous fragments of parenchyma [B, E] consisting of thin-walled, rounded, ovoid or subrectangular cells, some of which contain triangular, pointed, subsquare or irregularly shaped sandy calcium oxalate microcrystals [Ba, Ea]; bundles of vessels [C, F], reticulate [Fa] or bordered pitted (8-93 µm in diameter) [Ca, Fb], sometimes accompanied by fibres [Cb], with slightly thickened walls and sparse, oblique-slit-shaped, cross-shaped or V-shaped pits; numerous fragments of isolated vessels [H]; cork fragments with more or less square, rectangular, rounded or polygonal cells (surface view [A]); the cork layers (transverse section [G]) are superimposed and associated with the 1<sup>st</sup> layers of parenchyma [Ga]; numerous scattered microcrystals of calcium oxalate [D], clearly visible in polarised light.

**C. High-performance thin-layer chromatography (2.8.25).**

**Test solution** To 1.0 g of the powdered herbal drug (355) (2.9.12) add 5 mL of a mixture of 2 volumes of *water R* and 8 volumes of *methanol R*. Sonicate for 30 min and centrifuge. Take up the residue with 8 mL of *water R*. Sonicate for 1 min (or shake for 1 min), centrifuge and combine the supernatants. Condition a solid phase extraction (SPE) column containing 0.200 g of *octadecylsilyl silica gel for chromatography R* with 5 mL of *methanol R* and then with 3 mL of *water R* at a rate of 1 drop per second, ensuring that the column does not dry out. Transfer the solution to the SPE column. Allow to drain, ensuring that the column does not dry out, and discard the eluate. Wash the column with 2 mL of *water R*. Elute the column using 1 mL of *methanol R*. Collect the eluate.

Figure 2999-1. – Illustration for identification test B of powdered herbal drug of *Achyranthes bidentata* root

**Reference solution (a)** Dissolve 1.0 mg of  $\beta$ -ecdysterone R and 1.0 mg of ginsenoside Ro R in methanol R and dilute to 2.0 mL with the same solvent.

**Reference solution (b)** Mix 1.0 mL of reference solution (a) and 3.0 mL of methanol R.

**Reference solution (c)** Dissolve 1 mg of  $\beta$ -ecdysterone R and 1 mg of cyasterone R in methanol R and dilute to 2 mL with the same solvent.

**Intensity marker**  $\beta$ -ecdysterone.

**Plate** TLC silica gel F<sub>254</sub> plate R (2–10  $\mu$ m).

**Mobile phase** anhydrous formic acid R, water R, methanol R, methylene chloride R (1:1:5:14 V/V/V/V).

**Application** 3  $\mu$ L as bands of 8 mm.

**Development** 70 mm from the lower edge of the plate.

**Drying** In a current of cold air for 5 min.

**Detection** Treat with a 100 g/L solution of sulfuric acid R in ethanol (96 per cent) R and heat at 100 °C for 5 min; examine in ultraviolet light at 366 nm.

**System suitability** Reference solution (c):

- the chromatogram shows in the upper third 2 distinct zones, which may be touching; the lower zone ( $\beta$ -ecdysterone) shows a blue fluorescence and the upper zone (cyasterone) shows a bright blue fluorescence.

**Results** See below the sequence of zones present in the chromatograms obtained with reference solution (a) and the test solution. Furthermore, in the chromatogram obtained with the test solution, other faint fluorescent zones may be present.

Top of the plate

## TESTS

### Loss on drying (2.2.32)

Maximum 15.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

### Total ash (2.4.16)

Maximum 9.0 per cent.

### Ash insoluble in hydrochloric acid (2.8.1)

Maximum 1.5 per cent.

## ASSAY

Liquid chromatography (2.2.29).

**Solvent mixture** water R, methanol R (20:80 V/V).

**Test solution** To 1.0 g of the powdered herbal drug (355) (2.9.12) add 45 mL of the solvent mixture and 5 mL of butanol R saturated with water R. Sonicate for 30 min and filter. Evaporate the filtrate to dryness under reduced pressure. Dissolve the residue in the solvent mixture and dilute to 10.0 mL with the solvent mixture. Filter through a membrane filter (nominal pore size 0.45  $\mu$ m).

**Reference solution (a)** Dissolve 6.0 mg of  $\beta$ -ecdysterone CRS in the solvent mixture and dilute to 25.0 mL with the solvent mixture. Dilute 2.0 mL of the solution to 5.0 mL with the solvent mixture.

**Reference solution (b)** To 5 mg of *Achyranthes bidentata* root dry extract for system suitability HRS add 5 mL of the solvent mixture. Sonicate for 10 min and shake well. Filter through a membrane filter (nominal pore size 0.45  $\mu$ m).

**Column:**

- size:  $l = 0.15$  m,  $\varnothing = 4.6$  mm;
- stationary phase: solid core octadecylsilyl silica gel for chromatography R (2.7  $\mu$ m);
- temperature: 35 °C.

**Mobile phase:**

- mobile phase A: water for chromatography R;
- mobile phase B: acetonitrile for chromatography R;

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 3	85	15
3 - 18	85 → 81	15 → 19

Flow rate 0.8 mL/min.

Detection Spectrophotometer at 248 nm.

Injection 10 µL.

**Identification of peaks** Use the chromatogram supplied with *Achyranthes bidentata* root dry extract for system suitability HRS and the chromatogram obtained with reference solution (b) to identify the peaks due to sterones 2 and 3 and peak 4; use the chromatogram obtained with reference solution (a) to identify the peak due to β-ecdysterone (sterone 1).

**Relative retention** With reference to β-ecdysterone (retention time = about 12.5 min): peak 4 = about 1.04; sterone 2 = about 1.11; sterone 3 = about 1.19.

**System suitability** Reference solution (b):

— resolution: minimum 1.5 between the peaks due to β-ecdysterone and peak 4.

Calculate the percentage content of total sterones expressed as β-ecdysterone using the following expression:

$$\frac{A_1 \times m_2 \times 4 \times p}{A_2 \times m_1 \times 25}$$

- $A_1$  = sum of the peak areas due to sterones 2 and 3 and β-ecdysterone in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to β-ecdysterone in the chromatogram obtained with reference solution (a);
- $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;
- $m_2$  = mass of β-ecdysterone CRS used to prepare reference solution (a), in grams;
- $p$  = percentage content of β-ecdysterone in β-ecdysterone CRS.

Ph Eur

## Agnus Castus Fruit

(Ph. Eur. monograph 2147)

### Preparation

Agnus Castus Fruit Dry Extract

Ph Eur

### DEFINITION

Whole, ripe, dried fruit of *Vitex agnus-castus* L.

### Content

Minimum 0.08 per cent of casticin (C<sub>19</sub>H<sub>18</sub>O<sub>8</sub>; M<sub>r</sub> 374.3) (dried drug).

### IDENTIFICATION

A. *Agnus castus* fruit is oval or almost globular, with a diameter of up to 5 mm. The persistent calyx is greenish-grey, finely pubescent, ends in 4-5 short teeth and envelops 2/3 to 3/4 of the surface of the fruit. The blackish-brown fruit consists of a pericarp that becomes progressively sclerous up to the endocarp. The style scar is often visible. Some of the fruits may retain a stalk, about 1 mm long. A transverse section of the fruit shows 4 locules, each containing an elongated seed.

B. Microscopic examination (2.8.23). Examine under a microscope using chloral hydrate solution R. The powder shows the following diagnostic characters: fragments of the outer epidermis of the calyx composed of polygonal cells

densely covered with short, bent or undulate, uni-, bi- or tri-cellular uniseriate covering trichomes; cells of the epicarp with thick walls and well-marked, large pits; isolated glandular trichomes with a unicellular stalk and a uni- or multi-cellular head; layers of parenchyma from the outer part of the mesocarp, some containing brown pigment, others extending into septa; fragments from the inner part of the mesocarp composed of thin-walled, pitted, sclerenchymatous cells and of typical isodiametric sclerous cells with very thick, deeply grooved walls and a narrow, stellate lumen; small brown cells of the endocarp; fragments of the testa containing areas of fairly large, thin-walled lignified cells with reticulate bands of thickening; numerous fragments of the endosperm composed of thin-walled parenchymatous cells containing aleurone grains and oil droplets.

C. Thin-layer chromatography (2.2.27).

**Test solution** To 1.0 g of the powdered herbal drug (355) (2.9.12) add 10 mL of methanol R. Heat in a water-bath at 60 °C for 10 min. Allow to cool and filter.

**Reference solution** Dissolve 0.5 mg of aucubin R and 1 mg of agnuside R in methanol R and dilute to 1.0 mL with the same solvent.

**Plate** TLC silica gel F<sub>254</sub> plate R (5-40 µm) [or TLC silica gel F<sub>254</sub> plate R (2-10 µm)].

**Mobile phase** water R, methanol R, ethyl acetate R (8:15:77 V/V/V).

**Application** 10 µL [or 8 µL] as bands of 10 mm [or 8 mm].

**Development** Over a path of 8 cm [or 5 cm].

**Drying** In air.

**Detection** Treat with anhydrous formic acid R and heat at 120 °C for 10 min; examine in daylight.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Agnuside: a blue zone	A blue zone (agnuside)
Aucubin: a blue zone	A blue zone (aucubin)
Reference solution	Test solution

### TESTS

**Foreign matter** (2.8.2)

Maximum 3.0 per cent.

**Other species of *Vitex*, in particular *Vitex negundo* L.** No fruit of other species with a much greater diameter is present.

**Total ash** (2.4.16)

Maximum 8.0 per cent.

**Loss on drying** (2.2.32)

Maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

### ASSAY

Liquid chromatography (2.2.29).

**Test solution** Extract 1.000 g of the powdered herbal drug (355) (2.9.12) with 40 mL of methanol R for 2 min using a suitable-speed homogeniser. Collect the supernatant liquid and filter into a 250 mL flask. Repeat the extraction with a

further 40 mL of *methanol R*, collecting the supernatant liquid and filtering as before. Rinse the residue carefully with a small quantity of *methanol R*. Combine the methanol extracts and rinsings and evaporate to dryness *in vacuo* in a water-bath at not more than 30 °C. With the aid of ultrasound, dissolve the residue obtained in *methanol R* and dilute to 20.0 mL with the same solvent. Filter the solution through a membrane filter (nominal pore size 0.45 µm). Dilute 2.0 mL of the solution to 10.0 mL with *methanol R*.

**Reference solution** Suspend a quantity of *agnus castus fruit dry extract HRS* corresponding to 0.10 mg of casticin in 7.5 mL of *methanol R*, sonicate for 5 min and dilute to 10.0 mL with the same solvent. Filter through a membrane filter (nominal pore size 0.45 µm).

**Column:**

- size:  $l = 0.125$  m,  $\varnothing = 4.0$  mm;
- stationary phase: end-capped octadecylsilyl silica gel for chromatography *R* (5 µm).

**Mobile phase:**

- mobile phase A: 5.88 g/L solution of phosphoric acid *R*;
- mobile phase B: acetonitrile *R*;

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 30	70 → 45	30 → 55

**Flow rate** 1.0 mL/min.

**Detection** Spectrophotometer at 348 nm.

**Injection** 10 µL.

**Identification of peaks** Use the chromatogram supplied with *agnus castus fruit dry extract HRS* and the chromatogram obtained with the reference solution to identify the peaks due to penduletin and casticin.

**System suitability** Reference solution:

- resolution: minimum 1.5 between the peaks due to penduletin and casticin.

Calculate the percentage content of casticin using the following expression:

$$\frac{A_1 \times m_2 \times p \times 10}{A_2 \times m_1}$$

- $A_1$  = area of the peak due to casticin in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to casticin in the chromatogram obtained with the reference solution;
- $m_1$  = mass of the herbal drug used to prepare the test solution, in grams;
- $m_2$  = mass of *agnus castus fruit dry extract HRS* used to prepare the reference solution, in grams;
- $p$  = percentage content of casticin in *agnus castus fruit dry extract HRS*.

Ph Eur

## Agnus Castus Fruit Dry Extract

(Ph. Eur. monograph 2309)

Ph Eur

### DEFINITION

Dry extract produced from *Agnus castus fruit* (2147).

### Content

Minimum 0.1 per cent of casticin ( $C_{19}H_{18}O_8$ ;  $M_r$  374.3) (dried extract).

### PRODUCTION

The extract is produced from the herbal drug by a suitable procedure using ethanol (40-80 per cent V/V).

### CHARACTERS

#### Appearance

Brown, amorphous powder.

#### IDENTIFICATION

Thin-layer chromatography (2.2.27).

**Test solution** Suspend 0.5 g of the extract to be examined in 5 mL of *methanol R* and sonicate for 15 min. Shake the mixture vigorously 3 or 4 times during the procedure. Filter.

**Reference solution** Dissolve 1 mg of *caffeic acid R* and 4 mg of *homoorientin R* in 10 mL of *methanol R*.

**Plate** TLC silica gel  $F_{254}$  plate *R* (5-40 µm) [or TLC silica gel  $F_{254}$  plate *R* (2-10 µm)].

**Mobile phase** water *R*, anhydrous formic acid *R*, toluene *R*, tetrahydrofuran *R* (1:2:8:16 V/V/V/V).

**Application** 12 µL [or 3 µL] as bands of 10 mm [or 8 mm].

**Development** Over a path of 11 cm [or 6 cm].

**Drying** In air.

**Detection** Treat with a 10 g/L solution of *diphenylboric acid aminoethyl ester R* in *methanol R* and dry in a current of cold air, then treat with a 50 g/L solution of *macrogol 400 R* in *methanol R*, allow to dry and examine in ultraviolet light at 365 nm.

**Results** See below the sequence of fluorescent zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint fluorescent zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Caffeic acid: a light blue fluorescent zone	An orange fluorescent zone and a white or pale yellow fluorescent zone, partly superimposed
	Several light blue fluorescent zones
	1 or 2 yellow fluorescent zones
Homoorientin: a yellow fluorescent zone	A light blue fluorescent zone
	A yellow fluorescent zone (homoorientin)
	A yellow fluorescent zone
Reference solution	Test solution

### ASSAY

Liquid chromatography (2.2.29).

**Test solution** Suspend 0.200 g of the extract to be examined in 15 mL of *methanol R*, sonicate for 5 min and dilute to 20.0 mL with the same solvent. Filter through a membrane filter (nominal pore size 0.45 µm).

**Reference solution** Suspend a quantity of *agnus castus fruit dry extract HRS* corresponding to 0.10 mg of casticin in 7.5 mL of *methanol R*, sonicate for 5 min and dilute to 10.0 mL with the same solvent. Filter through a membrane filter (nominal pore size 0.45 µm).

**Column:**

- size:  $l = 0.125\text{ m}$ ,  $\varnothing = 4.0\text{ mm}$ ;
- stationary phase: end-capped octadecylsilyl silica gel for chromatography R (5  $\mu\text{m}$ ).

**Mobile phase:**

- mobile phase A: 5.88 g/L solution of phosphoric acid R;
- mobile phase B: acetonitrile R;

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 30	70 → 45	30 → 55

Flow rate 1.0 mL/min.

Detection Spectrophotometer at 348 nm.

Injection 10  $\mu\text{L}$ .

**Identification of peaks** Use the chromatogram supplied with *agnus castus fruit dry extract HRS* and the chromatogram obtained with the reference solution to identify the peaks due to penduletin and casticin.

**System suitability** Reference solution:

- resolution: minimum 1.5 between the peaks due to penduletin and casticin.

Calculate the percentage content of casticin using the following expression:

$$\frac{A_1 \times m_2 \times p \times 2}{A_2 \times m_1}$$

- $A_1$  = area of the peak due to casticin in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to casticin in the chromatogram obtained with the reference solution;
- $m_1$  = mass of the extract to be examined used to prepare the test solution, in grams;
- $m_2$  = mass of *agnus castus fruit dry extract HRS* used to prepare the reference solution, in grams;
- $p$  = percentage content of casticin in *agnus castus fruit dry extract HRS*.

Ph Eur

**Agrimony**

(Ph. Eur. monograph 1587)

Ph Eur

**DEFINITION**

Dried flowering tops of *Agrimonia eupatoria* L.

**Content**

Minimum 2.0 per cent of tannins, expressed as pyrogallol ( $\text{C}_6\text{H}_6\text{O}_3$ ;  $M_r$  126.1) (dried drug).

**IDENTIFICATION**

A. The stem is green or, more usually, reddish, cylindrical and infrequently branched. It is covered with long, erect or tangled hairs. The leaves are compound imparipennate with 3 or 6 opposite pairs of leaflets, with 2 or 3 smaller leaflets between. The leaflets are deeply dentate to serrate, dark green on the upper surface, greyish and densely tomentose on the lower face. The flowers are small and form a terminal spike. They are pentamerous and borne in the axils of hairy bracts, the calyces closely surrounded by numerous terminal hooked spires, which occur on the rim of the hairy receptacle. The petals are free, yellow and deciduous. Fruit-bearing obconical receptacles, with deep furrows and hooked bristles, are usually present at the base of the inflorescence.

B. Microscopic examination (2.8.23). The powder is yellowish-green or grey. Examine under a microscope using chloral hydrate solution R. The powder shows the following diagnostic characters (Figure 1587.-1): numerous straight or bent, unicellular, long, thick-walled (about 500  $\mu\text{m}$ ) covering trichomes [Ab, Ca, F], finely warty, and sometimes spirally marked, often fragmented [F]; fragments of the epidermis of the stems [A] with stomata [Aa], covering trichomes [Ab] and glandular trichomes [Ac]; fragments of upper leaf epidermis (surface view [C]) with straight walls bearing covering trichomes [Ca], accompanied by palisade parenchyma [Cb], with some of the cells containing calcium oxalate prisms [Cc]; fragments of lower leaf epidermis in surface view [J] with sinuous walls and abundant stomata [Ja], mostly anomocytic (2.8.3) but occasionally anisocytic, and glandular trichomes [Jb]; ovoid to subspherical pollen grains, with 3 pores and a smooth exine [D]; glandular trichomes with a multicellular, uniseriate stalk and a unicellular to quadricellular head [B, Jb]; fragments of the stems [H] with groups of fibres [Ha] and parenchymatous cells, some of which contain cluster crystals of calcium oxalate [Hb]; small spiral vessels from the leaflets [G]; fragments of large, spiral or bordered-pitted vessels from the stem [E].

Figure 1587.-1. – Illustration for identification test B of powdered herbal drug of agrimony

C. Thin-layer chromatography (2.2.27).

**Test solution** To 2.0 g of the powdered herbal drug (355) (2.9.12) add 20 mL of methanol R. Heat with shaking at 40 °C for 10 min. Filter.

**Reference solution** Dissolve 1.0 mg of isoquercitroside R and 1.0 mg of rutoside trihydrate R in 2 mL of methanol R.

**Plate** TLC silica gel plate R.

**Mobile phase** anhydrous formic acid R, water R, ethyl acetate R (10:10:80 V/V/V).

**Application** 10 µL as bands.

**Development** Over a path of 12 cm.

**Drying** At 100-105 °C.

**Detection** Spray the still-warm plate with a 10 g/L solution of diphenylboric acid aminoethyl ester R in methanol R and then with a 50 g/L solution of macrogol 400 R in methanol R; allow the plate to dry in air for 30 min and examine in ultraviolet light at 365 nm.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution.

Top of the plate	
	An orange fluorescent zone may be present (quercitrin)
Isoquercitroside: an orange fluorescent zone	An orange fluorescent zone (isoquercitroside)
	An orange fluorescent zone (hyperoside)
Rutoside: an orange fluorescent zone	An orange fluorescent zone (rutoside)
Reference solution	Test solution

## TESTS

**Loss on drying** (2.2.32)

Maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

**Total ash** (2.4.16)

Maximum 10.0 per cent.

## ASSAY

**Tannins** (2.8.14)

Use 1.000 g of the powdered herbal drug (180) (2.9.12).

Ph Eur

## Akebia Stem

(Ph. Eur. monograph 2472)

Ph Eur

### DEFINITION

Whole or fragmented, dried stem of *Akebia quinata* (Houtt.) Decne. or *Akebia trifoliata* (Thunb.) Koidz., or a mixture of the 2 species.

### Content

Minimum 0.15 per cent of oleanolic acid (C<sub>30</sub>H<sub>48</sub>O<sub>3</sub>; M<sub>r</sub> 456.7) (dried drug).

### IDENTIFICATION

A. The whole drug is cylindrical, often slightly twisted, 30-70 cm long and 0.5-2 cm in diameter. Externally light grey or greyish-brown, rough, with irregular longitudinal and horizontal cracks and irregular longitudinal furrows.

The outer bark is sometimes easily removed; the exposed inner surface is yellowish-brown or reddish-brown. Lenticels are distinct. Nodes are sometimes swollen, with scars of lateral branches. The texture is light and compact.

The fracture is uneven; the bark is relatively thick and easily distinguished from the wood, sometimes with arched hollows

around the outside of the wood; it is yellowish-brown or reddish-brown, with pale yellow, granular dots visible; the wood is yellowish-white, with distinct radial striations, the pith is small, occasionally hollowed, yellowish-white or yellowish-brown.

The fragmented drug occurs as rounded, elliptical or irregular slices, 0.5-2 cm in diameter. Externally light grey or greyish-brown, rough, with irregular longitudinal and horizontal cracks and occasional lenticels; the outer bark is easily removed, the inner exposed surface is yellowish-brown or reddish-brown. The texture is light, compact and easily broken. The cut surface has a relatively thick, yellowish-brown, greyish-brown or reddish-brown bark that is easily distinguished from the wood and appears granular and sometimes lamellar in transverse section. Hollows appearing as arches may be present around the outside of the wood. The wood is yellowish-white, with distinct radial striations and distinct xylem vessels. The pith is small, occasionally hollowed, yellowish-white or yellowish-brown.

B. Microscopic examination (2.8.23). The powder is pale yellow to light brown. Examine under a microscope using chloral hydrate solution R. The powder shows the following diagnostic characters (Figure 2472.-1): groups of fibres, frequently broken [C], whose narrow lumens contain small prisms of calcium oxalate [Ca]; these groups are usually surrounded by crystal sheaths of calcium oxalate [Cb]; groups of parenchymatous cells with thick, pitted walls [F], some containing compact masses of large polyhedral or prismatic crystals of calcium oxalate [Fa]; some of these cells are isolated [G]; cork fragments consisting of reddish-brown polygonal cells with brown contents (surface view [A]); fragments of parenchyma consisting of cells with thin colourless walls (transverse section [K], longitudinal section [L]); isolated cubic or prismatic crystals of calcium oxalate [D]; rare tetragonal, polygonal, elongated or rounded sclereids with very thick walls and granular contents [B, M]; abundant single or grouped narrow tracheids with oblique pits and very fine oblique or criss-cross lines [E]; vessels often fragmented, mostly bordered pitted, up to 120-160 µm in diameter [J]; ligneous, more or less rectangular parenchyma cells of the medullary rays with very thick, pitted walls [H].

C. Thin-layer chromatography (2.2.27).

**Test solution** To 0.5 g of the powdered herbal drug (1400) (2.9.12) add 5 mL of methanol R. Sonicate for 10 min and filter or centrifuge. Use the filtrate or the supernatant as the test solution.

**Reference solution** Dissolve 1 mg of hederagenin R and 1 mg of oleanolic acid R in 8 mL of methanol R.

**Plate** TLC silica gel plate R (2-10 µm).

**Mobile phase** glacial acetic acid R, acetone R, toluene R (5:20:80 V/V/V).

**Application** 15 µL as bands of 8 mm.

**Development** Over a path of 6 cm.

**Drying** In air.

**Detection** Treat with a 10 per cent V/V solution of sulfuric acid R in ethanol (96 per cent) R, heat at 105 °C until the spots appear and examine in daylight.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other coloured zones may be present in the chromatogram obtained with the test solution.

Reference solution	Test solution

#### TESTS

**Total ash (2.4.16)**

Maximum 6.5 per cent.

**Loss on drying (2.2.32)**

Maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 3 h.

**Aristolochic acids (2.8.21, Method A)**

It complies with the test.

#### ASSAY

**Liquid chromatography (2.2.29).**

**Test solution** To 2.00 g of the powdered herbal drug (1400) (2.9.12) add 50 mL of methanol R, sonicate for 30 min and

filter. Wash the residue with an appropriate quantity of methanol R, combine the filtrate and washings and evaporate to dryness. Dissolve the residue in 10 mL of water R, extract with 3 quantities, each of 20 mL, of butanol R saturated with water R, combine the extracts and evaporate to dryness. Take up the residue with a mixture of 2 mL of hydrochloric acid R and 20 mL of methanol R and heat under a reflux condenser for 2 h. Add 10 mL of water R, extract with 2 quantities, each of 20 mL, of methylene chloride R, combine the extracts and evaporate to dryness. Dissolve the residue in methanol R and dilute to 10.0 mL with the same solvent.

**Reference solution (a)** Dissolve 20.0 mg of oleanolic acid CRS in methanol R and dilute to 20.0 mL with the same solvent.

**Reference solution (b)** Dissolve 10 mg of ursolic acid R in reference solution (a) and dilute to 10.0 mL with the same solution.

**Reference solutions (c), (d), (e), (f), (g), (h)** Dilute reference solution (a) with methanol R to obtain 6 reference solutions of oleanolic acid, the concentrations of which span the expected value in the test solution.

**Column:**

— size:  $l = 0.25$  m,  $\varnothing = 4.6$  mm;

— stationary phase: end-capped octadecylsilyl silica gel for chromatography R (5 µm).

**Mobile phase** triethylamine R, glacial acetic acid R, water for chromatography R, methanol R (0.02:0.04:13:87 V/V/V/V).

**Flow rate** 1.0 mL/min.

**Detection** Evaporative light-scattering detector: the following settings have been found to be suitable; if the detector has different setting parameters, adjust the detector settings so as to comply with the system suitability criterion for signal-to-noise ratio:

— carrier gas: nitrogen R;

— pressure: 350 kPa;

— evaporator temperature: 60 °C.

**Injection** 10 µL.

**Run time** 24 min.

**Retention time** Oleanolic acid = about 19 min; ursolic acid = about 20 min.

**System suitability:**

— resolution: minimum 1.7 between the peaks due to oleanolic acid and ursolic acid in the chromatogram obtained with reference solution (b);

— signal-to-noise ratio: minimum 40 for the peak due to oleanolic acid in the chromatogram obtained with reference solution (a).

Establish a calibration curve with the logarithm of the concentration (in milligrams per 10 mL) of reference solutions (c), (d), (e), (f), (g) and (h) (corrected by the declared percentage content of oleanolic acid CRS) as the abscissa and the logarithm of the corresponding peak area as the ordinate.

Calculate the percentage content of oleanolic acid using the following expression:

$$\frac{10^A}{m \times 10}$$

$A$  = logarithm of the concentration of oleanolic acid in the test solution, determined from the calibration curve;

$m$  = mass of the herbal drug to be examined used to prepare the test solution, in grams.

# Alchemilla

(Ph. Eur. monograph 1387)

Ph Eur

## DEFINITION

Whole or cut, dried, flowering, aerial parts of *Alchemilla vulgaris* L. s.l.

## Content

Minimum 6.0 per cent of tannins, expressed as pyrogallol ( $C_6H_6O_3$ ;  $M_r$  126.1) (dried drug).

## IDENTIFICATION

A. The greyish-green, partly brownish-green, radical leaves, which are the main part of the drug, are reniform or slightly semicircular with a diameter generally up to 8 cm, seldom up to 11 cm and have 7-9 or 11 lobes and a long petiole. The smaller, cauline leaves, which have a pair of large stipules at the base, have 5-9 lobes and a shorter petiole or they are sessile. The leaves are densely pubescent especially on the lower surface and have a coarsely serrated margin. Young leaves are folded with a whitish-silvery pubescence; older leaves are slightly pubescent and have a finely meshed venation, prominent on the lower surface. The greyish-green or yellowish-green petiole is pubescent, about 1 mm in diameter, with an adaxial groove. The apetalous flowers are yellowish-green or light green and about 3 mm in diameter. The calyx is double with 4 small segments of the epicalyx alternating with 4 larger sepals, subacute or triangular. They are 4 short stamens and a single carpel with a capitate stigma. The greyish-green or yellowish-green stem is pubescent, more or less longitudinally wrinkled and hollow.

B. Microscopic examination (2.8.23). The powder is yellow to yellowish-brown. Examine under a microscope using chloral hydrate solution R. The powder shows the following diagnostic characters (Figure 1387.-1): narrow, unicellular covering trichomes, isolated or included in an epidermis, whole [Ba] or sheared off [Be], up to 1 mm long, with thick, lignified, spirally striated walls, bluntly pointed at the apex and pitted at the base; fragments of leaves (transverse section [E]) consisting of a slightly cuticularised and stomatiferous upper epidermis [Ea], 2 layers of palisade parenchyma with the cells of the upper layer [Eb] being 2-3 times longer than those of the lower layer [Ec] (which contain cluster crystals of calcium oxalate, up to 25  $\mu$ m in diameter), and spongy parenchyma [Ed]; fragments of the upper epidermis of the leaf (surface view [C]) consisting of somewhat sinuous cells with beaded anticlinal walls [Ca], a few anomocytic stomata (2.8.3) [Cb], and accompanied by palisade parenchyma [Cc]; fragments of the lower epidermis of the leaf (surface view [A]) composed of sinuous cells with unevenly thickened anticlinal walls [Aa], anomocytic stomata [Ab] and covering trichomes or their scars [Ac], rounded, thick-walled and channelled; fragments from the petioles and stems [K], consisting of spiral or bordered-pitted vessels [Ka] and lignified fibres [Kb]; a few straight, conical hairs [D] from the corolla, about 300  $\mu$ m long, with regularly thickened walls; parenchymatous cells of the mesophyll [H], with thin walls, containing cluster crystals of calcium oxalate [Ha], and spiral xylem vessels [Hb] accompanied by short fibres [Hc]; fragments of the epidermis of the stems [B] consisting of polygonal cells with straight, thin walls; spherical pollen grains [F], about 15  $\mu$ m in diameter, with 3 distinct germinal pores and a granular exine; fragments of the corolla [J] with rectangular epidermal cells with sinuous walls [Ja] and parenchyma with polygonal cells, each containing a small

cluster crystal of calcium oxalate [Jb]; occasional fragments of the ovary [G] with cells each containing a prism crystal of calcium oxalate.

Figure 1387.-1. – Illustration for identification test B of powdered herbal drug of alchemilla

## C. Thin-layer chromatography (2.2.27).

**Test solution** To 0.5 g of the powdered herbal drug (355) (2.9.12) add 5 mL of methanol R and heat in a water-bath at 70 °C under a reflux condenser for 5 min. Cool and filter.

**Reference solution** Dissolve 1 mg of caffeic acid R and 1 mg of chlorogenic acid R in 10 mL of methanol R.

**Plate** TLC silica gel plate R.

**Mobile phase** anhydrous formic acid R, water R, ethyl acetate R (8:8:84 V/V/V).

**Application** 20  $\mu$ L of the test solution and 10  $\mu$ L of the reference solution, as bands.

**Development** Over a path of 10 cm.

**Drying** At 100-105 °C for 5 min.

**Detection** Spray with a 10 g/L solution of diphenylboric acid aminoethyl ester R in methanol R, then spray with a 50 g/L solution of macrogol 400 R in methanol R; allow to dry in air for about 30 min and examine in ultraviolet light at 365 nm.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other fluorescent zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Caffeic acid: a light blue fluorescent zone	1 or 2 intense light blue fluorescent zones  1 or several intense green or greenish-yellow fluorescent zones
Chlorogenic acid: a light blue fluorescent zone	An intense yellow or orange fluorescent zone
Reference solution	Test solution

**TESTS****Loss on drying (2.2.32)**

Maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

**Total ash (2.4.16)**

Maximum 12.0 per cent.

**ASSAY****Tannins (2.8.14)**

Use 0.50 g of the powdered herbal drug (355) (2.9.12).

Ph Eur

***Alisma Plantago-Aquatica*****DEFINITION**

*Alisma Plantago-Aquatica* is the dried rhizome of *Alisma plantago-aquatica* L.

**PRODUCTION**

The rhizomes are collected in winter after the stem has withered, washed clean, dried and fibrous roots removed. May be sliced and dried, rhizomes may be salted. May be processed with vinegar.

**IDENTIFICATION**

A. The whole rhizome is sub spherical, elliptical or ovate, 2 to 7 cm long and 2 to 6 cm in diameter. Externally yellowish-white or yellowish-brown, with irregular transverse-annular shallow furrows and numerous small raised fibrous root scars, occasionally tuberculate bud scars attached to the base. Texture compact, fracture yellowish-white, starchy, with numerous small pores. The rhizome is frequently cut to give roughly circular or oval discs up to about 7 cm along the longest axis and 3 to 7 mm thick. The outer surface of the discs is dull pale or mid-brown, (sometimes reddish brown,) with paler markings and shallow grooves and occasional rootlets. The cut surface is very finely granular and buff (or reddish) coloured.

B. Reduce to a powder, Appendix XVII A. Examine under a microscope using *chloral hydrate solution*. The powder shows the following characteristics: The powder is pale buff to reddish buff coloured. Abundant parenchymous cells, many sub rounded with elliptical pits aggregated into pit areas; slightly smaller ovoid cells, often in clusters; more angular parenchyma cells often with beaded or pitted walls; occasional endodermis cells with sinuous, thickened and lignified walls; xylem elements with scalariform or reticulate thickening; oil cavities mostly broken, whole ones sub rounded, 50 to 100 µm in diameter. Mount in *water*, the

following characteristics are observed. Numerous small starch granules, ovoid, sub spherical or ellipsoid, hilum a short slit, V-shaped or Y-shaped, often in small clusters.

C. Carry out the method for *high performance thin-layer chromatography*, Appendix XI W, using the following solutions.

(1) Mix 1 g of freshly powdered herbal drug with 5 mL of *methanol* and mix with aid of ultrasound for 15 minutes and filter.

(2) 0.025% w/v of *alisol B 23-acetate* in *methanol* and 0.05% w/v of *alisol B* in *methanol*.

(3) Dilute 1 volume of solution (2) to 4 volumes with *methanol*.

(4) 0.025% w/v of *alisol B 23-acetate* and 0.025% w/v of  $\beta$ -*sitosterol* in *methanol*.

**CHROMATOGRAPHIC CONDITIONS**

(a) Use as the coating *high performance silica gel F<sub>254</sub>* (Merck silica gel 60 F<sub>254</sub> plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 8 µL of each solution, as 8 mm zones.

(d) Develop the plate to 7 cm.

(e) After removal of the plate, dip in *methanolic sulfuric acid* 10%, heat at 120° for 3 minutes and examine under *ultraviolet light (366 nm)*.

**MOBILE PHASE**

1 volume of *cyclohexane* and 2 volumes of *ethyl acetate*.

**SYSTEM SUITABILITY**

The test is not valid unless the chromatogram obtained with solution (4) shows two clearly separated zones under *ultraviolet light (366 nm)*.

**CONFIRMATION**

The chromatogram obtained with solution (1) when observed under UV light at 366 nm shows two zones in the top third of the plate, a faint zone corresponding to the purple  $\beta$ -*sitosterol* zone in the chromatogram obtained with solution (4), two intense to faint orange zones corresponding to *alisol B 23 acetate* and *alisol B* in the chromatograms obtained with solutions (2) and (3) and a blue-white zone in the bottom third of the plate.

Top of the plate		
A purple zone ( $\beta$ -sitosterol)		An intense to faint zone
		An intense to faint blue zone
		A faint to very faint zone
An orange zone ( <i>Alisol B 23 acetate</i> )	An orange zone ( <i>Alisol B 23 acetate</i> )	An intense to faint orange zone
	An orange zone ( <i>Alisol B</i> )	An intense to faint orange zone
		A blue-white zone
<i>Solution (4)</i> SST	<i>Solution (2) and (3)</i> Intensity markers	<i>Solution (1)</i> Test Solution

**TESTS****Foreign matter**

Not more than 2.0%, Appendix XI D.

**Loss on drying**

When dried for 2 hours at 105°, loses not more than 9.0% of its weight, Appendix IX D. Use 1 g.

**Total Ash**

Not more than 3.0%, Appendix XI J, Method II.

**Acid insoluble ash**

Not more than 0.5%, Appendix XI K.

**Barbados Aloes****Curaçao Aloes**

(Ph. Eur. monograph 0257)

**Preparation**

Standardised Aloes Dry Extract

Ph Eur

**DEFINITION**

Concentrated and dried juice of the leaves of *Aloe barbadensis* Mill.

**Content**

Minimum 28.0 per cent of hydroxyanthracene derivatives, expressed as barbaloin (C<sub>21</sub>H<sub>22</sub>O<sub>9</sub>; M<sub>r</sub> 418.4) (dried drug).

**CHARACTERS****Appearance**

Dark brown masses, slightly shiny or opaque with a conchoidal fracture, or brown powder.

**Solubility**

Partly soluble in boiling water, soluble in hot ethanol (96 per cent).

**IDENTIFICATION**

Examine the chromatograms obtained in the test for Cape aloes.

**Results A** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint fluorescent zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Aloe emodin: a yellow fluorescent zone	
Barbaloin: an orange fluorescent zone	An orange fluorescent zone (barbaloin)  A bluish-white fluorescent zone A bluish-green fluorescent zone
Reference solution	Test solution

**Results B** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Aloe emodin: a violet zone	
Barbaloin: a brown zone	A brown zone (barbaloin)  A violet zone
Reference solution	Test solution

**TESTS****Loss on drying (2.2.32)**

Maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug by drying in an oven at 105 °C.

**Total ash (2.4.16)**

Maximum 2.0 per cent.

**Cape aloes****Thin-layer chromatography (2.2.27).**

**Test solution** To 0.25 g of the powdered herbal drug add 20 mL of *methanol R* and heat to boiling in a water-bath. Shake for a few minutes and decant the solution. Store at about 4 °C and use within 24 h.

**Reference solution** Dissolve 2 mg of *aloe emodin R* and 2 mg of *barbaloin R* in *methanol R* and dilute to 1 mL with the same solvent.

**Plate** TLC silica gel plate R (5–40 µm) [or TLC silica gel plate R (2–10 µm)].

**Mobile phase** *water R*, *methanol R*, *ethyl acetate R* (13:17:100 V/V/V).

**Application** 10 µL [or 2 µL] as bands of 20 mm [or 8 mm].

**Development** Over a path of 10 cm [or 6 cm].

**Drying** In air.

**Detection A** Examine in ultraviolet light at 365 nm.

**Results A** The chromatogram obtained with the test solution shows no blue fluorescent zones above the orange fluorescent zone due to barbaloin.

**Detection B** Treat with a 100 g/L solution of *potassium hydroxide R* in *methanol R*, heat at 110 °C for 5 min and examine in daylight.

**ASSAY**

Carry out the assay protected from bright light.

Introduce 0.300 g of the powdered herbal drug (180) (2.9.12) into a 250 mL conical flask. Moisten with 2 mL of *methanol R*, add 5 mL of *water R* warmed to about 60 °C, mix, then add a further 75 mL of *water R* at about 60 °C and shake for 30 min. Cool, filter into a volumetric flask, rinse the conical flask and filter with 20 mL of *water R*, add the rinsings to the volumetric flask and dilute to 1.0 L with *water R*. Transfer 10.0 mL of this solution to a 100 mL round-bottomed flask containing 1 mL of a 600 g/L solution

of *ferric chloride R* and 6 mL of *hydrochloric acid R*. Heat in a water-bath under a reflux condenser for 4 h, with the water level above that of the liquid in the flask. Allow to cool, transfer the solution to a separating funnel, rinse the flask successively with 4 mL of *water R*, 4 mL of 1 M *sodium hydroxide* and 4 mL of *water R* and add the rinsings to the separating funnel. Shake the contents of the separating funnel with 3 quantities, each of 20 mL, of *ether R*. Wash the combined ether layers with 2 quantities, each of 10 mL, of *water R*. Discard the washings and dilute the organic phase to 100.0 mL with *ether R*. Evaporate 20.0 mL of the solution carefully to dryness on a water-bath and dissolve the residue in 10.0 mL of a 5 g/L solution of *magnesium acetate R* in *methanol R*. Measure the absorbance (2.2.25) at 512 nm using *methanol R* as the compensation liquid.

Calculate the percentage content of hydroxyanthracene derivatives, expressed as barbaloin, using the following expression:

$$\frac{A \times 19.6}{m}$$

i.e. taking the specific absorbance of barbaloin to be 255.

*A* = absorbance at 512 nm;  
*m* = mass of the substance to be examined, in grams.

#### STORAGE

In an airtight container.

**Amomum Fruit**

(Ph. Eur. monograph 2554)

Ph Eur

**DEFINITION**

Dried, whole or fragmented, peeled or unpeeled ripe fruit of *Amomum villosum* Lour. or *Amomum longiligulare* T.L.Wu.

**Content**

- *essential oil*: minimum 30 mL/kg for *A. villosum* (anhydrous drug) and minimum 10 mL/kg for *A. longiligulare* (anhydrous drug);
- *boranyl acetate* (C<sub>12</sub>H<sub>20</sub>O<sub>2</sub>; *M<sub>r</sub>* 196.3): minimum 30.0 per cent of the essential oil.

**IDENTIFICATION**

**A. *A. villosum*.** The fruit is an indehiscent capsule, ovoid or ellipsoidal, indistinctly 3-ridged, up to 2 cm long and 1.5 cm in diameter. The outer surface is brown and covered with soft spiny protuberances. The apex bears the remains of the perianth and the base usually bears a stalk. The pericarp is thin and soft. The seeds are agglomerated into 3 masses, each consisting of 5-25 seeds, separated by whitish septa. The seeds are hard, irregularly polyhedral, 2-3 mm in diameter, reddish-brown or blackish-brown on the surface, finely wrinkled and covered with a pale brown, transparent, membranous aril; the endosperm is whitish-grey.

**A. *A. longiligulare*** The fruit is an indehiscent capsule, long, ovoid or ellipsoidal, distinctly 3-ridged, up to 2 cm long and 1.2 cm in diameter. The outer surface is brown, longitudinally channelled and scaly, and bears numerous soft spiny protuberances, sometimes branched. The apex bears a prominent stylopodium and the base shows the scar of the stalk. The pericarp is thick and hard. The seeds are agglomerated into 3 relatively small masses, each consisting of about 2-24 seeds, separated by incomplete septa. The seeds are small, 1.5-2 mm in diameter, polyhedral with rounded edges, reddish-brown or blackish-brown on the surface, finely wrinkled and covered with a pale brown, transparent, membranous aril; the endosperm is whitish.

**B. *A. villosum*.** Microscopic examination (2.8.23). The powder is greyish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of epicarp consisting of brownish-orange polyhedral cells containing microcrystals and prisms of calcium oxalate, clearly visible in polarised light and sometimes long covering trichomes, about 250 µm long, usually unicellular, straight or bent, with slightly and regularly thickened walls; fragments of mesocarp composed of thin-walled polygonal cells and round oil cells, with orange to dark brown contents; vascular bundles consisting of vessels, mainly spiral, and fibres with thick and pitted walls; fragments of the outer testa consisting of a layer of cells, fusiform in surface view, with slightly and regularly thickened walls, usually accompanied by a layer of rectangular or polyhedral cells, perpendicular to the previous layers, and sometimes by underlying oil cells; brownish-red fragments of the inner testa, in surface view, composed of very regularly polyhedral cells with heavily thickened walls and a punctiform lumen; brownish-red fragments of the inner testa, in transverse section, composed of palisade cells with strongly thickened inner and lateral walls. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows numerous fragments composed of sub-rectangular or irregular cells, filled with aggregates of small starch granules; some of these cells also contain small prisms

Ph Eur

of calcium oxalate; a few aggregates of small starch granules are also present.

**A. longiligulare** Microscopic examination (2.8.23). The powder is greyish-brown. Examine under a microscope using chloral hydrate solution R. The powder shows the following diagnostic characters: fragments of epicarp consisting of brownish-orange, polyhedral or elongated cells containing microcrystals and prisms of calcium oxalate, clearly visible in polarised light; fragments of mesocarp composed of thin-walled polygonal cells and occasional round oil cells with orange to dark brown contents; vascular bundles composed of spiral or reticulate vessels and fibres with thick and distinctly pitted walls; fragments of the aril consisting of elongated, very thin-walled cells, some of which contain prisms and microcrystals that are clearly visible in polarised light; fragments of the outer testa consisting of a layer of cells, fusiform in surface view, with slightly and regularly thickened walls, usually accompanied by a layer of rectangular or polyhedral cells with brown contents, perpendicular to the previous layers; brownish-red fragments of the inner testa, composed of very thick-walled and very regularly polyhedral cells, in surface view; brownish-red fragments of the inner testa, in transverse section, composed of rectangular or palisade cells with heavily thickened inner and lateral walls. Examine under a microscope using a 50 per cent VIV solution of glycerol R. The powder shows numerous fragments of the endosperm with sub-rectangular or polyhedral cells, filled with small starch granules aggregated into masses and free aggregates of starch granules.

**C. Thin-layer chromatography (2.2.27).**

**Test solution** To 1 g of the powdered herbal drug (355) (2.9.12) add 5 mL of a mixture of equal volumes of toluene R and xylene R. Sonicate for 10 min. Centrifuge and use the supernatant.

**Reference solution** Dissolve 10 µL of bornyl acetate R, 10 µL of cineole R and 10 mg of borneol R in 1 mL of toluene R.

**Plate** TLC silica gel plate R (2-10 µm).

**Mobile phase** ethyl acetate R, toluene R (7:93 VIV).

**Application** 5 µL as bands of 8 mm.

**Development** Over a path of 6 cm.

**Drying** In air.

**Detection A** Examine in ultraviolet light at 366 nm.

**Results A** See below the sequence of zones present in the chromatogram obtained with the test solution. The reference solution shows no spots at 366 nm. Furthermore, other faint fluorescent zones may be present in the chromatogram obtained with the test solution.

Reference solution	Test solution

**TESTS**

**Water (2.2.13)**

Maximum 120 mL/kg, determined by distillation on 20.0 g of the powdered herbal drug (355) (2.9.12).

**Total ash (2.4.16)**

Maximum 9.0 per cent.

**ASSAY**

**Essential oil (2.8.12)**

Use 10.0 g of the herbal drug reduced to a powder (1400) (2.9.12) immediately before the assay, a 500 mL round-bottomed flask, 200 mL of water R as the distillation liquid and 0.5 mL of trimethylpentane R in the graduated tube. Distil at a rate of 3-3.5 mL/min for 5 h.

**Bornyl acetate**

Gas chromatography (2.2.28): use the normalisation procedure.

**Test solution** Dilute a volume of the essential oil-trimethylpentane mixture obtained in the assay of essential oil corresponding to 150 µL of the essential oil in heptane R and dilute to 10.0 mL with the same solvent.

**Reference solution (a)** Dissolve 25 mg of camphor R in heptane R, add 25 µL of bornyl acetate R and dilute to 5.0 mL with heptane R.

**Reference solution (b)** Dilute 5 µL of bornyl acetate R to 100.0 mL with heptane R. Dilute 1.5 mL of the solution to 10.0 mL with heptane R.

**Column:**

— material: fused silica;

— size: l = 60 m, Ø = 0.25 mm;

— stationary phase: macrogol 20 000 R (film thickness 0.25 µm).

Carrier gas helium for chromatography R.

Flow rate 0.9 mL/min.

Split ratio 1:50.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 60	60 → 210
Injection port		230
Detector		250

Detection Flame ionisation.

Injection 1 µL.

Identification of peaks Use the chromatogram obtained with reference solution (a) to identify the peaks due to camphor and bornyl acetate.

Relative retention With reference to camphor (retention time = about 26 min): bornyl acetate = about 1.1.

System suitability Reference solution (a):

— resolution: minimum 5 between the peaks due to camphor and bornyl acetate.

Calculate the percentage content of bornyl acetate. Disregard any peak due to the solvent or with an area less than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

#### LABELLING

The label states the species present.

Ph Eur

## Andrographis Herb

(Ph. Eur. monograph 2712)

Ph Eur

#### DEFINITION

Dried, whole or fragmented flowering and/or fruit-bearing aerial parts of *Andrographis paniculata* (Burm.f.) Nees.

#### Content

Minimum 0.80 per cent of the sum of andrographolide (C<sub>20</sub>H<sub>30</sub>O<sub>5</sub>; M<sub>r</sub> 350.4) and 14-deoxy-11,12-didehydroandrographolide (C<sub>20</sub>H<sub>28</sub>O<sub>4</sub>; M<sub>r</sub> 332.4) (dried drug).

#### IDENTIFICATION

A. The whole aerial parts consist of the following: the green, brown, or yellowish-green stems are mostly square in cross-section with a white, central pith, about 50-70 cm long, 1.2-5 mm (sometimes up to 9 mm) in diameter, frequently branched, slightly swollen at the nodes, with longitudinal wrinkles on the outer surface; the leaves are opposite, simple, glabrous, shortly petiolate or nearly sessile with a lamina that is crumpled and easily broken; when whole, the lamina is lanceolate to ovate-lanceolate, 2-15 cm long and 1-5 cm wide; the apex is acuminate, the base cuneate and decurrent, the margin is entire or undulate, the upper surface is green to dark almost blackish-green and the lower surface is greyish-green or light green. Cystoliths may be visible as short, lighter-coloured markings on the upper surface of the leaf and stem. The texture is fragile. The fragmented aerial parts occur as small pieces of flattened green, brown, or yellowish-

green stems, mostly square in cross-section with a white, central pith, 1.2-5 mm (sometimes up to 9 mm) in diameter and 0.5-5.0 cm in length, with longitudinal wrinkles on the outer surface, and fragments of crumpled lamina, green to dark almost blackish-green on the upper surface and greyish-green or light green on the lower surface. Cystoliths may be visible as short, lighter-coloured markings on the upper surface of the leaf and stem. The texture is fragile. Partial remains of flowers are sometimes present consisting of fine and delicate pedicels and sepals with a pointed apex bearing glandular hairs with a long stalk and dark head. The light yellowish-brown or greenish-yellow fruits are narrow linear-lanceolate or oblong capsules, with 2 locules, widely opening from the apex to form a V-shaped fruit, with 2 valves that mostly no longer contain seeds; when seeds are present, they are dark brown or brownish-yellow and sub-polyhedral to square; funicle remains are often present.

B. Microscopic examination (2.8.23). The powder is dark green or greyish-green. Examine under a microscope using chloral hydrate solution R. The powder shows the following diagnostic characters (Figure 2712.-1): fragments of stem and leaf tissue with cystolith cells, diacytic stomata, and short glandular trichomes. Ovoid, rounded or elongated cystolithic cells up to 250 µm long [leaf: Ab, Bd, Dc] and up to 39 µm wide, with concentric striations. Short glandular trichomes with a unicellular stalk and a rounded, multicellular head, 27-37 µm in diameter, consisting of 6-8 (sometimes 5) cells [leaf: Ad, Bc]; green fragments of leaf, fragments of the upper epidermis of the leaves (surface view [B]) with rigid-walled polygonal cells [Ba], cystolithic cells [Bb] and rare diacytic stomata (2.8.3); fragments of the lower epidermis of the leaves (surface view [A]) with slightly sinuous to very sinuous cells [Aa], cystolithic cells [Ab] and numerous diacytic stomata [Ac]; rare glandular trichomes [Ad, Bc] and very rare, unicellular or multicellular (2-4 cells) conical covering trichomes with a pointed or rounded apex, thick, sometimes lignified cell walls and a striated cuticle, up to 190 µm long and 40 µm wide at the base (transverse section [Da]), which may be present on both epidermises; fragments of leaf mesophyll [D] consisting of 1 or 2 layers of palisade parenchyma, one of which, under the upper epidermis [Db], is composed of long narrow cells (up to 150 µm long and 8-17 µm wide), cells containing cystoliths, (surface view [Ab, Bd], transverse section [Dc]) and loosely arranged spongy parenchyma [Dd]; yellowish-brown or colourless fragments of stem with polygonal epidermal cells, cystolithic cells, diacytic stomata and short glandular hairs; fragments of pith from the stem with polygonal cells with pitted walls; numerous fragments of vascular tissue [E] from the stems, with reticulate or pitted [Ea] vessels and long, thick-walled and pitted fibres [Eb]. If flowers are present, the powder also shows glandular trichomes (which may exceed 500 µm in length) with a multicellular, uniseriate stalk and a multicellular cup-shaped head [C], short glandular trichomes and fragmented or whole unicellular or multicellular covering trichomes [F] from the outer surface of the flower (sepals) and pedicel. If ripe fruits are present, the powder shows fragments of epicarp [G] consisting of elongated cells [Ga], covered by a thin striated cuticle, and diacytic stomata [Gb] and also shows groups of short, very thick-walled fibres arranged in perpendicular layers [H], from the mesocarp. Tricolpate pollen with a fine spiculate exine may be present.

C. Thin-layer chromatography (2.2.27).

Figure 2712.-1. – Illustration for identification test B of powdered herbal drug of andrographis herb

**Test solution** To 0.5 g of the powdered herbal drug (355) (2.9.12) add 5 mL of methanol R. Sonicate for 10 min. Centrifuge or filter; use the supernatant or filtrate.

**Reference solution** Dissolve 1 mg of 14-deoxy-11,12-didehydroandrographolide R and 2 mg of andrographolide R in 1 mL of methanol R.

**Plate** TLC silica gel F<sub>254</sub> plate R (2-10 μm).

**Mobile phase** methanol R, ethyl acetate R, methylene chloride R (4:30:40 V/V/V).

**Application** 5 μL as bands of 8 mm.

**Development** Over a path of 6 cm.

**Drying** In air.

**Detection** Treat with a 10 per cent V/V solution of sulfuric acid R in methanol R, heat at 100 °C for 5 min; examine in ultraviolet light at 366 nm.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint fluorescent zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
	A red fluorescent zone
	2 violet-brown fluorescent zones

Andrographolide: a pale violet fluorescent zone	A pale violet fluorescent zone (andrographolide)
	A violet-brown fluorescent zone
Reference solution	Test solution

**TESTS**

**Loss on drying (2.2.32)**

Maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

**Total ash (2.4.16)**

Maximum 12.0 per cent.

**ASSAY**

Liquid chromatography (2.2.29).

**Test solution** Disperse 2.000 g of the powdered herbal drug (355) (2.9.12) in 50 mL of methanol R. Heat on a water-bath under a reflux condenser for 15 min. Cool. Collect the methanolic extract. Repeat the extraction with 3 additional quantities, each of 50 mL, of methanol R. Combine the extracts. Filter. Evaporate under vacuum. Dilute to 50.0 mL

with *methanol R*. Dilute 25.0 mL of the solution to 50.0 mL with *acetonitrile for chromatography R*.

**Reference solution (a)** Dissolve 5.0 mg of *andrographolide CRS* in *methanol R* and dilute to 10.0 mL with the same solvent. Dilute 1.0 mL of the solution to 50.0 mL with *acetonitrile for chromatography R*.

**Reference solution (b)** Disperse 2 g of *andrographis herb HRS* in 50 mL of *methanol R*. Heat on a water-bath under a reflux condenser for 15 min. Cool. Collect the methanolic extract. Repeat the extraction with 3 additional quantities, each of 50 mL, of *methanol R*. Combine the extracts. Filter. Evaporate under vacuum. Dilute to 50.0 mL with *methanol R*. Dilute 25.0 mL of the solution to 50.0 mL with *acetonitrile for chromatography R*.

**Column:**

- size:  $l = 0.25$  m,  $\varnothing = 4.6$  mm;
- stationary phase: end-capped octadecylsilyl silica gel for chromatography with embedded polar groups R (5  $\mu$ m);
- temperature: 30 °C.

**Mobile phase:**

- mobile phase A: water for chromatography R, adjusted to pH 3.2 with anhydrous formic acid R;
- mobile phase B: *acetonitrile for chromatography R*;

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 3	90	10
3 - 11	90 → 62	10 → 38
11 - 25	62	38
25 - 30	62 → 50	38 → 50

**Flow rate** 1.0 mL/min.

**Detection** Spectrophotometer at 223 nm.

**Injection** 10  $\mu$ L.

**Identification of peaks** Use the chromatogram supplied with *andrographis herb HRS* and the chromatogram obtained with reference solution (b) to identify the peaks due to 14-deoxyandrographolide and 14-deoxy-11,12-didehydroandrographolide.

**Relative retention** With reference to andrographolide (retention time = about 16 min):

14-deoxyandrographolide = about 1.5; 14-deoxy-11,12-didehydroandrographolide = about 1.6.

**System suitability** Reference solution (b):

- resolution: minimum 1.5 between the peaks due to 14-deoxyandrographolide and 14-deoxy-11,12-didehydroandrographolide.

Calculate the percentage content of the sum of andrographolide and 14-deoxy-11,12-didehydroandrographolide using the following expression:

$$\frac{(A_1 + (A_3 \times 1.45)) \times m_2 \times p}{A_2 \times m_1 \times 5}$$

- $A_1$  = area of the peak due to andrographolide in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to andrographolide in the chromatogram obtained with reference solution (a);
- $A_3$  = area of the peak due to 14-deoxy-11,12-didehydroandrographolide in the chromatogram obtained with the test solution;
- $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;
- $m_2$  = mass of *andrographolide CRS* used to prepare reference solution (a), in grams;
- $p$  = percentage content of andrographolide in *andrographolide CRS*;

1.45 = peak correlation factor between andrographolide and 14-deoxy-11,12-didehydroandrographolide.

Ph Eur

## Anemarrhena Asphodeloides Rhizome

(Ph. Eur. monograph 2661)

Ph Eur

### DEFINITION

Dried, whole or fragmented, peeled or unpeeled, rhizome of *Anemarrhena asphodeloides* Bunge, with roots removed, collected in spring or autumn.

### Content

Minimum 0.5 per cent of mangiferin ( $C_{19}H_{18}O_{11}$ ;  $M_r$  422.3) (dried drug).

### IDENTIFICATION

**A.** The rhizome with cork intact (called maozhimu) is somewhat flattened, slightly curved, occasionally branched, 2-15 cm long and 0.8-2 cm in diameter. The outer surface is brownish-yellow, reddish-brown or brown, with the upper surface generally showing a concave groove. It consists of many annular nodes with dense brownish-yellow fibrous remains of the vasculature of the leaf bases growing upwards on both sides of the groove; at the branched end of the rhizome, whitish-yellow or light brown leaf blade bases may also be present; the lower surface is coarsely longitudinally wrinkled, showing depressed or protruding dotted root scars; the surface of the root scars is whitish-yellow or light brown and may show a circular ring of xylem tissue protruding from its centre. The rhizome with outer cork removed (called guangzhimu) is 5-15 cm in diameter. The outer surface is yellowish-white, with twisted grooves, sometimes with leaf scars and root scars.

The fragmented rhizome occurs in slices about 1.1-4 mm thick and 0.8-3.4 cm in diameter, often with a furrowed outline. It can be cut either longitudinally or transversely or obliquely. The outer surface is yellowish-white (guangzhimu) or brownish-yellow, reddish-brown or brown (maozhimu); it shows fibrous (vascular bundles) remains of leaves as well as annular striations and round root scars or short remnants of the root bases. The section is pale yellow or brownish-yellow, marked with numerous whitish-yellow pits or lines corresponding to vascular bundles.

**B.** Microscopic examination (2.8.23). The powder is pale yellow. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2661.-1): very numerous, whole or fragmented raphides of calcium oxalate up to 150  $\mu$ m long, free [D] or included in oval or rounded parenchyma cells of various sizes [A, E]; fragments of parenchyma, with thin walls [B] or with slightly thickened and pitted walls [H]; fragments of vessels [F] sometimes spiral [Fa], more often reticulate [Fb] or pitted [Fc], often accompanied by cells containing large acicular crystals of calcium oxalate, in bundles, whole or broken, up to 300  $\mu$ m long and 7  $\mu$ m wide [Fd]; free bundles of large acicular crystals may also be observed [J]; a few fragments of cork, orange-brown, present only in the unpeeled herbal drug [K]; a few fragments of parenchyma with elongated or polygonal cells with heavily lignified and pitted walls from the remains of the aerial parts [C]; a few fibres in bundles, with slightly thickened walls and

rounded ends, from the remains of the vascular bundles of the leaves [G].

Figure 2661-1. – Illustration for identification test B of powdered herbal drug of *Anemarrhena asphodeloides* rhizome

**C. Thin-layer chromatography (2.2.27).**

**Test solution** To 0.5 g of the powdered herbal drug (355) (2.9.12) add 5 mL of a mixture of *glacial acetic acid R* and *methanol R* (10:90 *V/V*). Sonicate for 10 min. Centrifuge or filter; use the supernatant or filtrate.

**Reference solution** Dissolve 1 mg of *arbutin R* and 1 mg of *aescin R* in 1 mL of *methanol R*.

**Plate** TLC silica gel plate R (2-10 μm).

**Mobile phase** *water R*, *methanol R*, *methylene chloride R* (4:30:70 *V/V/V*).

**Application** 5 μL as bands of 8 mm.

**Development** Over a path of 6 cm.

**Drying** In air.

**Detection** Treat with *anisaldehyde solution R* and heat at 100 °C for 3 min; examine in ultraviolet light at 365 nm.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Reference solution	Test solution

**TESTS**

**Loss on drying (2.2.32)**

Maximum 11.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

**Total ash (2.4.16)**

Maximum 6.0 per cent.

**Ash insoluble in hydrochloric acid (2.8.1)**

Maximum 1.0 per cent.

**ASSAY**

**Liquid chromatography (2.2.29).**

**Test solution** Disperse 0.100 g of the powdered herbal drug (355) (2.9.12) in 25.0 mL of a 50 per cent *V/V* solution of *methanol R*, weigh. Sonicate for 30 min. Allow to cool and weigh again. Compensate for the loss of solvent with a 50 per cent *V/V* solution of *methanol R*, mix and filter through a membrane filter (nominal pore size 0.45 μm).

**Reference solution (a)** Dissolve 5.0 mg of *mangiferin GRS* in a 50 per cent *V/V* solution of *methanol R* and dilute to 100.0 mL with the same solution.

**Reference solution (b)** Disperse 0.1 g of *Anemarrhena rhizome for system suitability HRS* in 25.0 mL of a 50 per cent *V/V* solution of *methanol R*, weigh. Sonicate for 30 min. Allow to cool and weigh again. Compensate for the loss of solvent with a 50 per cent *V/V* solution of *methanol R*, mix and filter through a membrane filter (nominal pore size 0.45 μm).

**Column:**

— size:  $l = 0.15$  m,  $\varnothing = 4.6$  mm;

— stationary phase: *end-capped octadecylsilyl silica gel for chromatography R* (5 μm).

**Mobile phase** *acetonitrile R*, 0.2 per cent *V/V* solution of *glacial acetic acid R* (15:85 *V/V*).

**Flow rate** 1.0 mL/min.

**Detection** Spectrophotometer at 258 nm.

**Injection** 10 μL.

**Run time** 3 times the retention time of mangiferin.

**Identification of peaks** Use the chromatogram supplied with *Anemarrhena rhizome for system suitability HRS* and the

chromatogram obtained with reference solution (b) to identify the peak due to isomangiferin.

**Retention time** Mangiferin = about 4.0 min;  
isomangiferin = about 4.9 min.

**System suitability** Reference solution (b):

— **resolution**: minimum 3.0 between the peaks due to mangiferin and isomangiferin.

Calculate the percentage content of mangiferin using the following expression:

$$\frac{A_1 \times m_2 \times p \times 0.25}{A_2 \times m_1}$$

- $A_1$  = area of the peak due to mangiferin in the chromatogram obtained with the test solution;  
 $A_2$  = area of the peak due to mangiferin in the chromatogram obtained with reference solution (a);  
 $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;  
 $m_2$  = mass of mangiferin CRS used to prepare reference solution (a), in grams;  
 $p$  = percentage content of mangiferin in mangiferin CRS.

Ph Eur

## Anethum Graveolens Sowa Fruit

### DEFINITION

Anethum Graveolens Sowa Fruit is the dried ripe fruit of *Anethum graveolens* L. Sowa Group.

### Content

It contains not less than 3.0% w/w of essential oil calculated with reference to the anhydrous drug.

### IDENTIFICATION

A. The dried fruits usually occur as separate mericarps, pedicels normally absent; broadly oval, highly compressed dorsally, about 4 mm long, 2 to 3 mm broad, with 5 dorsal ridges, each mericarp exhibiting 3 pale brown dorsal ridges, the two lateral ridges elongated into characteristic membranous wings; surface glabrous; remnants of the stylopod at the apex; commissural surface flat, often with attached, paler brown carphophore; vittae visible as two darker, arc-shaped, longitudinal bands.

B. Reduce to a powder, Appendix XVII A. The powder is pale brown. Examine under a microscope using *chloral hydrate solution*. The powder contains numerous fragments of the epicarp, with cuticular striations and infrequent anomocytic stomata; parquetry layer of endocarp in surface view; endosperm of oval to rectangular thick-walled cells containing oil globules and aleurone grains with embedded microsette crystals of calcium oxalate; fragments of yellowish-brown septate vittae; parenchyma of mesocarp consisting of elongated, lignified, reticulately thickened cells; sclereids of mesocarp thick-walled with few pits.

C. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Add 10 mL of *methanol* (70%) to 0.5 g of the powdered drug (355), mix and place in an ultrasonic bath for 30 minutes. Filter (a 0.45- $\mu$ m PTFE is suitable) into a 10 mL volumetric flask and dilute to 10 mL with *methanol* (70%).

(2) 0.05% w/v each of *carvone* and *dillapiole* in *methanol* (70%).

### CHROMATOGRAPHIC CONDITIONS

(a) Use high-performance *silica gel 60 F<sub>254</sub>* plates (Merck silica gel 60 F<sub>254</sub> HPTLC plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 10  $\mu$ L of each solution as 6 mm bands.

(d) Develop the plate to 8 cm.

(e) After removal of the plate, dry in air, spray with *vanillin reagent*, heat the plate at 110° until the coloured bands appear and examine in daylight.

### MOBILE PHASE

2 volumes of *acetic acid*, 10 volumes of *ethyl acetate* and 88 volumes of *toluene*.

### SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (2) shows two clearly separated bands.

### CONFIRMATION

The chromatogram obtained with solution (1) shows a purple band corresponding in position and colour to the band due to carvone in the chromatogram obtained with solution (2); a brown band corresponding in position and colour to the band due to dillapiole and other bands as shown in the table. Other bands may be present.

Top of the plate	
A faint brown band	
A brown band (dillapiole)	A brown band (dillapiole)
A purple band (carvone)	A purple band (carvone)
A grey band	
<i>Solution (1)</i>	<i>Solution (2)</i>

### TESTS

#### Apiole

Carry out the method for *gas chromatography*, Appendix III B, using the following solutions.

(1) Use the oil retained in the Assay of Essential oil.

(2) 1.0% w/v of *apiole* in *toluene*.

(3) 0.05% w/v of *apiole* in *toluene*.

(4) 0.05% v/v of  $\beta$ -*myrcene* and 0.8% v/v of *limonene* in *toluene*.

### CHROMATOGRAPHIC CONDITIONS

(a) Use a fused silica capillary column (30 m  $\times$  0.53 mm) bonded with a 1  $\mu$ m film thickness, *polyethylene glycol 20,000* (DB-Wax is suitable).

(b) Use *helium* as the carrier gas at 1.5 mL per minute.

(c) Use the gradient conditions described in the table.

(d) Use an inlet temperature of 250°.

(e) Use a flame ionisation detector at a temperature of 260°.

(e) Inject 1  $\mu$ L of each solution.

Time (Minutes)	Temperature	Comment
0-5	60°	isothermal
5-68	60°→250°	linear gradient
68-75	250°	isothermal

**SYSTEM SUITABILITY**

The test is not valid unless, in the chromatogram obtained with solution (4), the *resolution factor* between the peaks due to  $\beta$ -myrcene and limonene, is at least 4.5.

In the chromatogram obtained with solution (4), the substances elute in the following order:  $\beta$ -myrcene and limonene.

The signal-to-noise ratio of the peak due to apiole in solution (3) is at least 3.

**LIMITS**

In the chromatogram obtained with solution (1) the area of any peak due to apiole is not more than the area of the peak due to apiole in the chromatogram obtained with solution (3).

**Water**

Not more than 10.0% v/w, Appendix IX C, method II using 30 g of powdered drug, Appendix XVII A.

**Total Ash**

Not more than 8.0%, Appendix XI J, Method II.

**Chromatographic profile**

Carry out the method for *gas chromatography*, Appendix III B, using the following solutions.

(1) Use the oil retained in the Assay of Essential oil.

(2) 0.4% w/v each of *limonene*, *dihydrocarvone*, *carvone* and *dillapiole* in *toluene*.

(3) 0.05% v/v of  $\beta$ -myrcene and 0.8% v/v of *limonene* in *toluene*.

**CHROMATOGRAPHIC CONDITIONS**

The chromatographic procedure described under the test for Apiole may be used.

**SYSTEM SUITABILITY**

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to  $\beta$ -myrcene and limonene is at least 4.5.

In the chromatogram obtained with solution (2), the substances elute in the following order: limonene, dihydrocarvone isomer 1, dihydrocarvone isomer 2, carvone and dillapiole.

In the chromatogram obtained with solution (3), the substances elute in the following order:  $\beta$ -myrcene and limonene.

**LIMITS**

Calculate the content of limonene, dihydrocarvone, carvone and dillapiole by normalisation. Disregard the peak due to toluene.

**Limits:**

- limonene: 15.0 to 28.0%,
- sum of dihydrocarvone isomers 1 and 2: 5.0 to 30.0%,
- carvone: 20.0 to 45.0%,
- dillapiole: 15.0 to 35.0%.

Disregard any peak with an area less than 0.025 times the area of the peak due to carvone in the chromatogram obtained with solution (2).

**ASSAY****Essential oil**

Carry out the method for *Essential Oils in Herbal Drugs*, Appendix XI E, using 18 g of freshly prepared powdered drug (1400) with 250 mL of *water* as the distillation liquid. Distil at a rate of 2 to 3 mL per minute for 2 hours using 0.50 mL of *toluene* in the graduated tube. Measure the quantity of essential oil distilled and use in the tests for Apiole and Chromatographic profile.

**ANNEX**

*This section is non-mandatory.*

**DNA reference sequence**

A DNA reference sequence for the identity of *Anethum Graveolens* Sowa Fruit is published in *Supplementary Chapter VII D*.

**Angelica Archangelica Root**

(Ph. Eur. monograph 1857)

Ph Eur

**DEFINITION**

Whole or cut, carefully dried rhizome and root of *Angelica archangelica* L. (syn. *A. officinalis* Hoffm.).

**Content**

Minimum 2.0 mL/kg of essential oil (dried drug).

**CHARACTERS**

Bitter taste.

**IDENTIFICATION**

A. The rhizome is greyish-brown or reddish-brown, with occasionally branched roots often with incompletely encircling, transverse ridges. The apex sometimes shows remnants of stem and leaf bases. The fracture is uneven. The transversely cut surface shows a greyish-white, spongy, distinctly radiate bark, in which the secretory channels are visible as brown spots, and a bright yellow or greyish-yellow wood which, in the rhizome, surrounds the greyish or brownish-white pith.

B. Microscopic examination (2.8.23). The powder is brownish-white. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 1857.-1): fragments of cork consisting of several layers of thin-walled, greyish-brown or reddish-brown cells (surface view [C], transverse section [E]); large, yellowish-brown secretory channels, whole or fragmented (transverse section [A], longitudinal section [F]); fragments of medullary rays, 2 or 4 cells wide [G]; fragments of xylem [B] consisting of lignified vessels with reticulate thickening [Ba] occurring singly or in small groups, and unlignified parenchyma in which some of the cells associated with the vessels are collenchymatously thickened. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows numerous, simple starch granules 2-4  $\mu$ m in diameter, free or included in parenchyma cells [D].

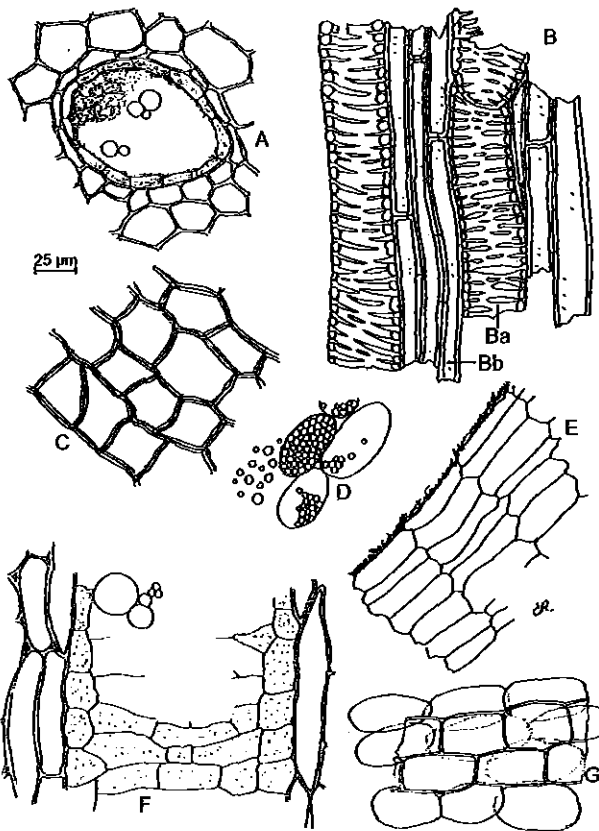

Figure 1857.-1. – Illustration for identification test B of powdered herbal drug of *angelica archangelica* root

C. Examine the chromatograms obtained in the test for other species of *Angelica*, *Levisticum* and *Ligusticum* described in the European Pharmacopoeia.

**Results A** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint fluorescent zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
(Z)-Ligustilide: a bluish-white fluorescent zone	
Osthole: a blue fluorescent zone	A blue fluorescent zone
Imperatorin: a whitish fluorescent zone	A whitish fluorescent zone
	A blue fluorescent zone
	3 blue fluorescent zones
Reference solution	Test solution

**Results B** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint quenching zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
(Z)-Ligustilide: a blue fluorescent zone	
Osthole: a quenching zone	A quenching zone
Imperatorin: a quenching zone	A quenching zone
	A quenching zone
	Several quenching zones
Reference solution	Test solution

#### TESTS

Other species of *Angelica*, *Levisticum* and *Ligusticum* described in the European Pharmacopoeia

Thin-layer chromatography (2.2.27).

**Test solution** To 1 g of the freshly powdered herbal drug (355) (2.9.12) add 4 mL of *heptane R*, close and sonicate for 5 min. Centrifuge the mixture and use the supernatant.

**Reference solution** Dissolve 1 mg of *imperatorin R*, 1 mg of (Z)-*ligustilide R* and 1 mg of *osthole R* in 10 mL of *methanol R*.

**Plate** TLC silica gel F<sub>254</sub> plate R (2–10 µm).

**Mobile phase** *glacial acetic acid R*, *ethyl acetate R*, *toluene R* (1:10:90 V/V/V).

**Application** 4 µL as bands of 8 mm.

**Development** Over a path of 6 cm.

**Drying** In air.

**Detection A** Examine in ultraviolet light at 365 nm.

**Results A** The chromatogram obtained with the test solution shows no zone at the position of (Z)-ligustilide in the chromatogram obtained with the reference solution.

**Detection B** Examine in ultraviolet light at 254 nm.

**Results B** The chromatogram obtained with the test solution shows no zone at or just below the position of (Z)-ligustilide in the chromatogram obtained with the reference solution.

#### Foreign matter (2.8.2)

Maximum 5 per cent of leaf bases and stem bases, maximum 5 per cent of discoloured pieces and maximum 1 per cent of other foreign matter.

#### Loss on drying (2.2.32)

Maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

#### Total ash (2.4.16)

Maximum 10.0 per cent.

#### Ash insoluble in hydrochloric acid (2.8.1)

Maximum 2.0 per cent.

#### ASSAY

##### Essential oil (2.8.12)

Reduce the herbal drug to a powder (500) (2.9.12) and immediately use 40.0 g for the determination. Use a 2 L round-bottomed flask, 10 drops of *liquid paraffin R*, 500 mL of *water R* as distillation liquid and 0.50 mL of *xylene R* in the graduated tube. Distil at a rate of 2–3 mL/min for 4 h.

## Angelica Dahurica Root

(Ph. Eur. monograph 2556)

Ph Eur

### DEFINITION

Dried, whole or fragmented root, with rootlets removed, of *Angelica dahurica* (Hoffm.) Benth. & Hook.f. ex Franch. & Sav. collected in summer or autumn.

### Content

Minimum 0.08 per cent of imperatorin ( $C_{16}H_{14}O_4$ ;  $M_r$  270.3) (dried drug).

### IDENTIFICATION

**A.** The non-fragmented drug consists of conical roots, about 10-25 cm long and 1.2-3.1 cm in diameter. The root crown is sub-quadrangular and obtuse and shows stem scars on prominences. It tapers to the tip. The outer surface is brownish-grey or yellowish-brown and clearly striated longitudinally, showing scars of the rootlets and lenticel-like transverse protuberances, some of them arranged in 4 longitudinal rows. The texture is compact, hard and heavy. The fracture is white or whitish-grey and mealy.

The cambium occurs as a fine-lined, distinct brown ring; it is subrounded, subsquare or subrectangular. Numerous brown to yellowish dots, corresponding to secretory canals, are visible in the cortex.

The fragmented drug occurs as subrounded or subsquare slices with an irregular margin, 1.2-3.1 cm in diameter and 0.1-0.4 cm thick. The cut surface is white, yellowish-white or greyish-white and mealy. The cambium occurs as a fine-lined, distinct brown ring; it is subrounded, subsquare or subrectangular. Numerous brown to yellowish dots, corresponding to secretory canals, are visible in the cortex.

Figure 2556.-1. – Illustration for identification test B of powdered herbal drug of *Angelica dahurica* root

**B.** Microscopic examination (2.8.23). The powder is yellowish-white. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2556.-1): reticulate vessels [B, G], free or in groups of 2 or 3 [G], and accompanied by xylem parenchyma cells with thin cellulose walls [Ba]; numerous fragments of parenchyma with ovoid cells [D]; a few orange cork fragments, consisting of several layers of superimposed cells (surface view [A]); secretory canals (longitudinal section [C], transverse section [F]), usually broken, with yellow or pale brown contents and droplets of essential oil. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows very numerous starch granules varying in size from 5 µm to 25 µm, simple or 2-8 compound; most are polyhedral, either due to compound granules breaking up or to compression in the cells; they are either isolated [E] or included in parenchyma cells [Ea].

**C.** Examine the chromatograms obtained in the test for other officinal species of *Angelica*, *Levisticum* and *Ligusticum*.

**Results A** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint fluorescent zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
(Z)-Ligustilide: a bluish-white fluorescent zone	
	A whitish fluorescent zone
Osthole: a blue fluorescent zone	A blue fluorescent zone
Imperatorin: a whitish fluorescent zone	A whitish fluorescent zone (imperatorin)
	A whitish fluorescent zone
Reference solution	Test solution

**Results B** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint quenching zones may be present in the chromatogram obtained with the test solution, in particular in the lower third of the chromatogram, below the zone due to imperatorin.

Top of the plate	
(Z)-Ligustilide: a blue fluorescent zone	
	A quenching zone
Osthole: a quenching zone	
Imperatorin: a quenching zone	A quenching zone (imperatorin)
Reference solution	Test solution

**Results C** See below the sequence of zones present in the chromatograms obtained with the reference solution and the

test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
(Z)-Ligustilide: a grey zone	2 prominent reddish zones
Osthole: a violet zone	A faint blue zone
Imperatorin: a reddish-grey zone	A yellow and violet double-zone
	A prominent violet zone
	A yellow zone
Reference solution	Test solution

### TESTS

Other official species of *Angelica*, *Levisticum* and *Ligusticum*

Thin-layer chromatography (2.2.27).

**Test solution** To 1 g of the powdered herbal drug (355) (2.9.12) add 4 mL of *heptane R*, close and sonicate for 5 min. Centrifuge the mixture and use the supernatant.

**Reference solution** Dissolve 1 mg of *imperatorin R*, 1 mg of (Z)-*ligustilide R* and 1 mg of *osthole R* in 10 mL of *methanol R*.

**Plate** TLC silica gel  $F_{254}$  plate *R* (2-10  $\mu$ m).

**Mobile phase** *glacial acetic acid R*, *ethyl acetate R*, *toluene R* (1:10:90 V/V/V).

**Application** 4  $\mu$ L as bands of 8 mm.

**Development** Over a path of 6 cm.

**Drying** In air.

**Detection A** Examine in ultraviolet light at 365 nm.

**Results A** The chromatogram obtained with the test solution shows no bluish-white fluorescent zone corresponding to the zone due to (Z)-*ligustilide* in the chromatogram obtained with the reference solution.

**Detection B** Examine in ultraviolet light at 254 nm.

**Results B** The chromatogram obtained with the test solution shows no blue fluorescent zone corresponding to the zone due to (Z)-*ligustilide* in the chromatogram obtained with the reference solution; the chromatogram obtained with the test solution shows no quenching zone corresponding to the zone due to *osthole* in the chromatogram obtained with the reference solution.

**Detection C** Treat with a 10 per cent V/V solution of *sulfuric acid R* in *methanol R*, heat at 100 °C for 5 min and examine in daylight.

**Results C** The chromatogram obtained with the test solution shows no violet zone corresponding to the zone due to *osthole* in the chromatogram obtained with the reference solution.

**Loss on drying** (2.2.32)

Maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

**Total ash** (2.4.16)

Maximum 6.0 per cent.

**Ash insoluble in hydrochloric acid** (2.8.1)

Maximum 1.5 per cent.

### ASSAY

Liquid chromatography (2.2.29).

**Test solution** Disperse 0.400 g of the powdered herbal drug (355) (2.9.12) in 45 mL of *methanol R* and sonicate for 1 h. Cool and dilute to 50.0 mL with *methanol R*. Filter through a membrane filter (nominal pore size 0.45  $\mu$ m).

**Reference solution (a)** Dissolve 5.0 mg of *imperatorin CRS* in *methanol R* and dilute to 50.0 mL with the same solvent. Dilute 1.0 mL of the solution to 10.0 mL with *methanol R*.

**Reference solution (b)** Disperse 80 mg of *Angelica dahurica root HRS* in 9 mL of *methanol R* and sonicate for 1 h. Cool and dilute to 10 mL with *methanol R*. Filter through a membrane filter (nominal pore size 0.45  $\mu$ m).

**Precolumn:**

— size:  $l = 4$  mm,  $\varnothing = 4.0$  mm;

— stationary phase: octadecylsilyl silica gel for chromatography *R* (5  $\mu$ m).

**Column:**

— size:  $l = 0.125$  m,  $\varnothing = 4.0$  mm;

— stationary phase: octadecylsilyl silica gel for chromatography *R* (5  $\mu$ m).

**Mobile phase:**

— mobile phase A: water for chromatography *R*;

— mobile phase B: acetonitrile *R1*;

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 15	45	55
15 - 33	45 → 5	55 → 95
33 - 35	5	95

**Flow rate** 1.0 mL/min.

**Detection** Spectrophotometer at 210 nm.

**Injection** 20  $\mu$ L.

**Identification of peaks** Use the chromatogram supplied with *Angelica dahurica root HRS* and the chromatogram obtained with reference solution (b) to identify the peak due to phellopterin.

**Relative retention** With reference to *imperatorin* (retention time = about 5 min): phellopterin = about 1.1.

**System suitability** Reference solution (b):

— resolution: minimum 1.5 between the peaks due to *imperatorin* and phellopterin.

Calculate the percentage content of *imperatorin* using the following expression:

$$\frac{A_1 \times m_2 \times p}{A_2 \times m_1 \times 10}$$

$A_1$  = area of the peak due to *imperatorin* in the chromatogram obtained with the test solution;

$A_2$  = area of the peak due to *imperatorin* in the chromatogram obtained with reference solution (a);

$m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;

$m_2$  = mass of *imperatorin CRS* used to prepare reference solution (a), in grams;

$p$  = percentage content of *imperatorin* in *imperatorin CRS*.

## Angelica Pubescens Root

(Ph. Eur. monograph 2557)

Ph Eur

### DEFINITION

Whole or fragmented dried root, without rootlets, of *Angelica biserrata* (R.H.Shan & C.Q.Yuan) C.Q.Yuan & R.H.Shan (syn. *Angelica pubescens* Maxim. f. *biserrata* R.H.Shan et C.Q.Yuan), collected in early spring before sprouting, or in the end of autumn when stem and leaves wither.

### Content

Minimum 0.50 per cent of osthole ( $C_{15}H_{16}O_3$ ;  $M_r$  244.3) (dried drug).

### IDENTIFICATION

A. The taproot is more or less cylindrical, branching rapidly into 2-3 or more principal roots at the lower part; the whole is about 5-30 cm long. The root crown is enlarged, with transverse, annulated wrinkles and measures about 0.5-4.5 cm in diameter; it shows the remains of stems, leaves or buds. The greyish-brown or dark brown outer surface is longitudinally wrinkled and shows slightly prominent rootlet scars and transverse lenticel-like protuberances. The fracture shows greyish-yellow bark, with abundant distinct brown dots due to secretory canals that may be radially arranged; the cambium ring is brown and the wood is greyish-yellow or yellowish-brown; fine rod-like crystals may be present on the fractured surface.

The fragmented drug occurs as subrounded or irregular slices, 0.4-3.9 cm in diameter and 0.2-0.6 cm thick. Externally it is greyish-brown or brown, with wrinkles. Fine rod-like crystals may be present on the cut surface. The bark is greyish-white or greyish-brown, with abundant, distinct brown or yellowish-brown dots due to secretory canals that may be radially arranged. The cambium ring is brown.

B. Microscopic examination (2.8.23). The powder is yellowish-brown or brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2557.-1): fragments of vessels up to 90  $\mu$ m in diameter with spiral or reticulate thickenings, free or in groups of 2 or 3 [E]; fragments of parenchyma with polyhedral cells [B]; fragments of phloem parenchyma [C] with fine, sinuous, fusiform cells, about 7-38  $\mu$ m in diameter, with slightly thickened walls and fine, oblique criss-cross striations [Ca], sometimes accompanied by medullary rays [Cb]; orange-brown cork fragments, consisting of several layers of superimposed, somewhat polyhedral cells (surface view [A]); secretory canals, usually broken, with yellow or pale brown contents and droplets of essential oil (transverse section [D], longitudinal section [F]). Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows numerous small, rounded or ovoid, simple starch granules, up to 10  $\mu$ m in diameter, with a punctiform hilum that is visible on the largest granules; a few starch granules consisting of 2-10 components are also present [G].

Figure 2557.-1. – Illustration for identification test B of powdered herbal drug of *Angelica pubescens* root

C. Examine the chromatograms obtained in the test for other official species of *Angelica*, *Levisticum* and *Ligusticum*.

**Results A** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint fluorescent zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
(Z)-Ligustilide: a bluish-white fluorescent zone	A bluish-white fluorescent zone
	A very faint whitish zone
Osthole: a blue fluorescent zone	A prominent blue fluorescent zone (osthole)
Imperatorin: a whitish fluorescent zone	A whitish fluorescent zone (may be missing)
	A blue fluorescent zone
	3 blue fluorescent zones
Reference solution	Test solution

**Results B** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint quenching zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
(Z)-Ligustilide: a blue fluorescent zone	A faint quenching zone
Osthole: a quenching zone	A quenching zone (osthole) A blue fluorescent zone
Imperatorin: a quenching zone	A quenching zone (may be missing) 2 or 3 quenching zones
Reference solution	Test solution

**Results C** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
(Z)-Ligustilide: a grey zone	A prominent reddish zone
Osthole: a violet zone	A violet zone (osthole)
Imperatorin: a grey zone	A violet zone (may be missing) A prominent violet zone A yellow zone
Reference solution	Test solution

## TESTS

Other official species of *Angelica*, *Levisticum* and *Ligusticum*

Thin-layer chromatography (2.2.27).

**Test solution** To 1 g of the powdered herbal drug (355) (2.9.12) add 4 mL of *heptane R*, close and sonicate for 5 min. Centrifuge the mixture and use the supernatant.

**Reference solution** Dissolve 1 mg of *imperatorin R*, 1 mg of (Z)-*ligustilide R* and 1 mg of *osthole R* in 10 mL of *methanol R*.

**Plate** TLC silica gel  $F_{254}$  plate R (2-10  $\mu\text{m}$ ).

**Mobile phase** *glacial acetic acid R*, *ethyl acetate R*, *toluene R* (1:10:90 V/V/V).

**Application** 4  $\mu\text{L}$  as bands of 8 mm.

**Development** Over a path of 6 cm.

**Drying** In air.

**Detection A** Examine in ultraviolet light at 365 nm.

**Results A** The chromatogram obtained with the test solution shows no intense whitish fluorescent zone directly above the position of osthole and no blue fluorescent zone just below the position of imperatorin in the chromatogram obtained with the reference solution.

**Detection B** Examine in ultraviolet light at 254 nm.

**Results B** The chromatogram obtained with the test solution shows no blue fluorescent zone corresponding to the zone due to (Z)-*ligustilide* in the chromatogram obtained with the reference solution.

**Detection C** Treat with a 10 per cent V/V solution of *sulfuric acid R* in *methanol R*, heat at 100 °C for 5 min and examine in daylight.

**Results C** The chromatogram obtained with the test solution shows no zone corresponding to the zone due to (Z)-*ligustilide* in the chromatogram obtained with the reference solution.

**Loss on drying** (2.2.32)

Maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

**Total ash** (2.4.16)

Maximum 8.0 per cent.

**Ash insoluble in hydrochloric acid** (2.8.1)

Maximum 3.0 per cent.

## ASSAY

Liquid chromatography (2.2.29).

**Test solution** Disperse 0.500 g of the powdered herbal drug (355) (2.9.12) in 18 mL of *methanol R* and sonicate for 30 min. Cool and dilute to 20.0 mL with *methanol R*. Mix and filter. Dilute 5.0 mL of the filtrate to 20.0 mL with *methanol R*.

**Reference solution (a)** Dissolve 5.0 mg of *osthole CRS* in *methanol R* and dilute to 100.0 mL with the same solvent.

**Reference solution (b)** Disperse 0.250 g of *Angelica pubescens root HRS* in 9 mL of *methanol R* and sonicate for 30 min. Cool and dilute to 10.0 mL with *methanol R*. Mix and filter. Dilute 5.0 mL of the filtrate to 20.0 mL with *methanol R*.

**Column:**

— size:  $l = 0.125$  m,  $\varnothing = 2.0$  mm;

— stationary phase: *octadecylsilyl silica gel for chromatography R* (4  $\mu\text{m}$ ).

**Mobile phase** *water for chromatography R*, *acetonitrile R* (40:60 V/V).

**Flow rate** 0.23 mL/min.

**Detection** Spectrophotometer at 322 nm.

**Injection** 10  $\mu\text{L}$ .

**Retention time** Osthole = about 8 min.

**System suitability** Reference solution (b):

— resolution: minimum 1.5 between the peak due to osthole and peak 2; use the chromatogram supplied with *Angelica pubescens root HRS* to identify peak 2.

Calculate the percentage content of osthole using the following expression:

$$\frac{A_1 \times m_2 \times p \times 0.8}{A_2 \times m_1}$$

- $A_1$  = area of the peak due to osthole in the chromatogram obtained with the test solution;  
 $A_2$  = area of the peak due to osthole in the chromatogram obtained with reference solution (a);  
 $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;  
 $m_2$  = mass of *osthole CRS* used to prepare reference solution (a), in grams;  
 $p$  = percentage content of osthole in *osthole CRS*.

Ph Eur

## Angelica Sinensis Root

### DEFINITION

Angelica Sinensis Root is the dried whole root of *Angelica sinensis* (Oliv.) Diels. (*Angelica polymorpha* Maxim. var. *sinensis* Oliv.). The dried root consists of the top (uppermost part), main body and small lateral roots (tails).

It is collected in late autumn, removed from rootlets and dried.

It contains not less than 0.1% of Z-ligustilide (C<sub>12</sub>H<sub>14</sub>O<sub>2</sub>), calculated with reference to the dried material.

### IDENTIFICATION

A. The whole root is yellowish-brown to brown, up to 25 cm long, irregularly cylindrical with 3 to 5 or more branch roots arising from the lower end. The upper part is 1.5 to 5 cm in diameter, annulated on the surface and rounded at the apex which may show purple or yellowish-green remains of stems and leaves; the surface of the remainder of the main root is strongly longitudinally wrinkled and has pale, transverse lenticels; the branch roots are 0.3 to 1 cm in diameter in the upper part, twisted and tapering towards the base, the outer surface is strongly striated and has few rootlet scars.

B. Reduce to a powder (355). The powder is pale yellowish to buff. Examine under a microscope using *chloral hydrate solution*. The powder shows brown fragments of cork composed of thin-walled cells; abundant thin-walled parenchyma from the secondary cortex, phloem and medullary rays, some of the phloem cells fusiform with slightly thickened walls; lignified vessels in groups of 2 or 3 associated with small celled and pitted xylem parenchyma; the vessels are up to 80 µm in diameter and have reticulate or scalariform thickening. Examine under a microscope using 50% v/v of *glycerol*. The powder shows small groups of single starch granules, spherical to ovoid, up to about 8 µm in diameter.

C. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Add 4 mL of *heptane* to 1.0 g of the powdered drug, mix with the aid of ultrasound for 5 minutes and filter (use a 0.22 µm membrane filter).

(2) 0.1% w/v of *linoleic acid* in *methanol*.

(3) 0.1% w/v of *ferulic acid* in *methanol*.

(4) 0.1% w/v of Z-ligustilide CRS in *methanol*.

### CHROMATOGRAPHIC CONDITIONS

(a) Use a *silica gel F<sub>254</sub>* precoated plate (Merck silica gel 60 F<sub>254</sub> HPTLC plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 10 µL of solution (1) and 5 µL of solutions (2) to (4), as bands.

(d) Develop the plate to 15 cm.

(e) Remove the plate, allow to dry in a stream of warm air for 5 minutes or until the solvents are completely removed. Examine under *ultraviolet light (254 nm)*. Spray the plate with *methanolic sulfuric acid (5%)*, heat at 105° for 3 minutes and examine in daylight.

### MOBILE PHASE

1 volume of *formic acid*, 10 volumes of *ethyl acetate* and 90 volumes of *toluene*.

### SYSTEM SUITABILITY

When examined under *ultraviolet light (254 nm)* the violet band with an R<sub>f</sub> value of approximately 0.7 the chromatogram obtained with solution (4) corresponds in

colour and position to that in the chromatogram obtained with solution (1). A band with an R<sub>f</sub> value of approximately 0.23 in the chromatogram obtained with solution (3) corresponds in position to a band in the chromatogram obtained with solution (1). Other bands may be present in the chromatogram obtained with solution (1).

### CONFIRMATION

When sprayed with *methanolic sulfuric acid (5%)* the chromatogram obtained with solution (1) shows three spots with similar R<sub>f</sub> values to the spots in the chromatograms obtained with solutions (2), (3) and (4). Other spots may be present in the chromatogram obtained with solution (1).

### TESTS

**Lovage root (*Levisticum officinale*)**

Carry out the method for *gas chromatography*, Appendix III B, using the following solutions.

(1) Extract approximately 20 g of the coarsely powdered drug in a 500 mL round-bottomed flask by hydrodistillation for 2 to 3 hours in 200 mL of *water*, collecting the distillate in suitable glassware. Extract the oily drops on top of the distillate with 5 mL of *toluene*.

(2) 0.2% w/v each of *coumarin* and *eugenol* in *toluene*.

(3) 0.1% w/v of Z-ligustilide CRS in *acetonitrile*.

(4) 0.1% w/v of *benzyl alcohol* in *toluene*.

(5) 0.1% w/v of (-)-*carvone* in *toluene*.

(6) 0.1% w/v of *octanoic acid* in *toluene*.

(7) 0.1% w/v of 3-*propylidene*phthalide in *toluene*.

### CHROMATOGRAPHIC CONDITIONS

(a) Use a fused silica capillary column (50 m × 0.32 mm) bonded with a film (1.05 µm) of 5% phenyl/95% dimethylpolysiloxane (HP 5 is suitable).

(b) Use *helium* as the carrier gas at 1 mL per minute.

(c) Use an oven maintained at an initial temperature of 40° increasing linearly to 220° at a rate of 5° per minute, then maintained at 220°.

(d) Use a split injection system having a split ratio of 1:20 maintained at 250°.

(e) Use a flame ionisation detector maintained at a temperature of 250°.

(f) Inject 1 µL of each solution.

(g) Record the chromatograms for a sufficient length of time to elute all the peaks in the chromatogram obtained with solution (1) (55 minutes may be suitable).

### SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the resolution between coumarin (eluting at approximately 34 minutes) and eugenol (eluting at approximately 37 minutes) is at least 3.0.

### CONFIRMATION

In the chromatogram obtained with solution (1):

- there are no peaks corresponding to the principal peaks in the chromatograms obtained with solutions (4), (5), (6) and (7);
- there is a peak corresponding to the principal peak in the chromatogram obtained with solution (3).

### Loss on drying

When dried at 100° to 105° for 2 hours, loses not more than 12.0% of its weight. Use 1 g.

### Total ash

Not more than 7.0%, Appendix XI J, Method II.

**Acid-insoluble ash**

Not more than 2.0%, Appendix XI K.

**Ethanol-soluble extractive**

Not less than 45%, Appendix XI B1.

**ASSAY**

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Finely powder not less than 5.0 g of the drug being examined. Transfer 0.5 g of the powder into a 25 mL volumetric flask and add 20 mL of *methanol*, place in an ultrasonic bath (maintained at a low temperature by adding ice to the bath) for 100 minutes, equilibrate to ambient temperature and dilute to volume with *methanol*. Centrifuge the solution at 5000 rpm for 5 minutes or until a clear supernatant is obtained. Filter through a 0.45- $\mu$ m filter.

(2) 0.025% w/v of *Z-ligustilide CRS* in *acetonitrile*.

**CHROMATOGRAPHIC CONDITIONS**

(a) Use a stainless steel column (15 cm  $\times$  4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5  $\mu$ m) (Hypersil ODS is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.0 mL per minute.

(d) Use a detection wavelength of 350 nm.

(e) Inject 10  $\mu$ L of each solution.

**MOBILE PHASE**

A mixture of 8 volumes of *water* and 12 volumes of *acetonitrile*.

**SYSTEM SUITABILITY**

Inject solution (2) not less than five times. The test is not valid unless the relative standard deviation of the peak areas of the *Z-ligustilide* peak is not more than 3.0%, the relative standard deviation of the retention times of the *Z-ligustilide* peak is not more than 3.0%. The *column efficiency*, determined on the *Z-ligustilide* peak, is not less than 5000 theoretical plates. The *symmetry factor*, determined on the *Z-ligustilide* peak, is not more than 1.3.

Inject solution (1). The test is not valid unless the *resolution factor* between the *Z-ligustilide* peak and the closest peak (relative retention about 0.9 with respect to *Z-ligustilide*) is not less than 1.5.

**DETERMINATION OF CONTENT**

Using the retention time and the peak area from the chromatograms obtained with solution (2), locate and integrate the peak due to *Z-ligustilide* in the chromatogram obtained with solution (1).

Calculate the content of *Z-ligustilide* in the sample using the declared content of *Z-ligustilide* ( $C_{12}H_{14}O_2$ ) in *Z-ligustilide CRS* and the following expression:

$$\frac{A_1}{A_2} \times \frac{m_2}{V_2} \times \frac{V_1}{m_1} \times p \times \frac{100}{100-d}$$

$A_1$	=	Area of the peak due to <i>Z-ligustilide</i> in the chromatogram obtained with solution (1).
$A_2$	=	Area of the peak due to <i>Z-ligustilide</i> in the chromatogram obtained with solution (2).
$m_1$	=	Weight of the drug being examined in mg.
$m_2$	=	Weight of <i>Z-ligustilide CRS</i> in mg.
$V_1$	=	Dilution volume of solution (1) in mL.
$V_2$	=	Dilution volume of solution (2) in mL.
$p$	=	Percentage content of $C_{12}H_{14}O_2$ in <i>Z-ligustilide CRS</i> .
$d$	=	Percentage loss on drying of the herbal drug being examined.

**STORAGE**

*Angelica Sinensis* Root should be protected from moisture.

**Processed *Angelica Sinensis* Root**

(*Angelica Sinensis* Root, Ph. Eur. monograph 2558)

Ph Eur

**DEFINITION**

Smoke-dried, whole or fragmented root, with rootlets removed, of *Angelica sinensis* (Oliv.) Diels collected in late autumn.

**Content**

Minimum 0.050 per cent of *trans-ferulic acid* ( $C_{10}H_{10}O_4$ ;  $M_r$  194.2) (dried drug).

**IDENTIFICATION**

A. Taproot branching rapidly into 10 or more conical principal roots; the whole is about 15-25 cm long. The annulated root crown is about 1.5-4 cm in diameter; its blunt, rounded tip shows the yellowish-green remains of stems and petioles of leaves. The outer surface is light brownish-yellow or dark brown, lumpy, irregularly striated longitudinally and shows scars of secondary roots and transversal lenticel-like markings. The branching roots have a thick upper part (0.3-1 cm in diameter) and a thin lower part. They are frequently twisted and show few scars of secondary roots. The texture is friable. The fracture, yellowish-white or yellowish-brown, shows a thick bark with some clefts and numerous brown dots due to secretory canals. The cambium occurs as a yellowish-brown ring. The wood is light coloured.

The fragmented roots occur as long strips about 1.5-2 mm thick, 1.5-4 cm wide at the root crown and 10-15 cm long.

B. Microscopic examination (2.8.23). The powder is yellowish-white. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2558.-1): reticulate or scalariform vessels [D] up to 80  $\mu$ m in diameter, free or in groups of 2 or 3 and accompanied by xylem parenchyma cells [Da] and medullary rays [Db]; numerous fragments of parenchyma with ovoid cells [C]; orange cork fragments, consisting of several layers of superimposed cells, more or less rectangular (surface view [A], transverse section [B]); very small calcium oxalate prisms in the cork [Aa], visible in polarised light; secretory canals, often broken, up to 170  $\mu$ m in diameter (transverse section [G], longitudinal section [F]) with orange-yellow contents in droplets [Fa, Ga]. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows small (less than 10  $\mu$ m), simple, rounded or ovoid starch granules, usually included in parenchyma cells [E].

Figure 2558.-1. – Illustration for identification test B of powdered herbal drug of *Angelica sinensis* root

C. Examine the chromatograms obtained in the test for other officinal species of *Angelica*, *Levisticum* and *Ligusticum*.

**Results A** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint fluorescent zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
(Z)-Ligustilide: a bluish-white fluorescent zone	A prominent bluish-white fluorescent zone ((Z)-ligustilide)
Osthole: a blue fluorescent zone	
Imperatorin: a whitish fluorescent zone	
Reference solution	Test solution

**Results B** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint quenching zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
(Z)-Ligustilide: a blue fluorescent zone	A prominent blue fluorescent zone ((Z)-ligustilide)
	A faint quenching zone
Osthole: a quenching zone	A faint quenching zone
Imperatorin: a quenching zone	
Reference solution	Test solution

#### TESTS

Other officinal species of *Angelica*, *Levisticum* and *Ligusticum*

Thin-layer chromatography (2.2.27).

**Test solution** To 1 g of the powdered herbal drug (355) (2.9.12) add 4 mL of *heptane R*, close and sonicate for 5 min. Centrifuge and use the supernatant.

**Reference solution** Dissolve 1 mg of (Z)-ligustilide R, 1 mg of imperatorin R and 1 mg of osthole R in 10 mL of *methanol R*.

**Plate** TLC silica gel F<sub>254</sub> plate R (2–10 µm).

**Mobile phase** glacial acetic acid R, ethyl acetate R, toluene R (1:10:90 V/V/V).

**Application** 4 µL as bands of 8 mm.

**Development** Over a path of 6 cm.

**Drying** In air.

**Detection A** Examine in ultraviolet light at 365 nm.

**Results A** The chromatogram obtained with the test solution shows no intense blue fluorescent zone at or below the position of osthole in the chromatogram obtained with the reference solution.

**Detection B** Examine in ultraviolet light at 254 nm.

**Results B** The chromatogram obtained with the test solution shows no quenching zone at or below the position of imperatorin in the chromatogram obtained with the reference solution.

#### Loss on drying (2.2.32)

Maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

#### Total ash (2.4.16)

Maximum 7.0 per cent.

#### Ash insoluble in hydrochloric acid (2.8.1)

Maximum 2.0 per cent.

#### ASSAY

Liquid chromatography (2.2.29).

**Test solution** Disperse 0.200 g of the powdered herbal drug (355) (2.9.12) in 20.0 mL of a 70 per cent V/V solution of *methanol R* in a conical flask, stopper tightly and weigh. Heat under a reflux condenser for 30 min, cool and weigh again. Compensate the loss of solvent with a 70 per cent V/V solution of *methanol R*, mix well and allow to stand. Filter the supernatant through a membrane filter (nominal pore size 0.45 µm); use the filtrate.

**Reference solution (a)** In a brown-glass volumetric flask, dissolve 10.0 mg of *ferulic acid CRS* in a 70 per cent V/V solution of *methanol R* and dilute to 100.0 mL with the same solvent.

**Reference solution (b)** In order to prepare *cis*-ferulic acid *in situ*, introduce 2 mL of reference solution (a) into a transparent vial and expose to ultraviolet light at 254 nm for about 60 min.

**Column:**

- size:  $l = 0.150$  m,  $\text{Ø} = 2.0$  mm;
- stationary phase: octadecylsilyl silica gel for chromatography R (4  $\mu\text{m}$ );
- temperature: 35 °C.

**Mobile phase** acetonitrile R, 0.085 per cent V/V solution of phosphoric acid R (17:83 V/V).

**Flow rate** 0.23 mL/min.

**Detection** Spectrophotometer at 316 nm.

**Injection** 10  $\mu\text{L}$ .

**Retention time** *trans*-ferulic acid = about 13 min; *cis*-ferulic acid = about 14 min.

**System suitability** Reference solution (b):

- resolution: minimum 1.3 between the peaks due to *trans*-ferulic acid and *cis*-ferulic acid.

Calculate the percentage content of *trans*-ferulic acid using the following expression:

$$\frac{A_1 \times m_2 \times p}{A_2 \times m_1 \times 5}$$

- $A_1$  = area of the peak due to *trans*-ferulic acid in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to *trans*-ferulic acid in the chromatogram obtained with reference solution (a);
- $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;
- $m_2$  = mass of ferulic acid CRS used to prepare reference solution (a), in grams;
- $p$  = percentage content of *trans*-ferulic acid in ferulic acid CRS.

Ph Eur

## Aniseed

Anise

(Ph. Eur. monograph 0262)

When Powdered Aniseed is prescribed or demanded, material complying with the requirements below, with the exception of Identification test A and the test for Foreign matter, shall be dispensed or supplied.

Ph Eur

### DEFINITION

Whole, dry cremocarp of *Pimpinella anisum* L.

### Content

Minimum 20 mL/kg of essential oil (anhydrous drug).

### CHARACTERS

Reminiscent odour of anethole.

The fruit is a cremocarp and generally entire; a small fragment of the thin, rigid, slightly curved pedicel is frequently attached.

### IDENTIFICATION

**A.** The cremocarp is ovoid or pyriform and slightly compressed laterally, yellowish-green or greenish-grey, 3-5 mm long and up to 3 mm wide, surmounted by a stylopod with 2 short, reflexed stylar points. The mericarps are attached by their tops to the carpophore with a plane commissural surface and a convex dorsal surface, the latter being covered with short, warty trichomes visible using a

lens; each mericarp shows 5 primary ridges, running longitudinally, comprising 3 dorsal ridges and 2 lateral ridges, non-prominent, and lighter in colour.

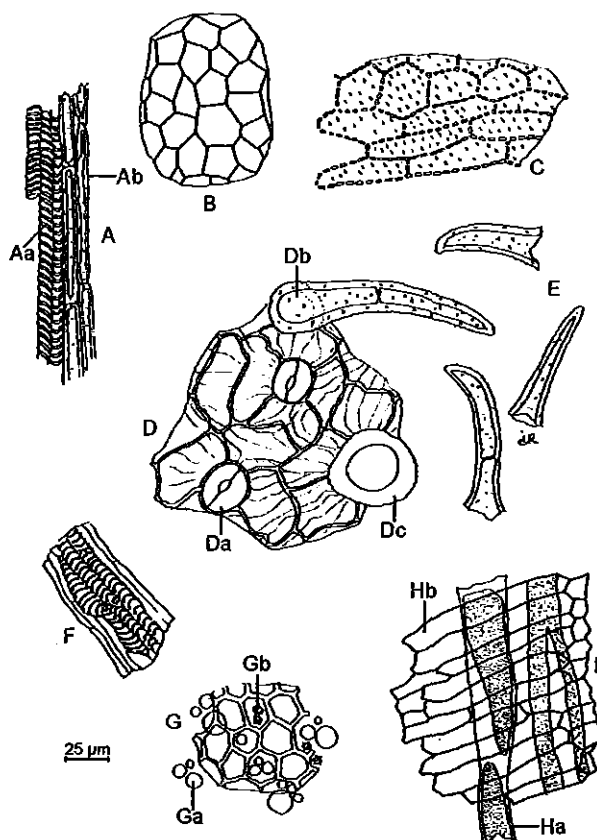

Figure 0262.-1. — Illustration for identification test B of powdered herbal drug of aniseed

**B. Microscopic examination (2.8.23).** The powder is greenish-yellow or brownish-green. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 0262.-1): fragments of epicarp in surface view [D] with a striated cuticle, occasional anomocytic stomata (2.8.3) [Da], bases of covering trichomes [Dc] and whole covering trichomes [Db], mostly unicellular, sometimes curved, with a blunt apex and a warty cuticle; isolated fragments of covering trichomes [E]; fragments [H] of numerous narrow, branched vittae [Ha], often accompanied by elongated cells of the commissural surface [Hb]; fragments of testa [B] consisting of a layer of brown, polyhedral, thin-walled cells; fragments of endosperm [G] containing oil droplets [Ga], aleurone grains and small cluster crystals of calcium oxalate [Gb]; oblong sclereids from the mesocarp [C] or the commissural surface of the fruit; bundles of short sclerenchymatous fibres [A] from the carpophore and the pedicel [Ab], accompanied by vessels with spiral or annular thickening [Aa, F].

**C. Thin-layer chromatography (2.2.27).**

**Test solution** Shake 0.10 g of the powdered herbal drug (1400) (2.9.12) with 2 mL of *methylene chloride R* for 15 min. Filter and carefully evaporate the filtrate to dryness on a water-bath at 60 °C. Dissolve the residue in 0.5 mL of *toluene R*.

**Reference solution** Dissolve 3  $\mu\text{L}$  of *anethole R* and 40  $\mu\text{L}$  of *olive oil R* in 1 mL of *toluene R*.

**Plate** TLC silica gel GF<sub>254</sub> plate R.

*Mobile phase* toluene R.

*Application* 2 µL and 3 µL of the test solution, then 1 µL, 2 µL and 3 µL of the reference solution, at 2 cm intervals.

*Development* Over a path of 10 cm.

*Drying* In air.

*Detection A* Examine in ultraviolet light at 254 nm.

*Results A* The chromatograms show a quenching zone (anethole) in the central part against a light background.

*Detection B* Spray with a freshly prepared 200 g/L solution of phosphomolybdic acid R in ethanol (96 per cent) R, using 10 mL for a 200 mm square plate, and heat at 120 °C for 5 min.

*Results B* The spots due to anethole appear blue against a yellow background. In the chromatogram obtained with 2 µL of the test solution, the spot due to anethole is intermediate in size between the corresponding spots in the chromatograms obtained with 1 µL and 3 µL of the reference solution. The chromatograms obtained with the test solution show in the lower third a blue spot (triglycerides) similar in position to the spot in the lower third of the chromatograms obtained with the reference solution (triglycerides of olive oil).

## TESTS

### Water (2.2.13)

Maximum 90 mL/kg, determined on 20.0 g of the herbal drug reduced to a coarse powder immediately before use.

### Total ash (2.4.16)

Maximum 12.0 per cent.

### Ash insoluble in hydrochloric acid (2.8.1)

Maximum 2.5 per cent.

## ASSAY

### Essential oil (2.8.12)

Use 10.0 g of the herbal drug reduced to a coarse powder immediately before the determination, a 250 mL round-bottomed flask, and 100 mL of water R as the distillation liquid. Place 0.50 mL of xylene R in the graduated tube. Distil at a rate of 2.5-3.5 mL/min for 2 h.

Ph Eur

## Star Anise

(Ph. Eur. monograph 1153)

### Preparation

Concentrated Anise Water

Ph Eur

### DEFINITION

Dried composite fruit of *Illicium verum* Hook.f.

### Content

- minimum 70 mL/kg of essential oil (anhydrous drug),
- minimum 86.0 per cent of *trans*-anethole in the essential oil.

### CHARACTERS

The fruit carpels are brown.

Odour of anethole.

### IDENTIFICATION

A. The fruit generally consists of 8 developed, one-seeded follicles, each 12-22 mm long and 6-12 mm high, radially arranged around a short, central, blunt-ending columella. In some fruits 1 or 2 follicles may be missing, but their

position is clearly visible. Each follicle is boat-shaped or boot-shaped, with a greyish-brown dorsal surface showing rough markings and lateral surfaces bearing scars from the neighbouring follicles. One or more follicles are split open along the ventral suture, exposing a single, lenticular, shiny, reddish-brown seed about 8 mm in diameter. The markings on the dorsal surface are not visible from the ventral surface. Some of the follicles (1-3) may be imperfectly developed. Isolated follicles, pedicels and seeds may be present.

B. Microscopic examination (2.8.23). The powder is reddish-brown. Examine under a microscope using chloral hydrate solution R. The powder shows the following diagnostic characters: brown epicarpal cells, polygonal in surface view, with a strongly striated cuticle and occasional anomocytic stomata (2.8.3); fragments of the endocarp with long palisade-like cells; fragments of the mesocarp with large parenchymatous cells, vessels, oil-containing cells and groups of stone cells; fragments of the seed testa with palisade-like, sclerified, strongly pitted, yellow cells up to 200 µm long; fragments of the columella and the fruit stalk with strongly and irregularly thickened, star-shaped stone cells about 400 µm long and 150 µm wide; rhomboidal or rectangular crystals of calcium oxalate.

C. Examine the chromatograms obtained in test B for *Illicium anisatum* (= *I. religiosum*) and certain other *Illicium* spp.

*Results* See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other weaker zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Caffeic acid: a light blue fluorescent zone	
Quercitrin: a brownish-yellow fluorescent zone	A brownish-yellow fluorescent zone
	A greenish fluorescent zone
Hyperoside: a brownish-yellow fluorescent zone	A brownish-yellow fluorescent zone
Chlorogenic acid: a light blue fluorescent zone	A green fluorescent zone
Rutoside: a brownish-yellow fluorescent zone	A brownish-yellow fluorescent zone
Reference solution	Test solution

### TESTS

*Illicium anisatum* (= *I. religiosum*) and certain other *Illicium* spp

A. Adulteration with *Illicium anisatum* or certain other *Illicium* spp. is indicated by the presence of fruits mainly consisting of more than 8 follicles; fruits either smaller than 2.5 cm or greater than 3.5 cm; follicles with the suture edged with a thickening extending to the neighbouring follicle, or with dorsal markings visible from the ventral surface; follicles somewhat undulate and ending in a fine beak or a small, ventrally turned hook; follicles with a profile fitting into a rectangle; pedicels more than 5 cm long; seedless fruits; seeds either very flat or almost spherical.

**B. Thin-layer chromatography (2.2.27).**

**Test solution** To 2.0 g of the powdered herbal drug (355) (2.9.12) add 10 mL of *methanol R* and heat under a reflux condenser in a water-bath at 60 °C for 5 min. Allow to cool and filter.

**Reference solution** Dissolve 1 mg of *caffeic acid R*, 1 mg of *chlorogenic acid R*, 2.5 mg of *quercitrin R*, 2.5 mg of *ruoside trihydrate R* and 2.5 mg of *hyperoside R* in 10 mL of *methanol R*.

**Plate** TLC silica gel plate R (2-10 µm).

**Mobile phase** *anhydrous formic acid R*, *glacial acetic acid R*, *water R*, *ethyl acetate R* (11:11:26:100 V/V/V/V).

**Application** 5 µL as bands.

**Development** Over a path of 6 cm.

**Drying** In a current of warm air.

**Detection** Spray with a 10 g/L solution of *diphenylboric acid aminoethyl ester R* in *methanol R* and then with a 50 g/L solution of *macrogol 400 R* in *methanol R*; after 30 min, examine in ultraviolet light at 365 nm.

**Results** The chromatogram obtained with the test solution shows no brownish-yellow fluorescent zone at or above the position of the zone due to quercitrin in the chromatogram obtained with the reference solution. No yellow fluorescent zone is seen at or above the position of the zone due to caffeic acid in the chromatogram obtained with the reference solution. No brownish-yellow fluorescent zone is seen directly above the zone due to hyperoside in the chromatogram obtained with the reference solution.

**Water (2.2.13)**

Maximum 100 mL/kg, determined by distillation on 20.0 g of the powdered herbal drug (355) (2.9.12).

**Total ash (2.4.16)**

Maximum 4.0 per cent.

**ASSAY****Essential oil (2.8.12)**

Use a 250 mL round-bottomed flask and 100 mL of *water R* as the distillation liquid. Immediately before the determination, reduce 50.0 g of the drug to a powder (1400) (2.9.12) and mix. Further reduce about 10.0 g of this mixture to a finer powder (710) (2.9.12). Use 2.50 g of the powder for the determination. Introduce 0.50 mL of *xylene R* into the graduated tube. Distil at a rate of 2-3 mL/min for 2 h.

**trans-Anethole**

**Gas chromatography (2.2.28):** use the normalisation procedure.

**Test solution** Dilute the mixture of essential oil and *xylene R* obtained in the assay of essential oil to 5.0 mL with *xylene R* by rinsing the apparatus.

**Reference solution** To 1.0 mL of *xylene R* add 20 µL of *estragole R*, 20 mg of *α-terpineol R* and 60 µL of *anethole R*.

**Column:**

- **material:** fused silica;
- **size:**  $l = 30$  m,  $\varnothing = 0.25$  mm;
- **stationary phase:** *macrogol 20 000 R*.

**Carrier gas** helium for chromatography R.

**Flow rate** 1.0 mL/min.

**Split ratio** 1:100.

**Temperature:**

	Time (min)	Temperature (°C)
Column	0 - 5	60
	5 - 80	60 → 210
	80 - 95	210
Injection port		200
Detector		220

**Detection** Flame ionisation.

**Injection** 1 µL.

**Elution order** Order indicated in the preparation of the reference solution.

**System suitability** Reference solution:

— **resolution:** minimum 5 between the peaks due to estragole and  $\alpha$ -terpineol.

Use the retention times from the chromatogram obtained with the reference solution locate the components of the reference solution in the chromatogram obtained with the test solution.

Calculate the percentage content of *trans*-anethole. Disregard any peak due to the solvent or with an area less than 0.05 per cent of the area of the principal peak in the chromatogram obtained with the test solution.

Ph Eur

**Star Anise Oil**

(Ph. Eur. monograph 2108)

Ph Eur

**DEFINITION**

Essential oil obtained by steam distillation from the dry ripe fruits of *Illicium verum* Hook.f.

**CHARACTERS****Appearance**

Clear, colourless or pale yellow liquid.

**IDENTIFICATION**

**First identification:** B.

**Second identification:** A.

**A. Thin-layer chromatography (2.2.27).**

**Test solution** Dissolve 1 g of the substance to be examined in *toluene R* and dilute to 10 mL with the same solvent.

**Reference solution** Dissolve 10 µL of *linalol R*, 30 µL of *anisaldehyde R* and 200 µL of *anethole R* and in *toluene R* and dilute to 15 mL with the same solvent. Dilute 1 mL of this solution to 5 mL with *toluene R*.

**Plate** TLC silica gel F<sub>254</sub> plate R.

**Mobile phase** *ethyl acetate R*, *toluene R* (7:93 V/V).

**Application** 5 µL as bands of 10 mm (for normal TLC plates) or 2 µL as bands of 10 mm (for fine particle TLC plates).

**Development** Over a path of 15 cm (for normal TLC plates) or over a path of 6 cm (for fine particle size plates).

**Drying** In air.

**Detection** A Examine in ultraviolet light at 254 nm.

**Results** A See below the sequence of zones present in the chromatograms obtained with the reference solution and the

test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Anethole: a quenching zone	A quenching zone, partly separated A very strong quenching zone (anethole)
Anisaldehyde: a quenching zone	A quenching zone (anisaldehyde)
Reference solution	Test solution

**Detection B** Spray with *methyl 4-acetylbenzoate reagent R* and heat at 100–105 °C for 10 min; examine the still hot plate in daylight within 10 min.

**Results B** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Anethole: a brown zone	A violet-brown zone, not fully separated A very strong brown zone (anethole)
Anisaldehyde: a yellow zone	A yellow zone (anisaldehyde)
Linalol: a grey zone	A grey zone (linalol)
Reference solution	Test solution

B. Examine the chromatograms obtained in the test for chromatographic profile.

**Results** The characteristic peaks in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with the reference solution.

#### TESTS

**Relative density (2.2.5)**  
0.979 to 0.985.

**Refractive index (2.2.6)**  
1.553 to 1.556.

**Freezing point (2.2.18)**  
15 °C to 19 °C.

#### Fenchone

Gas chromatography (2.2.28) as described in the test for chromatographic profile with the following modifications.

**Test solution** Dissolve 400 µL of the substance to be examined in 2.0 mL of *hexane R*.

**Reference solution (a)** Dilute 10 µL of *fenchone R* to 1.2 g with *hexane R*.

**Reference solution (b)** Dilute 100 µL of reference solution (a) to 100 mL with *hexane R*.

**System suitability** Reference solution (b):

— *signal-to-noise ratio*: minimum 10 for the principal peak.

**Limit:**

— *fenchone*: maximum 0.01 per cent.

#### Pseudoisoeugenyl 2-methylbutyrate

Gas chromatography (2.2.28) as described in the test for chromatographic profile with the following modifications.

**Test solution** The substance to be examined.

**Reference solution (a)** Dilute 10 mg of the test solution to 1.000 g with *hexane R*. Dilute 0.5 mL of this solution to 100 mL with *hexane R*.

**Reference solution (b)** *Pseudoisoeugenyl 2-methylbutyrate* for peak identification CRS.

**System suitability:**

— the chromatogram obtained with reference solution (b) is similar to the chromatogram provided with *pseudoisoeugenyl 2-methylbutyrate* for peak identification CRS.  
— *signal-to-noise ratio*: minimum 10 for the principal peak in the chromatogram obtained with reference solution (a).

**Limit** Locate the peak due to pseudoisoeugenyl 2-methylbutyrate by comparison with the chromatogram provided with *pseudoisoeugenyl 2-methylbutyrate* for peak identification CRS.

— *pseudoisoeugenyl 2-methylbutyrate*: maximum 0.01 per cent.

#### Fatty oils and resinified essential oils (2.8.7)

It complies with the test for fatty oils and resinified essential oils.

#### Chromatographic profile

Gas chromatography (2.2.28): use the normalisation procedure.

**Test solution** Dissolve 200 µL of the substance to be examined in 1.0 mL of *hexane R*.

**Reference solution** To 1.0 mL of *hexane R*, add 20 µL of *linalol R*, 20 µL of *estragole R*, 20 µL of *α-terpineol R*, 60 µL of *anethole R* and 30 µL of *anisaldehyde R*.

**Column:**

— *material*: fused silica,  
— *size*:  $l = 30$  m,  $\varnothing = 0.25$  mm,  
— *stationary phase*: *macrogol 20 000 R* (film thickness 0.25 µm).

**Carrier gas** *helium for chromatography R*.

**Flow rate** 1.0 mL/min.

**Split ratio** 1:100.

**Temperature:**

	Time (min)	Temperature (°C)
Column	0 - 5	60
	5 - 80	60 → 210
	80 - 95	210
Injection port		200
Detector		220

**Detection** Flame ionisation.

**Injection** 0.2 µL.

**Elution order** Order indicated in the composition of the reference solution; record the retention times of these substances.

**System suitability** Reference solution:

— *resolution*: minimum 1.5 between the peaks due to *estragole* and *α-terpineol*.

Using the retention times determined from the chromatogram obtained with the reference solution, locate the components of the reference solution in the chromatogram obtained with the test solution and locate *cis*-

Figure 2108.-1. – Chromatogram for the test for chromatographic profile of star anise oil

anethole and foeniculin using the chromatogram shown in Figure 2108.-1 (disregard any peak due to hexane).

Determine the percentage content of these components.

The percentages are within the following ranges:

- linalol: 0.2 per cent to 2.5 per cent,
- estragole: 0.5 per cent to 6.0 per cent,
- $\alpha$ -terpineol: maximum 0.3 per cent,
- cis-anethole: 0.1 per cent to 0.5 per cent,
- trans-anethole: 86 per cent to 93 per cent,
- anisaldehyde: 0.1 per cent to 0.5 per cent,
- foeniculin: 0.1 per cent to 3.0 per cent.

#### STORAGE

At a temperature not exceeding 25 °C.

Ph Eur

## Anise Oil

Aniseed Oil

(Ph. Eur. monograph 0804)

#### Preparation

Concentrated Anise Water

Ph Eur

#### DEFINITION

Essential oil obtained by steam distillation from the dry ripe fruits of *Pimpinella anisum* L.

#### CHARACTERS

##### Appearance

Clear, colourless or pale yellow liquid.

##### IDENTIFICATION

First identification: B.

Second identification: A.

A. Thin-layer chromatography (2.2.27).

**Test solution** Dissolve 1 g of the substance to be examined in toluene R and dilute to 10 mL with the same solvent.

**Reference solution** Dissolve 10  $\mu$ L of linalol R, 30  $\mu$ L of anisaldehyde R and 200  $\mu$ L of anethole R in toluene R and dilute to 15 mL with the same solvent. Dilute 1 mL of this solution to 5 mL with toluene R.

**Plate** TLC silica gel F<sub>254</sub> plate R.

**Mobile phase** ethyl acetate R, toluene R (7:93 V/V).

**Application** 5  $\mu$ L as bands of 10 mm (for normal TLC plates) or 2  $\mu$ L as bands of 10 mm (for fine particle size plates).

**Development** Over a path of 15 cm (for normal TLC plates) or over a path of 6 cm (for fine particle size plates).

**Drying** In air.

**Detection A** Examine in ultraviolet light at 254 nm.

**Results A** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Anethole: a quenching zone	A very strong quenching zone (anethole)
	A quenching zone
Anisaldehyde: a quenching zone	A quenching zone (anisaldehyde)
Reference solution	Test solution

**Detection B** Spray with *methyl 4-acetylbenzoate reagent R* and heat at 100-105 °C for 10 min; examine the still hot plate in daylight within 5 min.

**Results B** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Anethole: a brown zone	A violet-brown zone (monoterpene hydrocarbons) (solvent front) A very strong brown zone (anethole), distinctly separated
	A grey zone
Anisaldehyde: a yellow zone	A yellow zone (anisaldehyde)
	A grey zone (linalol)
Linalol: a grey zone	A grey zone
Reference solution	Test solution

B. Examine the chromatograms obtained in the test for chromatographic profile.

**Results** The characteristic peaks in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with the reference solution.

#### TESTS

**Relative density (2.2.5)**  
0.980 to 0.990.

**Refractive index (2.2.6)**  
1.552 to 1.561.

**Freezing point (2.2.18)**  
15 °C to 19 °C.

#### Fenchone

Gas chromatography (2.2.28) as described in the test for chromatographic profile with the following modifications.

**Test solution** Dissolve 400 µL of the substance to be examined in 2.0 mL of *hexane R*.

**Reference solution (a)** Dilute 10 µL of *fenchone R* to 1.2 g with *hexane R*.

**Reference solution (b)** Dilute 100 µL of reference solution (a) to 100 mL with *hexane R*.

**System suitability** Reference solution (b):

— *signal-to-noise ratio*: minimum 10 for the principal peak.

**Limit:**

— *fenchone*: maximum 0.01 per cent.

#### Foeniculin

Gas chromatography (2.2.28) as described in the test for chromatographic profile with the following modifications.

**Test solution** The substance to be examined.

**Reference solution (a)** Dilute 10 mg of the test solution to 1.000 g with *hexane R*. Dilute 0.5 mL of this solution to 100 mL with *hexane R*.

**Reference solution (b)** *Foeniculin for peak identification CRS*.

**System suitability:**

— the chromatogram obtained with reference solution (b) is similar to the chromatogram provided with *foeniculin for peak identification CRS*,

— *signal-to-noise ratio*: minimum 10 for the principal peak in the chromatogram obtained with reference solution (a).

**Limit** Locate the peak due to foeniculin by comparison with the chromatogram provided with *foeniculin for peak identification CRS*.

— *foeniculin*: maximum 0.01 per cent.

#### Fatty oils and resinified essential oils (2.8.7)

It complies with the test for fatty oils and resinified essential oils.

#### Chromatographic profile

Gas chromatography (2.2.28): use the normalisation procedure.

**Test solution** Dissolve 200 µL of the substance to be examined in 1.0 mL of *hexane R*.

**Reference solution** To 1.0 mL of *hexane R*, add 20 µL of *linalol R*, 20 µL of *estragole R*, 20 µL of *α-terpineol R*, 60 µL of *anethole R* and 30 µL of *anisaldehyde R*.

**Column:**

— *material*: fused silica,

— *size*:  $l = 30$  m,  $\varnothing = 0.25$  mm,

— *stationary phase*: *macrogol 20 000 R* (film thickness 0.25 µm).

**Carrier gas** *helium for chromatography R*.

**Flow rate** 1.0 mL/min.

**Split ratio** 1:100.

**Temperature:**

	Time (min)	Temperature (°C)
Column	0 – 5	60
	5 – 80	60 → 210
	80 – 95	210
Injection port		200
Detector		220

**Detection** Flame ionisation.

**Injection** 0.2 µL.

**Elution order** Order indicated in the composition of the reference solution. Record the retention times of these substances.

**System suitability** Reference solution:

— *resolution*: minimum 1.5 between the peaks due to *estragole* and *α-terpineol*.

Using the retention times determined from the chromatogram obtained with the reference solution, locate the components of the reference solution in the chromatogram obtained with the test solution and locate *cis-anethole* and *pseudoisoeugenyl 2-methylbutyrate* using the chromatogram shown in Figure 0804.-1 (disregard any peak due to hexane).

1. linalol  
2. estragole

3.  $\alpha$ -terpineol  
4. cis-anethole

5. trans-anethole  
6. anisaldehyde

7. pseudoisoeugenyl 2-methylbutyrate

Figure 0804.-1. – Chromatogram for the test for chromatographic profile of anise oil

Determine the percentage content of these components.

The percentages are within the following ranges:

- linalol: maximum 1.5 per cent,
- estragole: 0.5 per cent to 5.0 per cent,
- $\alpha$ -terpineol: maximum 1.2 per cent,
- cis-anethole: 0.1 per cent to 0.4 per cent,
- trans-anethole: 87 per cent to 94 per cent,
- anisaldehyde: 0.1 per cent to 1.4 per cent,
- pseudoisoeugenyl 2-methylbutyrate: 0.3 per cent to 2.0 per cent.

#### STORAGE

At a temperature not exceeding 25 °C.

Ph Eur

suitable filtering aid, allow to stand for a few hours, shaking occasionally, and filter.

The water complies with the requirements stated under Aromatic Waters and with the following requirements.

#### TESTS

##### Ethanol content

60 to 64% v/v, Appendix VIII F.

##### Weight per mL

0.898 to 0.908 g, Appendix V G.

## Concentrated Anise Water

#### DEFINITION

Anise Oil or Star Anise Oil	20 mL
Ethanol (90 per cent)	700 mL
Water	Sufficient to produce 1000 mL

#### Extemporaneous preparation

The following directions apply.

Dissolve the Anise Oil or Star Anise Oil in the Ethanol (90 per cent) and add gradually, with vigorous shaking after each addition, sufficient Water to produce 1000 mL.

Add 50 g of previously sterilised Purified Talc, or other

## Arnica Flower

(Ph. Eur. monograph 1391)

#### Preparation

Arnica Tincture

Ph Eur

#### DEFINITION

Whole or partially broken, dried flower-heads of *Arnica montana* L.

#### Content

Minimum 0.40 per cent *m/m* of total sesquiterpene lactones, expressed as dihydrohelenalin tiglactate (dried drug).

#### CHARACTERS

Aromatic odour.

The capitulum, when spread out, is about 20 mm in diameter and about 15 mm deep, and has a peduncle 2-3 cm long. The involucre consists of 18-24 elongated lanceolate bracts, with acute apices, arranged in 1-2 rows: the bracts, about 8-10 mm long, are green with yellowish-green external hairs visible under a lens. The receptacle, about 6 mm in diameter, is convex, alveolate and covered with hairs. Its periphery bears about 20 ligulate florets 20-30 mm long; the disc bears a greater number of tubular florets about 15 mm long. The ovary, 4-8 mm long, is crowned by a pappus of whitish bristles 4-8 mm long. Some brown achenes, crowned or not by a pappus, may be present.

#### IDENTIFICATION

A. The involucre consists of elongated oval bracts with acute apices; the margin is ciliated. The ligulate floret has a reduced calyx crowned by fine, shiny, whitish bristles, bearing small coarse trichomes. The orange-yellow corolla bears 7-10 parallel veins and ends in 3 small lobes. The stamens, with free anthers, are incompletely developed. The narrow, brown ovary bears a stigma divided into 2 branches curving outwards. The tubular floret is actinomorphic. The ovary and the calyx are similar to those of the ligulate floret. The short corolla has 5 reflexed triangular lobes; the 5 fertile stamens are fused at the anthers.

B. Microscopic examination (2.8.23). Separate the capitulum into its different parts. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 1391.-1): the epidermises of the bracts of the involucre [L, M, O, Q] have stomata [Lb, Oa, Qa] and trichomes, more abundant on the outer (abaxial) surface. There are several different types of trichomes: uniseriate multicellular covering trichomes, varying in length from 50-500  $\mu\text{m}$ , particularly abundant on the margins of the bract, whole [La] or fragmented [P]; secretory trichomes with uni- or biseriate multicellular stalks and with multicellular, globular heads, about 300  $\mu\text{m}$  long, abundant on the outer surface of the bract [Qb]; secretory trichomes with multicellular stalks and with multicellular, globular heads, about 80  $\mu\text{m}$  long, abundant on the inner surface of the bract (surface view [Ob], side view [Ma]). The epidermis of the ligulate corolla [C, G, H, J] consists of lobed or elongated cells covered by a striated cuticle [Ga], a few stomata and trichomes of different types: covering trichomes, with very sharp ends, whose length may exceed 500  $\mu\text{m}$ , consisting of 1-3 proximal, thick-walled cells and 2-4 distal, thin-walled cells [C, Hb]; secretory trichomes with biseriate multicellular heads (surface view [Gb], side view [Ja]); secretory trichomes with multicellular stalks and multicellular globular heads [K]. The ligule ends in rounded papillose cells [Ha]. Fragments of the epidermis of the ovary [A, B, D] are covered with trichomes of 2 types: secretory trichomes with short stalks and multicellular globular heads (surface view [Aa], side view [Da]); twinned covering trichomes usually consisting of 2 longitudinally united cells, with common pitted walls (surface view [Ab], side view [Ba]); their ends are sharp and sometimes bifid. The epidermises of the calyx consist of elongated cells bearing short, unicellular, covering trichomes pointing towards the upper end of the bristle [E]. The pollen grains have a diameter of about 30  $\mu\text{m}$ , are rounded, with a spiny exine, and have 3 germinal pores [F, N].

Figure 1391.-1. - Illustration for identification test B of powdered herbal drug of arnica flower

C. Examine the chromatograms obtained in the test for *Calendula officinalis* L. - *Heterotheca inuloides* Cass.

**Results** The chromatogram obtained with the test solution shows, in the middle, a fluorescent blue zone corresponding to the zone due to chlorogenic acid in the chromatogram obtained with the reference solution; it shows, above this zone, 3 fluorescent yellowish-brown or orange-yellow zones, and above these 3 zones a fluorescent greenish-yellow zone due to astragalgin; the zone located below the astragalgin zone is due to isoquercitroside; the zone located just below this zone is due to luteolin-7-glucoside; it also shows a fluorescent greenish-blue zone below the zone due to caffeic acid in the chromatogram obtained with the reference solution.

#### TESTS

##### Foreign matter (2.8.2)

Maximum 5.0 per cent.

*Calendula officinalis* L. - *Heterotheca inuloides* Cass  
Thin-layer chromatography (2.2.27).

**Test solution** To 2.00 g of the powdered herbal drug (710) (2.9.12) add 10 mL of methanol R. Heat in a water-bath at 60 °C for 5 min with shaking. Cool and filter.

**Reference solution** Dissolve 2.0 mg of caffeic acid R, 2.0 mg of chlorogenic acid R and 5.0 mg of rutoside trihydrate R in methanol R and dilute to 30 mL with the same solvent.

**Plate** TLC silica gel plate R.

**Mobile phase** anhydrous formic acid R, water R, methyl ethyl ketone R, ethyl acetate R (10:10:30:50 V/V/V/V).

**Application** 15 µL as bands.

**Development** Over a path of 15 cm.

**Drying** In air for a few minutes.

**Detection** Spray with a 10 g/L solution of diphenylboric acid aminoethyl ester R in methanol R, and then with a 50 g/L solution of macrogol 400 R in methanol R; heat at 100-105 °C for 5 min, allow to dry in air and examine in ultraviolet light at 365 nm.

**Results** The chromatogram obtained with the reference solution shows in the lower part an orange-yellow fluorescent zone due to rutoside, in the middle part a fluorescent zone due to chlorogenic acid and in the upper part a light bluish fluorescent zone due to caffeic acid; the chromatogram obtained with the test solution does not show a fluorescent orange-yellow zone corresponding to the zone due to rutoside in the chromatogram obtained with the reference solution, nor does it show a zone below this.

##### Loss on drying (2.2.32)

Maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

##### Total ash (2.4.16)

Maximum 10.0 per cent.

#### ASSAY

Liquid chromatography (2.2.29).

**Internal standard solution** Dissolve immediately before use 0.010 g of santonin CRS, accurately weighed, in 10.0 mL of methanol R.

**Test solution** Introduce 1.00 g of the powdered herbal drug (355) (2.9.12) into a 250 mL round-bottomed flask, add 50 mL of a mixture of equal volumes of methanol R and water R and heat under a reflux condenser in a water-bath at 50-60 °C for 30 min, shaking frequently. Allow to cool and filter through a paper filter. Add the paper filter, cut into pieces, to the residue in the round-bottomed flask, add 50 mL of a mixture of equal volumes of methanol R and water R and heat under a reflux condenser in a water-bath at

50-60 °C for 30 min, shaking frequently. Repeat this procedure twice. To the combined filtrates add 3.00 mL of the internal standard solution and evaporate to 18 mL under reduced pressure. Rinse the round-bottomed flask with water R and dilute, with the washings, to 20.0 mL. Transfer the solution to a chromatography column about 0.15 m long and about 30 mm in internal diameter containing 15 g of kieselguhr for chromatography R. Allow to stand for 20 min. Elute with 200 mL of a mixture of equal volumes of ethyl acetate R and methylene chloride R. Evaporate the eluate to dryness in a 250 mL round-bottomed flask. Dissolve the residue in 10.0 mL of methanol R and add 10.0 mL of water R. Add 7.0 g of neutral aluminium oxide R, shake for 120 s, centrifuge at 5000 g for 10 min and filter through a paper filter. Evaporate 10.0 mL of the filtrate to dryness. Dissolve the residue in 3.0 mL of a mixture of equal volumes of methanol R and water R and filter.

##### Column:

— size:  $l = 0.12$  m,  $\varnothing = 4$  mm;

— stationary phase: octadecylsilyl silica gel for chromatography R (4 µm).

##### Mobile phase:

— mobile phase A: water R;

— mobile phase B: methanol R;

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 3	62	38
3 - 20	62 → 55	38 → 45
20 - 30	55	45
30 - 55	55 → 45	45 → 55
55 - 57	45 → 0	55 → 100
57 - 70	0	100
70 - 90	62	38

**Flow rate** 1.2 mL/min.

**Detection** Spectrophotometer at 225 nm.

**Injection** 20 µL loop injector.

Calculate the percentage content of total sesquiterpene lactones, expressed as dihydrohelenalin tiglate, using the following expression:

$$\frac{S_{LS} \times C \times V \times 1.187 \times 100}{S_S \times m \times 1000}$$

$S_{LS}$	=	area of all peaks due to sesquiterpene lactones appearing after the santonin peak in the chromatogram obtained with the test solution;
$S_S$	=	area of the peak due to santonin in the chromatogram obtained with the test solution;
$m$	=	mass of the herbal drug to be examined, in grams;
$C$	=	concentration of santonin in the internal standard solution used for the test solution, in milligrams per millilitre;
$V$	=	volume of the internal standard solution used for the test solution, in millilitres;
1.187	=	peak correlation factor between dihydrohelenalin tiglate and santonin.

Ph Eur

## Arnica Tincture

(Ph. Eur. monograph 1809)

Ph Eur

### DEFINITION

Tincture produced from *Arnica flower* (1391).

### Content

Minimum 0.04 per cent of sesquiterpene lactones expressed as dihydrohelenalin tiglate ( $C_{20}H_{26}O_5$ ;  $M_r$  346.42).

### PRODUCTION

The tincture is produced from the herbal drug by a suitable procedure using 10 parts of ethanol (60-70 per cent *V/V*) for 1 part of drug.

### CHARACTERS

#### Appearance

Yellowish-brown liquid.

### IDENTIFICATION

Examine the chromatograms obtained in the test for *Calendula officinalis* - *Heterotheca inuloides*.

Chromatogram obtained with the test solution:

- in the middle, a fluorescent blue zone corresponding to the zone due to chlorogenic acid in the chromatogram obtained with the reference solution;
- above this zone, 3 fluorescent yellowish-brown to orange-yellow zones, and above these 3 zones a fluorescent greenish-yellow zone corresponding to astragalín; the zone located below the astragalín zone corresponds to isoquercitrín; the zone located just below this zone corresponds to luteolin-7-glucoside;
- a fluorescent greenish-blue zone below the zone due to caffeic acid in the chromatogram obtained with the reference solution.

### TESTS

*Calendula officinalis* - *Heterotheca inuloides*

Thin-layer chromatography (2.2.27).

**Test solution** The tincture to be examined.

**Reference solution** Dissolve 2.0 mg of *caffeic acid R*, 2.0 mg of *chlorogenic acid R* and 5.0 mg of *rutoside trihydrate R* in *methanol R* and dilute to 30.0 mL with the same solvent.

**Plate** TLC silica gel plate R (5-40  $\mu$ m) [or TLC silica gel plate R (2-10  $\mu$ m)].

**Mobile phase** *anhydrous formic acid R*, *water R*, *methyl ethyl ketone R*, *ethyl acetate R* (10:10:30:50 *V/V/V/V*).

**Application** 30  $\mu$ L [or 8  $\mu$ L] as bands.

**Development** Over a path of 15 cm [or 8 cm].

**Drying** At 80-105 °C.

**Detection** Spray the plate whilst still hot with a 10 g/L solution of *diphenylboric acid aminoethyl ester R* in *methanol R* and then with a 50 g/L solution of *macrogol 400 R* in *methanol R*; heat 5 min at 100-105 °C, allow the plate to dry in air and examine in ultraviolet light at 365 nm.

**Results** The chromatogram obtained with the reference solution shows in the lower part an orange-yellow fluorescent zone (rutoside), in the middle part a fluorescent zone due to chlorogenic acid and in the upper part a light bluish fluorescent zone (caffeic acid). The chromatogram obtained with the test solution does not show any fluorescent orange-yellow zone corresponding to rutoside in the chromatogram obtained with the reference solution and no zone below the zone corresponding to rutoside.

### Ethanol (2.9.10)

The final ethanol concentration is not less than 90 per cent of that of the initial extraction solvent.

### Methanol and 2-propanol (2.9.11)

Maximum 0.05 per cent *V/V* of methanol and maximum 0.05 per cent *V/V* of 2-propanol.

### Dry residue (2.8.16)

Minimum 1.7 per cent.

### ASSAY

Liquid chromatography (2.2.29).

**Internal standard solution** Dissolve immediately before use 0.010 g accurately weighed of *santonin CRS* and 0.02 g of *butyl 4-hydroxybenzoate R* in 10.0 mL of *methanol R*.

**Test solution** In a round-bottomed flask introduce 5.00 g of the tincture to be examined, add 2.00 mL of the internal standard solution and 3 g of *anhydrous aluminium oxide R*, shake for 120 s and filter through a filter paper. Rinse the round-bottomed flask and filter with 5 mL of a mixture of equal volumes of *methanol R* and *water R* and filter. Evaporate the filtrate to dryness. Dissolve the residue in 2.0 mL of a mixture of 20 volumes of *water R* and 80 volumes of *methanol R* and filter through a membrane filter (nominal pore size 0.45  $\mu$ m).

**Reference solution** Dissolve 0.02 g of *methyl 4-hydroxybenzoate R* and 0.02 g of *ethyl 4-hydroxybenzoate R* in *methanol R* and dilute to 10.0 mL with the same solvent.

### Column:

- size:  $l = 0.12$  m,  $\varnothing = 4$  mm;
- stationary phase: end-capped octadecylsilyl silica gel for chromatography R (5  $\mu$ m);
- temperature: 20 °C.

### Mobile phase:

- mobile phase A: *water R*;
- mobile phase B: *methanol R*;

Time (min)	Mobile phase A (per cent <i>V/V</i> )	Mobile phase B (per cent <i>V/V</i> )
0 - 3	62	38
3 - 20	62 → 55	38 → 45
20 - 30	55	45
30 - 55	55 → 45	45 → 55

**Flow rate** 1.2 mL/min.

**Detector** Spectrophotometer at 225 nm.

**Injection** 20  $\mu$ L.

**Relative retention** With reference to santonin (retention time = about 9.5 min): butyl 4-hydroxybenzoate = about 4.6.

**System suitability** Reference solution:

- resolution: minimum 5 between the peaks due to methyl 4-hydroxybenzoate and ethyl 4-hydroxybenzoate.

Calculate the percentage of lactone sesquiterpenes, expressed as dihydrohelenalin tiglate, using the following expression:

$$\frac{F_1 \times C \times V \times 1.187}{F_2 \times m \times 10}$$

- $F_1$  = area of all peaks appearing between the peaks due to santonin and butyl 4-hydroxybenzoate in the chromatogram obtained with the test solution;
- $F_2$  = area of the peak due to santonin in the chromatogram obtained with the test solution;
- $m$  = mass of the tincture to be examined, in grams;
- $C$  = concentration of santonin in the internal standard solution used to prepare the test solution, in milligrams per millilitre;
- $V$  = volume of the internal standard solution used to prepare the test solution, in millilitres;

1.187 = peak correlation factor between dihydrohelenalin tiglate and santonin.

Ph Eur

## Artichoke Leaf

(Ph. Eur. monograph 1866)

### Preparation

Artichoke Leaf Dry Extract

Ph Eur

### DEFINITION

Whole or cut, dried leaf of *Cynara cardunculus* L. (syn. *C. scolymus* L.).

### Content

Minimum 0.7 per cent of chlorogenic acid ( $C_{16}H_{18}O_9$ ;  $M_r$  354.3) (dried drug).

### IDENTIFICATION

A. The entire leaf may be up to 70 cm long and 30 cm wide. The lamina is deeply lobed in the upper part to within 1-2 cm of the petiole on either side, in the lower part the leaf becomes pinnate; all the segments have markedly dentate margins and taper at the apex. Spines are absent. The upper surface of the lamina is green with a fine covering of whitish hairs, the lower surface is pale green or white and densely tomentose with long, tangled hairs. The petiole and main veins are flat on the upper surface, prominently raised and longitudinally ridged on the lower surface, with conspicuous hairs on both surfaces.

Figure 1866.-1. – Illustration for identification test B of powdered herbal drug of artichoke leaf

B. Microscopic examination (2.8.23). Reduce to a powder (1000) (2.9.12). The powder is greenish-grey. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 1866.-1): fragments of the epidermises of the lamina, in surface view; the upper epidermis [F] is composed of cells with straight or slightly sinuous walls [Fa], accompanied by palisade parenchyma [Fb]; the lower epidermis [C] is composed of more sinuous-walled cells; abundant anomocytic stomata (2.8.3) on both surfaces [D] and multicellular, uniseriate covering trichomes in felted masses, the majority fragmented [Ca] with a short stalk composed of several cells and a very long, narrow and frequently curled terminal cell, others consisting of 4-6 cylindrical cells; very occasional glandular trichomes with a short stalk and a uniseriate or biseriate head (surface view [E], transverse section [Ba]); abundant fragments of covering trichomes [G]; fragments of the lamina (transverse section [B]); abundant fragments of vascular tissue from the petiole and veins [A].

C. Thin-layer chromatography (2.2.27).

**Test solution** To 2.0 g of the powdered herbal drug (1000) (2.9.12) add 20 mL of *ethanol (60 per cent V/V) R*. Allow to stand for 2 h with occasional stirring. Filter.

**Reference solution** Dissolve 5 mg of *luteolin-7-glucoside R* and 5 mg of *chlorogenic acid CRS* in *methanol R* and dilute to 10 mL with the same solvent.

**Plate** *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

**Mobile phase** *anhydrous formic acid R, glacial acetic acid R, water R, ethyl acetate R* (11:11:27:100 V/V/V/V).

**Application** 10 µL [or 2 µL] as bands of 10 mm [or 8 mm].

**Development** Over a path of 13 cm [or 6 cm].

**Drying** In air.

**Detection** Heat at 100 °C for 5 min; treat the warm plate with a 10 g/L solution of *diphenylboric acid aminoethyl ester R* in *methanol R* followed by a 50 g/L solution of *macrogol 400 R* in *methanol R*; examine in ultraviolet light at 365 nm.

**Results** See below the sequence of fluorescent zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other fluorescent zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
	A light blue fluorescent zone
Luteolin-7-glucoside: a yellow or orange fluorescent zone	A yellow or orange fluorescent zone (luteolin-7-glucoside)
Chlorogenic acid: a light blue fluorescent zone	A light blue fluorescent zone (chlorogenic acid)
Reference solution	Test solution

### TESTS

**Total ash** (2.4.16)

Maximum 20.0 per cent.

**Loss on drying** (2.2.32)

Maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (710) (2.9.12) by drying in an oven at 105 °C for 2 h.

**ASSAY**

Liquid chromatography (2.2.29).

*Solvent mixture* methanol R, water R (30:70 V/V).*Test solution* To 0.500 g of the powdered herbal drug (1000) (2.9.12) add 50.0 mL of methanol R and heat under a reflux condenser on a water-bath at 70 °C for 1 h. Centrifuge and transfer the supernatant to a 200 mL volumetric flask. Repeat the procedure and dilute to 200.0 mL with water R.*Reference solution (a)* Dissolve 5.0 mg of chlorogenic acid CRS in 50.0 mL of methanol R. Transfer 5.0 mL of this solution to a volumetric flask, add 5 mL of methanol R and dilute to 20.0 mL with water R.*Reference solution (b)* Dissolve 30 mg of artichoke leaf dry extract HRS in the solvent mixture and dilute to 25.0 mL with the solvent mixture.*Column:*

- size:  $l = 0.25$  m,  $\varnothing = 4.6$  mm;

## Ash Leaf

(Ph. Eur. monograph 1600)

Ph Eur

### DEFINITION

Dried leaf of *Fraxinus excelsior* L. or *Fraxinus angustifolia* Vahl (syn. *Fraxinus oxyphylla* M. Bieb) or of hybrids of these 2 species or of a mixture.

### Content

Minimum 2.5 per cent of total hydroxycinnamic acid derivatives, expressed as chlorogenic acid ( $C_{16}H_{18}O_9$ ;  $M_r$  354.3) (dried drug).

### IDENTIFICATION

A. The leaf consists of leaflets that are sometimes detached and separated from the rachis. The leaflet is about 6 cm long and 3 cm wide. Each leaflet is subsessile or shortly petiolate, oblong, lanceolate, somewhat unequal at the base, acuminate at the apex, with fine, acute teeth on the margins; the upper surface is dark green and the lower surface is greyish-green. The midrib and secondary veins are whitish and prominent on the lower surface.

B. Microscopic examination (2.8.23). The powder is greyish-green. Examine under a microscope using chloral hydrate solution R. The powder shows the following diagnostic characters (Figure 1600.-1): fragments of the upper epidermis of the lamina (surface view [B]), with some of the cells showing cuticular striations, accompanied by underlying palisade parenchyma [Ba]; fragments of the lower epidermis in surface view [A] consisting of cells covered by fine cuticular striations [Aa], numerous anomocytic stomata (2.8.3) [Ab] and rare peltate glandular trichomes with a unicellular stalk and a glandular head composed of radiating cells [Ac]; fragments of lamina in transverse section [F] with 2 layers of palisade parenchyma [Fa], spongy parenchyma [Fb] and, occasionally, glandular trichomes embedded in the epidermis [Fc]; occasional multicellular, uniseriate, conical covering trichomes composed of cells with thick striated walls, either on an epidermis [C] or fragmented [D]; fragments of vascular tissue from the leaflets [E] composed of spiral vessels [Ea], short fibres [Eb] and sometimes palisade parenchyma [Ec]; fragments of vascular tissue from the veins [G] composed of fibres [Ga], sometimes accompanied by cells with thick, pitted walls from the medullary rays [Gb].

C. Examine the chromatograms obtained in the test for *Fraxinus ornus*.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. The intensity of the zones present in the chromatogram obtained with the test solution may vary depending on the presence of *F. excelsior*, *F. angustifolia*, their hybrids or their concentration in a mixture. Furthermore, other fluorescent zones may be present in the chromatogram obtained with the test solution.

Rutoside: an orange fluorescent zone	A light blue fluorescent zone An orange fluorescent zone (rutoside)
Reference solution	Test solution

## TESTS

### Foreign matter (2.8.2)

Maximum 3.0 per cent of stems and maximum 2.0 per cent of other foreign matter.

### Fraxinus ornus

Thin-layer chromatography (2.2.27).

**Test solution** To 1 g of the powdered herbal drug (355) (2.9.12) add 20 mL of *methanol R*. Stir with a magnetic stirrer for 10 min. Filter.

**Reference solution** Dissolve 5 mg of *rutoside trihydrate R* and 5 mg of *chlorogenic acid R* in 10 mL of *methanol R*.

**Plate** TLC silica gel plate R (5-40 µm) [or TLC silica gel plate R (2-10 µm)].

**Mobile phase** *anhydrous formic acid R*, *water R*, *ethyl acetate R* (10:10:80 V/V/V).

**Application** 10 µL [or 4 µL] as bands of 10 mm [or 8 mm].

**Development** Over a path of 10 cm [or 6 cm].

**Drying** In air.

**Detection** Heat at 100 °C for 3 min; treat the still-warm plate with a 10 g/L solution of *diphenylboric acid aminoethyl ester R* in *methanol R*; dry in air; treat with a 50 g/L solution of *macrogol 400 R* in *methanol R*; dry in air; examine in ultraviolet light at 365 nm.

**Results** The chromatogram obtained with the test solution does not show any intense light blue fluorescent zones in the upper third of the chromatogram.

**Loss on drying (2.2.32)**

Maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

**Total ash (2.4.16)**

Maximum 12.0 per cent.

## ASSAY

**Test solution (a)** To 0.300 g of the powdered herbal drug (355) (2.9.12) add 95 mL of *ethanol (50 per cent V/V) R*. Boil in a water-bath under a reflux condenser for 30 min. Allow to cool and filter. Rinse the filter with 5 mL of *ethanol (50 per cent V/V) R*. Combine the filtrate and the rinsings in a volumetric flask and dilute to 100.0 mL with *ethanol (50 per cent V/V) R*.

**Test solution (b)** To 1.0 mL of test solution (a) in a test tube, add 2 mL of 0.5 M *hydrochloric acid*, 2 mL of a solution prepared by dissolving 10 g of *sodium nitrite R* and 10 g of *sodium molybdate R* in 100 mL of *water R*, then add 2 mL of *dilute sodium hydroxide solution R* and dilute to 10.0 mL with *water R*; mix.

Immediately measure the absorbance (2.2.25) of test solution (b) at 525 nm, using as compensation liquid a solution prepared as follows: mix 1.0 mL of test solution (a), 2 mL of 0.5 M *hydrochloric acid*, 2 mL of *dilute sodium hydroxide solution R* and dilute to 10.0 mL with *water R*.

Calculate the percentage content of total hydroxycinnamic acid derivatives, expressed as chlorogenic acid, using the following expression:

$$\frac{A \times 5.3}{m}$$

taking the specific absorbance of chlorogenic acid to be 188.

*A* = absorbance at 525 nm;  
*m* = mass of the herbal drug to be examined, in grams.

Ph Eur

## Astragalus Mongholicus Root

(Ph. Eur. monograph 2435)

Ph Eur

## DEFINITION

Whole or fragmented, dried root of *Astragalus mongholicus* Bunge with secondary roots and root crown removed.

## Content

Minimum 0.040 per cent of astragaloside IV (C<sub>41</sub>H<sub>68</sub>O<sub>14</sub>; M<sub>r</sub> 785) (dried drug).

**IDENTIFICATION**

A. Cylindrical, often with branches, upper part relatively thick, 30-90 cm long and 1-3.5 cm in diameter. Externally pale brownish-yellow or pale brown, with irregular, longitudinal wrinkles or furrows. Texture hard and tenacious; uneasily broken, fracture highly fibrous and weakly (cultivated origin) or strongly starchy (wild origin), bark yellowish-white, wood pale yellow, with radiate striations and fissures; the central region is dark brown and in older roots may be broken down to form a hollow surrounded by fragments of disintegrating tissue.

Figure 2435.-1. – Illustration for identification test B of powdered herbal drug of astragalus mongholicus root

B. Microscopic examination (2.8.23). The powder is yellowish-white. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2435.-1): fibres, isolated [A] or in groups [C], 8-30 µm in diameter, with thick walls having longitudinal striations on the surface, the primary walls [Aa] sometimes separated from the secondary walls [Ab] with the ends of the fibres often broken and fibrous [Ac], rounded or slightly truncated [Ca]; vessels [G] are annular [Ga], reticulate [Gb] or bordered-pitted with closely spaced pits [D], colourless or orange; rare sclereids [F], rounded, oblong or irregular, with slightly thickened walls; cork fragments with polygonal cells (surface view [B]); numerous medullary rays with thin-walled cells [E]. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows small (less than 10 µm), simple, rounded or ovoid starch granules, usually included in parenchyma cells [H].

C. Thin-layer chromatography (2.2.27).

**Test solution** Heat 3 g of the powdered herbal drug (355) (2.9.12) with 50 mL of *methanol R* for 50 min under reflux and then filter. Evaporate the filtrate under reduced pressure to dryness and take up the residue in 1 mL of *water R*. Apply the solution to a 6 mL solid phase extraction column

containing *octadecylsilyl silica gel for chromatography R* previously conditioned with 3 mL of *methanol R* and then with 3 mL of *water R*. Wash the column with 15 mL of *water R* followed by 15 mL of a 30 per cent *V/V* solution of *methanol R*. Discard the washings. Elute with 20 mL of *methanol R* and collect the eluate. Evaporate the eluate under reduced pressure to dryness and take up the residue with 2 mL of *methanol R*.

**Reference solution** Dissolve 10.0 mg of *daidzin R* and 5.0 mg of *daidzein R* in 5.0 mL of *methanol R*.

**Plate** TLC silica gel  $F_{254}$  plate R (2-10 µm).

**Mobile phase** *water R*, *methanol R*, *ethyl acetate R* (10:13.5:100 *V/V/V*).

**Application** 3 µL as bands of 8 mm.

**Development** Over a path of 7 cm.

**Drying** In air.

**Detection A** Examine in ultraviolet light at 254 nm.

**Results A** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Daidzein: a quenching zone	A blue fluorescent zone
	A quenching zone
Daidzin: a quenching zone	A quenching zone
	A quenching zone

**Detection B** Treat with *anisaldehyde solution R*. Heat at 100 °C for 3 min. Examine in ultraviolet light at 366 nm.

**Results B** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Daidzein: a pale blue zone	A violet zone
	A violet zone
Daidzin: a pale blue zone	A violet zone
	A brown zone
	5 brown zones
Reference solution	Test solution

**TESTS**

**Foreign matter (2.8.2)**

Maximum 5 per cent.

**Loss on drying (2.2.32)**

Maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 3 h.

**Total ash (2.4.16)**

Maximum 5.0 per cent.

**Ash insoluble in hydrochloric acid (2.8.1)**

Maximum 1.0 per cent.

**ASSAY**

Liquid chromatography (2.2.29).

**Test solution** To 4.000 g of the powdered herbal drug (355) (2.9.12) add 25 mL of *methanol R* and sonicate at 80 °C for 30 min. Centrifuge for 7 min and transfer the supernatant to a round-bottomed flask. Add to the residue 25 mL of *methanol R* and sonicate at 80 °C for 30 min. Centrifuge for 7 min and add the supernatant to the same round-bottomed flask. Repeat this operation once. Combine the 3 fractions of supernatant and evaporate to dryness. Dissolve the residue in 10 mL of *water R* using sonication if necessary. Transfer the solution to a separating funnel and shake with 4 quantities, each of 40 mL, of *butanol R* saturated with *water R*. Combine the butanol extracts and wash with 2 quantities, each of 40 mL, of *ammonia R*. Discard the ammonia layers and evaporate the butanol layers to dryness. Dissolve the residue in 5.0 mL of *methanol R* and filter through a membrane filter (nominal pore size 0.45 µm).

**Reference solution (a)** Dissolve 10.0 mg of *astragaloside IV CRS* in *methanol R* and dilute to 10.0 mL with the same solvent.

**Reference solutions (b), (c); (d)** Dilute reference solution (a) to obtain 3 reference solutions of *astragaloside IV*, the concentrations of which span the expected value in the test solution.

**Reference solution (e)** Dissolve 5.0 mg of *ginsenoside Rb1 R* in 5 mL of *methanol R* and dilute to 10.0 mL with reference solution (a).

**Column:**

- size:  $l = 0.25$  m,  $\varnothing = 3.2$  mm;
- stationary phase: octadecylsilyl silica gel for chromatography R (3 µm);
- temperature: 25 °C.

**Mobile phase:**

- mobile phase A: *water R*;
- mobile phase B: *acetonitrile R*;

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 5	90	10
5 - 10	90 → 80	10 → 20
10 - 20	80 → 75	20 → 25
20 - 30	75 → 67	25 → 33
30 - 40	67 → 65	33 → 35
40 - 50	65 → 40	35 → 60
50 - 55	40	60

**Flow rate** 0.5 mL/min.

**Detection** Evaporative light-scattering detector; the following settings have been found to be suitable; if the detector has different setting parameters, adjust the detector settings so as to comply with the system suitability criterion:

- carrier gas: air;
- flow rate: 1.5 mL/min;
- evaporator temperature: 50 °C.

**Injection** 20 µL of the test solution and reference solutions (b), (c), (d) and (e).

**Relative retention** With reference to *ginsenoside Rb1* (retention time = about 33.6 min):  
*astragaloside IV* = about 1.05.

**System suitability:**

— resolution: minimum 4.0 between the peaks due to *astragaloside IV* and *ginsenoside Rb1* in the chromatogram obtained with reference solution (e).

Establish a calibration curve with the logarithm of the concentration (mg/mL) of reference solutions (b), (c) and (d) (corrected by the declared percentage content of *astragaloside IV CRS*) as the abscissa and the logarithm of the corresponding peak area as the ordinate. Calculate the percentage content of *astragaloside IV* using the following expression:

$$\frac{10^A \times 0.5}{m}$$

- $A$  = logarithm of the concentration corresponding to the *astragaloside IV* peak in the chromatogram obtained with the test solution, determined from the calibration curve;
- $m$  = mass of the herbal drug to be examined used to prepare the test solution, in grams.

Ph Eur

**Atractylodes Lancea Rhizome**

(Ph. Eur. monograph 2559)

Ph Eur

**DEFINITION**

Dried, whole or fragmented rhizome of *Atractylodes lancea* (Thunb.) DC. (syn. *Atractylodes chinensis* (Bunge) Koidz.; *Atractylodes japonica* Koidz.) with the roots removed, collected in spring and autumn.

**Content**

Minimum 14 mL/kg of essential oil (anhydrous drug).

**IDENTIFICATION**

**A. Whole drug.** The whole rhizome is somewhat curved, irregularly moniliform or nodular-cylindrical, occasionally branched, 3-10 cm long and 1-3 cm in diameter. The external surface is wrinkled and irregularly transversely segmented, dark greyish-brown or yellowish-brown; it shows numerous rounded protuberances and large circular stem scars and smaller root scars. The texture is hard, easily broken; the fractured surface is yellowish-white or brownish-yellow, uneven, with many glistening yellowish-orange or reddish-brown oil cavities appearing as dots scattered throughout the tissue.

**Fragmented drug** The fragmented rhizome occurs in transverse or longitudinal slices with a highly variable diameter (1-4 cm) and a thickness up to 0.5 cm.

The external surface is wrinkled, dark greyish-brown or yellowish-brown and shows numerous small rootlet scars. The cut surface is whitish-yellow or brownish-yellow, with particularly abundant yellowish-orange or reddish-brown oil cavities appearing as dots scattered throughout the tissue. Occasionally, some cavities crystallise out as fine white needle- or hair-like crystals.

**B. Microscopic examination (2.8.23).** The powder is brownish-yellow. Examine under a microscope using *chloral*

*hydrate solution R*. The powder shows the following diagnostic characters (Figure 2559.-1): fragments of orange cork with polyhedral cells (surface view [K]); fragments of dermal tissue (transverse section [H]), consisting of several layers of cork [Ha] often accompanied by subrectangular or ovoid sclereids from the phelloderm [Hb] with very thick, channelled walls and a narrow lumen; fragments of phelloderm containing groups of sclereids (surface view [J]); isolated sclereids, variable in shape (20-51  $\mu\text{m}$  in diameter) [B, G]; fragments of parenchyma with polyhedral, subrectangular or subrounded cells containing small needle-shaped crystals of calcium oxalate (5-30  $\mu\text{m}$  in length) clearly visible in polarised light [D]; fragments of fibres in bundles, with heavily thickened and slightly pitted walls (up to 40  $\mu\text{m}$  in diameter) and a narrow lumen, very often associated with xylem vessels [A]; fragments of short, reticulate or pitted vessels, usually included in parenchyma with thin-walled cells [F]; fragments of oil glands with thin-walled cells and orange-brown contents [C] accompanied by parenchyma cells containing small needle-shaped crystals of calcium oxalate [Ca]. Examine under a microscope, without heating, using *glycerol R*. The powder shows pieces of inulin, free [E] or included in parenchyma cells.

Figure 2559.-1. – Illustration for identification test B of powdered herbal drug of *Atractylodes lancea* rhizome

C. Examine the chromatograms obtained in the test for *Atractylodes macrocephala*.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
$\beta$ -Caryophyllene: a pink zone	A pink or violet zone An orange zone may be present
	An intense greyish-green zone A very faint violet zone
Bornyl acetate: a brown zone	A violet zone Several violet zones
Reference solution	Test solution

### TESTS

#### *Atractylodes macrocephala*

Thin-layer chromatography (2.2.27).

**Test solution** Introduce 0.5 g of the powdered herbal drug (355) (2.9.12) into a centrifuge tube, add 2 mL of *methanol R* and stopper the tube. Sonicate at 25 °C for 15 min and centrifuge.

**Reference solution** Dissolve 10 mg of  $\beta$ -caryophyllene *R* and 10 mg of bornyl acetate *R* in 5 mL of *methanol R*.

**Plate** TLC silica gel plate *R* (5-40  $\mu\text{m}$ ) [or TLC silica gel plate *R* (2-10  $\mu\text{m}$ )].

**Mobile phase** ethyl acetate *R*, heptane *R* (5:95 *V/V*).

**Application** 5  $\mu\text{L}$  [or 3  $\mu\text{L}$ ] as bands of 10 mm [or 6 mm].

**Development** In an unsaturated tank, over a path of 10 cm [or 6 cm].

**Drying** In air.

**Detection** Treat with *anisaldehyde solution R* and heat at 105-110 °C for 5-10 min; examine in daylight.

**Results** The chromatogram obtained with the test solution shows an intense greyish-green zone in the middle third. In the case of a substitution by *Atractylodes macrocephala*, no intense greyish-green zone is present in the middle third.

#### Water (2.2.13)

Maximum 100 mL/kg, determined on 20.0 g of the powdered herbal drug (355) (2.9.12).

#### Total ash (2.4.16)

Maximum 7.0 per cent.

#### Ash insoluble in hydrochloric acid (2.8.1)

Maximum 1.0 per cent.

### ASSAY

#### Essential oil (2.8.12)

Use 15.0 g of freshly powdered herbal drug (710) (2.9.12), a 500 mL round-bottomed flask, 200 mL of *water R* as the distillation liquid and 0.50 mL of *xylene R* in the graduated tube. Distil at a rate of 2-3 mL/min for 2 h.

Ph Eur

## Largehead Atractylodes Rhizome

(Ph. Eur. monograph 2560)

Ph Eur

### DEFINITION

Dried, whole or fragmented rhizome of *Atractylodes macrocephala* Koidz. with the roots removed, collected in winter when the lower leaves of the plant turn yellow and the upper leaves become fragile.

### Content

Minimum 9 mL/kg of essential oil (anhydrous drug).

### IDENTIFICATION

**A. Whole drug.** The whole rhizome is irregularly shaped, 3-13 cm long and 1.5-7 cm in diameter, externally yellowish greyish-brown or dark brown. Small knob-like protrusions are present, concentrated at the rhizome apex and interspersed with straighter narrower regions, whose outer surface is covered with longitudinal wrinkles and grooves. The texture is hard, difficult to break, and the fracture is uneven with wide spaces between the tissues, especially in the central region. The fracture is whitish-yellow to brownish, with yellowish-brown to orange oil cavities scattered throughout, particularly abundant in the external tissues. A greyish-brown cambium is occasionally visible.

**Fragmented drug** The fragmented rhizome mostly occurs as longitudinal slices with a highly variable diameter (1-7 cm) and a thickness of about 0.5 cm. The external surface is wrinkled or grooved, more or less dark yellowish greyish-brown with root scars and knob-like protrusions. The texture is hard. The cut surface is whitish-yellow to brownish, consisting of tissues with wide spaces between them and scattered with many yellowish-brown to orange oil cavities appearing as dots that are particularly abundant in the external tissues.

**B. Microscopic examination (2.8.23).** The powder is brownish-yellow. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2560.-1): fragments of orange cork (surface view [A], transverse section [B]), with superimposed cells [Aa, Ba] sometimes accompanied by parenchyma cells containing fine needles of calcium oxalate [Ab, Bb]; fragments of parenchyma with polyhedral, subrectangular or subrounded cells, many of which contain small needle-shaped crystals of calcium oxalate (10-32 µm in length) clearly visible in polarised light [E]; sclereids, isolated or in small groups, with very thick, channelled walls, variable in shape (35-65 µm in diameter) [D, F]; larger sclereids often with thinner walls and a large lumen; rare fragments of fibres, isolated or in bundles, with moderately thickened and slightly pitted walls (up to 40 µm in diameter) [C]; fragments of xylem [J] consisting of short, reticulate or pitted vessels [Ja], usually included in parenchyma with thin-walled cells [Jb]; oil glands [G] or fragments of oil glands with thin-walled cells [Ga] and orange-brown contents, accompanied by parenchyma cells containing small, needle-shaped crystals of calcium oxalate [Gb]. Examine under a microscope, without heating, using *glycerol R*. The powder shows abundant pieces of inulin, free [H] or included in parenchyma cells.

Figure 2560.-1. – Illustration for identification test B of powdered herbal drug of *Atractylodes rhizome, largehead*

**C.** Examine the chromatograms obtained in the test for *Atractylodes lancea*.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
$\beta$ -Caryophyllene: a pink zone	A pink or violet zone An orange zone
	A very faint violet zone
Bornyl acetate: a brown zone	A very faint violet zone Several faint violet zones
Reference solution	Test solution

**D.** To 0.5 g of the powdered herbal drug (355) (2.9.12) add 5 mL of *ethanol (96 per cent) R*, heat in a water-bath at 60 °C for 2 min and filter. To 1 mL of the filtrate add 0.25 mL of a solution freshly prepared as follows: dissolve 5 mg of *vanillin R* in 0.5 mL of *ethanol (96 per cent) R*, to this solution add 0.5 mL of *water R* and 3 mL of *hydrochloric acid R*. Shake immediately; a red or reddish-purple colour develops and persists.

### TESTS

*Atractylodes lancea*

Thin-layer chromatography (2.2.27).

**Test solution** Introduce 0.5 g of the powdered herbal drug (355) (2.9.12) into a centrifuge tube, add 2 mL of methanol R and stopper the tube. Sonicate at 25 °C for 15 min and centrifuge.

**Reference solution** Dissolve 10 mg of  $\beta$ -caryophyllene R and 10 mg of bornyl acetate R in 5 mL of methanol R.

**Plate** TLC silica gel plate R (5-40  $\mu$ m) [or TLC silica gel plate R (2-10  $\mu$ m)].

**Mobile phase** ethyl acetate R, heptane R (5:95 V/V).

**Application** 5  $\mu$ L [or 3  $\mu$ L] as bands of 10 mm [or 6 mm].

**Development** In an unsaturated tank, over a path of 10 cm [or 6 cm].

**Drying** In air.

**Detection** Treat with anisaldehyde solution R and heat at 105-110 °C for 5-10 min; examine in daylight.

**Results** The chromatogram obtained with the test solution shows no greyish-green zone in the middle third, above the very faint violet zone.

#### Water (2.2.13)

Maximum 100 mL/kg, determined on 20.0 g of the powdered herbal drug (710) (2.9.12).

#### Total ash (2.4.16)

Maximum 5.0 per cent.

#### Ash insoluble in hydrochloric acid (2.8.1)

Maximum 1.0 per cent.

#### ASSAY

##### Essential oil (2.8.12)

Use 15.0 g of freshly powdered herbal drug (710) (2.9.12), a 500 mL round-bottomed flask, 200 mL of water R as the distillation liquid and 0.50 mL of xylene R in the graduated tube. Distil at a rate of 2-3 mL/min for 2 h.

Ph Eur

## Aucklandia Root

(Ph. Eur. monograph 1797)

Ph Eur

#### DEFINITION

Whole or fragmented dried root of *Saussurea costus* (Falc.) Lipsch. (syn. *Saussurea lappa* C.B. Clarke, *Aucklandia lappa* Decne., *Aucklandia costus* Falc.). It is collected in winter and spring, and the rootlets removed.

#### Content

Minimum 0.6 per cent of costunolide ( $C_{15}H_{20}O_2$ ;  $M_r$  232.3) and minimum 1.8 per cent for the sum of costunolide and dehydrocostus lactone ( $C_{15}H_{18}O_2$ ;  $M_r$  230.3) (dried drug).

#### IDENTIFICATION

A. *Whole drug*. It consists of long, sub-cylindrical or sub-conical, slightly flattened, occasionally branched pieces, 4-12 cm in length, 0.5-5 cm in diameter, with some pieces slightly bent, and sometimes longitudinally cut. The stem scar forms a dent at the crown. The outer surface is yellowish-brown or greyish-brown, with coarse, longitudinal wrinkles and furrows, and also additional fine, reticulate furrows. The remains and scars of lateral roots are also present. The bark is tightly adhering; occasional roots are without bark, and have an exposed surface without a distinct network of vessels. The fractured surface has brownish-yellow, reddish-brown or dark brown oil dots and cavities

scattered throughout, radially striated xylem, and a brown or greyish-brown cambium. The texture is hard, dense and difficult to break.

**Fragmented drug** It occurs as subrounded or irregular transverse slices, oblique or longitudinal slices or as small, irregular pieces. The slices are mostly about 5 mm thick, 6-33 mm in diameter, externally greyish-brown or brownish-yellow, with longitudinal wrinkles and furrows and occasional lateral root scars. The cut surface has narrow, radially striated xylem with fine clefts occasionally present, which do not extend into the centre; the brownish cambium is mostly distinct; dark brown or greyish-brown annulations are occasionally visible at intervals. There are scattered dots and oil cavities, that are brownish-yellow, reddish-brown or dark brown in colour. The peripheral outer layer is mostly yellowish-brown or greyish-brown. The older roots have a broad pith sometimes forming a hollow. The texture is hard and dense.

B. **Microscopic examination** (2.8.23). The powder is yellowish-green or yellow-brown. Examine under a microscope using chloral hydrate solution R. The powder shows the following diagnostic characters (Figure 1797.-1): yellowish-brown cork fragments consisting of several layers of thin-walled cells (surface view [B], transverse section [E]); fragments of oil canals with orange-brown granular contents, some about 50  $\mu$ m in diameter; numerous fragments of parenchyma with ovoid cells [F, D], some associated with oil canal fragments (transverse section [Da]); fragments of xylem [A, G] with dense, cellulose xylem parenchyma [Aa, Gb], and mostly reticulate vessels [Ac, Ga] though occasionally pitted, lignified or slightly lignified, and sometimes associated with oil canal fragments (longitudinal section [Ab]); fragments of medullary ray, composed of aligned rectangular cells (longitudinal section [J]); occasional bundles of long, fusiform fibres, usually fragmented, about 20  $\mu$ m in diameter, with walls showing slit-, V- or Y-shaped pits (surface view [C]). Examine under a microscope using a solution of glycerol R. The powder shows abundant inulin fragments, irregular, mostly angular, some wing-like, either free [H] or included in parenchymatous cells [K].

C. Examine the chromatograms obtained in the test for *Vladimiria souliei* (Franch.) Y. Ling and *Inula helenium* L.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint pink zones may be present below the zone due to costunolide in the chromatogram obtained with the test solution.

Top of the plate	
	A faint pink zone
Dehydrocostus lactone: a violet zone	A violet zone (dehydrocostus lactone)
Costunolide: a greyish-violet zone	A greyish-violet zone (costunolide)
Reference solution	Test solution

Figure 1797.-1. – Illustration for identification test B of powdered herbal drug of aucklandia root

## TESTS

*Vladimiria souliei* (Franch.) Y. Ling and *Inula helenium* L.

Thin-layer chromatography (2.2.27).

**Test solution** To 0.5 g of the powdered herbal drug (355) (2.9.12) add 10 mL of *methylene chloride R* and sonicate for 30 min; filter.

**Reference solution** Dissolve 5 mg of *dehydrocostus lactone R* and 5 mg of *costunolide R* in *methylene chloride R* and dilute to 10 mL with the same solvent.

**Plate** TLC silica gel plate R (2-10 µm).

**Mobile phase** *cyclohexane R*, *methylene chloride R* (1:5 V/V).

**Application** 2 µL as bands of 8 mm.

**Development** Over a path of 6 cm.

**Drying** In air.

**Detection** Treat with *anisaldehyde solution R* and heat at 100 °C for 5 min; examine in daylight.

**Results** The chromatogram obtained with the test solution shows no zone in the middle third, and no violet zone directly above the zone due to *dehydrocostus lactone*.

**Aristolochic acids** (2.8.21, Method A)

It complies with the test.

**Loss on drying** (2.2.32)

Maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

**Total ash** (2.4.16)

Maximum 4.0 per cent.

## ASSAY

Liquid chromatography (2.2.29).

**Test solution** Disperse 0.300 g of the freshly powdered herbal drug (355) (2.9.12) in 50.0 mL of *methanol R* in a conical flask, stopper tightly and weigh. Sonicate for 30 min and shake for 1 h. Allow to cool and weigh again. Compensate the loss of solvent with *methanol R* and mix thoroughly. Filter through a membrane filter (nominal pore size 0.45 µm).

**Reference solution (a)** Dissolve 5.0 mg of *costunolide CRS* in 5 mL of *methanol R*, shake vigorously, dilute to 50.0 mL with the same solvent and mix thoroughly.

**Reference solution (b)** Dissolve 2.5 mg of *dehydrocostus lactone R* in 5 mL of reference solution (a), shake vigorously, dilute to 25.0 mL with reference solution (a) and mix thoroughly.

**Column:**

— size:  $l = 0.15$  m,  $\varnothing = 4.6$  mm;

— stationary phase: end-capped octadecylsilyl silica gel for chromatography R (5 µm).

**Mobile phase** *water for chromatography R*, *methanol R* (35:65 V/V).

**Flow rate** 1 mL/min.

**Detection** Spectrophotometer at 225 nm.

**Injection** 10 µL.

**Run time** 20 min.

**Retention time** *Costunolide* = about 8 min; *dehydrocostus lactone* = about 10 min.

**System suitability** Reference solution (b):

— resolution: minimum 3.0 between the peaks due to *costunolide* and *dehydrocostus lactone*.

Calculate the percentage content of *costunolide* using the following expression:

$$\frac{A_1 \times m_2 \times p}{A_2 \times m_1}$$

$A_1$  = area of the peak due to *costunolide* in the chromatogram obtained with the test solution;

$A_2$  = area of the peak due to *costunolide* in the chromatogram obtained with reference solution (a);

$m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;

$m_2$  = mass of *costunolide CRS* used to prepare reference solution (a), in grams;

$p$  = percentage content of *costunolide* in *costunolide CRS*.

Calculate the percentage content of the sum of *costunolide* and *dehydrocostus lactone* using the following expression:

$$\frac{(A_1 + (1.52 \times A_3)) \times m_2 \times p}{A_2 \times m_1}$$

$A_1$  = area of the peak due to *costunolide* in the chromatogram obtained with the test solution;

$A_2$  = area of the peak due to *costunolide* in the chromatogram obtained with reference solution (a);

$A_3$  = area of the peak due to *dehydrocostus lactone* in the chromatogram obtained with the test solution;

$m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;

$m_2$  = mass of *costunolide CRS* used to prepare reference solution (a), in grams;

$p$  = percentage content of *costunolide* in *costunolide CRS*;

1.52 = correlation factor between *dehydrocostus lactone* and *costunolide*.

## Azadirachta Indica Leaf

Nimba Leaf

### DEFINITION

Azadirachta Indica Leaf is the dried leaf of *Azadirachta indica* A. Juss.

It contains not less than 1.0% of tetranortriterpenoids, expressed as salannin, calculated with reference to the dried drug.

### IDENTIFICATION

A. Leaflets thin and fragile, ovate to lanceolate, 3 to 10 cm long and 1 to 2.5 cm wide, curved with a serrate margin; base markedly asymmetrical, apex acuminate and terminating in a fine point; upper surface dark brownish-green, lower surface paler with distinct midrib and lateral veins running to the margins; both surfaces glabrous. Fragments of the rachis may be present; these are pale brown, slender, up to about 10 cm long, cylindrical with faint longitudinal striations and bearing alternating pairs of scars where the leaflets were attached.

B. Reduce to a powder (355). The powder is green. Examine under a microscope using *chloral hydrate solution*. The powder shows fragments of the epidermis composed of thin-walled tangentially elongated cells with abundant *anomocytic* stomata, Appendix XI H; abundant fragments of single layered palisade and thin-walled parenchymatous cells of the spongy mesophyll present, some with associated vessels; some fragments display rosette crystals of calcium oxalate often in rows.

C. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Add 30 mL of *methanol* to approximately 5 g of powdered herbal drug, mix thoroughly by hand and with the aid of ultrasound for 30 minutes. Centrifuge at 3000 rpm for 5 minutes and collect the clear supernatant liquid. Repeat the extraction twice, combine the supernatant liquid and dilute to 100 mL with *methanol*. Filter approximately 30 mL of the solution through a 0.45- $\mu$ m filter and use the filtrate.

(2) 0.025% w/v each of *azadirachtin*, *salannin CRS* and  *$\beta$ -sitosterol* in *methanol*.

### CHROMATOGRAPHIC CONDITIONS

(a) Use a *silica gel 60* or high-performance *silica gel 60* precoated plate [Merck silica gel 60 HPTLC plates are suitable].

(b) Use the mobile phase as described below.

(c) Apply as bands 5  $\mu$ L of each solution.

(d) Develop the plate to 15 cm [or 7 cm].

(e) After removal of the plate, spray with *vanillin reagent*, heat the plate at 100° for 3 minutes and examine in daylight.

### MOBILE PHASE

3 volumes of *hexane* and 7 volumes of *ethyl acetate*.

### SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (2) shows three clearly separated spots.

### CONFIRMATION

In the chromatogram obtained with solution (1), a black band with an  $R_f$  value of approximately 0.15 corresponding in position to a brown band in the chromatogram for solution (2) is obtained. A black band with an  $R_f$  value of approximately 0.3 corresponding in position to the indigo band in the chromatogram for solution (2) is obtained for salannin. An indigo band with an  $R_f$  value of approximately

0.6 corresponding in position to a purple band in the chromatogram for solution (2) is obtained for  *$\beta$ -sitosterol*.

Top of the plate	
Purple band	$\beta$ -sitosterol: a purple band
Black band	Salannin: an indigo band
Black band	Azadirachtin: a brown band
Solution (1)	Solution (2)

### TESTS

#### Foreign matter

Not more than 2%, Appendix XI D.

#### Loss on drying

When dried for 2 hours at 105°, loses not more than 10.0% of its weight. Use 1 g.

#### Ash

Not more than 10.0%, Appendix XI J, method II.

#### Water-soluble extractive

Not less than 20.0%, Appendix XI B2.

### ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Add 30 mL of *methanol* to approximately 5 g of powdered herbal drug, mix thoroughly by hand and with the aid of ultrasound for 30 minutes. Centrifuge at 3000 rpm for 5 minutes and collect the clear supernatant liquid. Repeat the extraction twice, combine the supernatant liquid and dilute to 100 mL with *methanol*. Filter approximately 30 mL of the solution through a 0.45- $\mu$ m filter and use the filtrate.

(2) 0.0025% w/v of *salannin CRS* and 0.001% w/v of *azadirachtin-A CRS* in *methanol*.

### CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm  $\times$  2.1 mm) packed with *octadecylsilyl silica gel for chromatography* (5  $\mu$ m) (Spherisorb ODS1 is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 0.5 mL per minute.

(d) Use a column temperature of 30°.

(e) Use a detection wavelength of 217 nm.

(f) Inject 10  $\mu$ L of each solution.

When the chromatograms are recorded under the prescribed conditions the retention time of the peak due to azadirachtin-A is about 15 minutes and the retention time of the peak due to salannin is about 22 minutes.

## MOBILE PHASE

**Mobile phase A** 0.1 volume of *trifluoroacetic acid* and 100 volumes of *water*.

**Mobile phase B** 0.1 volume of *trifluoroacetic acid* and 100 volumes of *acetonitrile*.

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-10	90→70	10→30	linear gradient
10-25	70→30	30→70	linear gradient
25-40	30	70	isocratic
40-45	30→90	70→10	linear gradient
45-50	90	10	re-equilibration

## SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2):

the *symmetry factor* of the peak due to azadirachtin-A is at most 1.2;

the *symmetry factor* of the peak due to salannin is at most 1.4.

## DETERMINATION OF CONTENT

Calculate the total content of tetranortriterpenoids, expressed as salannin, from the sum of the areas of the peaks eluting from three minutes before to three minutes after the retention time of salannin and from the declared content of salannin in *salannin CRS* using the following expression:

$$\frac{A_1}{A_2} \times \frac{m_2}{V_2} \times \frac{V_1}{m_1} \times p \times \frac{100}{100 - d}$$

- $A_1$  = combined areas of the peaks in the chromatogram obtained with solution (1) with retention times from three minutes before to three minutes after the retention time of peak due to salannin in the chromatogram obtained with solution (2),
- $A_2$  = area of the peak due to salannin in the chromatogram obtained with solution (2),
- $m_1$  = weight of the drug being examined in mg,
- $m_2$  = weight of *salannin CRS* in mg,
- $V_1$  = dilution volume of solution (1),
- $V_2$  = dilution volume of solution (2),
- $p$  = percentage content of salannin in *salannin CRS*,
- $d$  = percentage loss on drying of the herbal drug being examined.

## STORAGE

Azadirachta Indica Leaf should be protected from moisture.

## Bacopa Monnieri

## DEFINITION

*Bacopa Monnieri* is the dried aerial parts of *Bacopa monnieri* (L.) Wettst.

It contains not less than 1.0% w/w of bacopa saponins, expressed as bacopaside II (C<sub>47</sub>H<sub>76</sub>O<sub>8</sub>), calculated with reference to the dried drug.

## IDENTIFICATION

**A.** Pieces of herb, consisting mainly of stem and leaf; buff or greenish brown, angular stems, 1 to 2 mm in diameter and 10 to 30 cm long, nodes prominent, often showing sprouting rootlets and with numerous ascending branches; greenish leaves sessile or short petioled, fleshy, glabrous on the upper surface, simple, opposite, decussate, 0.6 to 2.5 cm long and

3 to 8 mm wide, reniform, spatulate or oblanceolate, margin entire or, rarely, dentate. If present, flowers are axillary and solitary, on peduncles usually longer than the leaves; corolla up to 1 cm long, five lobed, oblong, obtuse; fruit capsule ovoid-acuminate or slightly beaked at the apex, glabrous, up to 5 mm long.

**B.** Reduce to a powder (355). The powder is greenish or yellowish-brown. Examine under a microscope using *chloral hydrate solution*. The powder shows fragments of the epidermis, with a thin striated cuticle, multicellular glandular trichomes, *anomocytic* stomata; numerous xylem vessels with reticulate thickening. Examine under a microscope using 50% v/v of *glycerol in water*. Starch granules are present, usually simple, round or ovoid, 4 to 14 µm in diameter, without a visible hilum.

**C.** Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

- (1) Add 30 mL of *methanol* (70%) to 5.0 g of the powdered herbal drug, heat on a water-bath under reflux for 30 minutes, cool, centrifuge at 3000 rpm for 5 minutes and decant the supernatant liquid. Repeat the extraction procedure with a further two 30-mL quantities of *methanol* (70%). Combine the supernatant liquid, dilute to 100 mL with *methanol* (70%) and filter (0.45 µm PTFE is suitable).
- (2) 0.05% w/v of *bacopaside II CRS in methanol* (70%).
- (3) 0.05% w/v each of *bacopaside I CRS* and *bacopaside II CRS in methanol* (70%).

## CHROMATOGRAPHIC CONDITIONS

- Use silica gel 60 precoated plates or high-performance silica gel 60 (Merck silica gel 60 plates are suitable).
- Use the mobile phase as described below.
- Apply 20 µL [or 10 µL] of each solution, as bands.
- Develop the plate to 15 cm [or 8 cm].
- After removal of the plate, dip in *anisaldehyde solution R1*, heat in an oven at 105° for 5 minutes and examine in daylight.

## MOBILE PHASE

10 volumes of 1% v/v of *formic acid*, 20 volumes of *methanol* and 70 volumes of *ethyl acetate*.

## SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) shows two clearly separated bands.

## CONFIRMATION

The chromatogram obtained with solution (1) shows a dark band with an R<sub>f</sub> value of approximately 0.4 corresponding to the band obtained with bacopaside II in the chromatogram obtained with solution (3), a lighter band with an R<sub>f</sub> value of approximately 0.3 corresponding to the band obtained with bacopaside I in the chromatogram obtained with solution (3). Bands with R<sub>f</sub> values of approximately 0.2 and 0.8 are also present. Other bands may be present in solution (1).

Top of the plate		
unknown: dark band		
bacopaside II: dark band	bacopaside II: dark band	bacopaside II: dark band
bacopaside I: light band		bacopaside I: light band
unknown: light band		
Solution (1)	Solution (2)	Solution (3)

**TESTS****Foreign matter**

Not more than 1.0%, Appendix XI D.

**Loss on drying**

Not more than 11.0%, Appendix IX D. Use 1 g.

**Ash**

Not more than 13.0%, Appendix XI J, Method II.

**Water-soluble extractive**

Not less than 15.0%, Appendix XI B2.

**ASSAY**

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

- (1) Reduce to a powder (355). To 5.0 g of the powder, add 30 mL of *methanol* (70%) and heat under reflux for 30 minutes. Allow to cool, centrifuge and collect the supernatant liquid. Repeat the extraction twice with two further 30-mL quantities of *methanol* (70%). Combine the three supernatant liquids, dilute to 100 mL with *methanol* (70%) and filter (0.45 µm PTFE is suitable).
- (2) 0.05% w/v of *bacopaside II CRS* in *methanol* (70%).
- (3) 0.05% w/v of *bacoside A CRS* in *methanol* (70%).

**CHROMATOGRAPHIC CONDITIONS**

- (a) Use a stainless steel column (25 cm x 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Phenomenex Luna C18 is suitable).
- (b) Use isocratic elution and the mobile phase described below.
- (c) Use a flow rate of 1.0 mL per minute.
- (d) Use a column temperature of 30°.
- (e) Use a detection wavelength of 205 nm.
- (f) Inject 20 µL of each solution.
- (g) Record the chromatograms for 75 minutes.

**MOBILE PHASE**

315 volumes of *acetonitrile* and 685 volumes of 0.71% w/v *anhydrous sodium sulfate*, previously adjusted to pH 2.3 with *sulfuric acid*.

When the chromatograms are recorded under the prescribed conditions the retention time of bacopaside II is about 36 minutes. The retention times relative to bacopaside II are: bacoside A<sub>3</sub>, about 0.9; bacopaside X, about 1.2; bacopasaponin C, about 1.3; bacopaside I, about 1.4.

**SYSTEM SUITABILITY**

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due

to bacoside A<sub>3</sub> and bacopaside II is at least 1.5 and the *resolution factor* between the peaks due to bacopaside X and bacopasaponin C is at least 2.4.

**DETERMINATION OF CONTENT**

Calculate the total content of bacopa saponins (bacoside A<sub>3</sub>, bacopaside II, bacopaside X, bacopasaponin C and bacopaside I), expressed as bacopaside II from the chromatograms obtained, and using the declared content of bacopaside II in *bacopaside II CRS*.

**Barbary Wolfberry Fruit**

(Ph. Eur. monograph 2612)

Ph Eur

**DEFINITION**

Dried, whole, ripe fruit of *Lycium barbarum* L.

**IDENTIFICATION**

A. The berry is elliptical, fusiform or ovoid and frequently flattened, about 6-20 mm long and 3-10 mm in diameter. The apex of the fruit shows a ring-shaped scar of the nectar-bearing base of the style and the base of the fruit bears the whitish to light brown remnants of the cut stalk. The external surface is orange-red or dark red. The pericarp is fleshy, wrinkled, soft and viscous. It contains 20-50 hard, flat, subreniform seeds, bent upwards. Each pale yellow or yellowish-brown seed is about 1.7 mm long and 1.5 mm wide.

B. Microscopic examination (2.8.23). The powder is orange-red or reddish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2612.-1): fragments of the epicarp (surface view [A]) with polygonal or elongated cells, about 60 µm in diameter, with straight or slightly wavy walls, covered with a thick cuticle, with distinct, more or less parallel striations; fragments of the epicarp (transverse section [F]) covered by a crenate cuticle [Fa], consisting of 1 or 2 layers of cells [Fb] associated with the mesocarp [Fc]; fragments of the mesocarp [C] with thin-walled subpolygonal cells containing reddish-orange or brownish-red spherical granules [Ca, Cd] or microsphenoidal crystals of calcium oxalate [Cb]; fragments of the seeds (surface view [B]) with a testa consisting of greenish-yellow sclereids with heavily thickened, striated and lobed walls and (transverse section [E]) with a testa having thin external walls [Ea] and deeply lobed, irregularly thickened, striated, radial internal walls [Eb]; fragments of endosperm containing oil droplets [D]; fragments of vascular tissue with narrow, spiral or annular vessels [G].

C. Thin-layer chromatography (2.2.27).

*Test solution* To 0.1 g of the powdered herbal drug (355) (2.9.12) add 7 mL of *water R*. Sonicate for 10 min and centrifuge. Prepare a ready-to-use sample preparation cartridge containing 0.50 g of octadecylsilyl silica gel (50 µm) using 3 mL of *methanol R*, drying with a stream of air, then using 3 mL of *water R*. The flow rate does not exceed 6 mL/min. Apply 4 mL of the supernatant to the top of the cartridge. Wash the cartridge twice with 1 mL of a mixture of 1 volume of *methanol R* and 9 volumes of *water R*. Elute the cartridge with 1 mL of *methanol R*; collect the eluate and use it as the test solution.

Figure 2612.-1. – Illustration for identification test B of powdered herbal drug of barbary wolfberry fruit

**Reference solution** Dissolve 1 mg of *scopoletin R* in 10 mL of *methanol R*. Dilute 1 mL of the solution to 10 mL with *methanol R* to obtain solution (a). Dissolve 1 mg of *rutoside trihydrate R* in 5 mL of solution (a).

**Plate** TLC silica gel  $F_{254}$  plate R (2-10 µm).

**Mobile phase** *anhydrous formic acid R*, *glacial acetic acid R*, *water R*, *ethyl acetate R* (11:11:27:100 V/V/V/V).

**Application** 2 µL as bands of 8 mm.

**Development** Over a path of 6 cm.

**Drying** In air.

**Detection** Heat at 100 °C for 3 min; treat the still-warm plate with a 5 g/L solution of *diphenylboric acid aminoethyl ester R* in *ethyl acetate R*, then treat with a 50 g/L solution of *macrogol 400 R* in *methylene chloride R*; examine in ultraviolet light at 365 nm after 5 min.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

#### TESTS

##### Loss on drying (2.2.32)

Maximum 11.0 per cent, determined on 2.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

##### Total ash (2.4.16)

Maximum 5.0 per cent.

##### Extractable matter

Minimum 55.0 per cent.

To 2.00 g of the powdered herbal drug (355) (2.9.12) add 50.0 g of *water R*, boil under reflux for 1 h, compensate the loss of water and filter. Evaporate 25.0 g of the filtrate to dryness on a water-bath and dry in an oven at 105 °C for 3 h. The residue weighs a minimum of 0.55 g.

Ph Eur

## Holy Basil Leaf

### DEFINITION

Holy Basil Leaf is the dried leaves of *Ocimum tenuiflorum* Linn. (syn. *Ocimum sanctum*). The leaf content is not less than 70% of the material harvested.

### IDENTIFICATION

**A.** Pieces of herb consisting mainly of whole or fragmented leaf, petiole and stem, with some flower parts, mainly calyx. Leaves simple, opposite, petiolate, ovate or elliptical with an acute or obtuse apex, up to 5 cm long and 3.5 cm wide, green or purple, with an entire or serrated margin and pubescent on both surfaces. Fragments of petiole and stem twisted, hairy, purplish-brown or dark green-black, subquadrangular, petiole thin up to 3 cm long, stem herbaceous or woody and fibrous, thicker and highly branched. Fragments of calyx, if present, membranous, veined, 3 to 4 mm long, ovoid or campanulate bi-lipped with upper lip broadly obovate and shortly apiculate, lower lip longer with two short lateral and two larger central mucronate teeth. Corolla about 4 mm long, pubescent; fruit consisting of 4 nutlets enclosed in a calyx, each nutlet sub-globose, slightly compressed, nearly smooth; pale brown or reddish with a small black hilum and each with one seed. Seed rounded to ovoid brown, about 0.1 cm long.

**B.** Reduce to a powder, Appendix XVII A. The powder is brownish-green to greenish-brown. Examine under a microscope using *chloral hydrate solution*. The powder shows the following characteristics: leaf tissue fragments with

polygonal, more or less straight walled epidermal cells and occasional diacytic stomata; covering trichomes elongated, uniseriate with three to seven cells; glandular trichomes of two types: (a) unicellular base with small, rounded unicellular or bicellular head; (b) unicellular base with enlarged oval head composed of eight radiating cells. Fragments of leaf midrib and petiole have thin walled ovoid cells and underlying collenchyma, up to four cells in depth. Some fragments from calyx, seeds and stems may also be seen. Calyx fragments are paler in colour and have characteristic epidermal cells with deeply sinuous walls, elongated over the veins and occasional covering and glandular trichomes of the same type as the leaf tissues. Seed fragments consist of closely packed cells with thick wavy walls and blackish contents and closely packed polygonal parenchyma. Stem fragments consist of narrow, closely packed fibres, vessels with spiral thickening, some pitted vessels and closely packed parenchyma merging with collenchyma.

Partially clear a second mount with *chloral hydrate solution*, then carefully remove the chloral hydrate solution whilst retaining the powder. Irrigate the powder thoroughly with a 10 % v/v alcoholic solution of *phloroglucinol*, allow the solution to evaporate, and then add 1 to 2 drops of *hydrochloric acid*. Mix, then mount in a 50% v/v solution of *glycerol*. The large, eight celled glandular trichomes are stained red due to the presence of eugenol. Lignified fibres and vessels also stain red.

C. Carry out the method for thin-layer chromatography, Appendix III A, using the following solutions.

- (1) Add 5 mL of *methanol* to approximately 0.5 g of the powdered herbal drug in a centrifuge tube. Mix using a vortex mixer briefly and then with the aid of ultrasound for 10 minutes. Centrifuge at 2500 rpm for 10 minutes and use the supernatant liquid.
- (2) 0.016% w/v each of *rutin*, *hyperoside* and *rosmarinic acid* in *methanol*.

**CHROMATOGRAPHIC CONDITIONS**

- (a) Use as the coating *silica gel* (Merck silica gel HPTLC plates are suitable).
- (b) Use the mobile phase as described below.
- (c) Apply 10 µL of solution (1) and 2 µL of solution (2) as 8 mm bands.
- (d) Develop the plate to 7 cm.
- (e) After removal of the plate, dry in air for 5 minutes and heat at 100° for 3 minutes. Whilst the plate is hot dip the plate into a 0.5% w/v solution of *diphenylboric acid aminoethyl ester* in *ethyl acetate*, dry and dip in a 5% w/v solution of *polyethylene glycol 400* in *dichloromethane*. Examine under *ultraviolet light* (366 nm).

**MOBILE PHASE**

1 volume of *formic acid*, 1 volume of *water* and 15 volumes of *ethyl acetate*.

**SYSTEM SUITABILITY**

The test is not valid unless, the chromatogram obtained with solution (2) shows three clearly separated bands of which two are orange bands with Rf values of approximately 0.1 (*rutin*) and 0.2 (*hyperoside*).

**CONFIRMATION**

The chromatogram obtained with solution (1) shows a strong yellow-orange fluorescent band that elutes between the 2 orange bands due to *rutin* and *hyperoside* in the chromatogram obtained with solution (2). Several other

fluorescent bands will be present as shown in the table. Other fluorescent bands may be present.

Top of the plate	
A red fluorescent band	
A turquoise-blue fluorescent band	A turquoise-blue fluorescent band (rosmarinic acid)
Two blue fluorescent bands may be present	
Two turquoise fluorescent bands may be present	
A yellow-orange fluorescent band	An orange fluorescent band (hyperoside)
	An orange fluorescent band (rutin)
<i>Solution (1)</i>	<i>Solution (2)</i>

D. Carry out the method for thin-layer chromatography, Appendix III A, using the following solutions.

- (1) Add 5 mL of *methanol* to approximately 0.5 g of the powdered herbal drug in a centrifuge tube. Mix using a vortex mixer briefly and then with the aid of ultrasound for 10 minutes. Centrifuge at 2500 rpm for 10 minutes and use the supernatant liquid.
- (2) 0.04% w/v of *methyleugenol* in *methanol*.
- (3) 0.02% w/v of *ursolic acid* and 0.04% w/v of *eugenol* in *methanol*.

**CHROMATOGRAPHIC CONDITIONS**

- (a) Use as the coating *silica gel* (Merck silica gel HPTLC plates are suitable).
- (b) Use the mobile phase as described below.
- (c) Apply 10 µL of solution (1) and 2 µL each of solutions (2) and (3) as 8 mm bands.
- (d) Develop the plate to 7 cm.
- (e) After removal of the plate, dry in air for 5 minutes. Dip in *anisaldehyde solution* and heat at 100° for 3 minutes. Examine under white light and *ultraviolet light* (366 nm).

**MOBILE PHASE**

15 volumes of *ethyl acetate* and 85 volumes of *toluene*.

**SYSTEM SUITABILITY**

The test is not valid unless the chromatogram obtained with solution (3) shows two clearly separated bands and the band due to *methyleugenol* in the chromatogram obtained with solution (2) has an Rf of approximately 0.6.

## CONFIRMATION

When examined under white light the chromatogram obtained with solution (1), as shown in the table, shows a pink band that elutes above the band due to methyl-eugenol in the chromatogram obtained with solution (2) and a grey band corresponding to the grey band due to ursolic acid obtained with solution (3). A grey-green band corresponding to the band due to eugenol in the chromatogram obtained with solution (3) may be present. A grey-green band corresponding to the band due to methyl-eugenol in the chromatogram obtained with solution (2) may be present. Other bands may be present.

Top of the plate		
A pink band	A grey-green band (methyl eugenol)	A grey-green band (eugenol)
A grey band		A grey band (ursolic acid)
<i>Solution (1)</i>	<i>Solution (2)</i>	<i>Solution (3)</i>

When examined under ultraviolet light (366 nm), the chromatogram obtained with solution (1) shows the bands as shown in the table. Other bands may be present.

Top of the plate		
A red fluorescent band	A greyish-brown fluorescent band (methyl eugenol)	A brownish fluorescent band (eugenol)
A red fluorescent band		A yellow fluorescent band (ursolic acid)
A yellow fluorescent band		
<i>Solution (1)</i>	<i>Solution (2)</i>	<i>Solution (3)</i>

When examined under both white light and ultraviolet light (366 nm) at least one band due to either eugenol or methyl eugenol should be present in the chromatogram obtained with solution (1).

## TESTS

## Foreign matter

Not more than 2%, Appendix XI D.

## Loss on drying

When dried at 100° to 105° for 2 hours, loses not more than 10% of its weight, Appendix XI D. Use 1 g.

## Total ash

Ignite for 18 hours at 450°. Not more than 17.7%, Appendix XI J, Method I.

## Acid insoluble ash

Not more than 6.0%, Appendix XI K, Method II. Use a second ignition temperature set at 900° for 1 hour (to ensure full combustion of the filter paper).

## ANNEX

*This section is non-mandatory.*

## DNA reference sequence

A DNA reference sequence for the identity of *Holy Basil Leaf* is published in *Supplementary Chapter VII D*.

## Bearberry Leaf

## Uva Ursi

(*Ph. Eur. monograph 1054*)

*Ph Eur*

## DEFINITION

Whole or fragmented, dried leaf of *Arctostaphylos uva-ursi* (L.) Spreng.

## Content

Minimum 7.0 per cent of anhydrous arbutin ( $C_{12}H_{16}O_7$ ;  $M_r$  272.3) (dried drug).

## IDENTIFICATION

A. The leaf, shiny and dark green on the adaxial surface, lighter on the abaxial surface, is generally 7-30 mm long and 5-12 mm wide. The entire leaf is obovate with smooth margins, somewhat reflexed downwards, narrowing at the base into a short petiole. The leaf is obtuse or retuse at its apex. The lamina is thick and coriaceous. The venation, pinnate and finely reticulate, is clearly visible on both surfaces. The adaxial surface is marked with sunken veinlets, giving it a characteristic grainy appearance. Only the young leaf has ciliated margins. Old leaves are glabrous.

B. Microscopic examination (2.8.23). The powder is green, greenish-grey or yellowish-green. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 1054.-1): fragments of adaxial epidermis (surface view [A]) showing thick and irregularly pitted polygonal cells [Aa] usually accompanied by palisade parenchyma [Ab]; fragments of adaxial epidermis (transverse section [G]), showing straight-walled cells [Ga] covered by a thick smooth cuticle [Gb], and accompanied by palisade parenchyma [Gc] consisting of 3 or 4 layers of cells of unequal lengths, some of which contain numerous prisms of calcium oxalate [Gd]; fragments of abaxial epidermis (surface view [B, E]), showing anomocytic stomata (2.8.3) [Ba] surrounded by 5-11 subsidiary cells, scars of hair bases [Ea], and accompanied by spongy parenchyma [Eb]; groups of lignified fibres from the pericycle [D]; fragments of the vascular system [F] consisting of pitted vessels [Fa] and fibres [Fb] accompanied by rows of cells containing prisms of calcium oxalate [Fc]; oil droplets are

present in the parenchymatous cells; occasional fragments of conical, unicellular covering trichomes [C].

Figure 1054.-1. – Illustration for identification test B of powdered herbal drug of bearberry leaf

#### C. Thin-layer chromatography (2.2.27).

**Test solution** To 0.5 g of the powdered herbal drug (355) (2.9.12) add 5 mL of a mixture of equal volumes of *methanol R* and *water R*, and heat under a reflux condenser for 10 min. Filter whilst hot. Wash the flask and the filter with a mixture of equal volumes of *methanol R* and *water R* and dilute to 5 mL with the same mixture of solvents.

**Reference solution** Dissolve 50 mg of *arbutin R* and 25 mg of *gallic acid R* in *methanol R* and dilute to 20.0 mL with the same solvent.

**Plate** TLC silica gel plate R (5-40 µm) [or TLC silica gel plate R (2-10 µm)].

**Mobile phase** *anhydrous formic acid R*, *water R*, *ethyl acetate R* (6:6:88 V/V/V).

**Application** 10 µL [or 2 µL] as bands of 15 mm [or 8 mm].

**Development** Over a path of 15 cm [or 6 cm].

**Drying** At 105-110 °C until the mobile phase has evaporated.

**Detection** treat with a 10 g/L solution of *dichloroquinonechlorimide R* in *methanol R*, then treat with a 20 g/L solution of *anhydrous sodium carbonate R*.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other blue or brown zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Gallic acid: a brownish zone	A brownish zone
	A brown zone
Arbutin: a blue zone	An intense blue zone (arbutin)
Reference solution	Test solution

#### TESTS

##### Foreign matter (2.8.2)

Maximum 5 per cent of stems and maximum 3 per cent of other foreign matter.

##### Leaves of different colour

Maximum 10 per cent, determined in the same manner as foreign matter (2.8.2).

##### Loss on drying (2.2.32)

Maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

##### Total ash (2.4.16)

Maximum 5.0 per cent.

#### ASSAY

##### Liquid chromatography (2.2.29).

**Test solution** In a 100 mL flask with a ground-glass neck, place 0.800 g of the powdered herbal drug (250) (2.9.12). Add 20 mL of *water R* and heat under a reflux condenser on a water-bath for 30 min. Allow to cool and filter the liquid through a plug of absorbent cotton. Add the absorbent cotton to the residue in the 100 mL flask and extract with 20 mL of *water R* under a reflux condenser on a water-bath for 30 min. Allow to cool and filter through a paper filter. Combine the filtrates and dilute to 50.0 mL with *water R*. Filter through a paper filter. Discard the first 10 mL of the filtrate.

**Reference solution (a)** Dissolve 50.0 mg of *arbutin CRS* in the mobile phase and dilute to 50.0 mL with the mobile phase.

**Reference solution (b)** Dissolve 2.5 mg of *hydroquinone R* in the mobile phase and dilute to 10.0 mL with the mobile phase. To 5.0 mL of the solution, add 2.5 mL of reference solution (a) and dilute to 10.0 mL with the mobile phase.

##### Column:

— size:  $l = 0.25$  m,  $\varnothing = 4$  mm;

— stationary phase: base-deactivated octadecylsilyl silica gel for chromatography R (5 µm).

**Mobile phase** *methanol R*, *water R* (10:90 V/V).

**Flow rate** 1.2 mL/min.

**Detection** Spectrophotometer at 280 nm.

**Injection** 20 µL.

**System suitability** Reference solution (b):

— resolution: minimum 4.0 between the peaks due to arbutin and hydroquinone.

Calculate the percentage content of arbutin using the following expression:

$$\frac{F_1 \times m_2 \times p}{F_2 \times m_1}$$

- $F_1$  = area of the peak due to arbutin in the chromatogram obtained with the test solution;
- $F_2$  = area of the peak due to arbutin in the chromatogram obtained with reference solution (a);
- $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;
- $m_2$  = mass of *arbutin CRS* used to prepare reference solution (a), in grams;
- $p$  = percentage content of arbutin in *arbutin CRS*.

Ph Eur

## Belamcanda Chinensis Rhizome

(Ph. Eur. monograph 2561)

Ph Eur

### DEFINITION

Dried, whole or fragmented rhizome of *Iris domestica* (L.) Goldblatt et Mabb. (syn. *Belamcanda chinensis* (L.) DC.), collected in early spring while the plant is budding or in late autumn while the aerial part is withering, with roots removed.

### Content

Minimum 0.10 per cent of irisflorentin ( $C_{20}H_{18}O_8$ ;  $M_r$  386.4) (dried drug).

### IDENTIFICATION

**A.** The whole rhizome is nodular, rounded, about 3-10 cm long and 1-2 cm in diameter, irregular, more or less branched, with numerous annular striations; there are crateriform, annular stem scars on the upper surface and small roots about 2-3 mm in diameter on the lower surface. The longitudinally fragmented rhizome occurs as pieces about 2-8 cm long, 2 cm wide and 1 cm thick; stem scars and root fragments are present. The orange-brown or dark brown outer surface is the same colour as the fracture. The central parenchyma has a pitted appearance due to the numerous primary vascular bundles. The texture is hard. The fracture is granular.

**B.** Microscopic examination (2.8.23). The powder is orange-brown or dark brown. Examine under a microscope using chloral hydrate solution R. The powder shows the following diagnostic characters (Figure 2561.-1): rare fragments of brown cork with superimposed polyhedral cells (surface view [B]); numerous fragments of parenchyma [D, G] containing somewhat rounded cells with irregularly thickened and pitted walls [Da], some of which are thin-walled and contain a very large calcium oxalate prism up to 250 µm long and about 50 µm in diameter [Db]; very numerous free calcium oxalate prisms, usually broken [A]; annular, reticulate or pitted lignified vessels [C], sometimes accompanied by long fibres [F]. Examine under a microscope using a 50 per cent V/V solution of glycerol R. The powder shows very numerous rounded or ovoid starch granules, 3-15 µm in diameter, simple or rarely 2- to 5-compound; the punctiform hilum is sometimes visible [E].

Figure 2561.-1. – Illustration for identification test B of powdered herbal drug of *belamcanda chinensis* rhizome

**C.** Examine the chromatograms obtained in the test for *Iris tectorum* Maxim.

**Results A** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Coumarin: a quenching zone	A quenching zone
Irisflorentin: a quenching zone	A quenching zone (irisflorentin)
Reference solution	Test solution

**Results B** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint fluorescent zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Coumarin: a faint dark blue fluorescent zone	A faint blue fluorescent zone
	A black zone
	A broad blue fluorescent zone
Irisfloreantin: a blue fluorescent zone	A blue fluorescent zone (irisfloreantin)
Reference solution	Test solution

**TESTS****Iris tectorum Maxim**

Thin-layer chromatography (2.2.27).

**Test solution** To 0.5 g of the powdered herbal drug (355) (2.9.12) add 5 mL of methanol R and sonicate for 10 min. Centrifuge and filter.

**Reference solution** Dissolve 1 mg of coumarin R and 1 mg of irisfloreantin R in 4 mL of methanol R.

**Plate** TLC silica gel F<sub>254</sub> plate R (2-10 µm).

**Mobile phase** glacial acetic acid R, cyclohexane R, ethyl acetate R (1:20:80 V/V/V).

**Application** 4 µL as bands of 8 mm.

**Development** Over a path of 6 cm.

**Drying** In air.

**Detection A** Examine in ultraviolet light at 254 nm.

**Results A** The chromatogram obtained with the test solution shows no quenching zone between the zones due to coumarin and irisfloreantin in the chromatogram obtained with the reference solution; the chromatogram obtained with the test solution shows no quenching zones in the lower third.

**Detection B** Examine in ultraviolet light at 365 nm.

**Results B** The chromatogram obtained with the test solution shows no pale blue fluorescent zone above the zone due to coumarin in the chromatogram obtained with the reference solution.

**Loss on drying (2.2.32)**

Maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

**Total ash (2.4.16)**

Maximum 7.0 per cent.

**Ash insoluble in hydrochloric acid (2.8.1)**

Maximum 1.0 per cent.

**ASSAY**

Liquid chromatography (2.2.29).

**Test solution** Disperse 0.100 g of the powdered herbal drug (355) (2.9.12) in 10 mL of ethanol (70 per cent V/V) R in a 50 mL centrifuge tube. Sonicate for 30 min. Mix and centrifuge for 5 min. Transfer the supernatant to a 25 mL volumetric flask. Add to the residue 10 mL of ethanol (70 per cent V/V) R and sonicate for 30 min. Filter and add the filtrate to the same volumetric flask. Dilute to 25.0 mL with ethanol (70 per cent V/V) R and mix. Filter through a membrane filter (nominal pore size 0.45 µm).

**Reference solution (a)** Dissolve 5.0 mg of irisfloreantin CRS in ethanol (70 per cent V/V) R and dilute to 50.0 mL with the same solvent. Dilute 5.0 mL of the solution to 50.0 mL with ethanol (70 per cent V/V) R.

**Reference solution (b)** Disperse 0.10 g of belamcanda chinensis rhizome HRS in 10 mL of ethanol (70 per cent V/V) R in a 50 mL centrifuge tube. Sonicate for 30 min. Mix and centrifuge for 5 min. Transfer the supernatant to a 25 mL volumetric flask. Add to the residue 10 mL of ethanol (70 per cent V/V) R and sonicate for 30 min. Filter and add the filtrate to the same volumetric flask. Dilute to 25.0 mL with ethanol (70 per cent V/V) R and mix. Filter through a membrane filter (nominal pore size 0.45 µm).

**Column:**

— size:  $l = 0.25$  m,  $\varnothing = 4.6$  mm;

— stationary phase: base-deactivated end-capped octadecylsilyl silica gel for chromatography R (5 µm).

**Mobile phase:**

— mobile phase A: 0.05 per cent V/V solution of phosphoric acid R;

— mobile phase B: acetonitrile R;

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 5	82	18
5 - 20	82 → 80	18 → 20
20 - 30	80 → 67	20 → 33
30 - 50	67 → 60	33 → 40
50 - 65	60 → 47	40 → 53

**Flow rate** 1.0 mL/min.

**Detection** Spectrophotometer at 266 nm.

**Injection** 10 µL.

**Identification of peaks** Use the chromatogram obtained with reference solution (a) to identify the peak due to irisfloreantin; use the chromatogram supplied with belamcanda chinensis rhizome HRS and the chromatogram obtained with reference solution (b) to identify the peaks due to tectoridin and peak 2 (unknown).

**Relative retention** With reference to irisfloreantin (retention time = about 54 min): tectoridin = about 0.39; peak 2 = about 0.42.

**System suitability** Reference solution (b):

— resolution: minimum 1.5 between the peak due to tectoridin and peak 2.

Calculate the percentage content of irisfloreantin using the following expression:

$$\frac{A_1 \times m_2 \times p}{A_2 \times m_1 \times 20}$$

$A_1$	=	area of the peak due to irisfloreantin in the chromatogram obtained with the test solution;
$A_2$	=	area of the peak due to irisfloreantin in the chromatogram obtained with reference solution (a);
$m_1$	=	mass of the herbal drug to be examined used to prepare the test solution, in grams;
$m_2$	=	mass of irisfloreantin CRS used to prepare reference solution (a), in grams;
$p$	=	percentage content of irisfloreantin in irisfloreantin CRS.

Ph Eur

## Belladonna Leaf

Belladonna Herb

(Ph. Eur. monograph 0221)

### Preparations

Prepared Belladonna

Standardised Belladonna Leaf Dry Extract

Belladonna Tincture

When Belladonna Herb, Belladonna Leaf or Powdered Belladonna Herb is prescribed, Prepared Belladonna shall be supplied.

Ph Eur

### DEFINITION

Dried leaf or dried leaf and flowering, and occasionally fruit-bearing, tops of *Atropa belladonna* L.

### Content

Minimum 0.30 per cent of total alkaloids, expressed as hyoscyamine ( $C_{17}H_{23}NO_3$ ;  $M_r$  289.4) (dried drug). The alkaloids consist mainly of hyoscyamine together with small quantities of hyoscyne (scopolamine).

### CHARACTERS

Slightly-nauseous odour.

### IDENTIFICATION

A. The leaves are green or brownish-green, slightly darker on the upper surface, often crumpled and rolled and partly matted together in the drug. The leaf is petiolate and the lamina is acute and decurrent. The margin is entire. The flowering stems are flattened and bear at each node a pair of leaves unequal in size, in the axils of which occur singly the flowers or occasionally fruits. The flowers have a gamosepalous calyx and campanulate corolla. The drug may contain fruits, as globular berries, green or brownish-black and surrounded by the persistent calyx with widely spread lobes.

B. Microscopic examination (2.8.23). The powder is dark green. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 0221.-1): fragments of the lamina showing sinuous-walled epidermal cells with striated cuticle [A, C] and part of the underlying palisade parenchyma [Aa] associated with the upper epidermis [A]; numerous stomata [Ca] more frequent on the lower epidermis [C], anisocytic and also some anomocytic (2.8.3); multicellular, uniseriate covering trichomes with a smooth cuticle [F], glandular trichomes with unicellular heads and multicellular, uniseriate stalks [D] or with multicellular heads and unicellular stalks [B]; parenchyma cells including rounded cells, some of which contain microsphenoidal crystals of calcium oxalate [E]; annularly and spirally thickened vessels [K]. The powdered herbal drug may also show: fibres and reticulately thickened vessels from the stems; subspherical pollen grains, 40-50  $\mu$ m in diameter, with 3 germinal pores, 3 furrows and an extensively pitted exine [H]; fragments of the corolla with a papillose epidermis [J] or bearing numerous covering or glandular trichomes of the types previously described [L]; fragments of the brownish-yellow testa consisting of irregularly sclerified cells [G].

Figure 0221.-1. – Illustration for identification test B of powdered herbal drug of belladonna leaf

C. Shake 1 g of the powdered herbal drug (180) (2.9.12) with 10 mL of *dilute sulfuric acid R1* for 2 min. Filter and add to the filtrate 1 mL of *concentrated ammonia R* and 5 mL of *water R*. Shake cautiously with 15 mL of *ether R*, avoiding formation of an emulsion. Separate the ether layer and dry over *anhydrous sodium sulfate R*. Filter and evaporate the ether in a porcelain dish. Add 0.5 mL of *fuming nitric acid R* and evaporate to dryness on a water-bath. Add 10 mL of *acetone R* and, dropwise, a 30 g/L solution of *potassium hydroxide R* in *ethanol (96 per cent) R*. A deep violet colour develops.

D. Examine the chromatograms obtained in the chromatography test.

**Results** The principal zones in the chromatograms obtained with the test solution are similar in position, colour and size to the principal zones in the chromatograms obtained with the same volume of the reference solution.

### TESTS

#### Chromatography

Thin-layer chromatography (2.2.27).

**Test solution** To 0.6 g of the powdered herbal drug (180) (2.9.12) add 15 mL of *dilute sulfuric acid R1*, shake for 15 min and filter. Wash the filter with *dilute sulfuric acid R1* until 20 mL of filtrate is obtained. To the filtrate add 1 mL of *concentrated ammonia R* and shake with 2 quantities, each of 10 mL, of *peroxide-free ether R*. If necessary, separate by centrifugation. Dry the combined ether layers over *anhydrous sodium sulfate R*, filter and evaporate to dryness on a water-bath. Dissolve the residue in 0.5 mL of *methanol R*.

**Reference solution** Dissolve 50 mg of *hyoscyamine sulfate R* in 9 mL of *methanol R*. Dissolve 15 mg of *hyoscyne hydrobromide R* in 10 mL of *methanol R*. Mix 1.8 mL of the

hyoscine hydrobromide solution and 8 mL of the hyoscyamine sulfate solution.

Plate TLC silica gel G plate R.

Mobile phase concentrated ammonia R, water R, acetone R (3:7:90 V/V/V).

Application 10 µL and 20 µL, as bands of 20 mm by 3 mm, leaving 1 cm between the bands.

Development Over a path of 10 cm.

Drying At 100-105 °C for 15 min; allow to cool.

Detection A Spray with potassium iodobismuthate solution R2, using about 10 mL for a plate 200 mm square, until the orange or brown zones become visible against a yellow background.

Results A The zones in the chromatograms obtained with the test solution are similar in position (hyoscyamine in the lower third, hyoscine in the upper third of the chromatograms) and colour to the bands in the chromatograms obtained with the reference solution.

The zones in the chromatograms obtained with the test solution are at least equal in size to the corresponding zones in the chromatogram obtained with the same volume of the reference solution. Faint secondary zones may appear, particularly in the middle of the chromatogram obtained with 20 µL of the test solution or near the starting point in the chromatogram obtained with 10 µL of the test solution.

Detection B Spray with sodium nitrite solution R until the coating is transparent; examine after 15 min.

Results B The zones due to hyoscyamine in the chromatograms obtained with the reference solution and the test solution change from brown to reddish-brown but not to greyish-blue (atropine) and any secondary zones disappear.

#### Foreign matter (2.8.2)

Maximum 3 per cent of stems with a diameter greater than 5 mm.

#### Total ash (2.4.16)

Maximum 16.0 per cent.

#### Ash insoluble in hydrochloric acid (2.8.1)

Maximum 4.0 per cent.

#### ASSAY

a) Determine the loss on drying (2.2.32) on 2.000 g of the powdered herbal drug (180) (2.9.12), by drying in an oven at 105 °C.

b) Moisten 10.00 g of the powdered herbal drug (180) (2.9.12) with a mixture of 5 mL of ammonia R, 10 mL of ethanol (96 per cent) R and 30 mL of peroxide-free ether R and mix thoroughly. Transfer the mixture to a suitable percolator, if necessary with the aid of the extracting mixture. Allow to macerate for 4 h and percolate with a mixture of 1 volume of chloroform R and 3 volumes of peroxide-free ether R until the alkaloids are completely extracted. Evaporate to dryness a few millilitres of the liquid flowing from the percolator, dissolve the residue in 0.25 M sulfuric acid and verify the absence of alkaloids using potassium tetraiodomercurate solution R. Concentrate the percolate to about 50 mL by distilling on a water-bath and transfer it to a separating funnel, rinsing with peroxide-free ether R. Add a quantity of peroxide-free ether R equal to at least 2.1 times the volume of the percolate to produce a liquid of a density well below that of water. Shake the solution with no fewer than 3 quantities, each of 20 mL, of 0.25 M sulfuric acid, separate the 2 layers by centrifugation if necessary and transfer the acid layers to a 2<sup>nd</sup> separating funnel. Make the acid layer alkaline with ammonia R and shake with 3 quantities, each of 30 mL, of

chloroform R. Combine the chloroform layers, add 4 g of anhydrous sodium sulfate R and allow to stand for 30 min with occasional shaking. Decant the chloroform and wash the sodium sulfate with 3 quantities, each of 10 mL, of chloroform R. Add the washings to the chloroform extract, evaporate to dryness on a water-bath and heat in an oven at 100-105 °C for 15 min. Dissolve the residue in a few millilitres of chloroform R, add 20.0 mL of 0.01 M sulfuric acid and remove the chloroform by evaporation on a water-bath. Titrate the excess of acid with 0.02 M sodium hydroxide using methyl red mixed solution R as indicator.

Calculate the percentage content of total alkaloids, expressed as hyoscyamine, using the following expression:

$$\frac{57.88 \times (20 - n)}{(100 - d) \times m}$$

*d* = loss on drying, as a percentage;  
*n* = volume of 0.02 M sodium hydroxide, in millilitres;  
*m* = mass of the powdered herbal drug, in grams.

Ph Eur

## Prepared Belladonna

Prepared Belladonna Herb

(Ph. Eur. monograph 0222)

Ph Eur

#### DEFINITION

Belladonna leaf powder (180) (2.9.12) adjusted, if necessary, by adding powdered lactose or belladonna leaf powder with a lower alkaloidal content.

#### Content

0.28 per cent to 0.32 per cent of total alkaloids, expressed as hyoscyamine (*M<sub>r</sub>* 289.4) (dried drug).

#### CHARACTERS

Slightly nauseous odour.

#### IDENTIFICATION

A. Microscopic examination (2.8.23) of the powder (180) (2.9.12). The powder is dark green. Examine under a microscope, using chloral hydrate solution R. The powder shows the following diagnostic characters: fragments of leaf lamina showing sinuous-walled epidermal cells, a striated cuticle and numerous stomata predominantly present on the lower epidermis (anisocytic and also some anomocytic) (2.8.3); multicellular uniseriate covering trichomes with smooth cuticle, glandular trichomes with unicellular heads and multicellular, uniseriate stalks or with multicellular heads and unicellular stalks; parenchyma cells including rounded cells containing microsphenoidal crystals of calcium oxalate; annular and spirally thickened vessels. The powdered herbal drug may also show the following: fibres and reticulately thickened vessels from the stems; subspherical pollen grains, 40-50 µm in diameter, with 3 germinal pores, 3 furrows and an extensively pitted exine; fragments of the corolla, with a papillose epidermis or bearing numerous covering or glandular trichomes of the types previously described; brownish-yellow seed fragments containing irregularly sclerified and pitted cells of the testa. Examined in glycerol (85 per cent) R, the powder may be seen to contain lactose crystals.

B. Shake 1 g with 10 mL of dilute sulfuric acid R1 for 2 min. Filter and add to the filtrate 1 mL of concentrated ammonia R

and 5 mL of *water R*. Shake cautiously with 15 mL of *ether R*, avoiding formation of an emulsion. Separate the ether layer and dry over *anhydrous sodium sulfate R*. Filter and evaporate the ether in a porcelain dish. Add 0.5 mL of *fuming nitric acid R* and evaporate to dryness on a water-bath. Add 10 mL of *acetone R* and, dropwise, a 30 g/L solution of *potassium hydroxide R* in *ethanol (96 per cent) R*. A deep violet colour develops.

C. Examine the chromatograms obtained in the test Chromatography.

**Results** The principal zones in the chromatograms obtained with the test solution are similar in position, colour and size to the principal zones in the chromatogram obtained with the same volume of the reference solution.

## TESTS

### Chromatography

Thin-layer chromatography (2.2.27).

**Test solution** To 0.6 g of the drug to be examined add 15 mL of *dilute sulfuric acid R1*, shake for 15 min and filter. Wash the filter with *dilute sulfuric acid R1* until 20 mL of filtrate is obtained. To the filtrate add 1 mL of *concentrated ammonia R* and shake with 2 quantities, each of 10 mL, of *peroxide-free ether R*. If necessary, separate by centrifugation. Dry the combined ether layers over *anhydrous sodium sulfate R*, filter, and evaporate to dryness on a water-bath. Dissolve the residue in 0.5 mL of *methanol R*.

**Reference solution** Dissolve 50 mg of *hyoscyamine sulfate R* in 9 mL of *methanol R*. Dissolve 15 mg of *hyoscyne hydrobromide R* in 10 mL of *methanol R*. Mix 1.8 mL of the hyoscyne hydrobromide solution and 8 mL of the hyoscyamine sulfate solution.

**Plate** TLC silica gel G plate R.

**Mobile phase** *concentrated ammonia R*, *water R*, *acetone R* (3:7:90 V/V/V).

**Application** 10 µL and 20 µL of each solution, as bands of 20 mm by 3 mm, leaving 1 cm between each band.

**Development** Over a path of 10 cm.

**Drying** At 100-105 °C for 15 min; allow to cool.

**Detection A** Spray with *potassium iodobismuthate solution R2*, using about 10 mL for a plate 200 mm square, until orange or brown zones become visible against a yellow background.

**Results A** The zones in the chromatograms obtained with the test solution are similar in position (hyoscyamine in the lower third, hyoscyne in the upper third) and colour to those in the chromatograms obtained with the reference solution; the zones in the chromatograms obtained with the test solution are at least equal in size to the corresponding zones in the chromatogram obtained with the same volume of the reference solution; faint secondary zones may appear, particularly in the middle of the chromatogram obtained with 20 µL of the test solution or near the point of application in the chromatogram obtained with 10 µL of the test solution.

**Detection B** Spray with *sodium nitrite solution R* until the coating is transparent and examine after 15 min.

**Results B** The zones due to hyoscyamine in the chromatograms obtained with the test solution and the reference solution change from brown to reddish-brown but not to greyish-blue (atropine), and any secondary zones disappear.

### Loss on drying (2.2.32)

Maximum 5.0 per cent, determined on 1.000 g by drying in an oven at 105 °C.

### Total ash (2.4.16)

Maximum 16.0 per cent.

### Ash insoluble in hydrochloric acid (2.8.1)

Maximum 4.0 per cent.

## ASSAY

a) Determine the loss on drying (2.2.32) on 2.000 g by drying in an oven at 105 °C.

b) Moisten 10.00 g with a mixture of 5 mL of *ammonia R*, 10 mL of *ethanol (96 per cent) R* and 30 mL of *peroxide-free ether R* and mix thoroughly. Transfer the mixture to a suitable percolator, if necessary with the aid of the extracting mixture. <i>m</i>	=	mass of the herbal drug used, in grams.	

## STORAGE

In an airtight container.

Ph Eur

## Standardised Belladonna Leaf Dry Extract

(Ph. Eur. monograph 1294)

Ph Eur

### DEFINITION

Standardised dry extract obtained from *Belladonna leaf* (0221).

### Content

0.95 per cent to 1.05 per cent of total alkaloids, expressed as hyoscyamine ( $C_{17}H_{23}NO_3$ ;  $M_r$  289.4) (dried extract).

### PRODUCTION

The extract is produced from the herbal drug by a suitable procedure using ethanol (70 per cent *V/V*).

### CHARACTERS

#### Appearance

Brown or greenish, hygroscopic powder.

### IDENTIFICATION

A. Thin-layer chromatography (2.2.27).

**Test solution** To 1 g of the extract to be examined add 5.0 mL of *methanol R*. Shake for 2 min and filter.

**Reference solution** Dissolve 1.0 mg of *chlorogenic acid R* and 2.5 mg of *rutoside trihydrate R* in 10 mL of *methanol R*.

**Plate** TLC silica gel plate R.

**Mobile phase** *anhydrous formic acid R*, *water R*, *methyl ethyl ketone R*, *ethyl acetate R* (10:10:30:50 *V/V/V/V*).

**Application** 20  $\mu$ L as bands.

**Development** Over a path of 15 cm.

**Drying** At 100-105 °C.

**Detection** Treat the warm plate with a 10 g/L solution of *diphenylboric acid aminoethyl ester R* in *methanol R*, then treat with a 50 g/L solution of *macrogol 400 R* in *methanol R*; allow to dry in air for 30 min and examine in ultraviolet light at 365 nm.

**Results** The chromatograms obtained with the reference solution and the test solution show in the central part a light blue fluorescent zone (chlorogenic acid) and in the lower part a yellowish-brown fluorescent zone (rutoside); furthermore, the chromatogram obtained with the test solution shows a little above the start a yellowish-brown fluorescent zone and directly above that a yellow fluorescent zone, and a yellow or yellowish-brown fluorescent zone between the zone due to rutoside and the zone due to chlorogenic acid. Further zones may be present.

B. Examine the chromatograms obtained in the test for atropine.

**Results** The principal zones in the chromatogram obtained with the test solution are similar in position and colour to the principal zones in the chromatogram obtained with the reference solution.

### TESTS

#### Atropine

Thin-layer chromatography (2.2.27).

**Test solution** To 0.20 g of the extract to be examined add 10.0 mL of *dilute sulfuric acid R1*, shake for 2 min and filter.

Add 1.0 mL of *concentrated ammonia R* and shake with 2 quantities, each of 10 mL, of *peroxide-free ether R*.

If necessary, separate by centrifugation. Dry the combined ether layers over about 2 g of *anhydrous sodium sulfate R*, filter

and evaporate to dryness on a water-bath. Dissolve the residue in 0.5 mL of *methanol R*.

**Reference solution** Dissolve 50 mg of *hyoscyamine sulfate R* in 9 mL of *methanol R*. Dissolve 15 mg of *hyoscine hydrobromide R* in 10 mL of *methanol R*. Mix 1.8 mL of the hyoscine hydrobromide solution and 8 mL of the hyoscyamine sulfate solution.

**Plate** TLC silica gel plate R.

**Mobile phase** *concentrated ammonia R*, *water R*, *acetone R* (3:7:90 *V/V/V*).

**Application** 20  $\mu$ L as bands.

**Development** Over a path of 10 cm.

**Drying** At 100-105 °C for 15 min; allow to cool.

**Detection A** Treat with *potassium iodobismuthate solution R2*, until orange or brown zones become visible against a yellow background.

**Results A** The zones in the chromatogram obtained with the test solution are similar in position (hyoscyamine in the lower third, hyoscine in the upper third) and colour to those in the chromatogram obtained with the reference solution. Other faint zones may be present in the chromatogram obtained with the test solution.

**Detection B** Treat with *sodium nitrite solution R* until the coating is transparent and examine after 15 min.

**Results B** The zones due to hyoscyamine in the chromatograms obtained with the test solution and the reference solution change from orange or brown to reddish-brown but not to greyish-blue (atropine).

**Loss on drying** (2.8.17)

Maximum 5.0 per cent.

### ASSAY

At each extraction stage it is necessary to check that the alkaloids have been completely extracted. If the extraction is into the organic phase this is done by evaporating to dryness a few millilitres of the last organic layer, dissolving the residue in 0.25 *M* *sulfuric acid* and verifying the absence of alkaloids using *potassium tetraiodomercurate solution R*. If the extraction is into the acid aqueous phase, this is done by taking a few millilitres of the last acid aqueous phase and verifying the absence of alkaloids using *potassium tetraiodomercurate solution R*.

Disperse 3.00 g in a mixture of 5 mL of *ammonia R* and 15 mL of *water R*. Shake with no fewer than 3 quantities, each of 40 mL, of a mixture of 1 volume of *methylene chloride R* and 3 volumes of *peroxide-free ether R* until the alkaloids are completely extracted. Concentrate the combined organic layers to about 50 mL by distilling on a water-bath and transfer the resulting liquid to a separating funnel, rinsing with *peroxide-free ether R*. Add a quantity of *peroxide-free ether R* equal to at least 2.1 times the volume of the liquid to produce a layer having a density well below that of water. Shake the resulting solution with no fewer than 3 quantities, each of 20 mL, of 0.25 *M* *sulfuric acid* until the alkaloids are completely extracted. Separate the layers by centrifugation, if necessary, and transfer the acid layers to a 2<sup>nd</sup> separating funnel. Make the combined acid layers alkaline with *ammonia R* and shake with no fewer than 3 quantities, each of 30 mL, of *methylene chloride R* until the alkaloids are completely extracted. Combine the organic layers, add 4 g of *anhydrous sodium sulfate R* and allow to stand for 30 min with occasional shaking. Decant the methylene chloride and wash the sodium sulfate with 3 quantities, each of 10 mL, of *methylene chloride R*. Combine

the organic extracts and evaporate to dryness on a water-bath. Heat the residue in an oven at 100-105 °C for 15 min. Dissolve the residue in a few millilitres of *methylene chloride R*, evaporate to dryness on a water-bath and again heat the residue in an oven at 100-105 °C for 15 min. Dissolve the residue in a few millilitres of *methylene chloride R*, add 20.0 mL of 0.01 M *sulfuric acid* and remove the methylene chloride by evaporation on a water-bath. Titrate the excess of acid with 0.02 M *sodium hydroxide* using *methyl red mixed solution R* as indicator.

Calculate the percentage content of total alkaloids, expressed as hyoscyamine, using the following expression:

$$\frac{57.88 \times (20 - n)}{100 \times m}$$

*n* = volume of 0.02 M *sodium hydroxide* used, in millilitres;  
*m* = mass of the extract to be examined, in grams.

Ph Eur

## Belladonna Tincture

(Standardised *Belladonna Leaf Tincture*, Ph. Eur. monograph 1812)

Ph Eur

### DEFINITION

Tincture produced from *Belladonna leaf* (0221).

### Content

0.027 per cent to 0.033 per cent of total alkaloids, calculated as hyoscyamine (C<sub>17</sub>H<sub>23</sub>NO<sub>3</sub>; *M*, 289.4). The alkaloids consist mainly of hyoscyamine together with small quantities of hyoscyne.

### PRODUCTION

The tincture is produced from 1 part of the powdered herbal drug (355) (2.9.12) and 10 parts of ethanol (70 per cent *V/V*) by a suitable procedure.

### IDENTIFICATION

A. Thin-layer chromatography (2.2.27).

**Test solution** Evaporate to dryness 10.0 mL of the tincture to be examined in a water-bath at 40 °C under reduced pressure. Dissolve the residue in 1.0 mL of *methanol R*.

**Reference solution** Dissolve 1.0 mg of *chlorogenic acid R* and 2.5 mg of *rutoside trihydrate R* in 10 mL of *methanol R*.

**Plate** TLC silica gel plate *R*.

**Mobile phase** *anhydrous formic acid R*, *water R*, *methyl ethyl ketone R*, *ethyl acetate R* (10:10:30:50 *V/V/V/V*).

**Application** 40 µL as bands.

**Development** Over a path of 15 cm.

**Drying** At 100-105 °C.

**Detection** Spray the warm plate with a 10 g/L solution of *diphenylboric acid aminoethyl ester R* in *methanol R*; subsequently spray the plate with a 50 g/L solution of *macrogol 400 R* in *methanol R*; allow the plate to dry in air for 30 min and examine in ultraviolet light at 365 nm.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other fluorescent zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Chlorogenic acid: a light blue fluorescent zone	A light blue fluorescent zone (chlorogenic acid) A yellow or yellowish-brown fluorescent zone
Rutoside: a yellowish-brown fluorescent zone	A bluish-grey fluorescent zone A yellow fluorescent zone A yellowish-brown fluorescent zone
Reference solution	Test solution

B. Examine the chromatograms obtained in the test for atropine, detection A.

**Results A** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Faint secondary zones may appear, particularly in the middle of the chromatogram obtained with 40 µL of the test solution or near the point of application in the chromatogram obtained with 20 µL of the test solution.

Top of the plate	
Hyoscyne: a brownish-orange zone	A brownish-orange zone (hyoscyne)  Faint secondary zones
Hyoscyamine: a brownish-orange zone	A brownish-orange zone (hyoscyamine) Faint secondary zones
Reference solution	Test solution

### TESTS

#### Atropine

Thin-layer chromatography (2.2.27).

**Test solution** To 15.0 mL of the tincture to be examined add 15 mL of *dilute sulfuric acid R1*. Filter. Add 1 mL of *concentrated ammonia R* to the filtrate and shake with 2 quantities, each of 10 mL, of *peroxide-free ether R*. Separate by centrifugation if necessary. Dry the combined ether layers over *anhydrous sodium sulfate R*. Filter and evaporate to dryness on a water-bath. Dissolve the residue in 0.5 mL of *methanol R*.

**Reference solution** Dissolve 50 mg of *hyoscyamine sulfate R* in 9 mL of *methanol R*. Dissolve 15 mg of *hyoscyne hydrobromide R* in 10 mL of *methanol R*. Mix 1.8 mL of the hyoscyne hydrobromide solution and 8 mL of the hyoscyamine sulfate solution.

**Plate** TLC silica gel plate *R*.

**Mobile phase** *concentrated ammonia R*, *water R*, *acetone R* (3:7:90 *V/V/V*).

**Application** 20 µL and 40 µL of each solution, as bands.

**Development** Over a path of 10 cm.

**Drying** At 100-105 °C for 15 min.

**Detection A** Spray with *potassium iodobismuthate solution R2*.

**Detection B** Spray with *sodium nitrite solution R* until the plate is transparent. Examine after 15 min.

**Results B** The zones due to hyoscyamine in the chromatograms obtained with the test solution and the reference solution change from brownish-orange to reddish-brown but not to greyish-blue (atropine) and any secondary zones disappear.

Ethanol (2.9.10)

64 per cent *V/V* to 69 per cent *V/V*.

#### ASSAY

Evaporate 50.0 g of the tincture to be examined to a volume of about 10 mL. Transfer quantitatively to a separating funnel, with the minimum volume of *alcohol* (70 per cent *V/V*) *R*. Add 5 mL of *ammonia R* and 15 mL of *water R*. Shake with not fewer than 3 quantities each of 40 mL of a mixture of 1 volume of *methylene chloride R* and 3 volumes of *peroxide-free ether R*, carefully to avoid emulsion, until the alkaloids are completely extracted. Combine the organic layers and concentrate the solution to a volume of about 50 mL by distilling on a water-bath. Transfer the resulting solution quantitatively to a separating funnel, rinsing with *peroxide-free ether R*. Add a quantity of *peroxide-free ether R* equal to at least 2.1 times the volume of the solution to produce a layer having a density well below that of water. Shake the resulting solution with not fewer than 3 quantities each of 20 mL of 0.25 *M sulfuric acid* until the alkaloids are completely extracted. Separate the layers by centrifugation if necessary and transfer the layers to a separating funnel. Make the combined layers alkaline with *ammonia R* and shake with not fewer than 3 quantities each of 30 mL of *methylene chloride R* until the alkaloids are completely extracted. Combine the organic layers, add 4 g of *anhydrous sodium sulfate R* and allow to stand for 30 min with occasional shaking. Decant the methylene chloride and filter. Wash the sodium sulfate with 3 quantities each of 10 mL of *methylene chloride R*. Combine the organic extracts, evaporate to dryness on a water-bath. Heat the residue in an oven at 100–105 °C for 15 min. Dissolve the residue in a few millilitres of *methylene chloride R*, evaporate to dryness on a water-bath and heat the residue in an oven at 100–105 °C for 15 min again. Dissolve the residue in a few millilitres of *methylene chloride R*. Add 20.0 mL of 0.01 *M sulfuric acid* and remove the methylene chloride by evaporation on a water-bath. Titrate the excess of acid with 0.02 *M sodium hydroxide* using *methyl red mixed solution R* as indicator.

Calculate the percentage content of total alkaloids, expressed as hyoscyamine, using the following expression:

$$\frac{57.88 \times (20 - n)}{100 \times m}$$

*n* = volume of 0.02 *M sodium hydroxide* used, in millilitres,  
*m* = mass of the herbal drug used, in grams.

Ph Eur

## Siam Benzoin

(Ph. Eur. monograph 2158)

#### Preparation

Siam Benzoin Tincture

Ph Eur

#### DEFINITION

Resin obtained by incising the trunk of *Styrax tonkinensis* (Pierre) Craib ex Hartwich.

#### Content

35.0 per cent to 55.0 per cent of total acids, expressed as benzoic acid ( $C_7H_6O_2$ ; *M<sub>r</sub>* 122.1) (dried drug).

#### CHARACTERS

Reminiscent odour of vanillin.

#### IDENTIFICATION

A. Siam benzoin occurs as opaque, often shiny, rounded, ovoid or angular masses (tears or almonds), usually broken and varying in size from a few millimetres up to about 3 cm. Individual tears are yellowish-white or reddish externally, often with brown or grey patches of discolouration, and have a waxy, whitish fracture which becomes reddish on prolonged exposure to air.

B. Examine the chromatograms obtained in test B for Sumatra benzoin.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint quenching zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Methyl cinnamate: a quenching zone	
Cinnamic acid: a quenching zone	
	A quenching zone
	A very prominent quenching zone
Vanillin: a quenching zone	
	A quenching zone
	3 quenching zones
Reference solution	Test solution

#### TESTS

##### Sumatra benzoin

A. To 0.2 g of the finely powdered herbal drug add 10 mL of *ethanol* (96 per cent) *R*. Shake vigorously until almost completely dissolved and filter. Place 5 mL of the filtrate in a test-tube and add 0.5 mL of a 50 g/L solution of *ferric chloride R* in *ethanol* (96 per cent) *R*. A green colour is produced. No yellow colour is produced.

B. Thin-layer chromatography (2.2.27).

**Test solution** Sonicate 0.2 g of the finely powdered herbal drug in 5 mL of *ethanol* (96 per cent) *R* and centrifuge. Use the supernatant.

**Reference solution** Dissolve 4 mg of *vanillin R*, 10 mg of *trans-cinnamic acid R* and 10 mg of *methyl cinnamate R* in 10 mL of *ethanol* (96 per cent) *R*.

**Plate** TLC silica gel *F<sub>254</sub>* plate *R* (5–40 μm) [or TLC silica gel *F<sub>254</sub>* plate *R* (2–10 μm)].

**Mobile phase** *glacial acetic acid R*, *di-isopropyl ether R*, *cyclohexane R* (10:40:60 *V/V/V*).

**Application** 10 μL [or 2 μL] as bands of 15 mm [or 8 mm].

**Development** Over a path of 12 cm [or 6 cm].

**Drying** In air.

**Detection** Examine in ultraviolet light at 254 nm.

**Results** The chromatogram obtained with the test solution shows no zone in the same position as the zone due to cinnamic acid in the chromatogram obtained with the reference solution.

**Matter insoluble in ethanol**

Maximum 5 per cent.

To 2.0 g of the powdered herbal drug add 25 mL of *ethanol* (90 per cent V/V) R. Boil until almost completely dissolved. Filter through a previously tared sintered-glass filter (16) (2.1.2) and wash with 3 quantities, each of 5 mL, of boiling *ethanol* (90 per cent V/V) R. Heat the glass filter and its contents in an oven at 100-105 °C for 2 h. Weigh after cooling.

**Loss on drying** (2.2.32)

Maximum 5.0 per cent, determined on 2.000 g of the coarsely powdered herbal drug by drying *in vacuo* for 4 h.

**Total ash** (2.4.16)

Maximum 2.0 per cent.

**ASSAY**

Place 0.750 g of the finely powdered herbal drug in a 250 mL borosilicate glass flask and add 15.0 mL of 0.5 M alcoholic potassium hydroxide. Boil under a reflux condenser on a water-bath for 30 min. Allow to cool and rinse the condenser with 20 mL of *ethanol* (96 per cent) R. Titrate the excess of potassium hydroxide with 0.5 M hydrochloric acid. Determine the end-point potentiometrically (2.2.20). Carry out a blank titration.

1 mL of 0.5 M alcoholic potassium hydroxide is equivalent to 61.05 mg of benzoic acid (C<sub>7</sub>H<sub>6</sub>O<sub>2</sub>).

Ph Eur

## Siam Benzoin Tincture

(Ph. Eur. monograph 2157)

Ph Eur

**DEFINITION**

Tincture produced from *Siam benzoin* (2158).

**Content**

Minimum 5.0 per cent *m/m* of total acids, calculated as benzoic acid (C<sub>7</sub>H<sub>6</sub>O<sub>2</sub>; M<sub>r</sub> 122.1).

**PRODUCTION**

The tincture is produced from 1 part of the drug and 5 parts of ethanol (75 per cent V/V to 96 per cent V/V) by a suitable procedure.

**CHARACTERS**

**Appearance**

Orange-yellow liquid.

It has a characteristic odour of vanillin.

**IDENTIFICATION**

A. Place 10 mL in a test tube; add 0.5 mL of a 50 g/L solution of *ferric chloride* R in *ethanol* (96 per cent) R. A green colour is produced.

B. Examine the chromatograms obtained in the test for Sumatra benzoin tincture.

**Results** See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint fluorescent zones may

be present in the chromatogram obtained with the test solution.

Top of the plate	
Methyl cinnamate: a very prominent quenching zone	
Benzoic acid: a quenching zone	A quenching zone (benzoic acid)
Cinnamic acid: a prominent quenching zone	
	A quenching zone
	A very prominent quenching zone
Vanillin: a quenching zone	A quenching zone (vanillin)
	Series of unresolved zones including a quenching zone
Reference solution	Test solution

**TESTS**

**Sumatra benzoin tincture**

Thin-layer chromatography (2.2.27).

**Test solution** The tincture to be examined.

**Reference solution** Dissolve 20 mg of *benzoic acid* R, 10 mg of *trans-cinnamic acid* R, 4 mg of *vanillin* R and 20 mg of *methyl cinnamate* R in 20 mL of ethanol of the same concentration as that used for the production of the tincture.

**Plate** TLC silica gel F<sub>254</sub> plate R (5-40 μm) [or TLC silica gel F<sub>254</sub> plate R (2-10 μm)].

**Mobile phase** *glacial acetic acid* R, *di-isopropyl ether* R, *hexane* R (10:40:60 V/V/V).

**Application** 20 μL [or 8 μL] as bands.

**Development** Over a path of 12 cm [or 6 cm].

**Drying** In air.

**Detection** Examine in ultraviolet light at 254 nm.

**Results** The chromatogram obtained with the test solution does not show any zone in the same position as the zones due to cinnamic acid and methyl cinnamate in the chromatogram obtained with the reference solution.

**Ethanol** (2.9.10)

95 per cent to 105 per cent of the content stated on the label.

**ASSAY**

Place 3.50 g in a 250 mL borosilicate glass flask and add 15.0 mL of 0.5 M alcoholic potassium hydroxide. Boil under a reflux condenser on a water-bath for 30 min. Allow to cool and rinse the condenser with 20 mL of *ethanol* (96 per cent) R. Titrate the excess of potassium hydroxide with 1 M hydrochloric acid, determining the end-point potentiometrically (2.2.20). Carry out a blank titration.

1 mL of 0.5 M alcoholic potassium hydroxide is equivalent to 61.05 mg of benzoic acid (C<sub>7</sub>H<sub>6</sub>O<sub>2</sub>).

Ph Eur

## Sumatra Benzoin

Benzoin

(Ph. Eur. monograph 1814)

## Preparations

Benzoin Inhalation

Compound Benzoin Tincture

Sumatra Benzoin Tincture

Ph Eur

## DEFINITION

Resin obtained by incising the trunk of *Styrax benzoin* Dryander.

## Content

25.0 per cent to 50.0 per cent of total acids, calculated as benzoic acid ( $C_7H_6O_2$ ;  $M_r$  122.1) (dried drug).

## IDENTIFICATION

A. Sumatra benzoin occurs as creamy white, rounded to ovoid tears, which may be embedded in a dull greyish-brown or reddish-brown matrix. It is hard and brittle and the fractured surface is dull and uneven.

B. Examine the chromatograms obtained in test B for *Styrax tonkinensis*.

**Results** See below the sequence of quenching zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint quenching zones may be present in the chromatogram obtained with the test solution.

Top of the plate

Vanillin: a dark zone	A very weak dark zone (vanillin)
	Series of unresolved zones including 2 dark zones
Reference solution	Test solution

## TESTS

## Dammar gum

Thin-layer chromatography (2.2.27).

**Test solution** Dissolve 0.2 g of the drug to be examined with gentle heating in 10 mL of *ethanol (90 per cent V/V) R* and centrifuge.

**Plate** TLC aluminium oxide G plate R.

**Mobile phase** light petroleum R4, ether R (40:60 V/V).

**Application** 5  $\mu$ L.

**Development** Over a path of 10 cm.

**Drying** In air.

**Detection** Spray with *anisaldehyde solution R* and heat at 100-105 °C for 5 min.

**Results** The chromatogram obtained does not show any prominent spot with an  $R_F$  between 0.4 and 1.0.

*Styrax tonkinensis*

A. To 0.2 g of the finely powdered herbal drug add 10 mL of *ethanol (96 per cent) R*. Shake vigorously until almost completely dissolved and filter. Place 5 mL of the filtrate in a test-tube and add 0.5 mL of a 50 g/L solution of *ferric chloride R* in *ethanol (96 per cent) R*. A yellowish, slightly green colour is produced.

B. Thin-layer chromatography (2.2.27).

**Test solution** Sonicate 0.2 g of the finely powdered herbal drug in 5 mL of *ethanol (96 per cent) R* and filter. Collect the filtrate.

**Reference solution** Dissolve 20 mg of *benzoic acid R*, 10 mg of *trans-cinnamic acid R*, 4 mg of *vanillin R* and 20 mg of *methyl cinnamate R* in 10 mL of *ethanol (96 per cent) R*.

**Plate** TLC silica gel F<sub>254</sub> plate R (5-40  $\mu$ m) [or TLC silica gel F<sub>254</sub> plate R (2-10  $\mu$ m)].

**Mobile phase** glacial acetic acid R, di-isopropyl ether R, hexane R (10:40:60 V/V/V).

**Application** 10  $\mu$ L [or 2  $\mu$ L] as bands.

**Development** Over a path of 12 cm [or 5 cm].

**Drying** In air.

**Detection** Examine in ultraviolet light at 254 nm.

**Results** The chromatogram obtained with the test solution shows 2 faint zones in the same positions as the dark zones due to benzoic acid and vanillin in the chromatogram obtained with the reference solution.

## Matter insoluble in ethanol

Maximum 20.0 per cent.

To 2.0 g of the powdered herbal drug add 25 mL of *ethanol (90 per cent V/V) R*. Boil until almost completely dissolved. Filter through a tared sintered-glass filter (16) (2.1.2) and wash with 3 quantities, each of 5 mL, of boiling *ethanol (90 per cent V/V) R*. Heat the glass filter and its contents in an oven at 100-105 °C for 2 h. Allow to cool and weigh.

## Loss on drying (2.2.32)

Maximum 5.0 per cent, determined on 2.000 g of the coarsely powdered herbal drug by drying *in vacuo* for 4 h.

## Total ash (2.4.16)

Maximum 2.0 per cent.

## ASSAY

Place 0.750 g of the finely powdered herbal drug in a 250 mL borosilicate glass flask and add 15.0 mL of 0.5 M alcoholic potassium hydroxide. Boil under a reflux condenser on a water-bath for 30 min. Allow to cool and rinse the condenser with 20 mL of *ethanol (96 per cent) R*. Titrate the excess of potassium hydroxide with 0.5 M hydrochloric acid, determining the end-point potentiometrically (2.2.20). Carry out a blank titration.

1 mL of 0.5 M alcoholic potassium hydroxide is equivalent to 61.05 mg of benzoic acid ( $C_7H_6O_2$ ).

Ph Eur

## Sumatra Benzoin Tincture

(Ph. Eur. monograph 1813)

Ph Eur

### DEFINITION

Tincture produced from *Sumatra benzoin* (1814).

### Content

Minimum 4.0 per cent *m/m* of total acids, calculated as benzoic acid ( $C_7H_6O_2$ ;  $M_r$  122.1).

### PRODUCTION

The tincture is produced from 1 part of the drug and 5 parts of ethanol (75 per cent *V/V* to 96 per cent *V/V*) by a suitable procedure.

### CHARACTERS

#### Appearance

Orange-yellow liquid.

### IDENTIFICATION

Examine the chromatograms obtained in the test for Siam benzoin tincture.

**Results** See below the sequence of quenching zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint quenching zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
	A very intense dark zone
Methyl cinnamate: a very intense dark zone	A dark zone
Benzoic acid: a dark zone	A very weak dark zone (benzoic acid)
Cinnamic acid: an intense dark zone	A very intense dark zone (cinnamic acid)
	A dark zone
	A very intense dark zone
	A dark zone
Vanillin: a dark zone	A very weak dark zone (vanillin)
	Series of unresolved dark zones
Reference solution	Test solution

### TESTS

#### Siam benzoin tincture

Thin-layer chromatography (2.2.27).

**Test solution** The tincture to be examined.

**Reference solution** Dissolve 20 mg of *benzoic acid R*, 10 mg of *trans-cinnamic acid R*, 4 mg of *vanillin R* and 20 mg of *methyl cinnamate R* in 20 mL of ethanol of the same concentration as that used for the production of the tincture.

**Plate** TLC silica gel  $F_{254}$  plate R (5–40  $\mu$ m) [or TLC silica gel  $F_{254}$  plate R (2–10  $\mu$ m)].

**Mobile phase** *glacial acetic acid R*, *di-isopropyl ether R*, *hexane R* (10:40:60 *V/V/V*).

**Application** 20  $\mu$ L [or 8  $\mu$ L] as bands.

**Development** Over a path of 12 cm [or 6 cm].

**Drying** In air.

**Detection** Examine in ultraviolet light at 254 nm.

**Results** The chromatogram obtained with the test solution does not show zones due to benzoic acid and vanillin that are more intense than the corresponding zones in the chromatogram obtained with the reference solution.

**Ethanol** (2.9.10)

95 per cent to 105 per cent of the content stated on the label.

### ASSAY

Place 3.50 g in a 250 mL borosilicate glass flask and add 15.0 mL of 0.5 M alcoholic potassium hydroxide. Boil under a reflux condenser on a water-bath for 30 min. Allow to cool and rinse the condenser with 20 mL of *ethanol* (96 per cent) *R*. Titrate the excess of potassium hydroxide with 1 M *hydrochloric acid*, determining the end-point potentiometrically (2.2.20). Carry out a blank titration. 1 mL of 0.5 M alcoholic potassium hydroxide is equivalent to 61.05 mg of benzoic acid ( $C_7H_6O_2$ ).

Ph Eur

## Compound Benzoin Tincture

Friars' Balsam

### DEFINITION

Barbados Aloes or Cape Aloes	20 g
Prepared storax of commerce	100 g
Sumatra Benzoin crushed	100 g
Ethanol (90 per cent)	Sufficient to produce 1000 mL

### Extemporaneous preparation

The following directions apply.

Macerate the Barbados Aloes or Cape Aloes, the prepared storax and the Sumatra Benzoin with 800 mL of Ethanol (90 per cent) in a closed vessel for not less than 2 days, shaking occasionally, filter and pass sufficient Ethanol (90 per cent) through the filter to produce 1000 mL.

*The tincture complies with the requirements for Tinctures stated under Extracts and with the following requirements.*

### Content of total balsamic acids

Not less than 4.5% *w/v*, calculated as cinnamic acid,  $C_9H_8O_2$ .

### TESTS

#### Ethanol content

70 to 76% *v/v*, Appendix VIII F, Method III.

#### Dry residue

15 to 19% *w/v*.

#### Relative density

0.880 to 0.910, Appendix V G.

### ASSAY

Carry out the Assay described under Benzoin Inhalation using 10 mL of the tincture. Each mL of 0.1M *sodium hydroxide VS* is equivalent to 14.82 mg of total balsamic acids, calculated as cinnamic acid,  $C_9H_8O_2$ .

## Benzoin Inhalation

### Benzoin Inhalation Vapour

#### DEFINITION

Benzoin Inhalation is an *inhalation vapour, solution*.

Sumatra Benzoin crushed	100 g
Prepared storax of commerce	50 g
Ethanol (96 per cent)	Sufficient to produce 1000 mL

In making Benzoin Inhalation, Ethanol (96 per cent) may be replaced by Industrial Methylated Spirit<sup>1</sup>.

#### Extemporaneous preparation

The following directions apply.

Macerate the crushed Sumatra Benzoin and the prepared storax with 750 mL of Ethanol (96 per cent) for 24 hours. Filter and pass sufficient Ethanol (96 per cent) through the filter to produce 1000 mL.

The inhalation complies with the requirements stated under Preparations for Inhalation and with the following requirements.

#### Content of total balsamic acids

Not less than 3.0% w/v, calculated as cinnamic acid, C<sub>9</sub>H<sub>8</sub>O<sub>2</sub>.

#### Total solids

9.0 to 12.0% w/v when determined by drying at 105° for 4 hours, Appendix XI A. Use 2 mL.

#### ASSAY

Boil 10 mL with 25 mL of 0.5M *ethanolic potassium hydroxide* under a reflux condenser for 1 hour. Evaporate the ethanol, disperse the residue in 50 mL of hot *water*, cool, add 80 mL of *water* and 1.5 g of *magnesium sulfate* dissolved in 50 mL of *water*. Mix thoroughly and allow to stand for 10 minutes. Filter, wash the residue on the filter with 20 mL of *water*, acidify the combined filtrate and washings with *hydrochloric acid* and extract with four 40-mL quantities of *ether*. Discard the aqueous solution, combine the ether extracts and extract with successive quantities of 20, 20, 10, 10 and 10 mL of *sodium hydrogen carbonate solution*, washing each aqueous extract with the same 20 mL of *ether*. Discard the ether layers, carefully acidify the combined aqueous extracts with *hydrochloric acid* and extract with successive quantities of 30, 20, 20 and 10 mL of *chloroform*, filtering each extract through *anhydrous sodium sulfate* supported on absorbent cotton. Distil the chloroform from the combined filtrates until 10 mL remains and remove the remainder in a current of air. Dissolve the residue, with the aid of gentle heat, in 10 mL of *ethanol (96%)*, previously neutralised to *phenol red solution*, cool and titrate with 0.1M *sodium hydroxide VS* using *phenol red solution* as indicator. Each mL of 0.1M *sodium hydroxide VS* is equivalent to 14.82 mg of total balsamic acids, calculated as cinnamic acid, C<sub>9</sub>H<sub>8</sub>O<sub>2</sub>.

## Berberis Aristata

#### DEFINITION

Berberis Aristata is the dried, cut stem of *Berberis aristata* DC.

It contains not less than 1.4% of berberine (C<sub>20</sub>H<sub>19</sub>NO<sub>5</sub>), calculated with reference to the dried material.

#### IDENTIFICATION

A. The cut pieces of stem are subcylindrical, often branched and somewhat swollen at the nodes, from about 15-20 mm

diameter and varying in length. The bark is soft, about 4-8 mm thick, with a yellowish brown outer surface, finely wrinkled longitudinally or deeply furrowed, peeling off in places and exposing the inner dark yellow wood. Fracture short in the region of the bark, hard and fibrous in the wood.

B. Reduce to a powder. The powder is yellowish brown. Examine under a microscope using *chloral hydrate solution*. The powder contains numerous fragments of xylem, the vessels reticulately and spirally thickened, some tracheids; thick-walled, short, spindle-shaped, lignified, yellowish fibres of the phloem and xylem with a wide lumen; stone cells elongated with thick, pitted walls, some containing a single calcium oxalate crystal, normally present in groups; parenchyma cells of the medullary rays, some with yellow-brown contents, single prism crystals of calcium oxalate, or simple starch granules; cork cells yellowish-brown, thin-walled; numerous scattered starch grains and calcium oxalate crystals.

C. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Add 4 mL of *methanol (80%)* to 250 mg of the powdered herbal drug (180) in a centrifuge tube. Mix with the aid of ultrasound for 10 minutes. Centrifuge at 3000 rpm for 5 minutes and collect the clear supernatant. Repeat the extraction twice with a further two 2-mL portions of *methanol (80%)*. Combine the supernatants and dilute to 20 mL with *methanol (80%)*.

(2) 0.04% w/v each of *berberine chloride BPCRS* and *palmatine chloride BPCRS* in *methanol (80%)*.

#### CHROMATOGRAPHIC CONDITIONS

- Use as the coating *silica gel*.
- Use the mobile phase as described below.
- Apply 20 µL of each solution as 6 mm bands.
- Develop the plate to 15 cm.
- After removal of the plate, dry in air and examine under *ultraviolet light (254 nm)*.

#### MOBILE PHASE

10 volumes of *anhydrous formic acid*, 10 volumes of *water* and 80 volumes of *ethyl acetate*.

#### SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (2) shows two clearly separated bands.

#### CONFIRMATION

The chromatogram obtained with solution (1) shows a principal yellow band corresponding in colour and position to the band obtained for berberine chloride in solution (2), a yellow band corresponding in colour and position to the band obtained for palmatine in solution (2) and several other bands as shown in the table. Other bands may be present.

Top of the plate	
Yellow band (berberine chloride)	Yellow band (berberine chloride)
Faint yellow band	
Yellow band (palmatine)	Yellow band (palmatine)
Purple band	
Solution (1)	Solution (2)

<sup>1</sup> Statutory regulations governing the use of Industrial Methylated Spirit must be observed.

## TESTS

**D-Tetrahydropalmitine**

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) To 0.5 g of powdered sample, add 400 mL of a mixture of equal volumes of *acetonitrile* and 0.1% *v/v orthophosphoric acid*. Mix with the aid of ultrasound for 40 minutes and allow to cool. Dilute to 500 mL with the mobile phase and filter through a 0.45- $\mu$ m filter.

(2) 0.01% *w/v* each of *palmitine chloride BPCRS* and *berberine chloride BPCRS* in the mobile phase.

(3) 0.01% *w/v* of *D-tetrahydropalmitine hydrochloride* in the mobile phase.

## CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm  $\times$  4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5  $\mu$ m) (Phenomenex Luna C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 235 nm.

(f) Inject 10  $\mu$ L of each solution.

When the chromatograms are recorded under the prescribed conditions the retention times relative to palmitine (retention time = about 8 minutes) are berberine chloride = about 1.1; D-tetrahydropalmitine = about 1.6.

## MOBILE PHASE

27 volumes of *acetonitrile* and 73 volumes of a 1.36% *w/v* solution of *potassium dihydrogen orthophosphate*.

## SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the *resolution factor* between the peaks due to palmitine and berberine chloride is at least 2.0.

## CONFIRMATION

In the chromatogram obtained with solution (1), there are no peaks corresponding to the peak due to D-tetrahydropalmitine in the chromatogram obtained with solution (3).

## Loss on drying

When dried for 2 hours at 105°, loses not more than 10.0% of its weight, Appendix IX D. Use 1 g.

## Total Ash

Not more than 3.0%, Appendix XI J, Method II.

## ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) To 0.5 g of powdered sample, add 400 mL of a mixture of equal volumes of *acetonitrile* and 0.1% *v/v orthophosphoric acid*. Mix with the aid of ultrasound for 40 minutes and allow to cool. Dilute to 500 mL with the mobile phase and filter through a 0.45- $\mu$ m filter.

(2) 0.01% *w/v* each of *palmitine chloride BPCRS* and *berberine chloride BPCRS* in the mobile phase.

## CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under the test for D-tetrahydropalmitine may be used.

## MOBILE PHASE

27 volumes of *acetonitrile* and 73 volumes of a 1.36% *w/v* solution of *potassium dihydrogen orthophosphate*.

## SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the *resolution factor* between the peaks due to palmitine and berberine chloride is at least 2.0.

## DETERMINATION OF CONTENT

Using the retention time and the peak area from the chromatogram obtained with solution (2), locate and integrate the peak due to berberine chloride in the chromatogram obtained with solution (1). Calculate the content of berberine in the sample using the declared content of berberine in *berberine chloride BPCRS* and the following expression:

$$\frac{A_1}{A_2} \times \frac{m_2}{V_2} \times \frac{V_1}{m_1} \times p \times \frac{100}{100-d}$$

$A_1$	=	area of the peak due to berberine in the chromatogram obtained with solution (1),
$A_2$	=	area of the peak due to berberine in the chromatogram obtained with solution (2),
$m_1$	=	weight of the drug being examined in mg,
$m_2$	=	weight of berberine chloride BPCRS in mg,
$V_1$	=	dilution volume of solution (1) in mL,
$V_2$	=	dilution volume of solution (2) in mL,
$p$	=	percentage content of berberine in <i>berberine chloride BPCRS</i> ,
$d$	=	percentage loss on drying of the herbal drug being examined.

## STORAGE

*Berberis Aristata* should be protected from moisture.

## Dried Bilberry

(Dried Bilberry Fruit, Ph. Eur. monograph 1588)

Ph Eur

## DEFINITION

Dried ripe fruit of *Vaccinium myrtillus* L.

## Content

Minimum 0.8 per cent of tannins, expressed as pyrogallol ( $C_6H_6O_3$ ;  $M_r$  126.1) (dried drug).

## IDENTIFICATION

A. Dried bilberry is a blackish-blue, subglobular, shrunken berry about 5 mm in diameter covered in a whitish bloom. Its lower end shows a scar or, rarely, a fragment of the pedicel. The upper end is slightly depressed and is surmounted by the remains of the style and of the persistent calyx, which appears as a circular fold. The deep violet, fleshy mesocarp contains numerous (more than 10) small, brown, ovoid seeds.

B. Microscopic examination (2.8.23). The powder is violet-red. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 1588.-1): fragments of dark red epicarp [A] consisting of small groups of 2-4 polygonal, rectangular or quadrangular cells; in each group, the inner walls are thin [Aa] whereas the outer walls are regularly thickened [Ab]; fragments of mesocarp [B] consisting of large, rounded, thin-walled cells associated with fine spiral vessels [Ba]; numerous sclereids, isolated or in small groups, from the mesocarp [C]; groups of sclereids from the endocarp [D]; yellowish-brown fragments from the testa, with large sclereids having walls that are extensively channelled and pitted (surface view [E]) and with U-shaped

thickenings (transverse section [F]); irregular cluster crystals of calcium oxalate [G] and isolated prisms of calcium oxalate [H] from the mesocarp.

Figure 1588-1. – Illustration for identification test B of powdered herbal drug of dried bilberry fruit

#### C. Thin-layer chromatography (2.2.27).

**Test solution** To 2 g of the powdered herbal drug (355) (2.9.12) add 20 mL of *methanol R*. Shake for 15 min and filter.

**Reference solution** Dissolve 0.10 g of *bilberry dry extract HRS* in 25 mL of *methanol R*. Stir for 15 min and filter.

**Plate** TLC silica gel  $F_{254}$  plate R (5-40 µm) [or TLC silica gel  $F_{254}$  plate R (2-10 µm)].

**Mobile phase** *anhydrous formic acid R, water R, butanol R* (16:19:65 V/V/V).

**Application** 10 µL [or 2 µL] as bands of 15 mm [or 8 mm].

**Development** Over a path of 10 cm [or 6 cm].

**Drying** In air.

**Detection** Examine in daylight.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
A violet-red zone	A violet-red zone
A violet zone	A violet zone
A violet zone	A violet zone
A broad unresolved bluish-violet zone	A broad unresolved bluish-violet zone
Reference solution	Test solution

#### TESTS

##### Foreign matter (2.8.2)

Maximum 2 per cent, with no fruit of *Sambucus nigra* present.

Adulteration with *S. nigra* L. is indicated by the presence of glossy, violet-black, ovoid berries without the circular fold due to the calyx, and containing not more than 4 seeds.

##### Loss on drying (2.2.32)

Maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug by drying in an oven at 105 °C for 2 h.

##### Total ash (2.4.16)

Maximum 5.0 per cent.

#### ASSAY

##### Tannins (2.8.14)

Use 1.500 g of the powdered herbal drug (355) (2.9.12).

Ph Eur

## Fresh Bilberry

(Fresh Bilberry Fruit, Ph. Eur. monograph 1602)

#### Preparation

Refined and Standardised Fresh Bilberry Fruit Dry Extract

Ph Eur

#### DEFINITION

Fresh or frozen, ripe fruit of *Vaccinium myrtillus* L.

#### Content

Minimum 0.30 per cent of anthocyanins, expressed as cyanidin 3-*O*-glucoside chloride (chrysanthemine,  $C_{21}H_{21}ClO_{11}$ ;  $M_r$  484.8) (dried drug).

#### IDENTIFICATION

A. The fresh fruit is a blackish-blue globular berry about 5 mm in diameter, covered in a whitish bloom. Its lower end shows a scar or, rarely, a fragment of the pedicel. The upper end is slightly depressed and is surmounted by the remains of the style and of the persistent calyx, which appears as a circular fold. The violet, fleshy mesocarp includes 4 to 5 locules containing numerous (more than 10) small, brown, ovoid seeds.

B. The crushed fresh fruit is violet-red. Examine small fragments under a microscope using *chloral hydrate solution R*. They show the following diagnostic characters (Figure 1602.-1): fragments of dark red epicarp [A] consisting of small groups of 2-4 polygonal, rectangular or quadrangular

cells; in each group, the inner walls are thin [Aa] whereas the outer walls are regularly thickened [Ab]; fragments of mesocarp [B] consisting of large, rounded cells associated with fine spiral vessels [Ba]; numerous sclereids, isolated or in small groups, from the mesocarp [C]; groups of sclereids from the endocarp [D]; yellowish-brown fragments from the testa, with large sclereids having walls that are extensively channelled and pitted (surface view [E]) and with U-shaped thickenings (transverse section [F]); irregular cluster crystals of calcium oxalate [G] and isolated prisms of calcium oxalate [H] from the mesocarp.

Figure 1602-1. – Illustration for identification test B of the herbal drug of fresh bilberry fruit

**C. Thin-layer chromatography (2.2.27).**

**Test solution** To 5 g of the freshly crushed drug, add 20 mL of methanol R. Stir for 15 min and filter.

**Reference solution** Dissolve 0.10 g of bilberry dry extract HRS in 25 mL of methanol R. Stir for 15 min and filter.

**Plate** TLC silica gel F<sub>254</sub> plate R (5–40 µm) [or TLC silica gel F<sub>254</sub> plate R (2–10 µm)].

**Mobile phase** anhydrous formic acid R, water R, butanol R (16:19:65 V/V/V).

**Application** 10 µL [or 2 µL] as bands of 15 mm [or 8 mm].

**Development** Over a path of 10 cm [or 6 cm].

**Drying** In air.

**Detection** Examine in daylight.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
A violet-red zone	A violet-red zone
A violet zone	A violet zone
A violet zone	A violet zone
A broad unresolved bluish-violet zone	A broad unresolved bluish-violet zone
Reference solution	Test solution

**TESTS**

**Foreign matter (2.8.2)**

Maximum 2 per cent, with no fruit of *Sambucus nigra* present.

Adulteration with *S. nigra* L. is indicated by the presence of glossy, violet-black, ovoid berries without the circular fold due to the calyx, and containing not more than 4 seeds.

**Loss on drying (2.2.32)**

80.0 per cent to 90.0 per cent, determined on 5.000 g of the freshly crushed drug by drying in an oven at 105 °C.

**Total ash (2.4.16)**

Maximum 0.6 per cent.

**ASSAY**

Crush 50 g immediately before use. To about 5.00 g of the crushed, accurately weighed drug, add 95 mL of methanol R. Stir mechanically for 30 min. Filter into a 100.0 mL volumetric flask. Rinse the filter and dilute to 100.0 mL with methanol R. Prepare a 50-fold dilution of this solution in a 0.1 per cent V/V solution of hydrochloric acid R in methanol R. Measure the absorbance (2.2.25) of the solution at 528 nm, using a 0.1 per cent V/V solution of hydrochloric acid R in methanol R as the compensation liquid.

Calculate the percentage content of anthocyanins, expressed as cyanidin 3-O-glucoside chloride, using the following expression:

$$\frac{A \times 5000}{718 \times m}$$

718 = specific absorbance of cyanidin 3-O-glucoside chloride at 528 nm;  
 A = absorbance at 528 nm;  
 m = mass of the substance to be examined in grams.

**STORAGE**

When frozen, store at or below –18 °C.

Ph Eur

## Refined and Standardised Fresh Bilberry Fruit Dry Extract

(Ph. Eur. monograph 2394)

Ph Eur

### DEFINITION

Refined and standardised dry extract produced from *Fresh bilberry fruit* (1602).

### Content

32.4 per cent to 39.6 per cent of anthocyanins, expressed as cyanidin 3-*O*-glucoside chloride [chrysanthemine] ( $C_{21}H_{21}ClO_{11}$ ;  $M_r$  484.8) (dried extract).

### PRODUCTION

The extract is produced from the herbal drug by a suitable procedure using ethanol (70-96 per cent *V/V*) or methanol (minimum 60 per cent *V/V*). Refinement may be performed by ion-exchange chromatography.

### CHARACTERS

#### Appearance

Dark reddish-violet, amorphous, hygroscopic powder.

### IDENTIFICATION

First identification: B.

Second identification: A.

A. Thin-layer chromatography (2.2.27).

**Test solution** Dissolve 0.10 g of the extract to be examined in 25 mL of methanol *R*. Stir for 15 min and filter.

**Reference solution** Dissolve 0.10 g of *bilberry dry extract HRS* in 25 mL of methanol *R*. Stir for 15 min and filter.

**Plate** TLC silica gel  $F_{254}$  plate *R* (5-40  $\mu\text{m}$ ) [or TLC silica gel  $F_{254}$  plate *R* (2-10  $\mu\text{m}$ )].

**Mobile phase** anhydrous formic acid *R*, water *R*, butanol *R* (16:19:65 *V/V/V*).

**Application** 10  $\mu\text{L}$  [or 2  $\mu\text{L}$ ] as bands of 15 mm [or 8 mm].

**Development** Over a path of 10 cm [or 6 cm].

**Drying** In air.

**Detection** Examine in daylight.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
A violet-red zone	A violet-red zone
A violet zone	A violet zone
A violet zone	A violet zone
A broad unresolved bluish-violet zone	A broad unresolved bluish-violet zone
Reference solution	Test solution

B. Liquid chromatography (2.2.29) as described in the test for total anthocyanidins.

The characteristic anthocyanin peaks (peaks 1-8, 10-15 and 17) in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with reference solution (b).

### TESTS

#### Total anthocyanidins

Liquid chromatography (2.2.29). Maintain the solutions at 4 °C.

**Solvent mixture** hydrochloric acid *R*, methanol *R* (2:98 *V/V*).

**Test solution** Dissolve 0.1250 g of the extract to be examined in the solvent mixture and dilute to 25.0 mL with the solvent mixture. Dilute 5.0 mL of the solution to 20.0 mL with dilute phosphoric acid *R*.

**Reference solution (a)** Dissolve 10.0 mg of cyanidin chloride *CRS* in the solvent mixture and dilute to 25.0 mL with the solvent mixture. Dilute 2.0 mL of the solution to 100.0 mL with dilute phosphoric acid *R*.

**Reference solution (b)** Dissolve 0.1250 g of *bilberry dry extract HRS* in the solvent mixture and dilute to 25.0 mL with the solvent mixture. Dilute 5.0 mL of the solution to 20.0 mL with dilute phosphoric acid *R*.

#### Column:

— size:  $l = 0.250$  m,  $\varnothing = 4.6$  mm;

— stationary phase: end-capped octadecylsilyl silica gel for chromatography with extended pH range *R* (5  $\mu\text{m}$ );

— temperature: 30 °C.

#### Mobile phase:

— mobile phase A: anhydrous formic acid *R*, water for chromatography *R* (8.5:91.5 *V/V*);

— mobile phase B: anhydrous formic acid *R*, acetonitrile *R*, methanol *R*, water for chromatography *R* (8.5:22.5:22.5:41.5 *V/V/V/V*);

Time (min)	Mobile phase A (per cent <i>V/V</i> )	Mobile phase B (per cent <i>V/V</i> )
0 - 35	93 → 75	7 → 25
35 - 45	75 → 35	25 → 65
45 - 46	35 → 0	65 → 100
46 - 50	0	100

**Flow rate** 1.0 mL/min.

**Detection** Spectrophotometer at 535 nm.

**Injection** 10  $\mu\text{L}$ .

**Identification of peaks** Use the chromatogram supplied with *bilberry dry extract HRS* and the chromatograms obtained with reference solutions (a) and (b) to identify the peaks due to the anthocyanins and the anthocyanidins.

**Retention times** The retention times and the elution order of the peaks are similar to those shown in the chromatogram (Figure 2394.-1).

**System suitability** Reference solution (b):

— **peak-to-valley ratio**: minimum 2.0, where  $H_p$  = height above the baseline of the peak due to cyanidin 3-*O*-galactoside (peak 3) and  $H_v$  = height above the baseline of the lowest point of the curve separating this peak from the peak due to delphinidin 3-*O*-arabinoside (peak 4).

Calculate the percentage content of total anthocyanidins, expressed as cyanidin chloride, using the following expression:

$$\frac{A_1 \times m_2 \times 100 \times p}{m_1 \times A_2 \times 1250}$$

- |   |  |
|---|--|
| 1. delphinidin 3-O-galactoside chloride             | 11. petunidin 3-O-arabinoside chloride |
| 2. myrtillin (delphinidin 3-O-glucoside chloride)   | 12. peonidin 3-O-glucoside chloride    |
| 3. cyanidin 3-O-galactoside chloride                | 13. malvidin 3-O-galactoside chloride  |
| 4. delphinidin 3-O-arabinoside chloride             | 14. peonidin 3-O-arabinoside chloride  |
| 5. chrysanthemine (cyanidin 3-O-glucoside chloride) | 15. malvidin 3-O-glucoside chloride    |
| 6. petunidin 3-O-galactoside chloride               | 16. cyanidin chloride                  |
| 7. cyanidin 3-O-arabinoside chloride                | 17. malvidin 3-O-arabinoside chloride  |
| 8. petunidin 3-O-glucoside chloride                 | 18. petunidin chloride                 |
| 9. delphinidin chloride                             | 19. peonidin chloride                  |
| 10. peonidin 3-O-galactoside chloride               | 20. malvidin chloride                  |

Figure 2394.-1. – Chromatogram for the assay of refined and standardised fresh bilberry fruit dry extract

- $A_1$  = sum of the areas of the peaks due to the anthocyanins (peaks 9, 16, 18-20) in the chromatogram obtained with the test solution;  
 $A_2$  = area of the peak due to cyanidin chloride (peak 16) in the chromatogram obtained with reference solution (a);  
 $m_1$  = mass of the extract to be examined used to prepare the test solution, in grams;  
 $m_2$  = mass of cyanidin chloride CRS used to prepare reference solution (a), in grams;  
 $p$  = percentage content of cyanidin chloride in cyanidin chloride CRS.

**Limit** Not more than 1.0 per cent of total anthocyanidins, expressed as cyanidin chloride.

**Loss on drying (2.8.17)**  
Maximum 4.5 per cent.

**Total ash (2.4.16)**  
Maximum 2.0 per cent.

#### ASSAY

Liquid chromatography (2.2.29) as described in the test for total anthocyanidins with the following modification.

**Injection** Test solution and reference solution (b).

Calculate the percentage content of total anthocyanins, expressed as cyanidin 3-O-glucoside chloride, using the following expression:

$$\frac{A_1 \times m_2 \times p}{m_1 \times A_2}$$

- $A_1$  = sum of the areas of the peaks due to the anthocyanins (peaks 1-8, 10-15 and 17) in the chromatogram obtained with the test solution;  
 $A_2$  = area of the peak due to cyanidin 3-O-glucoside chloride (peak 5) in the chromatogram obtained with reference solution (b);  
 $m_1$  = mass of the extract to be examined used to prepare the test solution, in grams;  
 $m_2$  = mass of bilberry dry extract HRS used to prepare reference solution (b), in grams;  
 $p$  = percentage content of cyanidin 3-O-glucoside chloride in bilberry dry extract HRS.

Ph Eur

## Birch Leaf

(Ph. Eur. monograph 1174)

Ph Eur

### DEFINITION

Whole or fragmented, dried leaves of *Betula pendula* Roth and/or *Betula pubescens* Ehrh. as well as hybrids of both species.

### Content

Minimum 1.5 per cent of flavonoids, expressed as hyperoside ( $C_{21}H_{20}O_{12}$ ; *M*, 464.4) (dried drug).

### IDENTIFICATION

A. The leaves of both species are dark green on the adaxial surface and lighter greenish-grey on the abaxial surface; they show a characteristic dense reticulate venation. The veins are light brown or almost white.

The leaves of *B. pendula* are glabrous and show closely spaced glandular pits on both surfaces. The leaves of *B. pubescens* are 3-7 cm long and 2-5 cm wide; the petiole is long and the doubly dentate lamina is triangular or rhomboid and broadly cuneate or truncate at the base. The angle on each side is unrounded or slightly rounded, and the apex is long and acuminate.

The leaves of *B. pubescens* show few glandular trichomes and are slightly pubescent on both surfaces. The abaxial surface shows small bundles of yellowish-grey trichomes at the branch points of the veins. The leaves of *B. pubescens* are slightly smaller, oval or rhomboid and more rounded. They are more roughly and more regularly dentate. The apex is acute rather than acuminate.

B. Microscopic examination (2.8.23). The powder is greenish-grey. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 1174.-1): numerous fragments of the lamina, in surface view, with straight-walled, adaxial epidermal cells accompanied by underlying palisade parenchyma [E] and cells of the abaxial epidermis surrounding anomocytic stomata (2.8.3) [G]; large, free, glandular trichomes usually measuring 100-120  $\mu\text{m}$  [D]; fragments of the lamina (transverse section [B]), showing glandular trichomes on the epidermises [Ba], heterogeneous, asymmetrical mesophyll containing cluster crystals [Bb] and prisms [Bc] of calcium oxalate; fragments of spongy parenchyma [A] accompanied by crystal sheaths [Aa] and cells containing cluster crystals of calcium oxalate [Ab]; fragments of vessels and sclerenchyma fibres [C].

If *B. pubescens* is present, the powder also contains unicellular covering trichomes with very thick walls, about 80-600  $\mu\text{m}$  long, usually 100-200  $\mu\text{m}$ , numerous on the margin of the lamina [F] or on the epidermises (surface view [H]).

C. High-performance thin-layer chromatography (2.8.25).

**Test solution** To 0.5 g of the powdered herbal drug (355) (2.9.12) add 5.0 mL of *methanol R*. Sonicate for 15 min, then filter or centrifuge the solution and use the filtrate or supernatant.

**Reference solution (a)** Dissolve 2.5 mg of *hyperoside R* and 3.5 mg of *quercitrin R* in *methanol R* and dilute to 10.0 mL with the same solvent.

**Reference solution (b)** Dilute 2.5 mL of reference solution (a) to 10.0 mL with *methanol R*.

**Reference solution (c)** Dissolve 2.5 mg of *hyperoside R* and 3 mg of *chlorogenic acid R* in *methanol R* and dilute to 10.0 mL with the same solvent.

Figure 1174.-1. – Illustration for identification test B of powdered herbal drug of birch leaf

**Intensity marker** Hyperoside.

**Plate** TLC silica gel  $F_{254}$  plate R (2-10  $\mu\text{m}$ ).

**Mobile phase** *anhydrous formic acid R*, *water R*, *methyl ethyl ketone R*, *ethyl acetate R* (10:10:30:50 V/V/V/V).

**Application** 4  $\mu\text{L}$  as bands of 8 mm.

**Development** 70 mm from the lower edge of the plate.

**Drying** In a current of air at room temperature for 5 min.

**Detection** Heat at 100-105  $^{\circ}\text{C}$  for 5 min. Spray the warm plate with a 10 g/L solution of *diphenylboric acid aminoethyl ester R* in *methanol R*, then with a 50 g/L solution of *macrogol 400 R* in *methanol R* or, alternatively, dip the warm plate in a 5 g/L solution of *diphenylboric acid aminoethyl ester R* in *ethyl acetate R*, then in a 50 g/L solution of *macrogol 400 R* in *methylene chloride R*. Allow the plate to dry in air for about 1 min and examine in ultraviolet light at 366 nm.

**System suitability** Reference solution (c):

- the chromatogram shows 2 distinct zones in the middle third which may, however, be touching. The lower zone (chlorogenic acid) shows a light blue fluorescence and the upper zone (hyperoside) shows a yellow or orange fluorescence.

**Results** See below the sequence of zones present in the chromatograms obtained with reference solution (a) and the test solution. Furthermore, in the chromatogram obtained with the test solution, other faint to very faint fluorescent zones, which may be yellow or orange, or light blue, may be present and a light blue fluorescent zone may especially be present below the zone due to hyperoside.

Top of the plate	
Quercitrin: a yellow or orange fluorescent zone	<p>2 red fluorescent zones, the lower may be overlapped with an orange fluorescent zone</p> <p>A yellow or orange fluorescent zone or a faint yellow or orange fluorescent zone</p> <p>A yellow or orange fluorescent zone or a faint yellow or orange fluorescent zone (quercitrin)</p>
Hyperoside: a yellow or orange fluorescent zone	<p>A yellow or orange fluorescent zone or a faint yellow or orange fluorescent zone</p> <p>An intense yellow or orange fluorescent zone (hyperoside)</p> <p>A very faint to intense yellow or orange fluorescent zone</p>
Reference solution (a)	Test solution

**TESTS****Foreign matter (2.8.2)**

Maximum 3 per cent of fragments of female catkins and maximum 3 per cent of other foreign matter.

**Loss on drying (2.2.32)**

Maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

**Total ash (2.4.16)**

Maximum 6.0 per cent.

**ASSAY**

**Stock solution** In a 100 mL round-bottomed flask introduce 0.200 g of the powdered herbal drug (355) (2.9.12), 1 mL of a 5 g/L solution of *hexamethylenetetramine R*, 20 mL of *acetone R* and 2 mL of *hydrochloric acid R1*. Boil the mixture under a reflux condenser for 30 min. Filter the liquid through a plug of absorbent cotton into a 100 mL flask. Add the absorbent cotton to the residue in the round-bottomed flask and extract with 2 quantities, each of 20 mL, of *acetone R*, each time boiling under a reflux condenser for 10 min. Allow to cool to room temperature, filter the liquid through a plug of absorbent cotton then through a filter paper into the volumetric flask, and dilute to 100.0 mL with *acetone R* by rinsing the flask and filter. Introduce 20.0 mL of the solution into a separating funnel, add 20 mL of *water R* and extract the mixture with 1 quantity of 15 mL and then 3 quantities, each of 10 mL, of *ethyl acetate R*. Combine the ethyl acetate extracts in a separating funnel, wash with 2 quantities, each of 50 mL, of *water R*, and filter the extract

over 10 g of *anhydrous sodium sulfate R* into a 50 mL volumetric flask and dilute to 50.0 mL with *ethyl acetate R*.

**Test solution** To 10.0 mL of the stock solution add 1 mL of *aluminium chloride reagent R* and dilute to 25.0 mL with a 5 per cent *V/V* solution of *glacial acetic acid R* in *methanol R*.

**Compensation liquid** Dilute 10.0 mL of the stock solution to 25.0 mL with a 5 per cent *V/V* solution of *glacial acetic acid R* in *methanol R*.

Measure the absorbance (2.2.25) of the test solution after 30 min, by comparison with the compensation liquid at 425 nm.

Calculate the percentage content of flavonoids, expressed as hyperoside, using the following expression:

$$\frac{A \times 1.25}{m}$$

i.e. taking the specific absorbance of hyperoside to be 500.

*A* = absorbance at 425 nm;  
*m* = mass of the herbal drug to be examined, in grams.

Ph Eur

**Bistort Rhizome**

(Ph. Eur. monograph 2384)

Ph Eur

**DEFINITION**

Whole or fragmented, dried rhizome of *Persicaria bistorta* (L.) Samp. (syn. *Polygonum bistorta* L.) without adventitious roots.

**Content**

Minimum 3.0 per cent of tannins, expressed as pyrogallol ( $C_6H_6O_3$ ;  $M_r$  126.1) (dried drug).

**CHARACTERS**

The whole rhizome is up to 13 cm long and 2.5 cm in diameter. The remnants of the roots are not longer than 1 cm and are about 1 mm in diameter.

**IDENTIFICATION**

A. The whole rhizome, reddish-brown or blackish-brown, is thick, twisted, and turned back on itself. Its outer surface shows transverse striations and blackish-spots. It is flattened and somewhat depressed on the upper surface, convex on the lower surface. It shows adventitious root scars on the surface. The fracture, pinkish-beige, shows an elliptical zone of whitish pits corresponding to the vessels. The drug may also be obtained as more or less cylindrical fragments about 0.3 cm in diameter and up to 1 cm long, with a reddish-brown outer surface, marked by adventitious root scars and a pinkish-beige fracture.

B. Microscopic examination (2.8.23). The powder is reddish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2384.-1): very numerous cluster crystals of calcium oxalate, 15-65 µm in diameter, either free [G] or included in parenchyma cells [Da]; rare cork fragments (side view [B], surface view [H]); vascular bundles (longitudinal section [E], transverse section [J]) including small pitted vessels [Ea, Ja] accompanied by finely pitted, thick-walled fibres [Eb, Jb]; free fragments of vessels [C]; free fibres [F]; fragments of parenchyma [D] with rounded cells with slightly thickened walls; fragments of collenchyma [K]. Examine

under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows rounded or ovoid starch granules, simple, about 5-12  $\mu\text{m}$  in diameter, free or included in parenchyma cells [A].

Figure 2384-1. – Illustration for identification test B of powdered herbal drug of bistort rhizome

#### C. Thin-layer chromatography (2.2.27).

**Test solution** To 1.0 g of the powdered herbal drug (355) (2.9.12) add 10 mL of a mixture of equal volumes of *methanol R* and *water R*, heat on a water-bath at about 65 °C for 30 min and filter.

**Reference solution** Dissolve 5 mg of *fructose R* and 5 mg of *catechin R* in 5 mL of *methanol R*.

**Plate** TLC silica gel plate *R* (2-10  $\mu\text{m}$ ).

**Mobile phase** *water R*, *anhydrous formic acid R*, *ethyl acetate R* (5:10:85 *V/V/V*).

**Application** 2  $\mu\text{L}$  as bands.

**Development** Over a path of 7 cm.

**Drying** In air.

**Detection** treat with *anisaldehyde solution R* and heat at 100-105 °C for 5 min; examine in daylight.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Catechin: a brown zone	A brown zone (catechin)
	A brown zone

Fructose: a green zone	A green zone (fructose)
Reference solution	Test solution

#### TESTS

**Paris polyphylla Sm. or Paris quadrifolia L.**  
Microscopic examination (2.8.23). Examine under a microscope using *chloral hydrate solution R*. The presence of raphides of calcium oxalate, free or in bundles, indicates adulteration by the rhizome of *P. polyphylla Sm. var. yunnanensis* (Franch.) Hand.-Mazz. or *P. polyphylla Sm. var. chinensis* (Franch.) H.Hara or *P. quadrifolia L.*

**Loss on drying** (2.2.32)

Maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C.

**Total ash** (2.4.16)

Maximum 9.0 per cent.

**Ash insoluble in hydrochloric acid** (2.8.1)

Maximum 1.0 per cent.

#### ASSAY

**Tannins** (2.8.14)

Use 1.000 g of the powdered herbal drug (180) (2.9.12).

Ph Eur

## Black Cohosh

(Ph. Eur. monograph 2069)

Ph Eur

#### DEFINITION

Dried, whole or fragmented rhizome and root of *Actaea racemosa L.* (syn. *Cimicifuga racemosa (L.) Nutt.*).

#### Content

Minimum 1.0 per cent of triterpene glycosides, expressed as monoammonium glycyrrhizate ( $\text{C}_{42}\text{H}_{65}\text{NO}_{16}$ ;  $M_r$  840) (dried drug).

#### IDENTIFICATION

**A. Whole drug.** The rhizome is dark brown, hard, subcylindrical and somewhat knotted; 1.5-2.5 cm in diameter and 2-15 cm long; it shows numerous closely arranged, upright or curved branches each terminating in the remains of a bud or in a circular, cup-shaped scar. The fracture is horny, the transverse section shows a thin outer bark surrounding a ring of numerous pale, narrow wedges of vascular tissue alternating with darker medullary rays and a large central pith. Roots attached to the lower surface of the rhizome are usually broken off, leaving circular scars. The roots are dark brown, 1-3 mm in diameter, brittle,

nearly cylindrical or obtusely quadrangular and longitudinally wrinkled; the fracture is short; the transverse section shows a wide outer bark, a dark brown cylinder, in which the central region is composed of 3-6 lighter wedges of vascular tissue united at the centre and separated by broad, non-lignified medullary rays.

**Fragmented drug** More or less angular, irregular pieces of the rhizome and cylindrical pieces of the roots. The hard, horny rhizome fragments usually show a dark brown surface corresponding to the outer surface and several frequently striated, light brown surfaces corresponding to the section. The dark brown, more or less cylindrical root fragments are wrinkled longitudinally. The lighter coloured transverse section shows a distinct cambium line separating a thick outer bark from a central region composed of 3-6 wedges of vascular tissue united at the centre and separated by broad medullary rays.

Figure 2069.-1. – Illustration for identification test B of powdered herbal drug of black cohosh

**B. Microscopic examination (2.8.23).** The powder is light brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2069.-1): fragments of the epidermis of the rhizome, with brown polygonal cells [A]; numerous fragments of parenchyma consisting of rounded cells, with slightly and regularly thickened walls with small triangular spaces between them [H]; groups of short vessels with closely arranged bordered pits [C, J] sometimes accompanied by finely pitted fibres [Ja]; fragments of the parenchyma of the pith of the rhizome with thick-walled and channelled ovoid cells [F]; a few fragments of the phloem containing long isolated sclereids [D]; fragments of the dermal tissue of the roots (surface view [E], longitudinal section [B]), consisting of brown cells covered by a dark brown cuticle [Ba]. Examine under a microscope using a 50 per cent *V/V*

solution of *glycerol R*. The powder shows abundant starch granules, spherical or polygonal, simple, 5-10 µm in diameter, or 2 or 3 (rarely up to 6) compound; some granules have a slit-shaped hilum [G].

**C.** Examine the chromatograms obtained in the test for substitution by *Cimicifuga americana* Michx., *C. foetida* L., *C. dahurica* (Turcz.) Maxim. or *C. heracleifolia* Kom.

**Results B** Use the chromatograms supplied with *Actaea racemosa* HRS and the chromatogram obtained with reference solution (a) to identify the bands corresponding to *A. racemosa*.

See below the sequence of zones present in the chromatograms obtained with reference solutions (a) and (b) and the test solution. Furthermore, other faint zones may be present in the chromatograms obtained with reference solution (a) and the test solution.

**TESTS**

**Loss on drying (2.2.32)**

Maximum 12 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

**Foreign matter (2.8.2)**

Maximum 5 per cent.

**Total ash (2.4.16)**

Maximum 10 per cent.

**Ash insoluble in hydrochloric acid (2.8.1)**

Maximum 5 per cent.

**Substitution by *Cimicifuga americana* Michx., *C. foetida* L., *C. dahurica* (Turcz.) Maxim. or *C. heracleifolia* Kom.**

**Thin-layer chromatography (2.2.27).**

**Test solution** To 0.50 g of the powdered herbal drug (355) (2.9.12) add 10 mL of *ethanol (50 per cent V/V) R* and shake well. Sonicate for 10 min and centrifuge. Use the supernatant.

**Reference solution (a)** To 0.50 g of *Actaea racemosa* HRS add 10 mL of *ethanol (50 per cent V/V) R* and shake well. Sonicate for 10 min and centrifuge. Use the supernatant.

Table 2069.-1. - Application scheme

Track	1	2	3	4	5	6	7
Application volume (µL)	2	2	2	-	2	2	2
Solution	Reference solution (a)	Reference solution (b)	Test solution	Blank	Reference solution (a)	Reference solution (b)	Test solution

After development, the plate is cut along track 4 (blank). Tracks 1-3 are used for detection of a substitution by *C. americana*, *C. foetida*, *C. dahurica* or *C. heracleifolia* (detection A), tracks 5-7 for Identification C (detection B).

Table 2069.-2. - Application scheme

Application volume (µL)	20	2	2	20	-	20	2	2	20
Solution	Reference solution (a)	Reference solution (b)	Reference solution (c)	Test solution	Blank	Reference solution (a)	Reference solution (b)	Reference solution (c)	Test solution

After development and examination for detection of *C. americana* (detection A), the plate is cut along track 5 (blank). Tracks 1-4 are used for detection of adulteration with *C. foetida* (detection B), tracks 6-9 for detection of adulteration with *C. heracleifolia* and/or *C. dahurica* (detection C).

**Reference solution (b)** Dissolve 2 mg of *actein R* in *methanol R* and dilute to 10 mL with the same solvent.

**Plate** TLC silica gel *F<sub>254</sub>* plate R (2-10 µm).

**Mobile phase** *anhydrous formic acid R*, *ethyl formate R*, *toluene R* (20:30:50 *V/V/V*).

**Application** 2 µL as bands of 8 mm (see Table 2069.-1).

**Development** Over a path of 6 cm.

**Drying** In air.

**System suitability** Reference solution (b):

— the *R<sub>F</sub>* value of the zone due to *actein* is between 0.35 and 0.40 (detection B).

**Detection A** Examine in ultraviolet light at 254 nm.

**Results A** The chromatogram obtained with the test solution does not show any quenching zones more intense than those in the chromatogram obtained with reference solution (a) between *R<sub>F</sub>* value 0.2 and *R<sub>F</sub>* value 0.35.

**Detection B** Treat with a 10 per cent *V/V* solution of *sulfuric acid R* in *methanol R*; heat at 100 °C for 5 min; allow to cool to room temperature and examine in daylight.

**Adulteration with *Cimicifuga americana* Michx., *C. foetida* L., *C. dahurica* (Turcz.) Maxim. and/or *C. heracleifolia* Kom.**

Thin-layer chromatography (2.2.27) as described in the test for substitution by *Cimicifuga americana* Michx., *C. foetida* L., *C. dahurica* (Turcz.) Maxim. or *C. heracleifolia* Kom., with the following modifications.

**Reference solution (c)** Dissolve 2 mg of *cimifugin R* in *methanol R* and dilute to 10 mL with the same solvent.

**Application** 2 µL of reference solutions (b) and (c), 20 µL of the test solution and reference solution (a), as bands of 8 mm (see Table 2069.-2).

**System suitability** Reference solution (b):

— the *R<sub>F</sub>* value of the zone due to *actein* is between 0.35 and 0.40 (detections B and C).

**Detection A** Examine in ultraviolet light at 254 nm.

**Results A** Absence of more than 10 per cent of *C. americana*.

Compare the chromatogram supplied with *Actaea racemosa* HRS for *C. americana* and the chromatograms obtained with the test solution and reference solution (a). The chromatogram obtained with the test solution does not

show any quenching zone at *R<sub>F</sub>* value 0.3 (zone presented in capitals in the chromatogram of *C. americana*, see below). The presence of this zone in the chromatogram obtained with the test solution indicates adulteration with *C. americana* at a level greater than 10 per cent.

Top of the plate

A weak zone	A weak zone
_____	_____ A DARK ZONE
A weak zone	A weak zone
A dark zone	A dark zone
A dark zone	A dark zone
Reference solution (a)	<i>C. americana</i> (10 per cent)

**Detection B** Dissolve 4.5 g of *boric acid R* in 150 mL of *anhydrous ethanol R* (solution A); dissolve 5 g of *oxalic acid R* in 50 mL of *anhydrous ethanol R* (solution B); combine solutions A and B and mix well; treat the plate with this freshly prepared solution and heat at 120 °C for 5 min; examine in ultraviolet light at 365 nm.

**Results B** Absence of more than 5 per cent of *C. foetida*.

Compare the chromatogram supplied with *Actaea racemosa* HRS for *C. foetida* and the chromatograms obtained with the test solution and reference solutions (a), (b) and (c). The chromatogram obtained with the test solution does not show any intense fluorescent zone between *R<sub>F</sub>* value 0.03 and *R<sub>F</sub>* value 0.06 or at the same position as the bright fluorescent zone in the chromatogram obtained with reference solution (c) (zones presented in capitals in the chromatogram of *C. foetida*, see below). The presence of 1 or both zones in the chromatogram obtained with the test solution indicates adulteration with *C. foetida* at a level greater than 5 per cent.

## ASSAY

Liquid chromatography (2.2.29).

**Test solution** Introduce 4.00 g of the powdered herbal drug (355) (2.9.12) into a 200 mL screw-cap bottle. Add 50.0 mL of a mixture of equal volumes of *methanol R* and *water R*. Sonicate for 45 min and shake for 15 min. Filter through a membrane filter (nominal pore size 0.45 µm).

**Reference solution (a)** Dissolve 10.0 mg of *Actaea racemosa* for assay CRS (containing monoammonium glycyrrhizate) in *methanol R* with the aid of ultrasound and dilute to 10.0 mL with the same solvent.

**Reference solution (b)** Dilute 5.0 mL of reference solution (a) to 10.0 mL with *methanol R*.

**Reference solution (c)** Dilute 2.0 mL of reference solution (a) to 10.0 mL with *methanol R*.

**Reference solution (d)** Dilute 1.0 mL of reference solution (a) to 20.0 mL with *methanol R*.

**Reference solution (e)** Dissolve 500 mg of *Actaea racemosa* dry extract for system suitability HRS in *methanol R* and dilute to 10.0 mL with the same solvent; sonicate and filter through a membrane filter (nominal pore size 0.45 µm).

**Column:**

— size:  $l = 0.25$  m,  $\varnothing = 4.6$  mm;

— stationary phase: octadecylsilyl silica gel for chromatography R (5 µm).

**Mobile phase:**

— mobile phase A: 0.1 per cent V/V solution of anhydrous formic acid R in water R;

— mobile phase B: 0.1 per cent V/V solution of anhydrous formic acid R in a mixture of equal volumes of acetonitrile R and *methanol R*;

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 40	50 → 20	50 → 80
40 - 41	20 → 5	80 → 95
41 - 44	5	95

**Flow rate** 1.0 mL/min.

**Detection** Evaporative light-scattering detector; the following settings have been found to be suitable; if the detector has different setting parameters, adjust the detector settings so as to comply with the system suitability criterion for the signal-to-noise ratio:

— carrier gas: nitrogen R;

— flow rate: 0.8 mL/min;

— evaporator temperature: 100 °C;

— nebuliser temperature: 60 °C.

**Injection** 10 µL.

**Identification of peaks** Use the chromatogram supplied with *Actaea racemosa* dry extract for system suitability HRS and the chromatogram obtained with reference solution (e) to identify the peaks to be quantified.

**System suitability:**

— signal-to-noise ratio: minimum 4.0 for the peak due to monoammonium glycyrrhizate in the chromatogram obtained with reference solution (d);

— peak-to-valley ratio: minimum 3, where  $H_p$  = height above the baseline of peak 4 and  $H_v$  = height above the baseline of the lowest point of the curve separating this peak from peak 5 in the chromatogram obtained with reference solution (e).

Establish a calibration curve with the logarithm to base 10 of the concentration (in milligrams per millilitre) of reference solutions (a), (b), (c) and (d) (corrected by the assigned percentage content of monoammonium glycyrrhizate in *Actaea racemosa* for assay CRS) as the abscissa and the logarithm to base 10 of the corresponding peak area as the ordinate.

Calculate the percentage content of each peak using the following expression:

$$\frac{10^A \times 5}{m}$$

- A* = logarithm to base 10 of the concentration of each peak in the chromatogram obtained with the test solution, determined from the calibration curve;  
*m* = mass of the herbal drug to be examined used to prepare the test solution, in grams.

Calculate the percentage content of triterpene glycosides by taking the sum of the percentage contents of peaks 1 to 12.

Ph Eur

## Black Currant

### Preparation

Black Currant Syrup

### DEFINITION

Black Currant consists of the fresh ripe fruits of *Ribes nigrum* L., together with their pedicels and rachides.

### CHARACTERISTICS

Odour, strong and characteristic.

**Macroscopical** Berries: globose, ranging in diameter from about 7 to 15 mm, occurring in pendulous racemes; epicarp shiny black externally, enclosing a yellowish green translucent pulp containing numerous flattened ovoid seeds, about 2.5 mm long, 1.25 mm wide and 1 mm thick; berry crowned with withered remains of five-cleft calyx; pedicels thin, up to about 10 mm long, attached to a rachis of variable length.

**Microscopical** Epicarp: glands yellow, disc-shaped, roughly circular or broadly elliptical, varying in diameter from about 140 to 240 µm, each consisting of a single layer of cells attached in the centre to the epicarp by means of a short, multiseriate stalk. Calyx: trichomes unicellular, blunt-ended with thin, crooked walls, about 10 to 14 µm wide and averaging about 350 µm in length. Seed: testa with pigment layer composed of small cells with horseshoe-shaped wall thickenings as seen in cross section, each cell containing one or two prismatic crystals of calcium oxalate; endosperm cells with irregularly thickened walls.

## Black Currant Syrup

### DEFINITION

Black Currant Syrup is prepared either from the clarified juice of Black Currant or from concentrated black currant juice of commerce. It contains a suitable antioxidant. Permitted food grade colours may be added.

### PRODUCTION

It is prepared by dissolving 700 g of Sucrose either in 560 mL of clarified juice, previously diluted with Water to a weight per mL of 1.045 g, or in 560 mL of a solution of the same weight per mL prepared from the concentrated juice of commerce and Water, and adding to this solution sufficient Benzoic Acid to give a final concentration of not more than 800 ppm, or sufficient Sodium Metabisulfite or other suitable sulfite to give a final concentration of not more than 350 ppm of sulfur dioxide.

The syrup complies with the requirements stated under Oral Liquids and with the following requirements.

Content of ascorbic acid<sup>1</sup>, C<sub>6</sub>H<sub>8</sub>O<sub>6</sub>

Not less than 0.055% w/w.

### TESTS

Sulfur dioxide

Not more than 350 ppm, Appendix IX B.

Weight per mL

1.27 to 1.30 g, Appendix V G.

### ASSAY

Mix 5 g with 25 mL of a freshly prepared 20% w/v solution of metaphosphoric acid, add 20 mL of acetone and dilute to 100 mL with water. To four 3 mL quantities of this solution add 0.4, 0.5, 0.6 and 0.7 mL, respectively, of double-strength standard 2,6-dichlorophenolindophenol solution, mix well by agitation with a fine stream of carbon dioxide, add 3 mL of chloroform, agitate for a further 15 seconds, examine the solutions against a white background and select the two that are on either side of the end point (that is, one colourless and one pink). Prepare a further six solutions as directed above, but adding to the first an amount of dye solution equal to that added to the selected colourless solution, successively increasing this volume by 0.02 mL increments in the second to the fifth solutions and adding to the sixth solution a volume equal to that added to the selected pink solution. Select the solution exhibiting the faintest pink colour. Each mL of double-strength standard 2,6-dichlorophenolindophenol solution added to this solution is equivalent to 0.200 mg of C<sub>6</sub>H<sub>8</sub>O<sub>6</sub>.

### STORAGE

Black Currant Syrup should be kept in a well-filled container and protected from light.

Black Currant Syrup contains, in 10 mL, about 7.5 mg of ascorbic acid.

## Blackcurrant Leaf

(Ph. Eur. monograph 2528)

Ph Eur

### DEFINITION

Dried leaf of *Ribes nigrum* L.

### Content

Minimum 1.0 per cent of flavonoids, expressed as isoquercitroside (C<sub>21</sub>H<sub>20</sub>O<sub>12</sub>; M<sub>r</sub> 464.4) (dried drug).

### IDENTIFICATION

A. The leaf is simple. The lamina may be up to 10 cm long and 12 cm wide and shows 3 (rarely 5) rounded triangular lobes, dentate or crenate on the margins, with the median lobe being the largest. The light-brown midrib and secondary veins are very visible on the lower surface, and form a characteristic network through numerous anastomoses. The rigid, light-brown petiole shows a very distinct gutter on the upper part and its length is equal to half the length of the lamina.

B. Microscopic examination (2.8.23). The powder is brownish-green. Examine under a microscope using chloral hydrate solution R. The powder shows the following diagnostic characters (Figure 2528.-1): curved, unicellular covering trichomes, with moderately thickened, slightly verrucose walls [D]; orange-yellow, globular or ovoid glandular

<sup>1</sup> The requirement for Content of ascorbic acid does not apply when Black Currant Syrup is used as a flavouring agent for pharmaceutical purposes.

trichomes, lacking a visible stalk, with a multicellular head up to 200  $\mu\text{m}$  in diameter (surface view [A]); fragments of the lower epidermis (surface view [B]) composed of cells with irregularly thickened walls [Ba], numerous anomocytic stomata (2.8.3) [Bb] accompanied by spongy parenchyma [Bc]; fragments (surface view [C], transverse section [E]) of the upper epidermis [Ca, Ea], accompanied by palisade parenchyma [Cb, Eb]; cluster crystals of calcium oxalate up to 30  $\mu\text{m}$  in diameter, isolated [F] or included in parenchymatous cells [Bd, Cc, Ec].

Figure 2528.-1. – Illustration for identification test B of powdered herbal drug of blackcurrant leaf

#### C. Thin-layer chromatography (2.2.27).

**Test solution** To 1 g of the powdered herbal drug (355) (2.9.12) add 10 mL of *methanol R*. Heat in a water-bath at 60 °C for 10 min with occasional stirring. Allow to cool. Filter.

**Reference solution** Dissolve 5 mg of *isoquercitroside R* and 5 mg of *rutoside trihydrate R* in 10 mL of *methanol R*.

**Plate** TLC silica gel plate R (5–40  $\mu\text{m}$ ) [or TLC silica gel plate R (2–10  $\mu\text{m}$ )].

**Mobile phase** *anhydrous formic acid R*, *water R*, *ethyl acetate R* (10:10:80 *V/V/V*).

**Application** 10  $\mu\text{L}$  [or 5  $\mu\text{L}$ ] as bands of 10 mm [or 8 mm].

**Development** Over a path of 10 cm [or 6 cm].

**Drying** At 100–105 °C for 10 min.

**Detection** Treat with a 10 g/L solution of *diphenylboric acid aminoethyl ester R* in *methanol R*, then with a 50 g/L solution of *macrogol 400 R* in *methanol R*; allow to dry in air for about 30 min, then examine in ultraviolet light at 365 nm.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other fluorescent zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Isoquercitroside: an orange zone	A green zone An orange zone (mainly isoquercitroside) A light blue zone
Rutoside: an orange-yellow zone	An orange-yellow zone (rutoside)
Reference solution	Test solution

#### TESTS

**Foreign matter (2.8.2)**

Maximum 3 per cent.

**Loss on drying (2.2.32)**

Maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

**Total ash (2.4.16)**

Maximum 12.0 per cent.

#### ASSAY

Liquid chromatography (2.2.29).

**Test solution** Disperse 0.200 g of the powdered herbal drug (355) (2.9.12) in 10 mL of an 80 per cent *V/V* solution of *methanol R*. Heat under a reflux condenser in a water-bath at 60 °C for 30 min. Sonicate for 15 min. Allow to cool, dilute to 20.0 mL with an 80 per cent *V/V* solution of *methanol R*. Filter through a membrane filter (nominal pore size 0.45  $\mu\text{m}$ ).

**Reference solution (a)** Dissolve 5.0 mg of *isoquercitroside CRS* in an 80 per cent *V/V* solution of *methanol R* and dilute to 100.0 mL with the same solution.

**Reference solution (b)** Dissolve 5.0 mg of *rutoside trihydrate R* in *methanol R* and dilute to 100.0 mL with the same solvent.

**Reference solution (c)** Dilute 10.0 mL of reference solution (a) to 20.0 mL with reference solution (b).

**Reference solution (d)** Dilute 1.0 mL of reference solution (a) to 20.0 mL with an 80 per cent *V/V* solution of *methanol R*.

**Column:**

— size:  $l = 0.25 \text{ m}$ ,  $\varnothing = 4 \text{ mm}$ ;

— stationary phase: end-capped octadecylsilyl silica gel for chromatography R (5  $\mu\text{m}$ );

— temperature: 30 °C.

**Mobile phase:**

— mobile phase A: 0.05 per cent *V/V* solution of *trifluoroacetic acid R*;

— mobile phase B: *acetonitrile R*;

Time (min)	Mobile phase A (per cent <i>V/V</i> )	Mobile phase B (per cent <i>V/V</i> )
0–45	97 → 60	3 → 40

**Flow rate** 1.0 mL/min.

**Detection** Spectrophotometer at 350 nm.

**Injection** 10  $\mu\text{L}$ .

**Identification of peaks** Use the chromatogram obtained with reference solution (a) to identify the peak due to isoquercitroside and the chromatogram obtained with reference solution (b) to identify the peak due to rutoside.

**Retention time** Rutoside = about 28 min;  
isoquercitroside = about 29 min.

**System suitability** Reference solution (c):

— **resolution**: minimum 3.0 between the peaks due to rutoside and isoquercitroside.

**Disregard limit** The area of the principal peak in the chromatogram obtained with reference solution (d).

Calculate the percentage content of total flavonoids, expressed as isoquercitroside, using the following expression:

$$\frac{A_1 \times m_2 \times p}{A_2 \times m_1 \times 5}$$

- $A_1$  = sum of the areas of the peak due to rutoside and all peaks eluting after the peak due to rutoside in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to isoquercitroside in the chromatogram obtained with reference solution (a);
- $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;
- $m_2$  = mass of isoquercitroside CRS used to prepare reference solution (a), in grams;
- $p$  = percentage content of isoquercitroside in isoquercitroside CRS.

Ph Eur

## Black Horehound

(Ph. Eur. monograph 1858)

Ph Eur

### DEFINITION

Dried flowering tops of *Ballota nigra* L.

### Content

Minimum 1.5 per cent of total *ortho*-dihydroxycinnamic acid derivatives, expressed as acteoside ( $C_{29}H_{36}O_{15}$ ;  $M_r$  625) (dried drug).

### IDENTIFICATION

A. The stems are conspicuously 4-angled, longitudinally striated, dark green or reddish-brown and more or less pubescent. The leaves are greyish-green, petiolate, the lamina ovate or orbicular, 2-4 cm wide, the margin irregularly crenate, and cuneate or cordate at the base; both surfaces are covered with abundant whitish hairs; the venation is pinnate, prominent on the lower surface, slightly depressed on the upper. The flowers are sessile or very shortly pedicellate, the calyx is infundibuliform, densely pubescent, with 10 prominent ribs and 5 subequal, broadly ovate teeth; the corolla, with a tube slightly shorter than the calyx tube, is purple and bilabiate, the upper lip pubescent on the outer surface and the lower lip with 3 lobes, the middle of which is notched.

B. Microscopic examination (2.8.23). The powder is greyish-green and slightly flocculent. Examine under a microscope using chloral hydrate solution R. The powder shows the following diagnostic characters (Figure 1858.-1): numerous long, uniseriate, multicellular covering trichomes consisting of 4 or more cells, thickened and swollen at the junctions, with slightly lignified and pitted walls, free [C] or on an epidermis (transverse section [Ea]); fewer glandular trichomes, usually on epidermises (transverse section [E, F, G]): some with a unicellular or multicellular stalk and a globose, uni- or bicellular head [Ga], others with a unicellular stalk and a multicellular head (surface view [Ac], transverse section [Eb]), others with a unicellular stalk and an 8-celled head of

lamiate type (surface view [Ad], transverse section [Fa]); fragments of the adaxial leaf epidermis [B] with cells with sinuous walls, accompanied by cells of the palisade parenchyma, most containing fine, needle-shaped crystals [Ba]; fragments of the abaxial leaf epidermis [A] bearing numerous stomata, the majority anomocytic (2.8.3) [Aa] but some diacytic [Ab]; fragments of the epidermis of the corolla composed of polygonal cells, those of the inner epidermis of the lips papillose [H] and those of the inner epidermis of the tube bearing uni- or bicellular covering trichomes in a stellate arrangement [K]; pollen grains subspherical with 3 pores and a smooth exine [D]; fragments from the stem (G) with groups of collenchymatous cells [Gb] and lignified vessels, with annular or spiral thickenings [J].

Figure 1858.-1. – Illustration for identification test B of powdered herbal drug of black horehound

C. Thin-layer chromatography (2.2.27).

**Test solution** To 2 g of the powdered herbal drug (355) (2.9.12) add 100 mL of methanol R. Heat on a water-bath under a reflux condenser for 30 min. Allow to cool. Filter. Evaporate the filtrate under reduced pressure until a volume of about 10 mL is obtained.

**Reference solution** Dissolve 1 mg of chlorogenic acid R and 2.5 mg of rutoside trihydrate R in 10 mL of methanol R.

**Plate** TLC silica gel plate R.

**Mobile phase** anhydrous formic acid R, glacial acetic acid R, water R, ethyl acetate R (7.5:7.5:18:67 V/V/V/V).

**Application** 20 µL as bands.

**Development** Over a path of 15 cm.

**Drying** In air.

**Detection** Spray with a solution containing 10 g/L of diphenylboric acid aminoethyl ester R and 50 g/L of macrogol

400 R in *methanol R*; allow to dry in a current of warm air; examine in ultraviolet light at 365 nm after 30 min.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other fluorescent zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Chlorogenic acid: a light blue fluorescent zone	A reddish fluorescent zone
	A faint yellow fluorescent zone
Rutoside: an orange-yellow fluorescent zone	A light blue fluorescent zone (caffeoylmalic acid)
	A greenish-blue fluorescent zone (acteoside)
	A yellowish-brown fluorescent zone (luteolin 7-lactate)
	A greenish-blue fluorescent zone (forsythoside B)
Reference solution	2 greenish-blue fluorescent zones (arenarioside)
	A yellow fluorescent zone (luteolin 7-lactate glucoside).
	A faint greenish-blue fluorescent zone (ballotetroside).
Test solution	

## TESTS

### Loss on drying (2.2.32)

Maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

### Total ash (2.4.16)

Maximum 13.0 per cent.

## ASSAY

**Stock solution** Place 1.000 g of the powdered herbal drug (355) (2.9.12) in a flask. Add 90 mL of *ethanol (50 per cent V/V) R*. Heat under a reflux condenser on a water-bath for 30 min. Allow to cool and filter, collecting the filtrate in a 100 mL volumetric flask. Rinse the flask and the filter with 10 mL of *ethanol (50 per cent V/V) R*. Add the rinsings to the filtrate and dilute to 100.0 mL with *ethanol (50 per cent V/V) R*.

**Test solution** Into a 10 mL volumetric flask, introduce successively, with shaking after each addition, 1.0 mL of the stock solution, 2 mL of 0.5 M *hydrochloric acid*, 2 mL of a solution containing 100 g/L of *sodium nitrite R* and 100 g/L of *sodium molybdate R*, and 2 mL of *dilute sodium hydroxide solution R*, and dilute to 10.0 mL with *water R*.

**Compensation liquid** Into a 10 mL volumetric flask, introduce 1.0 mL of the stock solution, 2 mL of 0.5 M *hydrochloric acid* and 2 mL of *dilute sodium hydroxide solution R*, and dilute to 10.0 mL with *water R*.

Measure immediately the absorbance (2.2.25) of the test solution at 525 nm, by comparison with the compensation liquid.

Calculate the percentage content of total *ortho*-dihydroxycinnamic acid derivatives, expressed as acteoside, using the following expression:

$$\frac{A \times 1000}{185 \times m}$$

i.e. taking the specific absorbance of acteoside to be 185.

*A* = absorbance at 525 nm;  
*m* = mass of the substance to be examined, in grams.

Ph Eur

## Bogbean Leaf

(Ph. Eur. monograph 1605)

Ph Eur

## DEFINITION

Dried, entire or fragmented leaf of *Menyanthes trifoliata* L.

## CHARACTERS

Very bitter and persistent taste.

## IDENTIFICATION

**A.** The leaf is long-petiolated, trifoliate, with long sheaths from the base; the petiole is up to 5 mm in diameter and strongly striated longitudinally. The lamina is divided into equal leaflets, sessile, obovate up to 10 cm long and up to 5 cm wide, with an entire, occasionally sinuous margin with brownish or reddish hydathodes and a spatulate base; it is glabrous, dark green on the upper surface and paler green on the lower surface, with a wide, whitish, finely striated prominent midrib.

**B.** Microscopic examination (2.8.23). The powder is yellowish-green. Examine under a microscope using *chloral hydrate solution R*. The powder shows fragments of upper epidermis with polyhedral cells and thin wavy walls; fragments of lower epidermis with sinuous walls; anomocytic stomata (2.8.3), on both surfaces, with the subsidiary cells showing radiating striations; epidermal cells from the veins straight walled and papillose; fragments of mesophyll parenchyma with large intercellular spaces (aerenchyma); irregular cells with rare sclereids; fragments of spiral or annular vessels.

**C.** Thin-layer chromatography (2.2.27).

**Test solution** To 1.0 g of the powdered herbal drug (355) (2.9.12) add 10 mL of *methanol R*. Heat, with stirring, in a water-bath at 60 °C for 5 min. Allow to cool and filter. Evaporate to dryness under reduced pressure in a water-bath at 60 °C. Dissolve the residue in 2.0 mL of *methanol R*.

**Reference solution** Dissolve 5 mg of *loganin R* in 15 mL of *methanol R*.

**Plate** TLC silica gel plate R.

**Mobile phase** *water R*, *methanol R*, *ethyl acetate R* (8:15:77 V/V/V).

**Application** 30 µL, as bands.

**Development** Over a path of 15 cm.

**Drying** In air.

**Detection** Spray with *vanillin reagent R*. Heat in an oven at 100-105 °C for 10 min. Examine in daylight.

**Results** See below the sequence of the zones present in the chromatograms obtained with the reference and test solutions. Furthermore, other zones are present in the chromatogram obtained with the test solution.

Top of the plate	
Loganine: a greyish-violet zone	A violet zone
	An intense blue zone
	A violet to greyish-violet zone
	A grey to greyish-blue zone
	A brownish zone
Reference solution	Test solution

**TESTS**

**Loss on drying (2.2.32)**

Maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

**Total ash (2.4.16)**

Maximum 10.0 per cent.

**Bitterness value (2.8.15)**

Minimum 3000.

Ph Eur

**Boldo Leaf**

(Ph. Eur. monograph 1396)

**Preparation**

Boldo Leaf Dry Extract

Ph Eur

**DEFINITION**

Whole or fragmented dried leaf of *Peumus boldus* Molina.

**Content**

Minimum 0.1 per cent of total alkaloids, expressed as boldine (C<sub>19</sub>H<sub>21</sub>NO<sub>4</sub>; M<sub>r</sub> 327.4) (anhydrous drug).

**IDENTIFICATION**

A. The leaf is oval or elliptical usually 5 cm long with a short petiole, an obtuse or slightly emarginate or mucronate apex and an equal and rounded base; the margin is entire and slightly undulate and the thickened edges are more or less revolute. The lamina is greyish-green, thick, tough and brittle. The upper surface is rough with numerous prominent small protuberances and a depressed venation. The lower surface is finely pubescent, with the protuberances less well-marked, and a prominent, pinnate venation.

B. Microscopic examination (2.8.23). The powder is greyish-green. Examine under a microscope using chloral hydrate solution R. The powder shows the following diagnostic characters (Figure 1396.-1): fragments of the lamina of the leaf (surface view [C], transverse section [G]) consisting of the upper epidermis with rigid, thick-walled cells [Ca, Ga], the hypodermis with cells with straight or slightly sinuous, thickened and beaded walls [Cb, Gb], and palisade parenchyma [Cc] with 2 layers of cells [Gc]; fragments of the lower epidermis with numerous stomata surrounded by 4-7 subsidiary cells (surface view [A, J]); solitary [F], bifurcated or stellate clustered [D, H] unicellular covering trichomes with more or less thickened and lignified walls; debris of the spongy mesophyll (surface view [B]) including numerous large, rounded oil cells [Ba, Ge]; fragments of parenchyma containing fine needle-shaped crystals [Bb, Gd], thick-walled fibres and lignified, pitted parenchymatous cells associated with vascular tissue from the veins [E].

Figure 1396.-1. – Illustration for identification test B of powdered herbal drug of boldo leaf

**C. Thin-layer chromatography (2.2.27).**

**Test solution** Mix 1.5 g of the powdered herbal drug (355) (2.9.12) and 5 mL of methanol R and sonicate for 10 min. Filter the supernatant through a 3 cm × 0.5 cm column of cellulose for chromatography R1. Use the first 1 mL of the eluate.

**Reference solution** Dissolve 2 mg of boldine R and 10 mg of hyoscine hydrobromide R in 5 mL of methanol R.

**Plate** TLC silica gel plate R (5-40 µm) [or TLC silica gel plate R (2-10 µm)].

**Mobile phase** diethylamine R, methanol R, toluene R (10:10:80 V/V/V).

**Application** 40 µL [or 6 µL] of the test solution and 20 µL [or 2 µL] of the reference solution as bands of 15 mm [or 8 mm].

**Development** Over a path of 15 cm [or 6 cm].

**Drying** In air.

**Detection** Treat with potassium iodobismuthate solution R2, allow to dry in air for 5 min and treat with sodium nitrite solution R; examine in daylight after 30 min.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution.

Top of the plate	
Hyoscine: a pale brown zone	A yellowish-brown zone A yellow zone A brown zone A brown zone
Boldine: a brown zone	A brown zone (boldine) Several zones
Reference solution	Test solution

**TESTS****Essential oil (2.8.12)**

Maximum 40 mL/kg (anhydrous drug).

Use 10.0 g of the freshly fragmented herbal drug, a 1000 mL flask and 300 mL of water R as the distillation liquid. Distil at a rate of 2-3 mL/min for 3 h.

**Foreign matter (2.8.2)**

Maximum 4 per cent of twigs and maximum 2 per cent of other foreign matter.

**Water (2.2.13)**

Maximum 100 mL/kg, determined by distillation of 20.0 g of the powdered herbal drug (355) (2.9.12).

**Total ash (2.4.16)**

Maximum 13.0 per cent.

**ASSAY****Liquid chromatography (2.2.29).**

**Test solution** Disperse 1.000 g of the powdered herbal drug (355) (2.9.12) in 50 mL of dilute hydrochloric acid R and shake in a water-bath at 80 °C for 30 min. Filter, take up the residue with 50 mL of dilute hydrochloric acid R and shake in a water-bath at 80 °C for 30 min. Filter and repeat the operation once on the residue obtained. Filter. Combine the cooled filtrates and shake with 100 mL of a mixture of equal volumes of ethyl acetate R and hexane R. Discard the organic layer. Adjust the aqueous layer to pH 9.5 with concentrated ammonia R. Shake successively with 100 mL, 50 mL and a further 50 mL of methylene chloride R, taking care not to form an emulsion. If necessary, centrifuge at 1200 g for 10 min. Combine the lower layers and evaporate to dryness under reduced pressure. Dissolve the residue in the mobile phase and dilute to 10.0 mL with the mobile phase.

**Reference solution (a)** Dissolve 12.0 mg of boldine CRS in the mobile phase and dilute to 100.0 mL with the mobile phase. Dilute 1.0 mL of the solution to 10.0 mL with the mobile phase.

**Reference solution (b)** Disperse 0.5 g of boldo leaf dry extract HRS in 50 mL of dilute hydrochloric acid R and sonicate for 10 min. Transfer to a separating funnel and wash with 10 mL of a mixture of equal volumes of ethyl acetate R and hexane R. Discard the organic layer. Adjust the aqueous phase to pH 9.5 with concentrated ammonia R. After cooling, shake successively with 100 mL, 50 mL and a further 50 mL of methylene chloride R, taking care not to form an emulsion. If necessary, centrifuge at 1200 g for 10 min. Combine the lower layers and evaporate to dryness under

reduced pressure. Dissolve the residue in the mobile phase and dilute to 10.0 mL with the mobile phase.

**Column:**

— size:  $l = 0.25$  m,  $\varnothing = 4.6$  mm;

— stationary phase: base-deactivated end-capped octadecylsilyl silica gel for chromatography R (5  $\mu$ m).

**Solution A** Mix 0.2 mL of diethylamine R and 99.8 mL of acetonitrile R.

**Solution B** Mix 0.2 mL of diethylamine R and 99.8 mL of water R and adjust to pH 3 with anhydrous formic acid R.

**Mobile phase** Solution A, solution B (16:84 V/V).

**Flow rate** 1.5 mL/min.

**Detection** Spectrophotometer at 304 nm.

**Injection** 20  $\mu$ L.

**Identification of peaks** Use the chromatogram supplied with boldo leaf dry extract HRS and the chromatogram obtained with reference solution (b) to identify the peaks due to alkaloids 1, 3, 4, 5 and 6; use the chromatogram obtained with reference solution (a) to identify the peak due to boldine.

**Relative retention** With reference to boldine (retention time = about 6 min): alkaloid 1 = about 0.9; alkaloid 3 = about 1.8; alkaloid 4 = about 2.0; alkaloid 5 = about 2.9; alkaloid 6 = about 3.1. Additional peaks may be present.

**System suitability** Reference solution (b):

— resolution: minimum 1.5 between the peaks due to alkaloid 1 and boldine.

Calculate the percentage content of total alkaloids, expressed as boldine, using the following expression:

$$\frac{(\sum A_1) \times m_2 \times p}{A_2 \times m_1 \times 100}$$

- $\Sigma A_1$  = sum of the areas of the peaks due to alkaloids 1, 3, 4, 5 and 6 and the peak due to boldine in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to boldine in the chromatogram obtained with reference solution (a);
- $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;
- $m_2$  = mass of boldine CRS used to prepare reference solution (a), in grams;
- $p$  = percentage content of boldine in boldine CRS.

Ph Eur

**Boldo Leaf Dry Extract**

(Ph. Eur. monograph 1816)

Ph Eur

**DEFINITION**

Extract produced from Boldo leaf (1396).

**Content**

- for aqueous extracts: minimum 0.1 per cent of total alkaloids, expressed as boldine ( $C_{19}H_{21}NO_4$ ;  $M_r$  327.4) (anhydrous extract);
- for hydroalcoholic extracts: minimum 0.2 per cent of total alkaloids, expressed as boldine ( $C_{19}H_{21}NO_4$ ;  $M_r$  327.4) (anhydrous extract).

**PRODUCTION**

The extract is produced from the herbal drug by a suitable procedure using either hot water at not less than 65 °C or a

hydroalcoholic solvent equivalent in strength to ethanol (45-75 per cent V/V).

### CHARACTERS

#### Appearance

Brown or greenish-brown, hygroscopic powder.

### IDENTIFICATION

Thin-layer chromatography (2.2.27).

**Test solution** To 0.5 g of the extract to be examined add 1 mL of hydrochloric acid R and 20 mL of water R. Sonicate for 10 min. Transfer the liquid to a separating funnel and make alkaline with 2 mL of dilute ammonia R1. Shake with 2 quantities, each of 20 mL, of methylene chloride R. Evaporate the combined organic layers to dryness. Dissolve the residue in 1 mL of methanol R.

**Reference solution** Dissolve 2 mg of boldine R and 10 mg of hyoscyne hydrobromide R in 5 mL of methanol R.

**Plate** TLC silica gel plate R (5-40 µm) [or TLC silica gel plate R (2-10 µm)].

**Mobile phase** diethylamine R, methanol R, toluene R (10:10:80 V/V/V).

**Application** 20 µL [or 3 µL] as bands of 15 mm [or 8 mm].

**Development** Over a path of 15 cm [or 6 cm].

**Drying** In air.

**Detection** Treat with potassium iodobismuthate solution R2, allow to dry in air for 5 min and treat with sodium nitrite solution R; examine in daylight after 30 min.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

— resolution: minimum 1.5 between the peaks due to alkaloid 1 and boldine.

Calculate the percentage content of total alkaloids, expressed as boldine, using the following expression:

$$\frac{(\sum A_1) \times m_2 \times p}{A_2 \times m_1 \times 10}$$

- $\sum A_1$  = sum of the areas of the peaks due to alkaloids 1, 3, 4, 5 and 6 and the peak due to boldine in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to boldine in the chromatogram obtained with reference solution (a);
- $m_1$  = mass of the extract to be examined used to prepare the test solution, in grams;
- $m_2$  = mass of boldine CRS used to prepare reference solution (a), in grams;
- $p$  = percentage content of boldine in boldine CRS.

Ph Eur

## Buckwheat Herb

(Ph. Eur. monograph 2184)

Ph Eur

### DEFINITION

Whole or fragmented aerial parts of *Fagopyrum esculentum* Moench, collected in the early flowering period prior to fruiting and dried immediately.

### Content

Minimum 3.0 per cent of rutoside ( $C_{27}H_{30}O_{16}$ ;  $M_r$  611) (dried drug).

### IDENTIFICATION

**A.** The stem is cylindrical, hollow, finely ridged longitudinally, about 2-6 mm in diameter, brownish-green or reddish, with few branches and thickened at the internodes; the leaves are arranged spirally and have membranous, sheathing stipules; the surface is glabrous except in the region of the stipules, where short, white hairs may occur. The leaves are dark green, paler on the lower surface, up to 7 cm wide and 11 cm long, sagittate or cordate, almost pentagonal with 2 widely rounded lobes; the lower leaves are petiolate, the upper leaves sessile or amplexicaul; the lamina is glabrous and the margin finely sinuate and fringed with minute, reddish-brown projections; similar projections occur on the veins on the upper surface. The inflorescence is a cymose panicle, the individual flowers 1-2 mm long and 6 mm in diameter with 5 free, white or reddish petals.

**B.** Microscopic examination (2.8.23). The powder is dark green. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2184.-1): fragments of the epidermis of the stem (surface view [D]) composed of elongated cells showing striations on the outer walls [Da] and anomocytic stomata (2.8.3) [Db]; fragments of the upper epidermis of the lamina (surface view [B]), consisting of polygonal cells covered by a striated cuticle [Ba] and anomocytic stomata [Bb], often accompanied by palisade parenchyma [Bc]; fragments of the epidermis of the leaf margins [A] and of the epidermis covering the veins, often showing ovoid or rounded papilla-like projections, often reddish, with thickened and striated walls; fragments of the lower epidermis of the lamina [C] with thin-walled polygonal cells, numerous stomata [Ca] and rare glandular trichomes with a biserial stalk and a globular head usually composed of 8 cells [Cb]; fragments of mesophyll [F] with narrow, annular or spiral vessels [Fa] and of spongy parenchyma, numerous cells of which contain cluster crystals of calcium oxalate, varying in diameter (25-100  $\mu$ m) [Fb], smaller prismatic crystals of calcium oxalate [Fc], occurring scattered in the mesophyll and also in the parenchyma of the stem; fragments of lignified tissue [H] with bordered-pitted [Ha], reticulate or annular [Hb] vessels and thin-walled, pitted fibres [Hc]; occasional fragments of the corolla with a papillose epidermis [E]; spherical or ovoid pollen grains, about 50  $\mu$ m in diameter, with a pitted exine and 3 furrows [G].

**C.** Thin-layer chromatography (2.2.27).

**Test solution** To 0.5 g of the powdered herbal drug (355) (2.9.12) add 5.0 mL of *methanol R* and heat in a water-bath at 60 °C under a reflux condenser for 10 min. Cool and filter.

**Reference solution** Dissolve 10 mg of *hyperoside R* and 10 mg of *rutoside trihydrate R* in 10 mL of *methanol R*.

Figure 2184.-1. – Illustration for identification test B of powdered herbal drug of buckwheat herb

**Plate** TLC silica gel plate R (5-40  $\mu$ m) [or TLC silica gel plate R (2-10  $\mu$ m)].

**Mobile phase** *anhydrous formic acid R*, *water R*, *ethyl acetate R* (10:10:80 V/V/V).

**Application** 20  $\mu$ L [or 5  $\mu$ L] as bands of 15 mm [or 8 mm].

**Development** Over a path of 10 cm [or 6 cm].

**Drying** At 100-105 °C.

**Detection** treat with a 10 g/L solution of *diphenylboric acid aminoethyl ester R* in *methanol R*, subsequently treat with a 50 g/L solution of *macrogol 400 R* in *methanol R*; allow to dry in air for about 30 min and examine in ultraviolet light at 365 nm.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other fluorescent zones may be present in the chromatogram obtained with the test solution.

## TESTS

## Loss on drying (2.2.32)

Maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

## Total ash (2.4.16)

Maximum 15.0 per cent.

## ASSAY

Liquid chromatography (2.2.29).

**Test solution** To 0.500 g of the powdered herbal drug (355) (2.9.12), add 30 mL of an 80 per cent V/V solution of methanol R. Heat the mixture under a reflux condenser in a water-bath at 60 °C for 30 min, then extract the mixture in an ultrasonic bath for 15 min. Allow to cool, dilute to 50.0 mL with an 80 per cent V/V solution of methanol R and filter.

**Reference solution (a)** Dissolve 25.0 mg of rutoside trihydrate CRS in an 80 per cent V/V solution of methanol R and dilute to 50.0 mL with the same solvent.

**Reference solution (b)** Dissolve 20.0 mg of troxerutin R and 5.0 mg of quercitrin R in an 80 per cent V/V solution of methanol R and dilute to 50.0 mL with the same solvent.

## Column:

- size:  $l = 0.125$  m,  $\varnothing = 4$  mm;
- stationary phase: octadecylsilyl silica gel for chromatography R (5  $\mu$ m);
- temperature: 30 °C.

## Mobile phase:

- mobile phase A: mix 50 volumes of acetonitrile R and 950 volumes of water R adjusted to pH 2 with phosphoric acid R;
- mobile phase B: mix 95 volumes of water R adjusted to pH 2 with phosphoric acid R and 905 volumes of acetonitrile R;

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 6	94	6
6 - 16.5	94 → 85	6 → 15
16.5 - 22	85 → 76	15 → 24
22 - 25	76 → 59	24 → 41

**Flow rate** 1.0 mL/min.

**Detection** Spectrophotometer at 350 nm.

**Injection** 10  $\mu$ L.

**System suitability** Reference solution (b):

- elution order: order indicated in the composition of reference solution (b), when the chromatogram is recorded in the prescribed conditions;
- resolution: minimum 3 between the peaks due to troxerutin and quercitrin.

Using the retention times determined from the chromatogram obtained with reference solution (a), locate the peak due to rutoside in the chromatogram obtained with the test solution.

Calculate the percentage content of rutoside using the following expression:

$$\frac{A_1 \times m_2 \times p}{A_2 \times m_1}$$

$A_1$  = area of the peak due to rutoside in the chromatogram obtained with the test solution;

$A_2$  = area of the peak due to rutoside in the chromatogram obtained with reference solution (a);  
 $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;  
 $m_2$  = mass of rutoside trihydrate CRS used to prepare reference solution (a), in grams;  
 $p$  = percentage content of rutoside in rutoside trihydrate CRS.

Ph Eur

## Bupleurum Root

(Ph. Eur. monograph 2562)

Ph Eur

## DEFINITION

Dried, whole or fragmented root of *Bupleurum chinense* DC. or *Bupleurum scorzonrifolium* Willd.

## Content

Minimum 0.16 per cent of saikosaponin A ( $C_{42}H_{68}O_{13}$ ;  $M_r$  781) (dried drug).

## IDENTIFICATION

**A. *B. chinense*.** The whole root is cylindrical or elongated conical, branched in the lower part, up to 23 cm long and 1.2 cm in diameter. The upper part consists of a bulgy root crown, usually composed of 3-15 stem bases as well as the fibrous remnants of the leaf bases. The fragmented root consists of irregular pieces, 1-5 cm long, 0.2-0.3 cm in diameter. The outer surface is blackish-brown or light brown, marked with longitudinal wrinkles and showing rootlet scars and lenticel-like protuberances. The texture is hard and compact, difficult to break. The fracture shows concentric fibrous rings in the wood; the bark is thin, light brown or orange-brown, while the wood is whitish-yellow.

**B. *scorzonrifolium*** The whole root is thinner than that of *B. chinense*, elongated conical, usually unbranched or very slightly branched in the lower part, up to 15 cm long and 0.3-0.5 cm in diameter. The root crown bears numerous fibres from the bases of wilted leaves in a brush-like shape. The fragmented root consists of irregular pieces, 1-5 cm long. The outer surface is blackish-brown or reddish-brown and shows numerous annular striations near the root crown. The texture is slightly soft and the root breaks easily. The fracture is even and non-fibrous.

**B. Microscopic examination (2.8.23).** The powder is reddish-brown or yellowish-brown. Examine under a microscope using chloral hydrate solution R. The powder shows the following diagnostic characters (Figure 2562.-1): fragments of yellowish-brown to reddish-brown cork (surface view [A]) with rectangular and flattened cells (transverse section [H]), some cork cells containing small prism crystals visible mainly in polarised light [Ha]; fragments of vessels (5-80  $\mu$ m in diameter) with various thickenings [G], most of which are reticulate, accompanied by xylem parenchyma with elongated, thin-walled cells or by fibres with thick (2-8  $\mu$ m) and channelled walls [C]; xylem fibres, isolated [F] or in bundles [E], long, fusiform, about 7-25  $\mu$ m in diameter; fragments of secretory canals (10-15  $\mu$ m up to 40  $\mu$ m in diameter) with inconspicuous secretory cells and yellowish to orange contents [D]; fragments of parenchyma with conspicuous secretory canals visible as yellowish to orange-red ribbon-like secretions [B].

Figure 2562.-1. – Illustration for identification test B of powdered herbal drug of bupleurum root

C. High-performance thin-layer chromatography (2.8.25).  
Examine the chromatograms obtained in the test for *Bupleurum longiradiatum* Turcz.

**Results** See below the sequence of zones present in the chromatograms obtained with reference solution (a) and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

	A reddish-violet zone (saikosaponins C, H)
Reference solution (a)	Test solution

## TESTS

### *Bupleurum longiradiatum* Turcz

High-performance thin-layer chromatography (2.8.25).

**Test solution** To 1.0 g of the powdered herbal drug (355) (2.9.12) add 10.0 mL of *methanol R* and sonicate for 10 min. Centrifuge and use the supernatant.

**Reference solution (a)** Dissolve 1.0 mg of *saikosaponin A R* and 1.0 mg of *saikosaponin D R* in *methanol R* and dilute to 5.0 mL with the same solvent.

**Reference solution (b)** Dilute 2.5 mL of reference solution (a) to 10.0 mL with *methanol R*.

**Intensity marker** Saikosaponin D.

**Plate** TLC silica gel  $F_{254}$  plate *R* (2-10 µm).

**Mobile phase** *water R*, *2-propanol R*, *ethyl acetate R* (10:30:80 V/V/V).

**Application** 5 µL as bands of 8 mm.

**Development** 70 mm from the lower edge of the plate.

**Drying** In air.

**Detection** Treat with *anisaldehyde solution R* and heat at 100 °C for 3 min; examine in daylight.

**System suitability** Reference solution (a):

— the chromatogram shows 2 distinct zones in the lower part of the middle third; the lower zone (saikosaponin A) is grey and the upper zone (saikosaponin D) is orange-brown.

**Results** In the chromatogram obtained with the test solution, the presence of a greyish zone directly above the zone due to saikosaponin H (which co-migrates with saikosaponin C) indicates adulteration by *B. longiradiatum*.

**Loss on drying** (2.2.32)

Maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

**Total ash** (2.4.16)

Maximum 9.0 per cent.

**Ash insoluble in hydrochloric acid** (2.8.1)

Maximum 3.5 per cent.

## ASSAY

Liquid chromatography (2.2.29).

**Test solution** Disperse 0.250 g of the powdered herbal drug (355) (2.9.12) in a mixture of 3 mL of *concentrated ammonia R* and 12 mL of *methanol R*. Sonicate for 30 min and centrifuge for 10 min. Repeat the extraction twice, combine the supernatants and evaporate to dryness under reduced pressure. Dissolve the residue in *methanol R* and dilute to 5.0 mL with the same solvent. Filter through a membrane filter (nominal pore size 0.45 µm).

**Reference solution (a)** Dissolve 10.0 mg of *saikosaponin A CRS* in *methanol R* and dilute to 10.0 mL with the same solvent.

**Reference solution (b)** Dissolve 1 mg of *propyl parahydroxybenzoate R* in 1 mL of reference solution (a) and dilute to 10.0 mL with *methanol R*.

**Column:**

— size:  $l = 0.25$  m,  $\varnothing = 4.6$  mm;

— stationary phase: base-deactivated end-capped octadecylsilyl silica gel for chromatography *R* (5 µm).

**Mobile phase** *acetonitrile R1*, *water for chromatography R* (36:64 V/V).

**Flow rate** 1.0 mL/min.

**Detection** Spectrophotometer at 210 nm.

**Injection** 20 µL.

**Run time** 4 times the retention time of saikosaponin A.

**Relative retention** With reference to saikosaponin A (retention time = about 16 min): propyl parahydroxybenzoate = about 0.9.

**System suitability** Reference solution (b):

— **resolution:** minimum 3.0 between the peaks due to propyl parahydroxybenzoate and saikosaponin A.

Calculate the percentage content of saikosaponin A using the following expression:

$$\frac{A_1 \times m_2 \times p \times 0.5}{A_2 \times m_1}$$

- $A_1$  = area of the peak due to saikosaponin A in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to saikosaponin A in the chromatogram obtained with reference solution (a);
- $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;
- $m_2$  = mass of saikosaponin A CRS used to prepare reference solution (a), in grams;
- $p$  = percentage content of saikosaponin A in saikosaponin A CRS.

Ph Eur

## Greater Burnet Root

(*Sanguisorba* Root, Ph. Eur. monograph 2385)

Ph Eur

### DEFINITION

Whole or fragmented, dried underground parts of *Sanguisorba officinalis* L. without rootlets.

### Content

Minimum 5.0 per cent of tannins, expressed as pyrogallol ( $C_6H_6O_3$ ;  $M_r$  126.1) (dried drug).

### IDENTIFICATION

**A. Whole drug.** The whole root is irregular, fusiform or cylindrical, slightly curved or twisted, 5-25 cm long and 0.5-2 cm in diameter. The outer surface is greyish-brown or dark brown, rough with longitudinal wrinkles and sometimes bears the remains of short, hard rootlets. The texture is hard and brittle. The fracture is relatively even, pinkish or pale yellow, dense and granular. The xylem has a slightly radiate structure.

**Fragmented drug** The fragmented root, 0.5-2 cm in diameter, occurs as short, more or less cylindrical pieces or as oblique, subrounded or irregular slices. The outer surface is greyish-brown or dark brown, rough with longitudinal wrinkles and sometimes bears the remains of short, hard rootlets. The texture is hard and brittle. The fracture is relatively even, dense and granular; the cut surface is pinkish, pale yellow or yellowish-brown and shows the xylem which is sometimes lighter in colour, and has a slightly radiate structure.

**B. Microscopic examination (2.8.23).** The powder is yellowish-brown or dark brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2385.-1): abundant cluster crystals of calcium oxalate 11-65  $\mu$ m in diameter, free [L] or included in parenchyma cells sometimes forming crystal sheaths [Ca]; prisms of calcium oxalate; rare, whole or fragmented phloem fibres, usually isolated [B, F, H]; reticulate or pitted lignified vessels [E, K], 13-60  $\mu$ m in diameter, sometimes up to 70  $\mu$ m in diameter; fragments of yellowish-brown cork with cells that are polygonal in surface view [J] or rectangular in transverse section [A]. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows subrounded or ovoid starch

granules, free or included in parenchyma cells or in cells of the medullary rays [D]; the granules are mostly single, 3-9  $\mu$ m in diameter, sometimes up to 30  $\mu$ m in diameter; 2- to 4-compound starch granules are also present [G].

Figure 2385.-1. — Illustration for identification test B of powdered herbal drug of *sanguisorba* root

**C. Thin-layer chromatography (2.2.27).**

**Test solution** To 2.0 g of the powdered herbal drug (355) (2.9.12) add 50 mL of *water R* and boil under a reflux condenser for 30 min. Cool the solution and centrifuge for 10 min. Shake the supernatant with 2 quantities, each of 15 mL, of *di-isopropyl ether R* saturated with *hydrochloric acid R*. Combine the ether layers. Evaporate to dryness and dissolve the residue in 1.0 mL of *methanol R*. Filter through a polypropylene syringe filter (nominal pore size 0.45  $\mu$ m).

**Reference solution** Dissolve 5 mg of *gallic acid R* and 20 mg of *resorcinol R* in 20 mL of *methanol R*.

**Plate** TLC silica gel *F<sub>254</sub> plate R* (5-40  $\mu$ m) [or TLC silica gel *F<sub>254</sub> plate R* (2-10  $\mu$ m)].

**Mobile phase** *anhydrous formic acid R*, *ethyl acetate R*, *toluene R* (10:30:60 *V/V/V*).

**Application** 10  $\mu$ L [or 4  $\mu$ L] as bands.

**Development** Over a path of 10 cm [or 6 cm].

**Drying** In air.

**Detection A** Examine in ultraviolet light at 254 nm.

**Results A** See below the sequence of quenching zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint quenching zones may be present in the chromatogram obtained with the test solution.

**TESTS**

**Loss on drying (2.2.32)**

Maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C.

**Total ash (2.4.16)**

Maximum 10.0 per cent.

**Ash insoluble in hydrochloric acid (2.8.1)**

Maximum 2.0 per cent.

**ASSAY**

**Tannins (2.8.14)**

Use 0.500 g of the powdered herbal drug (180) (2.9.12).

Ph Eur

**Butcher's Broom**

(Ph. Eur. monograph 1847)

Ph Eur

**DEFINITION**

Dried, whole or fragmented underground parts of *Ruscus aculeatus* L.

**Content**

Minimum 1.0 per cent of total sapogenins, expressed as ruscogenins [mixture of neoruscogenin (C<sub>27</sub>H<sub>40</sub>O<sub>4</sub>; M<sub>r</sub> 428.6) and ruscogenin (C<sub>27</sub>H<sub>42</sub>O<sub>4</sub>; M<sub>r</sub> 430.6)] (dried drug).

**IDENTIFICATION**

**A.** The rhizome consists of yellowish, branched, articulated, somewhat knotty pieces, cylindrical or subconical, about 5-10 cm long and about 5 mm thick. The surface is marked with thin annulations about 1-3 mm wide, separated from one another; rounded scars of the aerial stems are present on the upper surface. On the lower surface numerous roots, or their scars, occur; the roots are about 2 mm in diameter and similar in colour to the rhizome. The outer layer is easily detached, revealing a yellowish-white, very hard central cylinder.

**B.** Microscopic examination (2.8.23). The powder is yellowish. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 1847.-1): groups of sclereids of the rhizome, with variously-shaped cells, rounded, elongated or rectangular; the walls are moderately thickened and distinctly beaded, with large, rounded or oval pits [F, G, L, P, Q]; fragments of the endodermis composed of a single layer of irregularly thickened cells [K]; groups of rounded parenchymatous cells, thickened at the corners, with small, triangular intercellular spaces [D, E, N]; thin-walled parenchyma [J] with some cells containing raphides of calcium oxalate [C]; groups [H] of thick-walled fibres [Ha] and small vessels, up to about 50 µm in diameter, the walls showing numerous small, slit-shaped pits [A, Hb]; rare fragments of dermal tissue of the root [B]; raphides of calcium oxalate, isolated [M].

Figure 1847.-1. – Illustration for identification test B of powdered herbal drug of butcher's broom

**C. Thin-layer chromatography (2.2.27).**

**Test solution** Introduce 1.0 g of the powdered herbal drug (355) (2.9.12) and 50 mL of *dilute hydrochloric acid R* into a 100 mL flask with a ground-glass neck. Heat on a water-bath under a reflux condenser for 40 min. Allow to cool and

extract the unfiltered mixture with 3 quantities, each of 25 mL, of *methylene chloride R*. Combine the organic solutions and dry over *anhydrous sodium sulfate R*. Filter and evaporate to dryness. Dissolve the residue in 5 mL of *methanol R*.

**Reference solution** Dissolve 1 mg of *ruscogenins CRS* and 1 mg of *stigmasterol R* in *methanol R* and dilute to 5 mL with the same solvent.

**Plate** TLC silica gel plate R (5-40 µm) [or TLC silica gel plate R (2-10 µm)].

**Mobile phase** *methanol R*, *methylene chloride R* (7:93 V/V).

**Application** 10 µL [or 4 µL] as bands.

**Development** Over a path of 15 cm [or 6 cm].

**Drying** In air.

**Detection** Spray with *vanillin reagent R*, dry in an oven at 100-105 °C for 1 min and examine in daylight.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other weak zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Stigmasterol: a violet zone	Several zones of various colours A violet zone
Ruscogenins: a yellow zone	A violet zone A yellow zone (ruscogenins) Several zones of various colours
Reference solution	Test solution

## TESTS

**Foreign matter (2.8.2)**

Maximum 5 per cent.

**Loss on drying (2.2.32)**

Maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

**Total ash (2.4.16)**

Maximum 12.0 per cent.

**Ash insoluble in hydrochloric acid (2.8.1)**

Maximum 5.0 per cent.

## ASSAY

Liquid chromatography (2.2.29).

**Test solution** To 2.000 g of the powdered herbal drug (355) (2.9.12) add 60 mL of *anhydrous ethanol R*, 15 mL of *water R* and 0.2 g of *potassium hydroxide R*. Extract on a water-bath under a reflux condenser for 4 h. Allow to cool and filter into a 100 mL volumetric flask. Rinse the extraction flask and the residue in the filter with 3 quantities, each of 10 mL, of *anhydrous ethanol R* and add the rinsings to the volumetric flask. Dilute to 100.0 mL with *anhydrous ethanol R*. Evaporate 25.0 mL of this solution to dryness under reduced pressure. Dissolve the residue in 10 mL of *butanol R* and add 3 mL of *hydrochloric acid R1* and 8 mL of *water R*. Heat on a water-bath under a reflux condenser for 1 h. Allow to cool and transfer to a 100 mL volumetric flask. Rinse the round-bottomed flask with 3 quantities, each of 20 mL, of *methanol R*. Add the rinsings to the volumetric flask and dilute to 100.0 mL with *methanol R*.

**Reference solution** Dissolve 5.0 mg of *ruscogenins CRS* in 100 mL of *methanol R*.

**Column:**

— size:  $l = 0.25$  m,  $\varnothing = 4.6$  mm;

— stationary phase: octadecylsilyl silica gel for chromatography R (5 µm).

**Mobile phase:**

— mobile phase A: *water R*;

— mobile phase B: *acetonitrile R1*;

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 25	40	60
25 - 27	40 → 0	60 → 100
27 - 37	0	100

**Flow rate** 1.2 mL/min.

**Detection** Spectrophotometer at 203 nm.

**Injection** 20 µL.

**Identification of peaks** Use the chromatogram supplied with *ruscogenins CRS* and the chromatogram obtained with the reference solution to identify the peaks due to neoruscogenin and ruscogenin.

**Relative retention** With reference to neoruscogenin (retention time = about 16 min): ruscogenin = about 1.2.

**System suitability** Reference solution:

— resolution: minimum 1.5 between the peaks due to neoruscogenin and ruscogenin.

Calculate the percentage content of sapogenins, expressed as ruscogenins (neoruscogenin and ruscogenin), using the following expression:

$$\frac{A_1 \times m_2 \times 4 \times p_1}{A_2 \times m_1} + \frac{A_3 \times m_2 \times 4 \times p_2}{A_4 \times m_1}$$

$A_1$  = area of the peak due to ruscogenin in the chromatogram obtained with the test solution;

$A_2$  = area of the peak due to ruscogenin in the chromatogram obtained with the reference solution;

$A_3$  = area of the peak due to neoruscogenin in the chromatogram obtained with the test solution;

$A_4$  = area of the peak due to neoruscogenin in the chromatogram obtained with the reference solution;

$m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;

$m_2$  = mass of *ruscogenins CRS* used to prepare the reference solution, in grams;

$p_1$  = percentage content of ruscogenin in *ruscogenins CRS*;

$p_2$  = percentage content of neoruscogenin in *ruscogenins CRS*.

Ph Eur

## Calendula Flower

(Ph. Eur. monograph 1297)

Ph Eur

### DEFINITION

Whole or cut, dried, and fully opened flowers that have been detached from the receptacle of the cultivated, double-flowered varieties of *Calendula officinalis* L.

### Content

Minimum 0.4 per cent of flavonoids, expressed as hyperoside ( $C_{21}H_{20}O_{12}$ ;  $M_r$  464.4) (dried drug).

### IDENTIFICATION

A. The ligulate florets consist of a yellow or orange-yellow ligule, about 3-5 mm wide and about 7 mm in the middle part, with a 3-toothed apex and a hairy, partly sickle-shaped,

yellowish-brown or orange-brown tube with a projecting style and a bifid stigma occasionally with a partly bent yellowish-brown or orange-brown ovary. The tubular florets, about 5 mm long, are present and consist of the yellow, orange-red or reddish-violet 5-lobed corolla and the yellowish-brown or orange-brown tube, hairy in its lower part, mostly with a partly bent yellowish-brown or orange-brown ovary.

Figure 1297.-1. – Illustration for identification test B of powdered herbal drug of calendula flower

**B. Microscopic examination (2.8.23).** The powder is yellowish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 1297.-1): fragments of epidermises of the corolla [C, F, K] containing light yellow oil droplets, some with fairly large anomocytic stomata (2.8.3) [Fa, Ka]; covering trichomes biseriate, multicellular and conical [G], usually fragmented, and glandular trichomes with a multicellular stalk [E], very abundant on the base of the corolla [D]; fragments of parenchyma of the corolla [B] containing prisms and very small cluster crystals of calcium oxalate [Ba, Da] and small vessels [Bb]; spherical pollen grains up to about 40 µm in diameter with a sharply spiny exine and 3 germinal pores [A, J]; occasional fragments of the stigmas with short, bulbous papillae [H].

**C. High-performance thin-layer chromatography (2.8.25).**

**Test solution** To 0.5 g of the powdered herbal drug (355) (2.9.12) add 5.0 mL of *methanol R*. Sonicate for 15 min, filter or centrifuge and use the filtrate or supernatant.

**Reference solution (a)** Dissolve 3.0 mg of *chlorogenic acid R* and 4.0 mg of *isorhamnetin-3-O-rutinoside R* in *methanol R* and dilute to 10.0 mL with the same solvent.

**Reference solution (b)** Dilute 2.5 mL of reference solution (a) to 10.0 mL with *methanol R*.

**Reference solution (c)** Dissolve 2.5 mg of *hyperoside R* and 3 mg of *chlorogenic acid R* in *methanol R* and dilute to 10 mL with the same solvent.

**Intensity marker** Isorhamnetin-3-O-rutinoside.

**Plate** TLC silica gel F<sub>254</sub> plate R (2-10 µm).

**Mobile phase** *anhydrous formic acid R, water R, ethyl acetate R* (10:10:80 V/V/V).

**Application** 4 µL as bands of 8 mm.

**Development** 70 mm from the lower edge of the plate.

**Drying** In a current of air at room temperature for 5 min.

**Detection** Heat at 100-105 °C for 5 min; spray the warm plate with a 10 g/L solution of *diphenylboric acid aminoethyl ester R* in *methanol R*, then with a 50 g/L solution of *macrogol 400 R* in *methanol R* or, alternatively, dip the warm plate in a 5 g/L solution of *diphenylboric acid aminoethyl ester R* in *ethyl acetate R* and then in a 50 g/L solution of *macrogol 400 R* in *methylene chloride R*; allow to dry in air for about 1 min and examine in ultraviolet light at 366 nm.

**System suitability** Reference solution (c):

- the chromatogram shows in the middle third 2 distinct zones, which may be touching; the lower zone (chlorogenic acid) shows a light blue fluorescence and the upper zone (hyperoside) shows a yellow or orange fluorescence.

**Results** See below the sequence of fluorescent zones present in the chromatograms obtained with reference solution (a) and the test solution. Furthermore, in the chromatogram obtained with the test solution, other faint to very faint blue, brown or orange fluorescent zones may be present.

Top of the plate	
	2 blue zones, faint to equivalent
	A greenish-yellow zone, faint
	-

	A brownish-orange zone, very faint to faint
Reference solution (a)	Test solution

## TESTS

## Foreign matter (2.8.2)

Maximum 5 per cent of bracts and maximum 2 per cent of other foreign matter.

## Loss on drying (2.2.32)

Maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (500) (2.9.12) by drying in an oven at 105 °C for 2 h.

## Total ash (2.4.16)

Maximum 10.0 per cent.

## ASSAY

**Stock solution** Into a 100 mL round-bottomed flask introduce 0.800 g of the powdered herbal drug (500) (2.9.12), 1 mL of a 5 g/L solution of *hexamethylenetetramine R*, 7 mL of *hydrochloric acid R1* and 20 mL of *acetone R*. Boil the mixture under a reflux condenser for 30 min. Filter the liquid through a plug of absorbent cotton into a 100 mL volumetric flask. Add the absorbent cotton to the residue in the round-bottomed flask and extract with 2 quantities, each of 20 mL, of *acetone R*, each time boiling under a reflux condenser for 10 min. Allow to cool to room temperature, filter the liquid through a plug of absorbent cotton, then filter the combined acetone solution through a filter-paper into the volumetric flask, and dilute to 100.0 mL with *acetone R* by rinsing the flask and filter. Introduce 20.0 mL of this solution into a separating funnel, add 20 mL of *water R* and extract the mixture with 1 quantity of 15 mL and then with 3 quantities, each of 10 mL, of *ethyl acetate R*. Combine the ethyl acetate extracts in a separating funnel, rinse with 2 quantities, each of 50 mL, of *water R*, filter the extract over 10 g of *anhydrous sodium sulfate R* into a 50 mL volumetric flask and dilute to 50.0 mL with *ethyl acetate R*.

**Test solution** To 10.0 mL of the stock solution add 1 mL of *aluminium chloride reagent R* and dilute to 25.0 mL with a 5 per cent *V/V* solution of *glacial acetic acid R* in *methanol R*.

**Compensation liquid** Dilute 10.0 mL of the stock solution to 25.0 mL with a 5 per cent *V/V* solution of *glacial acetic acid R* in *methanol R*.

Measure the absorbance (2.2.25) of the test solution after 30 min, by comparison with the compensation liquid at 425 nm.

Calculate the percentage content of flavonoids, expressed as hyperoside, using the following expression:

$$\frac{A \times 1.25}{m}$$

i.e. taking the specific absorbance of hyperoside to be 500.

*A* = absorbance at 425 nm;

*m* = mass of the herbal drug to be examined, in grams.

## Cape Jasmine Fruit

(*Ph. Eur. monograph 2565*)

*Ph Eur*

## DEFINITION

Whole or fragmented, ripe fruit of *Gardenia jasminoides* J. Ellis, with stalk removed, steamed or treated with boiling water, then dried.

## Content

Minimum 2.0 per cent of geniposide ( $C_{17}H_{24}O_{10}$ ;  $M_r$  388.4) (dried drug).

## IDENTIFICATION

**A. Whole drug.** The fruit is obovate or elliptical and may be elongated or more rounded; it is about 1-5 cm long (including the sepal remains) and 0.8-1.7 cm in diameter. The smooth or slightly rough outer surface is yellowish, reddish-yellow or brownish-red and usually has 6 antesepalous raised, longitudinal winged ribs; between the winged ribs, a well-marked, longitudinal and sometimes branched vein is clearly visible; raised, yellowish-brown, dark brown or black papillae are also commonly present on the fruit surface between the winged ribs. The remains of the basally gamosepalous calyx are visible at the upper end of the fruit (inferior ovary); the tips of the sepals are free and are either tapering and pointed or broken. At the lower end of the fruit, the 6 winged ribs join together at the stalk. In the centre of the fused sepals, a styler scar is visible, surrounded by a disc-shaped nectary. A transverse section of the fruit shows a single locule resulting from the incomplete fusion of both carpels; remnants of the incomplete septa are present on the inner surface of the fruit wall; the locule contains numerous seeds aggregated into a mass in a yellowish, reddish-yellow or, more rarely, dark red placenta, which protrudes between the seeds; the seed shape is variable and may be rounded, triangular or irregularly angular, and the seeds themselves are flat, brownish-red or yellowish-red, measuring up to 0.5 cm in length; the outer surface is densely and finely verrucose. The pericarp is brittle with a smooth, lustrous pale yellow or brownish-yellow inner surface.

**Fragmented drug** The fruit fragments consist of thin, brittle pieces of pericarp, with a smooth or slightly rough outer surface that is yellowish, reddish-yellow or brownish-red, sometimes with raised yellowish-brown, dark brown or black papillae or crossed by a fragment of winged rib and/or vein; the inner surface is smooth, lustrous, and pale yellow or brownish-yellow. The remains of the calyx or the stalk may be present. Numerous seeds, often aggregated, are visible, they are near circular, triangular or irregularly angular in shape, flat and measure to 0.5 cm in the long axis; their brownish-red or yellowish-red outer surface is densely and finely verrucose. The remains of the yellowish, yellowish-red or, more rarely, dark red placenta are present together with the seeds.

**B. Microscopic examination (2.8.23).** The powder is orange-brown or orange-red. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2565.-1): fragments of the epicarp (surface view [G]) consisting of polyhedral cells; fragments of pericarp (transverse section [D]) consisting of thin-walled parenchymatous cells [Da]; fragments of epicarp from the winged ribs or the calyx (surface view [F, J]) consisting of polyhedral cells, scars of covering trichomes [Ja] and rare, pointed, unicellular trichomes either short (up to

*Ph Eur*

380 µm) or more rarely longer, with smooth, thick walls [Fa]; fragments of mesocarp [A, B] consisting of thin-walled parenchymatous cells [Aa, Ba] associated with fibres and yellowish spiral or annular xylem vessels, up to 12 µm in diameter [Bb]; parenchyma, sometimes containing oil droplets [Dc] or cluster crystals [Ab, Db, Bf] or prisms [Ac, Be] of calcium oxalate; fibres, fusiform [Bd] or rectangular [Bc], with thickened, pitted walls about 10 µm in diameter and up to 100 µm long; parenchyma may also be associated with small groups of subrounded, polygonal or subrectangular sclereids with regularly thickened, pitted walls, 15-57 µm long and 11-30 µm in diameter [Ad]; fragments of endocarp [C] consisting of compact masses of mosaic-arranged fibres overlaid or cross-embedded with sclereids containing calcium oxalate prisms, 4-14 µm long [Ca, Cb], especially visible in polarised light; endocarp fibres, long and thin, about 10 µm in diameter and up to 100 µm long [Cc]; fragments of testa [H] consisting of large irregularly shaped sclereids, 58-150 µm in diameter and up to 260 µm long, with irregularly thickened yellowish walls, wide pits and containing a reddish-brown substance; fragments of endosperm with cells containing aleurone grains [K]; prisms or scattered clusters of calcium oxalate [E].

Figure 2565.-1. – Illustration for identification test B of powdered herbal drug of cape jasmine fruit

#### C. Thin-layer chromatography (2.2.27).

**Test solution** To 1 g of the powdered herbal drug (355) (2.9.12) add 10 mL of a 50 per cent *V/V* solution of methanol *R*. Sonicate for 10 min. Centrifuge and use the supernatant.

**Reference solution** Dissolve 6 mg of aescin *R* and 5 mg of geniposide *R* in 1 mL of methanol *R*.

**Plate** TLC silica gel plate *R* (5-40 µm) [or TLC silica gel plate *R* (2-10 µm)].

**Mobile phase** anhydrous formic acid *R*, water *R*, acetone *R*, ethyl acetate *R* (8:8:42:42 *V/V/V/V*).

**Application** 10 µL [or 2 µL] as bands of 15 mm [or 8 mm].

**Development** Over a path of 15 cm [or 6 cm].

**Drying** In air.

**Detection** Treat with anisaldehyde solution *R* and heat at 100-105 °C for 2 min; examine in daylight.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Geniposide: a prominent brown zone	A prominent brown zone (geniposide)

#### TESTS

##### Loss on drying (2.2.32)

Maximum 8.5 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

##### Total ash (2.4.16)

Maximum 6.0 per cent.

#### ASSAY

##### Liquid chromatography (2.2.29).

**Test solution** Disperse 0.500 g of the powdered herbal drug (355) (2.9.12) in 50 mL of a 50 per cent *V/V* solution of methanol *R* and sonicate for 40 min. Centrifuge and transfer the supernatant to a 200 mL volumetric flask. Repeat the procedure and dilute to 200.0 mL with a 50 per cent *V/V* solution of methanol *R*.

**Reference solution (a)** Dissolve 5.0 mg of geniposide *CRS* in methanol *R* and dilute to 25.0 mL with the same solvent.

**Reference solution (b)** Disperse 0.250 g of cape jasmine fruit for system suitability *HRS* in 25 mL of a 50 per cent *V/V* solution of methanol *R* and sonicate for 40 min. Centrifuge and transfer the supernatant to a 100 mL volumetric flask. Repeat the procedure and dilute to 100.0 mL with a 50 per cent *V/V* solution of methanol *R*.

##### Column:

— size:  $l = 0.25$  m,  $\varnothing = 4.6$  mm;

— stationary phase: end-capped octadecylsilyl silica gel for chromatography *R* (5 µm).

##### Mobile phase:

— mobile phase *A*: water *R* adjusted to pH 3.2 with anhydrous formic acid *R*;

— mobile phase B: methanol R;

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 4	80	20
4 - 40	80 → 20	20 → 80

Flow rate 1.0 mL/min.

Detection Spectrophotometer at 240 nm.

Injection 20 µL.

**Identification of peaks** Use the chromatogram obtained with reference solution (a) to identify the peak due to geniposide; use the chromatogram supplied with *cape jasmine fruit for system suitability HRS* and the chromatogram obtained with reference solution (b) to identify the peak due to genipin gentiobioside.

**Retention time** Genipin gentiobioside = about 14 min; geniposide = about 16 min.

**System suitability** Reference solution (b):

— resolution: minimum 5.0 between the peaks due to genipin gentiobioside and geniposide.

Calculate the percentage content of geniposide using the following expression:

$$\frac{A_1 \times m_2 \times p \times 8}{A_2 \times m_1}$$

- $A_1$  = area of the peak due to geniposide in the chromatogram obtained with the test solution;  
 $A_2$  = area of the peak due to geniposide in the chromatogram obtained with reference solution (a);  
 $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;  
 $m_2$  = mass of *geniposide CRS* used to prepare reference solution (a), in grams;  
 $p$  = percentage content of geniposide in *geniposide CRS*.

Ph Eur

## Capsicum

(Ph. Eur. monograph 1859)

### Preparations

Refined and Quantified Capsicum Oleoresin

Standardised Capsicum Oleoresin

Capsicum Tincture

Standardised Capsicum Tincture

Ph Eur

### DEFINITION

Dried ripe fruits of *Capsicum annuum* L. var. *minimum* (Miller) Heiser and small-fruited varieties of *Capsicum frutescens* L.

### Content

Minimum 0.4 per cent of total capsaicinoids, expressed as capsaicin ( $C_{18}H_{27}NO_3$ ;  $M_r$  305.4) (dried drug).

### CHARACTERS

Extremely pungent taste.

### IDENTIFICATION

A. The fruit is yellowish-orange or reddish-brown, oblong conical with an obtuse apex, about 1-3 cm long and up to 1 cm in diameter at the widest part, occasionally attached to a 5-toothed inferior calyx and a straight peduncle. Pericarp

somewhat shrivelled, glabrous, enclosing about 10-20 flat, reniform seeds 3-4 mm long, either loose or attached to a reddish dissepiment.

B. Microscopic examination (2.8.23). The powder is orange. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 1859.-1): fragments of the epicarp, in surface view, with cells often arranged in rows of 5 to 7 [E], thick-walled when close to the peduncle [B] and with a cuticle uniformly striated [A]; fragments of the pericarp (transverse section [D]) showing the epicarp covered by a thick cuticle [Da] and parenchymatous cells frequently containing droplets of red oil, occasionally containing microspenoidal crystals of calcium oxalate [Db]; fragments of endocarp [C] with characteristic island groups of sclerenchymatous cells [Ca], the groups being separated by thin-walled parenchymatous cells [Cb]; fragments of the seeds having an episperm composed of large, greenish-yellow, sinuous-walled sclereids with thin outer walls and strongly and unevenly thickened radial and inner walls which are conspicuously pitted [G]; endosperm parenchymatous cells with drops of oil and aleurone grains, 3-6 µm in diameter [H]; occasional fragments from the calyx having an outer epidermis with anisocytic stomata (2.8.3) [J], an inner epidermis with no stomata and many glandular trichomes with uniseriate stalks and multicellular heads [N], and a mesophyll [L] with many idioblasts containing prisms of calcium oxalate [La] or microspenoidal crystals of calcium oxalate [Lb]; prisms [K] or clusters [M] of calcium oxalate, isolated; annularly and spirally thickened vessels [F].

Figure 1859.-1. — Illustration for identification test B of powdered herbal drug of capsicum

C. Thin-layer chromatography (2.2.27).

**Test solution** To 0.50 g of the powdered herbal drug (500) (2.9.12) add 5.0 mL of *ether R*, shake for 5 min and filter.

**Reference solution** Dissolve 2 mg of *capsaicin R* and 2 mg of *dihydrocapsaicin R* in 5.0 mL of *ether R*.

**Plate** TLC octadecylsilyl silica gel plate *R*.

**Mobile phase** *water R*, *methanol R* (20:80 *V/V*).

**Application** 20 µL as bands.

**Development** Over a path of 12 cm.

**Drying** In air.

**Detection** Treat with a 5 g/L solution of *dichloroquinonechlorimide R* in *methanol R*, and expose to ammonia vapour until blue zones appear. Examine in daylight.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Capsaicin: a blue zone	A blue zone (capsaicin)
Dihydrocapsaicin: a blue zone	A blue zone (dihydrocapsaicin)
Reference solution	Test solution

## TESTS

### Nonivamide

Liquid chromatography (2.2.29).

**Test solution** To 2.5 g of the powdered herbal drug (500) (2.9.12) add 100 mL of *methanol R*. Allow to macerate for 30 min. Place in an ultrasonic bath for 15 min. Filter into a 100 mL volumetric flask, rinse the flask and filter with *methanol R*, then dilute to 100.0 mL with the same solvent.

**Reference solution (a)** Dissolve 10.0 mg of *capsaicin CRS* and 2.0 mg of *nonivamide CRS* in *methanol R* and dilute to 50.0 mL with the same solvent.

**Reference solution (b)** Dissolve 4.0 mg of *nonivamide CRS* in *methanol R* and dilute to 100.0 mL with the same solvent.

**Column:**

— size:  $l = 0.25$  m,  $\varnothing = 4.6$  mm;

— stationary phase: base-deactivated end-capped phenylsilyl silica gel for chromatography *R* (5 µm);

— temperature: 30 °C.

**Mobile phase** *acetonitrile RI*, 1 g/L solution of *phosphoric acid R* (40:60 *V/V*).

**Flow rate** 1.0 mL/min.

**Detection** Spectrophotometer at 225 nm.

**Injection** 10 µL.

**Run time** 1.2 times the retention time of dihydrocapsaicin.

**Elution order** Nordihydrocapsaicin, nonivamide, capsaicin, dihydrocapsaicin.

**System suitability** Reference solution (a):

— resolution: minimum 1.5 between the peaks due to nonivamide and capsaicin.

Calculate the percentage content of nonivamide with reference to the total capsaicinoid content, using the following expression:

$$\frac{A_1 \times m_2 \times p_1 \times 100}{A_2 \times m_1 \times C}$$

- $A_1$  = area of the peak due to nonivamide in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to nonivamide in the chromatogram obtained with reference solution (b);
- $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;
- $m_2$  = mass of *nonivamide CRS* used to prepare reference solution (b), in grams;
- $p_1$  = percentage content of nonivamide in *nonivamide CRS*;
- $C$  = percentage content of total capsaicinoids, as determined in the assay.

**Limit:**

— *nonivamide*: maximum 5.0 per cent of the total capsaicinoid content.

**Foreign matter (2.8.2)**

Fruits of *C. annuum* L. var. *longum* (Sendtn.) are absent.

**Loss on drying (2.2.32)**

Maximum 11.0 per cent, determined on 1.000 g of the powdered herbal drug (500) (2.9.12) by drying in an oven at 105 °C for 2 h.

**Total ash (2.4.16)**

Maximum 10.0 per cent.

## ASSAY

Liquid chromatography (2.2.29) as described in the test for nonivamide.

Calculate the percentage content of total capsaicinoids ( $C$ ), expressed as capsaicin, using the following expression:

$$\frac{(A_3 + A_5 + A_6) \times m_4 \times p_2 \times 2}{A_4 \times m_3}$$

- $A_3$  = area of the peak due to capsaicin in the chromatogram obtained with the test solution;
- $A_4$  = area of the peak due to capsaicin in the chromatogram obtained with reference solution (a);
- $A_5$  = area of the peak due to dihydrocapsaicin in the chromatogram obtained with the test solution;
- $A_6$  = area of the peak due to nordihydrocapsaicin in the chromatogram obtained with the test solution;
- $m_3$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;
- $m_4$  = mass of *capsaicin CRS* used to prepare reference solution (a), in grams;
- $p_2$  = percentage content of capsaicin in *capsaicin CRS*.

Ph Eur

## Refined and Standardised Capsicum Oleoresin

(Ph. Eur. monograph 2336)

Ph Eur

### DEFINITION

Refined and standardised oleoresin produced from *Capsicum* (1859).

### Content

12.0 per cent to 18.0 per cent *m/m* of total capsaicinoids, expressed as capsaicin ( $C_{18}H_{27}NO_3$ ;  $M_r$  305.4).

### PRODUCTION

The oleoresin is produced from the herbal drug by an appropriate procedure, using ethanol (minimum 90 per cent *V/V*).

### CHARACTERS

#### Appearance

Red or brown mobile extract.

**IDENTIFICATION**

Thin-layer chromatography (2.2.27).

**Test solution** Dissolve 50 mg of the oleoresin to be examined in 5 mL of ether R.

**Reference solution** Dissolve 2 mg of capsaicin R and 2 mg of dihydrocapsaicin R in 5 mL of ether R.

**Plate** TLC octadecylsilyl silica gel plate R (5-40 µm) [or TLC octadecylsilyl silica gel plate R (2-10 µm)].

**Mobile phase** water R, methanol R (20:80 V/V).

**Application** 20 µL [or 2 µL] as bands of 15 mm [or 8 mm].

**Development** Over a path of 12 cm [or 6 cm].

**Drying** In air.

**Detection** Treat with a 0.25 g/L solution of dichloroquinonechlorimide R in ethyl acetate R, expose to ammonia vapour until blue zones appear. Examine in daylight.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Capsaicin: a blue zone	A blue zone (capsaicin)
Dihydrocapsaicin: a blue zone	A faint blue zone (dihydrocapsaicin)
Reference solution	Test solution

**TESTS****Nonivamide**

Liquid chromatography (2.2.29).

**Test solution** Dissolve 0.300 g of the oleoresin to be examined in 60 mL of methanol R and dilute to 100.0 mL with the same solvent.

**Reference solution (a)** Dissolve 10.0 mg of capsaicin CRS and 2.0 mg of nonivamide CRS in methanol R and dilute to 50.0 mL with the same solvent.

**Reference solution (b)** Dissolve 4.0 mg of nonivamide CRS in methanol R and dilute to 100.0 mL with the same solvent.

**Column:**

— size:  $l = 0.25$  m,  $\varnothing = 4.6$  mm;

— stationary phase: base-deactivated end-capped phenylsilyl silica gel for chromatography R (5 µm);

— temperature: 30 °C.

**Mobile phase** acetonitrile R1, 1 g/L solution of phosphoric acid R (40:60 V/V).

**Flow rate** 1.0 mL/min.

**Detection** Spectrophotometer at 225 nm.

**Injection** 10 µL.

**Run time** 1.2 times the retention time of dihydrocapsaicin.

**Elution order** Nordihydrocapsaicin, nonivamide, capsaicin, dihydrocapsaicin.

**Relative retention** With reference to capsaicin (retention time = about 19 min): nordihydrocapsaicin = about 0.9; nonivamide = about 0.95; dihydrocapsaicin = about 1.3.

**System suitability** Reference solution (a):

— resolution: minimum 1.5 between the peaks due to nonivamide and capsaicin.

Calculate the percentage content of nonivamide with reference to the total capsaicinoid content, using the following expression:

$$\frac{A_1 \times m_2 \times p_1 \times 100}{A_2 \times m_1 \times C}$$

- $A_1$  = area of the peak due to nonivamide in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to nonivamide in the chromatogram obtained with reference solution (b);
- $m_1$  = mass of the oleoresin to be examined used to prepare the test solution, in grams;
- $m_2$  = mass of nonivamide CRS used to prepare reference solution (b), in grams;
- $p_1$  = percentage content of nonivamide in nonivamide CRS;
- $C$  = percentage content of total capsaicinoids, as determined in the assay.

**Limit:**

— nonivamide: maximum 5.0 per cent of the total capsaicinoid content.

**Water (2.5.12)**

Maximum 8.0 per cent, determined on 5.00 g.

**ASSAY**

Liquid chromatography (2.2.29) as described in the test for nonivamide.

Calculate the percentage content of total capsaicinoids (C), expressed as capsaicin, using the following expression:

$$\frac{(A_3 + A_5 + A_6) \times m_3 \times p_2 \times 2}{A_4 \times m_1}$$

- $A_3$  = area of the peak due to capsaicin in the chromatogram obtained with the test solution;
- $A_4$  = area of the peak due to capsaicin in the chromatogram obtained with reference solution (a);
- $A_5$  = area of the peak due to dihydrocapsaicin in the chromatogram obtained with the test solution;
- $A_6$  = area of the peak due to nordihydrocapsaicin in the chromatogram obtained with the test solution;
- $m_1$  = mass of the oleoresin to be examined used to prepare the test solution, in grams;
- $m_3$  = mass of capsaicin CRS used to prepare reference solution (a), in grams;
- $p_2$  = percentage content of capsaicin in capsaicin CRS.

Ph Eur

**Standardised Capsicum Oleoresin****DEFINITION**

Standardised Capsicum Oleoresin is produced from Capsicum.

**Content**

8.0 to 8.8% w/w of total capsaicinoids, expressed as capsaicin,  $C_{18}H_{27}NO_3$ .

**PRODUCTION**

The oleoresin is produced from whole or cut capsicums by an appropriate procedure, using ethanol (minimum 90% v/v) as the extraction solvent.

**Characteristics**

Dark red-brown to orange-brown mobile oily extract.

**IDENTIFICATION**

Carry out the method for thin-layer chromatography, Appendix III A, using the following solutions in ether.

(1) Dissolve 50 mg of the preparation being examined in 10 mL.

(2) 0.02% w/v each of *capsaicin* and *dihydrocapsaicin*.

#### CHROMATOGRAPHIC CONDITIONS

(a) Use *TLC octadecylsilyl silica gel plate* (5–40  $\mu\text{m}$ ) (Merck silica gel plates are suitable) [or *TLC octadecylsilyl silica gel plate* (2–10  $\mu\text{m}$ )].

(b) Use the mobile phase as described below.

(c) Apply 20  $\mu\text{L}$  [or 2  $\mu\text{L}$ ] of solutions as bands of 15 mm [or 8 mm].

(d) Develop the plate to 12 cm [6 cm].

(e) Remove the plate and allow to dry in air. Treat with a 0.25 g/L solution of *dichloroquinonechlorimide* in *ethyl acetate* and expose to ammonia vapour until blue zones appear. Examine in daylight.

#### MOBILE PHASE

20 volumes of *water* and 80 volumes of *methanol*.

#### CONFIRMATION

See below the sequence of zones present in the chromatograms obtained with the solutions (1) and (2). Furthermore, other faint zones may be present in the chromatogram obtained with solution (1).

Top of the plate	
A blue zone (capsaicin)	capsaicin: A blue zone
A faint blue zone (Dihydrocapsaicin)	Dihydrocapsaicin: A blue zone
Solution (1)	Solution (2)

#### TESTS

##### Nonivamide

Not more than 5% of the total capsaicinoids content.

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dissolve 0.3 g of the preparation being examined in 60 mL of *methanol* and dilute to 100 mL with the same solvent.

(2) 0.02% w/v of *capsaicin* EPCRS and 0.004% w/v of *nonivamide* EPCRS in *methanol*.

(3) 0.004% w/v of *nonivamide* EPCRS in *methanol*.

#### CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm  $\times$  4.6 mm) packed with *base-deactivated end-capped phenylsilyl silica gel for chromatography* (5  $\mu\text{m}$ ) (GL Sciences Inertsil Ph-3 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.0 mL per minute.

(d) Use a column temperature of 30°.

(e) Use a detection wavelength of 225 nm.

(f) Inject 10  $\mu\text{L}$  of each solution.

(g) Allow the chromatography to proceed for 1.7 times the retention time of dihydrocapsaicin.

#### MOBILE PHASE

40 volumes of *acetonitrile* R1 and 60 volumes of 1 g/L solution of *orthophosphoric acid*.

The order of elution of the peaks is nordihydrocapsaicin, nonivamide, capsaicin and dihydrocapsaicin.

The relative retentions with reference to capsaicin (retention time is about 19 minutes) are nordihydrocapsaicin, about 0.9; nonivamide, about 0.95 and dihydrocapsaicin, about 1.3.

#### SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the *resolution* between the peaks due to capsaicin and nonivamide is at least 1.5.

#### DETERMINATION OF CONTENT

Calculate the percentage content of nonivamide with reference to the total capsaicinoid content, using the following expression:

$$\frac{A_1 \times P_1 \times P_2 \times 100}{A_2 \times m_1 \times C}$$

- $A_1$  = area of the peak due to nonivamide in the chromatogram obtained with solution (1);  
 $A_2$  = area of the peak due to nonivamide in the chromatogram obtained with solution (3);  
 $m_1$  = weight of standardised oleoresin to be examined used to prepare solution (1), in grams;  
 $P_1$  = content of *nonivamide* EPCRS in solution (3), in percentage w/v;  
 $P_2$  = declared content of *nonivamide* EPCRS;  
 $C$  = percentage content of total capsaicinoids, as determined in the assay.

#### Water

Maximum 8% w/w, Appendix IX C. Use 5 g.

#### ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dissolve 0.3 g of the preparation being examined in 60 mL of *methanol* and dilute to 100 mL with the same solvent.

(2) 0.02% w/v of *capsaicin* EPCRS and 0.004% w/v of *nonivamide* EPCRS in *methanol*.

#### CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under the test for Nonivamide may be used.

#### DETERMINATION OF CONTENT

Calculate the percentage content of total capsaicinoids (C), expressed as capsaicin, using the following expression:

$$\frac{(A_3 + A_5 + A_6) \times P_3 \times P_4}{A_4 \times m_1}$$

- $A_3$  = area of the peak due to capsaicin in the chromatogram obtained with solution (1);  
 $A_4$  = area of the peak due to capsaicin in the chromatogram obtained with solution (2);  
 $A_5$  = area of the peak due to dihydrocapsaicin in the chromatogram obtained with solution (1);  
 $A_6$  = area of the peak due to nordihydrocapsaicin in the chromatogram obtained with solution (1);  
 $m_1$  = weight of the standardised oleoresin to be examined used to prepare solution (1), in grams;  
 $P_3$  = content of *capsaicin* EPCRS in solution (2) in percentage w/v;  
 $P_4$  = declared content of *capsaicin* EPCRS.

## Standardised Capsicum Soft Extract

(Ph. Eur. monograph 2529)

Ph Eur

### DEFINITION

Standardised soft extract produced from *Capsicum* (1859).

### Content

2.0 per cent to 2.4 per cent of total capsaicinoids, expressed as capsaicin (C<sub>18</sub>H<sub>27</sub>NO<sub>3</sub>; M<sub>r</sub> 305.4).

### PRODUCTION

The extract is produced from the herbal drug by a suitable procedure using ethanol (80 per cent V/V).

The content of total capsaicinoids in the extract is determined and adjusted, if necessary, to the value specified by adding a suitable inert excipient, for example liquid glucose.

### CHARACTERS

#### Appearance

Reddish-brown, glutinous matter.

### IDENTIFICATION

Thin-layer chromatography (2.2.27).

**Test solution** To 0.25 g of the extract to be examined add 10 mL of a mixture of *water R* and *propanol R* (40:60 V/V). Shake for 5 min. Filter, if necessary.

**Reference solution** Dissolve 2 mg of *capsaicin R* and 1 mg of *dihydrocapsaicin R* in 5 mL of *methanol R*.

**Plate** TLC octadecylsilyl silica gel plate R (5-40 µm) [or TLC octadecylsilyl silica gel plate R (2-10 µm)].

**Mobile phase** *water R*, *methanol R* (20:80 V/V).

**Application** 20 µL [or 2 µL] as bands of 15 mm [or 8 mm].

**Development** Over a path of 12 cm [or 6 cm].

**Drying** In air.

**Detection** Treat with a 0.25 g/L solution of *dichloroquinonechlorimide R* in *ethyl acetate R*, expose to ammonia vapour until blue zones appear. Examine in daylight.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Capsaicin: a blue zone	A blue zone (capsaicin)
Dihydrocapsaicin: a blue zone	A blue zone (dihydrocapsaicin)
Reference solution	Test solution

### TESTS

#### Nonivamide

Liquid chromatography (2.2.29).

**Test solution** Stir the extract to be examined until homogeneous, heating, if necessary, to not more than 60 °C. Disperse 0.350 g of the homogeneous extract in 35 mL of a mixture of *water R* and *propanol R* (40:60 V/V). Shake for

30 min and dilute to 50.0 mL with *propanol R*. Dilute 25.0 mL of the solution to 50.0 mL with the mobile phase and filter through a membrane filter (nominal pore size 0.45 µm).

**Reference solution (a)** Dissolve 2.0 mg of *nonivamide CRS* in the mobile phase and dilute to 25.0 mL with the mobile phase (solution A). Dissolve 8.0 mg of *capsaicin CRS* in a mixture of 5.0 mL of solution A and 45 mL of the mobile phase. Dilute to 100.0 mL with the mobile phase.

**Reference solution (b)** Dissolve 8.0 mg of *nonivamide CRS* in the mobile phase and dilute to 100.0 mL with the mobile phase. Dilute 5.0 mL of the solution to 100.0 mL with the mobile phase.

#### Column:

- size:  $l = 0.25$  m,  $\varnothing = 4.6$  mm;
- stationary phase: base-deactivated end-capped phenylsilyl silica gel for chromatography R (5 µm);
- temperature: 30 °C.

**Mobile phase** *acetonitrile R1*, 1 g/L solution of *phosphoric acid R* (40:60 V/V).

**Flow rate** 1.0 mL/min.

**Detection** Spectrophotometer at 225 nm.

**Injection** 10 µL.

**Run time** 1.2 times the retention time of dihydrocapsaicin.

**Elution order** Nordihydrocapsaicin, nonivamide, capsaicin, dihydrocapsaicin.

**Relative retention** With reference to capsaicin (retention time = about 19 min): nordihydrocapsaicin = about 0.9; nonivamide = about 0.95; dihydrocapsaicin = about 1.3.

**System suitability** Reference solution (a):

- resolution: minimum 1.5 between the peaks due to nonivamide and capsaicin.

Calculate the percentage content of nonivamide with reference to the total capsaicinoid content, using the following expression:

$$\frac{A_1 \times m_2 \times p_1 \times 5}{A_2 \times m_1 \times C}$$

- $A_1$  = area of the peak due to nonivamide in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to nonivamide in the chromatogram obtained with reference solution (b);
- $m_1$  = mass of the extract to be examined used to prepare the test solution, in grams;
- $m_2$  = mass of *nonivamide CRS* used to prepare reference solution (b), in grams;
- $p_1$  = percentage content of nonivamide in *nonivamide CRS*;
- $C$  = percentage content of total capsaicinoids, as determined in the assay.

#### Limit:

- *nonivamide*: maximum 5.0 per cent of the total capsaicinoid content.

#### Dry residue (2.8.16)

Minimum 70.0 per cent, determined on 2.00 g.

### ASSAY

Liquid chromatography (2.2.29) as described in the test for nonivamide.

Calculate the percentage content of total capsaicinoids (C), expressed as capsaicin, using the following expression:

$$\frac{(A_3 + A_5 + A_6) \times m_3 \times p_2}{A_4 \times m_1}$$

- $A_3$  = area of the peak due to capsaicin in the chromatogram obtained with the test solution;

$A_4$	=	area of the peak due to capsaicin in the chromatogram obtained with reference solution (a);
$A_5$	=	area of the peak due to dihydrocapsaicin in the chromatogram obtained with the test solution;
$A_6$	=	area of the peak due to nordihydrocapsaicin in the chromatogram obtained with the test solution;
$m_1$	=	mass of the extract to be examined used to prepare the test solution, in grams;
$m_3$	=	mass of <i>capsaicin CRS</i> used to prepare reference solution (a), in grams;
$P_2$	=	percentage content of capsaicin in <i>capsaicin CRS</i> .

Ph Eur

## Capsicum Tincture

### DEFINITION

Capsicum Tincture is a tincture produced from Standardised Capsicum Oleoresin.

### Content

0.036 to 0.044 % w/v of total capsaicinoids, expressed as capsaicin,  $C_{18}H_{27}NO_3$ .

### PRODUCTION

The tincture is produced by dissolving Standardised Capsicum Oleoresin in a suitable quantity of ethanol (96 % v/v) and water by an appropriate procedure.

### Characteristics

Yellow-orange to red-orange ethanolic liquid.

### IDENTIFICATION

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

- Shake 10 mL of the preparation being examined with 10 mL of *hexane*. Allow to separate and use the lower layer.
- 0.02% w/v each of *capsaicin* and *dihydrocapsaicin* in *ether*.

### CHROMATOGRAPHIC CONDITIONS

- Use a *TLC octadecylsilyl silica gel plate* (5–40  $\mu\text{m}$ ) (Merck silica gel plates are suitable) [or *TLC octadecylsilyl silica gel plate* (2–10  $\mu\text{m}$ )].
- Use the mobile phase described below.
- Apply 20  $\mu\text{L}$  [or 2  $\mu\text{L}$ ] of solution (1) and (2) as bands of 15 mm [or 8 mm].
- Develop the plate to 12 cm [6 cm].
- Remove the plate and allow to dry in air. Treat with a 0.25 g/L solution of *dichloroquinonechlorimide* in *ethyl acetate* and expose to ammonia vapour until blue zones appear. Examine in daylight.

### MOBILE PHASE

20 volumes of *water* and 80 volumes of *methanol*.

### CONFIRMATION

See below the sequence of zones present in the chromatograms obtained with solutions (1) and (2). Furthermore other faint zones may be present in the chromatogram obtained with solution (1).

Top of the plate	
A blue zone (capsaicin)	capsaicin: A blue zone
A faint blue zone (Dihydrocapsaicin)	Dihydrocapsaicin: A blue zone
Solution (1)	Solution (2)

### TESTS

#### Nonivamide

Not more than 5% of the total capsaicinoids content.

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in *methanol*.

- Dilute 50 mL of the preparation being examined to 100 mL.
- 0.02% w/v of *capsaicin EPCRS* and 0.004% w/v of *nonivamide EPCRS*.
- 0.004% w/v of *nonivamide EPCRS*.

### CHROMATOGRAPHIC CONDITIONS

- Use a stainless steel column (25 cm  $\times$  4.6 mm) packed with *base-deactivated end-capped phenylsilyl silica gel for chromatography R* (5  $\mu\text{m}$ ) (GL Sciences Inertsil Ph-3 is suitable).
- Use isocratic elution and the mobile phase described below.
- Use a flow rate of 1.0 mL per minute.
- Use a column temperature of 30°.
- Use a detection wavelength of 225 nm.
- Inject 10  $\mu\text{L}$  of each solution.
- Allow the chromatography to proceed for 1.7 times the retention time of dihydrocapsaicin.

### MOBILE PHASE

40 volumes of *acetonitrile R1* and 60 volumes of 1 g/L solution of *orthophosphoric acid*.

The order of elution of the peaks is nordihydrocapsaicin, nonivamide, capsaicin and dihydrocapsaicin.

The relative retentions with reference to capsaicin (retention time is about 19 minutes) are nordihydrocapsaicin about 0.9; nonivamide about 0.95 and dihydrocapsaicin about 1.3.

### SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the *resolution* between the peaks due to nonivamide and capsaicin is at least 1.5.

### DETERMINATION OF CONTENT

Calculate the percentage content of nonivamide with reference to the total capsaicinoid content, using the following expression:

$$\frac{A_1 \times P_1 \times P_2 \times 50}{A_2 \times C}$$

$A_1$	=	area of the peak due to nonivamide in the chromatogram obtained with solution (1);
$A_2$	=	area of the peak due to nonivamide in the chromatogram obtained with solution (3);
$P_1$	=	content of <i>nonivamide EPCRS</i> in solution (3), in percentage w/v;
$P_2$	=	declared content of <i>nonivamide EPCRS</i> ;
$C$	=	percentage content of total capsaicinoids, as determined in the assay.

### Ethanol

83 to 88 % v/v, Appendix VIII F.

### Methanol

Maximum 0.05 % v/v, Appendix VIII G, method II.

### ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute 50 mL of the preparation being examined to 100 mL with *methanol*.

(2) 0.02% w/v of *capsaicin EPCRS* and 0.004% w/v of *nonivamide EPCRS* in *methanol*.

#### CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under the test for *Nonivamide* may be used.

Calculate the percentage content of total capsaicinoids (C), expressed as *capsaicin*, using the following expression:

$$\frac{(A_3 + A_5 + A_6) \times P_3 \times P_4}{A_4 \times 50}$$

- $A_3$  = area of the peak due to *capsaicin* in the chromatogram obtained with solution (1);  
 $A_4$  = area of the peak due to *capsaicin* in the chromatogram obtained with solution (2);  
 $A_5$  = area of the peak due to *dihydrocapsaicin* in the chromatogram obtained with solution (1);  
 $A_6$  = area of the peak due to *nordihydrocapsaicin* in the chromatogram obtained with solution (1);  
 $P_3$  = content of *capsaicin EPCRS* in solution (2), in percentage w/v;  
 $P_4$  = declared content of *capsaicin EPCRS*.

## Standardised Capsicum Tincture

(Ph. Eur. monograph 2337)

Ph Eur

#### DEFINITION

Standardised tincture produced from *Capsicum* (1859) or *Refined and standardised capsicum oleoresin* (2336).

#### Content

90 per cent to 110 per cent of the nominal content of total capsaicinoids, expressed as *capsaicin* ( $C_{18}H_{27}NO_3$ ;  $M_r$  305.4), stated on the label, which is between 0.020 per cent *m/m* and 0.060 per cent *m/m*.

#### PRODUCTION

The tincture is produced from the herbal drug or oleoresin and ethanol (70 per cent *V/V* to 85 per cent *V/V*) by an appropriate procedure.

#### CHARACTERS

##### Appearance

Yellowish-orange or reddish-orange liquid.

#### IDENTIFICATION

Thin-layer chromatography (2.2.27).

**Test solution** Shake 10 mL of the tincture to be examined with 10 mL of *hexane R*. Allow to separate and use the lower layer.

**Reference solution** Dissolve 1 mg of *capsaicin R* and 1 mg of *dihydrocapsaicin R* in 5 mL of *ether R*.

**Plate** TLC octadecylsilyl silica gel plate R (5–40  $\mu\text{m}$ ) [or TLC octadecylsilyl silica gel plate R (2–10  $\mu\text{m}$ )].

**Mobile phase** *water R*, *methanol R* (20:80 *V/V*).

**Application** 20  $\mu\text{L}$  [or 2  $\mu\text{L}$ ] as bands of 15 mm [or 8 mm].

**Development** Over a path of 12 cm [or 6 cm].

**Drying** In air.

**Detection** Treat with a 0.25 g/L solution of *dichloroquinonechlorimide R* in *ethyl acetate R*, expose to

ammonia vapour until blue zones appear. Examine in daylight.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Capsaicin: a blue zone	A blue zone (capsaicin)
Dihydrocapsaicin: a blue zone	A faint blue zone (dihydrocapsaicin)
Reference solution	Test solution

#### TESTS

##### Nonivamide

Liquid chromatography (2.2.29).

**Test solution** Dilute 50.0 g of the tincture to be examined to 100.0 mL with *methanol R*.

**Reference solution (a)** Dissolve 10.0 mg of *capsaicin CRS* and 2.0 mg of *nonivamide CRS* in *methanol R* and dilute to 50.0 mL with the same solvent.

**Reference solution (b)** Dissolve 4.0 mg of *nonivamide CRS* in *methanol R* and dilute to 100.0 mL with the same solvent.

##### Column:

- size:  $l = 0.25$  m,  $\varnothing = 4.6$  mm;
- stationary phase: base-deactivated end-capped phenylsilyl silica gel for chromatography R (5  $\mu\text{m}$ );
- temperature: 30 °C.

**Mobile phase** *acetonitrile R1*, 1 g/L solution of *phosphoric acid R* (40:60 *V/V*).

**Flow rate** 1.0 mL/min.

**Detection** Spectrophotometer at 225 nm.

**Injection** 10  $\mu\text{L}$ .

**Run time** 1.2 times the retention time of *dihydrocapsaicin*.

**Elution order** *Nordihydrocapsaicin*, *nonivamide*, *capsaicin*, *dihydrocapsaicin*.

**System suitability** Reference solution (a):

- resolution: minimum 1.5 between the peaks due to *nonivamide* and *capsaicin*.

Calculate the percentage content of *nonivamide* with reference to the total capsaicinoid content, using the following expression:

$$\frac{A_1 \times m_2 \times p_1 \times 100}{A_2 \times m_1 \times C}$$

- $A_1$  = area of the peak due to *nonivamide* in the chromatogram obtained with the test solution;  
 $A_2$  = area of the peak due to *nonivamide* in the chromatogram obtained with reference solution (b);  
 $m_1$  = mass of the tincture to be examined used to prepare the test solution, in grams;  
 $m_2$  = mass of *nonivamide CRS* used to prepare reference solution (b), in grams;  
 $p_1$  = percentage content of *nonivamide* in *nonivamide CRS*;  
 $C$  = percentage content of total capsaicinoids, as determined in the assay.

##### Limit:

- *nonivamide*: maximum 5.0 per cent of the total capsaicinoid content.

**Ethanol (2.9.10)**

95 per cent to 105 per cent of the content stated on the label.

**Methanol and 2-propanol (2.9.11)**

Maximum 0.05 per cent *V/V* of methanol and maximum 0.05 per cent *V/V* of 2-propanol.

**ASSAY**

Liquid chromatography (2.2.29) as described in the test for nonivamide.

Calculate the percentage content of total capsaicinoids (C), expressed as capsaicin, using the following expression:

$$\frac{(A_3 + A_5 + A_6) \times m_4 \times p_2 \times 2}{A_4 \times m_3}$$

- $A_3$  = area of the peak due to capsaicin in the chromatogram obtained with the test solution;  
 $A_4$  = area of the peak due to capsaicin in the chromatogram obtained with reference solution (a);  
 $A_5$  = area of the peak due to dihydrocapsaicin in the chromatogram obtained with the test solution;  
 $A_6$  = area of the peak due to nordihydrocapsaicin in the chromatogram obtained with the test solution;  
 $m_3$  = mass of the tincture to be examined used to prepare the test solution, in grams;  
 $m_4$  = mass of capsaicin CRS used to prepare reference solution (a), in grams;  
 $p_2$  = percentage content of capsaicin in capsaicin CRS.

Ph Eur

**Caraway**

(Caraway Fruit, Ph. Eur. monograph 1080)

When Powdered Caraway is prescribed or demanded, material complying with the appropriate requirements below and containing not less than 2.5% *v/w* (25 mL/kg) of essential oil shall be dispensed or supplied.

Ph Eur

**DEFINITION**

Whole, dry mericarp of *Carum carvi* L.

**Content**

Minimum 30 mL/kg of essential oil (anhydrous drug).

**CHARACTERS**

Odour reminiscent of carvone.

**IDENTIFICATION**

**A.** The fruit is a cremocarp of almost cylindrical shape. It is generally 3-6.5 mm long and 1-1.5 mm wide. The mericarps, usually free, are greyish-brown or brown, glabrous, mostly sickle-shaped, with both ends sharply terminated. Each bears 5 prominent narrow ridges. When cut transversely the profile shows an almost regular pentagon and 4 vittae on the dorsal surface and 2 on the commissural surface may be seen with a lens.

**B.** Microscopic examination (2.8.23). The powder is yellowish-brown. Examine under a microscope using chloral hydrate solution R. The powder shows the following diagnostic characters (Figure 1080.-1): fragments of broad secretory canals (surface view [C, D], transverse section [F]) composed of yellowish-brown, thin-walled, polygonal secretory cells [Ca, Da, Fa], frequently associated with a layer of thin-walled, transversely elongated endocarp cells [Cb, Db], 8-12 µm wide and more or less rectangular in transverse section [Fb]; fragments of the epicarp covered by a

striated cuticle (surface view [B, L]), with thick-walled cells [Ba] and occasional anomocytic stomata (2.8.3) [Bb]; numerous endosperm fragments with more or less thickened polygonal cells [A, H] containing aleurone grains, droplets of fatty oil [Aa, Ha] and microcrystals of calcium oxalate in microsette formation [Ab, Hb]; spiral vessels accompanied by sclerenchymatous fibres [G]; rarely, fibre bundles from the carpophore; rectangular or subrectangular sclereids from the mesocarp [E, J, K] with moderately thickened and pitted walls, sometimes accompanied by thin-walled parenchyma cells [Ja].

Figure 1080.-1. – Illustration for identification test B of powdered herbal drug of caraway fruit

**C.** Thin-layer chromatography (2.2.27).

**Test solution** Shake 0.5 g of the powdered herbal drug (710) (2.9.12) with 5.0 mL of ethyl acetate R for 2-3 min. Filter over 2 g of anhydrous sodium sulfate R.

**Reference solution** Dissolve 2 µL of carvone R and 5 µL of olive oil R in 1.0 mL of ethyl acetate R.

**Plate** TLC silica gel F<sub>254</sub> plate R.

**Mobile phase** ethyl acetate R, toluene R (5:95 *V/V*).

**Application** 20 µL of the test solution and 10 µL of the reference solution, as bands.

**Development** Over a path of 10 cm.

**Drying** In air.

**Detection A** Examine in ultraviolet light at 254 nm.

**Results A** The chromatograms obtained with the test solution and with the reference solution show a quenching zone (carvone) in the central part against a light background.

**Detection B** Spray with anisaldehyde solution R and, while observing, heat at 100-105 °C for 2-4 min; examine in daylight.

**Results B** The zones due to carvone are dark orange-brown; the chromatogram obtained with the test solution shows above the zone due to carvone a violet zone similar in position and colour to the zone due to triglycerides of olive oil in the chromatogram obtained with the reference solution; the chromatogram obtained with the test solution shows close to the solvent front a weak violet zone due to terpene hydrocarbons and in the lower part some weak, mostly violet-grey and brownish zones.

#### TESTS

##### Water (2.2.13)

Maximum 100 mL/kg, determined on 10.0 g of the powdered herbal drug (710) (2.9.12).

##### Total ash (2.4.16)

Maximum 7.0 per cent.

#### ASSAY

##### Essential oil (2.8.12)

Use 10.0 g of the herbal drug reduced to a powder (710) (2.9.12) immediately before the determination, a 500 mL round-bottomed flask, 200 mL of water R as the distillation liquid, and 0.50 mL of xylene R in the graduated tube. Distil at a rate of 2-3 mL/min for 90 min.

Ph Eur

## Caraway Oil

(Ph. Eur. monograph 1817)

Ph Eur

#### DEFINITION

Oil obtained by steam distillation from the dry fruits of *Carum carvi* L.

#### CHARACTERS

##### Appearance

Clear, colourless or yellow liquid.

#### IDENTIFICATION

First identification: B.

Second identification: A.

A. Thin-layer chromatography (2.2.27).

**Test solution** Dissolve 40 µL of the substance to be examined in 1.0 mL of toluene R.

**Reference solution** Dissolve 10 µL of carvone R and 5 µL of carveol R in 1.0 mL of toluene R.

**Plate** TLC silica gel F<sub>254</sub> plate R (5-40 µm) [or TLC silica gel plate R (2-10 µm)].

**Mobile phase** ethyl acetate R, toluene R (5:95 V/V).

**Application** 10 µL [or 2 µL] as bands.

**Development** Over a path of 10 cm [or 5 cm].

**Drying** In air.

**Detection A** Examine in ultraviolet light at 254 nm.

**Results A** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Carvone: a quenching zone	A quenching zone (carvone)
Reference solution	Test solution

**Detection B** Spray with anisaldehyde solution R and heat at 100-105 °C for 5-10 min. Examine immediately in daylight.

**Results B** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, several zones of weak intensity are present, particularly in the lower third, in the chromatogram obtained with the test solution.

Top of the plate	
Carvone: a red to orange-brown zone	A reddish-violet zone A reddish-violet zone An intense red to orange-brown zone (carvone)
Carveol: a reddish-violet zone	A reddish-violet zone (carveol) A violet-blue zone
Reference solution	Test solution

B. Examine the chromatograms obtained in the test for chromatographic profile.

**Results** The characteristic peaks in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with the reference solution.

#### TESTS

**Relative density (2.2.5)**

0.904 to 0.920.

**Refractive index (2.2.6)**

1.484 to 1.490.

**Optical rotation (2.2.7)**

+ 65° to + 81°.

**Acid value (2.5.1)**

Maximum 1.0, determined on 5.00 g.

#### Chromatographic profile

Gas chromatography (2.2.28): use the normalisation procedure.

**Test solution** Dissolve 0.200 g of the substance to be examined in heptane R and dilute to 10.0 mL with the same solvent.

**Reference solution (a)** Dissolve 5 µL of β-myrcene R, 80 µL of limonene R, 5 µL of dihydrocarvone R, 100 µL of carvone R and 5 µL of carveol R in heptane R and dilute to 10.0 mL with the same solvent.

**Reference solution (b)** Dissolve 10 µL of carvone R in heptane R and dilute to 10 mL with the same solvent. Dilute 0.1 mL of this solution to 10 mL with heptane R.

#### Column:

— material: fused silica,

— size: l = 30 m, Ø = 0.53 mm,

— stationary phase: macrogol 20 000 R, (film thickness 1 µm).

Carrier gas helium for chromatography R.

Flow rate 1.5 mL/min.

Split ratio 1:50.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 5	60
	5 - 68	60 → 250
	68 - 75	250
Injection port		250
Detector		260

Detection Flame ionisation.

Injection 1.0 µL.

Elution order Order indicated in the composition of reference solution (a). Record the retention times of these substances.

System suitability Reference solution (a):

— resolution: minimum 4.5 between the peaks due to β-myrcene and limonene.

Using the retention times determined from the chromatogram obtained with the reference solution, locate the components of the reference solution in the chromatogram obtained with the test solution.

Limits:

- β-myrcene: 0.1 per cent to 1.0 per cent,
  - limonene: 30.0 per cent to 45.0 per cent,
  - trans-dihydrocarvone: maximum 2.5 per cent,
  - carvone: 50.0 per cent to 65.0 per cent,
  - trans-carveol: maximum 2.5 per cent.
- disregard limit: the area of the peak in the chromatogram obtained with reference solution (b).

#### Chiral purity

Gas chromatography (2.2.28).

Test solution Dissolve 20 mg of the substance to be examined in heptane R and dilute to 10.0 mL with the same solvent.

Reference solution Dissolve 10 mg of (-)-carvone R and 10 mg of carvone R1 in heptane R and dilute to 10.0 mL with the same solvent.

Column:

- material: fused silica,
- size:  $l = 30$  m,  $\varnothing = 0.25$  mm,
- stationary phase: modified β-cyclodextrin for chiral chromatography R1 (film thickness 0.25 µm).

Carrier gas helium for chromatography R.

Flow rate 2.0 mL/min.

Split ratio 1:30.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 80	50 → 170
Injection port		230
Detector		230

Detection Flame ionisation.

Injection 1 µL.

System suitability Reference solution:

— resolution: minimum 2.4 between the peaks due to (-)-carvone (1<sup>st</sup> peak) and carvone R1 (2<sup>nd</sup> peak).

Calculate the percentage content of the (-)-carvone from the following expression:

$$\frac{A_1}{A_1 + A_2} \times 100$$

$A_1$  = area of the peak due to (-)-carvone,  
 $A_2$  = area of the peak due to carvone R1.

Limit:

— (-)-carvone: maximum 1 per cent.

#### STORAGE

At a temperature not exceeding 25 °C.

Ph Eur

## Cardamom Fruit

In making preparations of Cardamom, only the seed is used. The seed is removed from the fruit, immediately powdered or bruised and used immediately in making the preparation. Cardamom seed, after removal from the fruit, should not be stored.

#### DEFINITION

Cardamom Fruit consists of the dried, nearly ripe fruit of *Elettaria cardamomum* Maton var. *minuscula* Burkill.

#### CHARACTERISTICS

Odour and taste of the seeds, strongly aromatic.

**Macroscopical** Fruit: a trilobular inferior capsule, up to about 2 cm long, ovoid or oblong, dull green to pale buff, plump or slightly shrunken, obtuse-triangular in cross section, nearly smooth or longitudinally striated. Seeds in each loculus in two rows, forming an adherent mass attached to the axile placenta. Seed: pale to dark reddish brown, about 4 mm long and 3 mm broad, irregularly angular, marked with six to eight transverse wrinkles, with a longitudinal channel containing the raphe, each seed enveloped by a colourless, membranous aril. Transversely cut surface of seed showing a brown testa, white starchy perisperm, grooved on one side, yellowish endosperm and a paler embryo.

**Microscopical** Seed: aril composed of flattened, thin-walled, parenchymatous cells. Testa composed of the following layers: (i) outer epidermis of thick-walled, narrow, axially elongated cells; (ii) a layer of collapsed parenchyma subjacent to the outer epidermis; (iii) a single layer (two or three layers near the raphe) of large, thin-walled, rectangular cells containing volatile oil; (iv) two or three layers of parenchyma; (v) layers of thin-walled, flattened cells; (vi) distinctive sclerenchymatous layer of closely packed brown, thick-walled cells, each with a bowl-shaped cavity in the upper part containing a warty silica body; (vii) inner layer consisting of flattened cells. Perisperm: cells thin-walled, packed with numerous starch granules up to 6 µm in diameter and, in a small cavity, one to seven prisms of calcium oxalate about 10 to 30 µm long. Endosperm parenchymatous, thin-walled, with a granular hyaline mass of protein in each cell. Embryo: cells small, containing aleurone grains.

#### TESTS

##### Foreign matter

Of the fruit, not more than 1.0%; of the separated seeds, not more than 3.0%, Appendix XI D.

**Volatile oil**

In the seeds, not less than 4.0% v/w, Appendix XI E, Method I. Use 20 g of the unground seeds and distil for 5 hours.

**Acid-insoluble ash**

Of the seeds, not more than 3.5%, Appendix XI K.

**Ash**

Of the seeds, not more than 6.0%, Appendix XI J.

**Cardamom Oil****Preparations**

Aromatic Cardamom Tincture

Compound Cardamom Tincture

**DEFINITION**

Cardamom Oil is obtained by distillation from crushed Cardamom Fruit.

**CHARACTERISTICS**

A clear, colourless or pale yellow liquid, visibly free from water; odour, that of Cardamom Fruit.

**TESTS****Ester value**

90 to 156, Appendix X C.

**Optical rotation**

+20° to +40°, Appendix V F.

**Refractive index**

1.461 to 1.467, Appendix V E.

**Solubility in ethanol**

Soluble, at 20°, in 6 volumes of ethanol (70%), Appendix X M.

**Weight per mL**

0.917 to 0.940 g, Appendix V G.

**STORAGE**

Cardamom Oil should be kept in a well-filled container and protected from light.

**Aromatic Cardamom Tincture****DEFINITION**

Cardamom Oil	3 mL
Caraway Oil	10 mL
Cinnamon Oil	10 mL
Clove Oil	10 mL
Strong Ginger Tincture	60 mL
Ethanol (90 per cent)	Sufficient to produce 1000 mL

The tincture complies with the requirements for Tinctures stated under Extracts and with the following requirements.

**TESTS****Ethanol content**

84 to 87% v/v, Appendix VIII F, Method III.

**Relative density**

0.825 to 0.845, Appendix V G.

**Compound Cardamom Tincture****DEFINITION**

Cardamom Oil	0.450 mL
Caraway Oil	0.400 mL
Cinnamon Oil	0.225 mL
Cochineal, in moderately coarse powder	7 g
Glycerol	50 mL
Ethanol (60 per cent)	Sufficient to produce 1000 mL

**Extemporaneous preparation**

The following directions apply.

Moisten the Cochineal with a sufficient quantity of Ethanol (60 per cent) and prepare 900 mL of tincture by percolation, Appendix XI F. Add the Cardamom Oil, the Caraway Oil, the Cinnamon Oil and the Glycerol and sufficient Ethanol (60 per cent) to produce 1000 mL; mix. Filter, if necessary.

The tincture complies with the requirements for Tinctures stated under Extracts and with the following requirements.

**TESTS****Ethanol content**

52 to 57% v/v, Appendix VIII F, Method III.

**Glycerol**

4.5 to 5.5% v/v when determined by the following method. Dilute 20 mL to 100 mL with water. To 20 mL of this solution add 100 mL of water and 1 g of activated charcoal and boil under a reflux condenser for 15 minutes. Filter and wash the filter and charcoal with sufficient water to produce 150 mL. Add 0.25 mL of bromocresol purple solution and neutralise with 0.1M sodium hydroxide or 0.05M sulfuric acid to the blue colour of the indicator. Add 1.4 g of sodium periodate and allow to stand for 15 minutes. Add 3 mL of propane-1,2-diol, shake and allow to stand for 5 minutes. Add 0.25 mL of bromocresol purple solution and titrate with 0.1M sodium hydroxide VS to the same blue colour. Each mL of 0.1M sodium hydroxide VS is equivalent to 9.210 mg of glycerol. Calculate the percentage v/v of glycerol, taking its weight per mL to be 1.260 g.

**Relative density**

0.925 to 0.937, Appendix V G.

**Cascara**

(Ph. Eur. monograph 0105)

**Preparation**

Standardised Cascara Dry Extract

When Powdered Cascara is prescribed or demanded, material complying with the requirements below with the exception of Identification test A and the test for Foreign matter shall be dispensed or supplied.

Ph Eur

**DEFINITION**

Dried, whole or fragmented bark of *Rhamnus purshiana* DC. (syn. *Frangula purshiana* (DC.) A.Gray).

**Content**

Minimum 8.0 per cent of hydroxyanthracene glycosides of which minimum 60 per cent consists of cascariosides, both expressed as cascarioside A (C<sub>27</sub>H<sub>32</sub>O<sub>14</sub>; M<sub>r</sub> 580.5) (dried drug).

**IDENTIFICATION**

A. The bark occurs in slightly channelled or nearly flat pieces, usually 1-5 mm in thickness, usually varying greatly in length and width. The outer surface is grey or dark greyish-brown and shows occasional lenticels that are orientated transversally. It is usually more or less completely covered by a whitish coat of lichens, epiphytic moss and foliaceous liverwort. The inner surface is yellow or reddish-brown or almost black with fine longitudinal striations; it turns red when treated with alkali. The yellow fracture is short and granular in the outer part and somewhat fibrous in the inner part.

B. Microscopic examination (2.8.23). The powder is yellowish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 0105.-1): bundles [A] of partly lignified phloem fibres [Aa], accompanied by crystal sheaths containing prisms of calcium oxalate [Ab] and sometimes including medullary rays [Ac]; isolated sclereids [G] or groups of sclereids [B] accompanied by crystal sheaths [Ba]; isolated cluster crystals [C] or prisms [E] of calcium oxalate; parenchymatous cells [F, H] containing a yellow substance that becomes deep red when treated with alkali, sometimes accompanied by cells containing cluster crystals of calcium oxalate [Ha]; cork cells (surface view [D], transverse section [J]), associated with parenchyma, some cells of which contain cluster crystals of calcium oxalate [Ja]; frequently epiphytes [K], which may be liverworts, entire or in fragments, having a lamina 1 cell thick without a midrib and composed of isodiametric cells, or leaves of mosses, having a lamina 1 cell thick composed of elongated cells and possessing a midrib several cells thick.

Figure 0105.-1. – Illustration for identification test B of powdered herbal drug of cascara

C. Examine the chromatograms obtained in test A for Other species of *Rhamnus*; anthrones.

**Results** The chromatogram obtained with the test solution shows several reddish-brown zones with different intensities: there are 4 faint zones, 3 being situated at about the mid-point of the chromatogram and 1 in the lower third and there is a strong zone in the upper third of the chromatogram. Examine in ultraviolet light at 365 nm. The chromatogram obtained with the test solution shows several zones with the same fluorescence, situated above and particularly below (cascarosides) that due to barbaloin in the chromatogram obtained with the reference solution.

D. Heat 0.2 g of the powdered herbal drug (180) (2.9.12) with 50 mL of *water R* on a water-bath for 15 min. Allow to cool and filter. To 10 mL of the filtrate add 20 mL of *hydrochloric acid R1* and heat on a water-bath for 15 min. Allow to cool, transfer to a separating funnel and shake with 3 quantities, each of 20 mL, of *ether R*. Reserve the aqueous layer (solution A). Combine the 3 ether extracts and shake with 10 mL of *dilute ammonia R2*. The aqueous layer becomes reddish-violet. Transfer solution A to a small flask, add 5 g of *ferric chloride R* and heat on a water-bath for 30 min. Allow to cool, transfer to a separating funnel and shake with 15 mL of *ether R*. Wash the ether layer with 10 mL of *water R*, discard the aqueous layer and shake the ether layer with 5 mL of *dilute ammonia R2*. A red colour develops in the aqueous layer.

**TESTS**

Other species of *Rhamnus*; anthrones

Thin-layer chromatography (2.2.27).

**Test solution** To 0.5 g of the powdered herbal drug (180) (2.9.12) add 5 mL of *ethanol (70 per cent V/V) R* and heat to boiling. Cool and centrifuge. Decant the supernatant immediately and use within 30 min.

**Reference solution** Dissolve 20 mg of *barbaloin R* in *ethanol (70 per cent V/V) R* and dilute to 10 mL with the same solvent.

**Plates** TLC silica gel plate R (2 plates).

**Mobile phase** *water R*, *methanol R*, *ethyl acetate R* (13:17:100 V/V/V).

**A. Application:** 10 µL as bands.

**Development** Over a path of 10 cm.

**Drying** In air for 5 min.

**Detection** Spray with about 10 mL of a 50 g/L solution of *potassium hydroxide R* in *ethanol (50 per cent V/V) R* and heat at 100–105 °C for 15 min; examine immediately after heating.

**Results** The chromatogram obtained with the reference solution shows, in the central part, a reddish-brown zone due to barbaloin; examine in ultraviolet light at 365 nm; the zone due to barbaloin shows intense yellowish-brown fluorescence; in the chromatogram with the test solution, no zone with orange-brown fluorescence is seen between the zone due to barbaloin and the zones due to cascarosides.

**B. Application:** 10 µL of the test solution, as a band.

**Development** Over a path of 10 cm.

**Drying** In air for not more than 5 min.

**Detection** Spray immediately with a 5 g/L solution of *nitroterazolium blue R* in *methanol R* and examine immediately.

**Results** No violet or greyish-blue zones appear.

**Foreign matter (2.8.2)**

Maximum 1 per cent.

**Loss on drying (2.2.32)**

Maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (180) (2.9.12) by drying in an oven at 105 °C for 2 h.

**Total ash (2.4.16)**

Maximum 7.0 per cent.

**ASSAY**

Carry out the assay in 24 h, protected from bright light.

Stir 1.00 g of the powdered herbal drug (180) (2.9.12) into 100 mL of boiling *water R* and continue boiling and stirring for 5 min. Allow to cool, dilute to 100.0 mL with *water R*, shake, filter and discard the first 20 mL of filtrate. Transfer 10.0 mL of the filtrate to a separating funnel, add 0.1 mL of 1 M *hydrochloric acid* and shake with 2 quantities, each of 20 mL, of a mixture of 1 volume of *ether R* and 3 volumes of *hexane R*. Wash the combined organic extracts with 5 mL of *water R*, discard the organic layer and return the rinsings to the aqueous layer. Shake the combined aqueous layers with 4 quantities, each of 30 mL, of *ethyl acetate R* freshly saturated with *water R* (to 150 mL of *ethyl acetate R* add 15 mL of *water R*, shake for 3 min and allow to stand) on each occasion allowing separation to take place until the organic layer is clear. Combine the ethyl acetate extracts. Use the aqueous layer for the assay for cascarosides and the organic layer for the assay for hydroxyanthracene glycosides other than cascarosides.

**Hydroxyanthracene glycosides other than cascarosides**

Transfer the organic layer to a suitable flask and remove the solvent by distillation, evaporating almost to dryness. Dissolve the residue in 0.3-0.5 mL of *methanol R* and transfer to a volumetric flask, rinsing the 1<sup>st</sup> flask with warm *water R* and adding the rinsings to the methanolic solution. Allow to cool and dilute to 50.0 mL with *water R*. Transfer 20.0 mL of this solution to a 100 mL round-bottomed flask with a ground-glass neck and containing 2 g of *ferric chloride R* and 12 mL of *hydrochloric acid R*. Attach a reflux condenser and place the flask in a water-bath so that the level of the water is above that of the liquid in the flask and heat for 4 h. Allow to cool, transfer the solution to a separating funnel and rinse the flask successively with 3-4 mL of 1 M *sodium hydroxide* and 3-4 mL of *water R*, adding the rinsings to the separating funnel. Shake the contents of the separating funnel with 3 quantities, each of 30 mL, of a mixture of 1 volume of *ether R* and 3 volumes of *hexane R*. Wash the combined organic layers with 2 quantities, each of 10 mL, of *water R* and discard the rinsings. Dilute the organic layer to 100.0 mL with the mixture of ether and hexane. Take 20.0 mL, evaporate carefully to dryness on a water-bath and dissolve the residue in 10.0 mL of a 5 g/L solution of *magnesium acetate R* in *methanol R*. Measure the absorbance (2.2.25) at 440 nm and 515 nm using *methanol R* as the compensation liquid. If the ratio of the absorbance at 515 nm to that at 440 nm is less than 2.4, the assay is invalid.

Calculate the percentage content of hydroxyanthracene glycosides other than cascarosides, expressed as cascaroside A, using the following expression:

$$\frac{A \times 6.95}{m}$$

i.e. taking the specific absorbance to be 180.

*A* = absorbance at 515 nm;  
*m* = mass of the substance to be examined, in grams.

**Cascarosides**

Dilute the aqueous layer to 50.0 mL with *water R*. Treat 20.0 mL of this solution as described above in the assay of hydroxyanthracene glycosides other than cascarosides. Measure the absorbance (2.2.25) of the test solution at 440 nm and 515 nm. If the ratio of the absorbance at 515 nm to that at 440 nm is less than 2.7, the assay is invalid.

Calculate the percentage content of cascarosides, expressed as cascaroside A, using the following expression:

$$\frac{A \times 6.95}{m}$$

i.e. taking the specific absorbance to be 180.

*A* = absorbance at 515 nm;  
*m* = mass of the substance to be examined, in grams.

Ph Eur

**Standardised Cascara Dry Extract**

(Ph. Eur. monograph 1844)

**Preparation**

Cascara Tablets

Ph Eur

**DEFINITION**

Standardised dry extract obtained from *Cascara* (0105).

**Content**

- *hydroxyanthracene glycosides expressed as cascaroside A* ( $C_{27}H_{32}O_{14}$ ;  $M_r$  580.5): 8.0 per cent to 25.0 per cent *m/m* (dried extract) and 90 per cent to 110 per cent of the nominal content stated on the label;
- *cascarosides expressed as cascaroside A* ( $C_{27}H_{32}O_{14}$ ;  $M_r$  580.5): minimum 60 per cent of the hydroxyanthracene glycosides.

**PRODUCTION**

The extract is produced from the herbal drug by an appropriate procedure using either boiling water or a hydroalcoholic solvent at least equivalent in strength to ethanol (60 per cent *V/V*).

**CHARACTERS****Appearance**

Brown, free-flowing powder.

**IDENTIFICATION**

Thin-layer chromatography (2.2.27).

**Test solution** To 0.2 g of the extract to be examined add 5 mL of *ethanol (70 per cent V/V) R* and heat to boiling. Cool and centrifuge. Decant the supernatant solution immediately and use within 30 min.

**Reference solution** Dissolve 20 mg of *barbaloin R* and 2 mg of *emodin R* in *ethanol (70 per cent V/V) R* and dilute to 10 mL with the same solvent.

**Plate** TLC *silica gel plate R* (5-40  $\mu$ m) [or TLC *silica gel plate R* (2-10  $\mu$ m)].

**Mobile phase** *water R*, *methanol R*, *ethyl acetate R* (13:17:100 *V/V/V*).

**Application** 10  $\mu$ L [or 2  $\mu$ L] as bands.

**Development** Over a path of 10 cm [or 6 cm].

**Drying** In air for 5 min.

**Detection** Treat with a 50 g/L solution of *potassium hydroxide R* in *ethanol (50 per cent V/V) R* and heat to 100–105 °C for 15 min; examine in ultraviolet light at 365 nm.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Emodin: a red fluorescent zone	A faint red fluorescent zone
Barbaloin: a yellowish-brown fluorescent zone	A yellowish-brown fluorescent zone A blue fluorescent zone
	An intense yellowish-brown fluorescent zone 3 yellowish-brown fluorescent zones
Reference solution	Test solution

## TESTS

### Loss on drying (2.8.17)

Maximum 5.0 per cent.

## ASSAY

Carry out the assay within 24 h, protected from bright light.

To 0.500 g of the extract to be examined add 90 mL of *water R* and sonicate at 40 °C for 15 min. Shake, cool and dilute to 100.0 mL with *water R*. Shake and filter, discarding the first 20 mL of filtrate. Transfer 10.0 mL of the filtrate to a separating funnel, add 0.1 mL of 1 M *hydrochloric acid* and shake with 2 quantities, each of 20 mL, of a mixture of 1 volume of *ether R* and 3 volumes of *hexane R*. Wash the combined organic extracts with 5 mL of *water R*. Discard the organic layer and return the rinsings to the hydroalcoholic layer. Shake with 4 quantities, each of 30 mL, of *ethyl acetate R* freshly saturated with *water R* (prepared as follows: to 150 mL of *ethyl acetate R* add 15 mL of *water R*, shake for 3 min and allow to stand), on each occasion allowing the layers to separate until the organic layer is clear. Combine the ethyl acetate extracts. Use the aqueous layer for the assay of *cascarosides* and the organic layer for the assay of *hydroxyanthracene glycosides* other than *cascarosides*.

### Hydroxyanthracene glycosides other than cascarosides

Transfer the organic layer to a round-bottomed flask and remove the solvent by distillation, evaporating almost to dryness. Dissolve the residue in 0.5 mL of *methanol R*, add 10 mL of *water R* at 40 °C and transfer to a 50 mL volumetric flask, rinsing the round-bottomed flask with *water R* at 40 °C and adding the rinsings to the hydromethanolic solution. Allow to cool and dilute to 50.0 mL with *water R*. Transfer 20.0 mL of the solution to a 100 mL round-bottomed flask with a ground-glass neck containing 2 g of *ferric chloride R* and 12 mL of *hydrochloric acid R*. Attach a reflux condenser and place the flask in a water-bath so that the level of the water is above that of the liquid in the flask and heat for 4 h. Allow to cool, transfer

the solution to a separating funnel and rinse the flask successively with 4 mL of 1 M *sodium hydroxide* and 4 mL of *water R*, adding the rinsings to the separating funnel. Shake the contents of the separating funnel with 3 quantities, each of 30 mL, of a mixture of 1 volume of *ether R* and 3 volumes of *hexane R*. Wash the combined organic layers with 2 quantities, each of 10 mL, of *water R* and discard the rinsings. Dilute the organic layer to 100.0 mL with a mixture of 1 volume of *ether R* and 3 volumes of *hexane R*. Take 20.0 mL of the solution, evaporate carefully to dryness on a water-bath and dissolve the residue in 10.0 mL of a 5 g/L solution of *magnesium acetate R* in *methanol R*. Measure the absorbance (2.2.25) at 440 nm and 515 nm, using *methanol R* as the compensation liquid.

### System suitability:

— absorbance ratio:  $A_{515}/A_{440}$  is not less than 2.4.

Calculate the percentage content of *hydroxyanthracene glycosides* other than *cascarosides*, expressed as *cascaroside A*, using the following expression:

$$\frac{A \times 6.95}{m}$$

i.e. taking the specific absorbance to be 180.

$A$  = absorbance at 515 nm;  
 $m$  = mass of the substance to be examined, in grams.

## Cascarosides

Dilute the aqueous layer to 50.0 mL with *water R*. Treat 20.0 mL of this solution as described above in the assay of *hydroxyanthracene glycosides* other than *cascarosides*. Measure the absorbance (2.2.25) at 440 nm and 515 nm.

### System suitability:

— absorbance ratio:  $A_{515}/A_{440}$  is not less than 2.7.

Calculate the percentage content of *cascarosides*, expressed as *cascaroside A*, using the following expression:

$$\frac{A \times 6.95}{m}$$

i.e. taking the specific absorbance to be 180.

$A$  = absorbance at 515 nm;  
 $m$  = mass of the substance to be examined, in grams.

## LABELLING

The label states the nominal content of *hydroxyanthracene glycosides*, expressed as *cascaroside A*.

Ph Eur

## Cascara Tablets

### DEFINITION

Cascara Tablets contain Standardised Cascara Dry Extract. They are coated.

The tablets comply with the requirements stated under *Tablets* and with the following requirements.

Content of total *hydroxyanthracene derivatives* 17.0 to 23.0 mg, of which not less than 60% consists of *cascarosides*, both expressed as *cascaroside A*.

### IDENTIFICATION

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Boil a quantity of the powdered tablets containing the equivalent of 32 mg of total hydroxyanthracene derivatives with 5 mL of 70% v/v of ethanol, cool and centrifuge. Decant the supernatant liquid immediately and use within 30 minutes.

(2) Dissolve 20 mg of barbaloin and 2 mg of emodin in 70% v/v of ethanol and dilute to 10 mL with the same solvent.

#### CHROMATOGRAPHIC CONDITIONS

(a) Use silica gel  $F_{254}$  precoated plates or high-performance silica gel  $F_{254}$  (Merck silica gel  $F_{254}$  HPTLC plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 10  $\mu$ L [or 2  $\mu$ L] of each solution, as bands.

(d) Develop the plate to 10 cm [or 6 cm].

(e) After removal of the plate, dry in air, spray with a 5% w/v solution of potassium hydroxide in 50% v/v ethanol, heat at 100 to 105° for 15 minutes and examine under ultraviolet light (365 nm).

#### MOBILE PHASE

13 volumes of water, 17 volumes of methanol and 100 volumes of ethyl acetate.

#### CONFIRMATION

The chromatogram obtained with solution (1) show yellowish-brown fluorescent bands with  $R_f$  values of between 0.2 and 0.25, an intense yellowish-brown fluorescent band with an  $R_f$  value of about 0.3, a blue fluorescent band with an  $R_f$  value of about 0.6, a yellowish-brown fluorescent band with an  $R_f$  value of about 0.7 corresponding in colour and position to the band obtained with barbaloin in solution (2) and a faint reddish fluorescent band with an  $R_f$  value of about 0.9 corresponding in position to emodin in solution (2).

Top of the plate	
A faint red fluorescent band	Emodin a red fluorescent band
A yellow-brown fluorescent band	Barbaloin; a yellow-brown fluorescent band
A blue fluorescent band	
An intense yellow-brown fluorescent band	
3 yellow-brown fluorescent bands	
Solution (1)	Solution (2)

#### TESTS

##### Disintegration

Comply with the requirements stated under Tablets but for sugar-coated tablets the maximum time is 120 minutes.

##### ASSAY

Carry out the assay within 24 hours, protected from bright light.

Add 80 mL of 70% v/v ethanol to a quantity of the powdered tablets containing 75 mg of total hydroxyanthracene derivatives. Shake and allow to stand in the dark for at least 8 hours. Dilute to 100.0 mL with 70% v/v of ethanol. Shake and filter, discarding the first 20 mL of filtrate. Transfer

10.0 mL of the filtrate to a separating funnel, add 0.1 mL of 1M hydrochloric acid and shake with 2-quantities, each of 20 mL, of a mixture of 1 volume of ether and 3 volumes of hexane. Wash the combined organic extracts with 5 mL of water. Discard the organic layer and return the rinsings to the hydroalcoholic layer. Shake with 4-quantities, each of 30 mL, of ethyl acetate freshly saturated with water prepared by shaking 150 mL of ethyl acetate with 15 mL of water for 3 minutes and allowing to stand until the layers have separated and the organic layer is clear. Combine the ethyl acetate extracts and use the aqueous layer for the assay of cascariosides and the organic layer for the assay of hydroxyanthracene glycosides other than cascariosides.

##### Hydroxyanthracene glycosides other than cascariosides

Transfer the organic layer to a round-bottomed flask and remove the solvent by distillation, evaporating almost to dryness. Dissolve the residue in 0.5 mL of methanol, add 10 mL of water at 40° and transfer to a 50 mL volumetric flask, rinsing the round-bottomed flask with water at 40° and adding the rinsings to the hydromethanolic solution. Allow to cool and dilute to 50.0 mL with water. Transfer 20.0 mL of the solution to a 100 mL round-bottomed flask with a ground-glass neck containing 2 g of iron (III) chloride hexahydrate and 12 mL of 7M hydrochloric acid. Attach a reflux condenser and place the flask in a water-bath so that the level of the water is above that of the liquid in the flask and heat for 4 hours. Allow to cool, transfer the solution to a separating funnel and rinse the flask successively with 4 mL of 1M sodium hydroxide and 4 mL of water, adding the rinsings to the separating funnel. Shake the contents of the separating funnel with 3-quantities, each of 30 mL, of a mixture of 1 volume of ether and 3 volumes of hexane. Wash the combined organic layers with 2-quantities, each of 10 mL, of water and discard the rinsings. Dilute the organic layer to 100.0 mL with a mixture of 1 volume of ether and 3 volumes of hexane. Take 20.0 mL of the solution, evaporate carefully to dryness on a water-bath and dissolve the residue in 10.0 mL of a 0.5% w/v solution of magnesium acetate in methanol. Measure the absorbance of the resulting solution at 440 nm and at 515 nm, Appendix II B, using methanol in the reference cell. The assay is not valid if the ratio of the absorbance at 515 nm to that at 440 nm is less than 2.4.

Calculate the percentage content of hydroxyanthracene glycosides other than cascariosides, expressed as cascarioside A, using the following expression:

$$\frac{A \times 6.95}{m}$$

i.e. taking the specific absorbance to be 180.

$A$  = absorbance at 515 nm;  
 $m$  = weight of the substance being examined, in grams.

##### Cascariosides

To the aqueous solution reserved from the preliminary extraction add sufficient water to produce 50.0 mL. Carry out the Assay for hydroxyanthracene glycosides other than cascariosides, beginning at the words, 'Transfer 20 mL ...'. Measure the absorbance of the resulting solution at 440 nm and at 515 nm, Appendix II B, using methanol in the reference cell. The assay is not valid if the ratio of the absorbance at 515 nm to that at 440 nm is less than 2.7. Calculate the percentage content of cascariosides, expressed as cascarioside A, using the following expression:

$$\frac{A \times 6.95}{m}$$

i.e. taking the specific absorbance to be 180.

*A* = absorbance at 515 nm;  
*m* = weight of the substance being examined, in grams.

### LABELLING

The label states the nominal content of hydroxyanthracene glycosides, expressed as cascariosides A.

## Cassia Oil

(Ph. Eur. monograph 1496)

Ph Eur

### DEFINITION

Essential oil obtained by steam distillation of the leaves and young branches of *Cinnamomum cassia* (L.) J.Presl (syn. *Cinnamomum aromaticum* Nees).

### CHARACTERS

#### Appearance

Clear, mobile, yellow or reddish-brown liquid.  
Characteristic odour reminiscent of cinnamic aldehyde.

### IDENTIFICATION

First identification: B.

Second identification: A.

A. Thin-layer chromatography (2.2.27).

**Test solution** Dissolve 0.5 mL of the essential oil to be examined in acetone R and dilute to 10 mL with the same solvent.

**Reference solution** Dissolve 50 µL of *trans-cinnamic aldehyde* R, 10 µL of *eugenol* R and 50 mg of *coumarin* R in acetone R and dilute to 10 mL with the same solvent.

**Plate** TLC silica gel plate R.

**Mobile phase** methanol R, toluene R (10:90 V/V).

**Application** 10 µL as bands.

**Development** Over a path of 15 cm.

**Drying** In air.

**Detection A** Examine in ultraviolet light at 365 nm.

**Results A** The zone of blue fluorescence in the chromatogram obtained with the test solution is similar in position and colour to the zone in the chromatogram obtained with the reference solution (coumarin).

**Detection B** Spray with *anisaldehyde solution* R; examine in daylight while heating at 100–105 °C for 5–10 min.

**Results B** The chromatogram obtained with the reference solution shows in its upper part a violet zone (eugenol) and above this zone a greenish-blue zone (*trans-cinnamic aldehyde*). The chromatogram obtained with the test solution shows a zone similar in position and colour to the zone due to *trans-cinnamic aldehyde* in the chromatogram obtained with the reference solution and may show a very faint zone due to eugenol. Other faint zones are present.

B. Examine the chromatograms obtained in the test for chromatographic profile.

**Results** The principal peaks in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with the reference solution.

Eugenol may be absent from the chromatogram obtained with the test solution.

### TESTS

**Relative density** (2.2.5)  
1.052 to 1.070.

**Refractive index** (2.2.6)  
1.600 to 1.614.

**Optical rotation** (2.2.7)  
−1° to +1°.

### Chromatographic profile

**Gas chromatography** (2.2.28): use the normalisation procedure.

**Test solution** The essential oil to be examined.

**Reference solution** Dissolve 100 µL of *trans-cinnamic aldehyde* R, 10 µL of *cinnamyl acetate* R, 10 µL of *eugenol* R, 10 µL of *trans-2-methoxycinnamaldehyde* R and 20 mg of *coumarin* R in 1 mL of acetone R.

#### Column:

- material: fused silica;
- size: *l* = 60 m, Ø = about 0.25 mm;
- stationary phase: macrogol 20 000 R.

**Carrier gas** helium for chromatography R.

**Flow rate** 1.5 mL/min.

**Split ratio** 1:100.

**Temperature:**

	Time (min)	Temperature (°C)
Column	0 - 10	60
	10 - 75	60 → 190
	75 - 160	190
Injection port		200
Detector		240

**Detection** Flame ionisation.

**Injection** 0.2 µL.

**Elution order** Order indicated in the composition of the reference solution, depending on the operating conditions and the state of the column, coumarin may elute before or after *trans-2-methoxycinnamaldehyde*; record the retention times of these substances.

**System suitability** Reference solution:

- resolution: minimum 1.5 between the peaks due to *trans-2-methoxycinnamaldehyde* and coumarin.

**Identification of components** Using the retention times determined from the chromatogram obtained with the reference solution, locate the components of the reference solution in the chromatogram obtained with the test solution.

Determine the percentage content of each of these components. The percentages are within the following ranges:

- *trans-cinnamic aldehyde*: 70 per cent to 90 per cent;
- *cinnamyl acetate*: 1.0 per cent to 6.0 per cent;
- *eugenol*: maximum 0.5 per cent;
- *trans-2-methoxycinnamaldehyde*: 3.0 per cent to 15 per cent;
- *coumarin*: 1.5 per cent to 4.0 per cent.

### STORAGE

Protected from heat.

Ph Eur

## Greater Celandine

(Ph. Eur. monograph 1861)

Ph Eur

### DEFINITION

Dried, whole or cut aerial parts of *Chelidonium majus* L. collected during flowering.

### Content

Minimum 0.6 per cent of total alkaloids, expressed as chelidoniumine ( $C_{20}H_{19}NO_5$ ;  $M_r$  353.4) (dried drug).

### IDENTIFICATION

A. The stems are rounded, ribbed, yellowish or greenish-brown, somewhat pubescent, about 3-7 mm in diameter, hollow and mostly collapsed. The leaves are thin, irregularly pinnate, the leaflets ovate to oblong with coarsely dentate margins, the terminal leaflet often 3-lobed; the adaxial surface is bluish-green and glabrous, the abaxial surface paler and pubescent, especially on the veins. The flowers have 2 deeply concavo-convex sepals, readily removed, and 4 yellow, broadly ovate, spreading petals about 8-10 mm long; the stamens are numerous, yellow, and a short style arises from a superior ovary; long, capsular, immature fruits are rarely present.

B. Microscopic examination (2.8.23). The powder is dark greyish-green or brownish-green. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 1861.-1): numerous fragments of upper epidermis, composed of cells with sinuous walls (surface view [B]), accompanied by underlying palisade parenchyma [Ba]; numerous fragments of lower epidermis in surface view [A, E] bearing anomocytic stomata (2.8.3) [Aa] and bases of covering trichomes [Ab], sometimes accompanied by underlying spongy parenchyma [Ea]; long, uniseriate, multicellular covering trichomes, usually fragmented, with thin-walled cells, sometimes collapsed [G]; vascular tissue from the leaves and stems consisting of pitted and spirally thickened vessels [D]; groups of fibres [C]; articulated latex tubes with yellowish-brown contents [F]; occasional fragments of the corolla [H] consisting of thin-walled cells containing numerous pale yellow droplets of oil [Ha]; spherical pollen grains about 30-40  $\mu\text{m}$  in diameter with 3 pores and a finely pitted exine [J].

C. Thin-layer chromatography (2.2.27).

**Test solution** To 0.4 g of the powdered herbal drug (710) (2.9.12) add 50 mL of *dilute acetic acid R*. Boil in a water-bath under a reflux condenser for 30 min. Cool and filter. To the filtrate add *concentrated ammonia R* until a strong alkaline reaction is produced. Shake with 30 mL of *methylene chloride R*. Dry the organic layer over *anhydrous sodium sulfate R*, filter and evaporate *in vacuo* to dryness. Dissolve the residue in 1.0 mL of *methanol R*.

**Reference solution** Dissolve 2 mg of *methyl red R* and 2 mg of *papaverine hydrochloride R* in 10 mL of *ethanol (96 per cent) R*.  
**Plate** TLC silica gel plate R.

**Mobile phase** *anhydrous formic acid R*, *water R*, *propanol R* (1:9:90 V/V/V).

**Application** 10  $\mu\text{L}$  as bands.

**Development** Over a path of 10 cm.

**Drying** In air.

Figure 1861.-1. – Illustration for identification test B of powdered herbal drug of greater celandine

**Detection** Spray with *potassium iodobismuthate solution R* and dry in air; spray with *sodium nitrite solution R* and allow to dry in air; examine in daylight.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other weaker zones may be present in the chromatogram obtained with the test solution.

Reference solution	Test solution

### TESTS

**Foreign matter** (2.8.2)

Maximum 10.0 per cent.

**Loss on drying** (2.2.32)

Maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

**Total ash** (2.4.16)

Maximum 13.0 per cent.

**ASSAY**

**Test solution** To 0.750 g of the powdered herbal drug (710) (2.9.12) add 200 mL of *dilute acetic acid R* and heat on a water-bath for 30 min, shaking frequently. Cool and dilute to 250.0 mL with *dilute acetic acid R*. Filter. Discard the first 20 mL of the filtrate. To 30.0 mL of the filtrate add 6.0 mL of *concentrated ammonia R* and 100.0 mL of *methylene chloride R*. Shake for 30 min. Separate the organic layer, place 50.0 mL in a 100 mL round-bottomed flask and evaporate to dryness *in vacuo* at a temperature not exceeding 40 °C. Dissolve the residue in about 2-3 mL of *ethanol (96 per cent) R*, warming slightly. Transfer the solution to a 25 mL volumetric flask by rinsing the round-bottomed flask with *dilute sulfuric acid R* and dilute to 25.0 mL with the same solvent. To 5.0 mL of the solution add 5.0 mL of a 10 g/L solution of *chromotropic acid, sodium salt R* in *sulfuric acid R* in a 25 mL volumetric flask, stopper the flask and mix carefully. Dilute to 25.0 mL with *sulfuric acid R* and stopper the flask.

**Compensation liquid** Prepare at the same time and in the same manner as for the test solution: place in a 25 mL volumetric flask 5.0 mL of *dilute sulfuric acid R* and 5.0 mL of a 10 g/L solution of *chromotropic acid, sodium salt R* in *sulfuric acid R*, stopper the flask and mix carefully. Dilute to 25.0 mL with *sulfuric acid R* and stopper the flask.

Place both solutions on a water-bath for 10 min. Cool to about 20 °C and dilute if necessary to 25.0 mL with *sulfuric acid R*. Measure the absorbance (2.2.25) of the test solution at 570 nm by comparison with the compensation liquid.

Calculate the percentage content of total alkaloids, expressed as chelidonine, using the following expression:

$$\frac{A \times 2.23}{m}$$

i.e. taking the specific absorbance of chelidonine to be 933.

*A* = absorbance at 570 nm;  
*m* = mass of the herbal drug to be examined, in grams.

Ph Eur

**Centaurium**

(Ph. Eur. monograph 1301)

Ph Eur

**DEFINITION**

Whole or fragmented dried flowering aerial parts of *Centaurium erythraea* Rafn s. l. including *C. majus* (H. et L.) Zeltner and *C. suffruticosum* (Griseb.) Ronn. (syn.: *Erythraea centaurium* Persoon; *C. umbellatum* Gilibert; *C. minus* Gars.).

**CHARACTERS**

Bitter taste.

**IDENTIFICATION**

A. The hollow cylindrical, light green to dark brown stem has longitudinal ridges, and is branched only in its upper part. The sessile leaves are entire, decussately arranged, and have an ovate to lanceolate lamina, up to about 3 cm long. Both surfaces are glabrous and green to brownish-green. The inflorescence is diaxially branched. The tubular calyx is green and has 5 lanceolate, acuminate teeth. The corolla consists of a whitish tube divided into 5 elongated lanceolate pink to reddish lobes, about 5-8 mm long. 5 stamens are

present attached to the top of the corolla tube. The ovary is superior and has a short style, a broad bifid stigma and numerous ovules. Cylindrical capsules, about 7-10 mm long, with small brown markedly rough seeds are frequently present.

B. Microscopic examination (2.8.23). The powder is greenish-yellow or brownish. Examine under a microscope, using *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments from the stem with lignified groups of fibres associated with narrow vessels, tracheidal vessels occasional vessels with spiral thickening; pitted parenchyma of the pith and medullary rays; fragments of leaf lamina with sinuous epidermal cells and striated cuticle, especially over the margins and surrounding the stomata; numerous stomata, mainly anisocytic (2.8.3); fragments of the palisade mesophyll, each cell containing a single prism crystal or, less frequently, a cluster crystal of calcium oxalate; fragments of calyx and corolla, those of the calyx with straight-walled epidermal cells, those of the inner epidermis of the corolla with obtuse papillae and radially striated cuticle; parts of the endothecium with reticulate or ridge-shaped wall thickenings; triangularly rounded or elliptical, yellow pollen grains, about 30 µm in diameter, with a distinctly pitted exine and 3 germinal pores; fragments of the wall of the fruit capsule composed of crossed layers of fusiform cells; oil droplets from the seeds, fragments of the epidermis of the testa showing large, brown reticulations and a pitted surface.

C. Thin-layer chromatography (2.2.27).

**Test solution** To 1.0 g of the powdered herbal drug (355) (2.9.12) add 25 mL of *methanol R*, shake for 15 min and filter. Evaporate the filtrate to dryness under reduced pressure and at a temperature not exceeding 50 °C. Take up the residue with small quantities of *methanol R* so as to obtain 5 mL of solution, which may contain a sediment.

**Reference solution** Dissolve 1 mg of *rutoside trihydrate R* and 1 mg of *swertiamarin R* in *methanol R* and dilute to 1 mL with the same solvent.

**Plate** TLC silica gel *F<sub>254</sub>* plate *R* (5-40 µm) [or TLC silica gel *F<sub>254</sub>* plate *R* (2-10 µm)].

**Mobile phase** *water R*, *anhydrous formic acid R*, *ethyl formate R* (4:8:88 *V/V/V*).

**Application** 10 µL [or 5 µL] as bands.

**Development** In an unsaturated tank over a path of 12 cm [or 6 cm].

**Drying** In air.

**Detection A** Examine in ultraviolet light at 254 nm.

**Results A** See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other less intense quenching zones may be present in the chromatogram obtained with the test solution.

#### TESTS

**Foreign matter (2.8.2)**

Maximum 3 per cent.

**Bitterness value (2.8.15)**

Minimum 2000.

**Loss on drying (2.2.32)**

Maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

**Total ash (2.4.16)**

Maximum 6.0 per cent.

Ph Eur

## Centella

(Ph. Eur. monograph 1498)

Ph Eur

#### DEFINITION

Dried, fragmented aerial parts of *Centella asiatica* (L.) Urb.

#### Content

Minimum 6.0 per cent of total triterpenoid derivatives, expressed as asiaticoside (C<sub>48</sub>H<sub>78</sub>O<sub>19</sub>; M<sub>r</sub> 959) (dried drug).

#### IDENTIFICATION

**A.** The leaves are alternate, sometimes grouped together at the nodes, reniform or orbicular or oblong-elliptic and have palmate nervation, usually with 7 veins, and a crenate margin. The leaves are very variable in size; the petiole is usually 5–10, sometimes 15, times longer than the lamina, which is 10–40 mm long and 20–40 mm, sometimes up to 70 mm, wide. Young leaves show a few trichomes on the lower surface while adult leaves are glabrous.

The inflorescence, if present, is a single umbel which usually consists of 3 flowers, rarely 2 or 4; the flowers are very small (about 2 mm), pentamerous and have an inferior ovary; the fruit, a brownish-grey, orbicular cremocarp, up to 5 mm long, is very flattened laterally and has 7–9 prominent curved ridges per mericarp.

**B.** Microscopic examination (2.8.23). The powder is greenish-grey. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 1498.-1): numerous fragments of upper epidermis of the leaf [D] composed of polygonal cells having an irregularly striated cuticle, accompanied by underlying palisade parenchyma [Da], with some cells containing cluster crystals of calcium oxalate [Db]; fragments of the lower epidermis of the leaf with usually paracytic stomata (2.8.3) [C]; fragments of petiole epidermis with elongated cells covered by a striated cuticle [J]; whole [A] or, usually, fragmented [B], uniseriate, long, flexuous, unicellular or occasionally multicellular covering trichomes of young leaves; secretory canals [M]; small prisms [L] and cluster crystals [E] of calcium oxalate up to 40 µm in diameter; vascular bundles from the stem [F] containing vessels [Fa] and narrow septate fibres [Fb]; fragments of the epicarp of the fruit [H] with polygonal cells having a markedly striated cuticle; fragments of the fruit [K] usually containing 2 layers of short fibres in a perpendicular parquetry arrangement [Ka], annular vessels, parenchymatous cells containing prisms of calcium oxalate [Kb] and numerous oil droplets [Kc]; short fibres, free or in small groups [G]; fragments of the endosperm with oily contents [N].

Figure 1498.-1. – Illustration for identification test B of powdered herbal drug of centella

**C.** Examine the chromatograms obtained in the test for *Bacopa monnieri* L.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, several brown zones may be present in the lower third of the chromatograms obtained with the test solution and the reference solution.

**TESTS****Bacopa monnieri** L.

Thin-layer chromatography (2.2.27).

**Test solution** To 0.5 g of the powdered herbal drug (355) (2.9.12) add 5 mL of ethanol (96 per cent) R, sonicate for 10 min and centrifuge. Use the supernatant.

**Reference solution** Dissolve 50 mg of *centella dry extract HRS* in 2 mL of ethanol (96 per cent) R.

**Plate** TLC silica gel plate R (5-40 µm) [or TLC silica gel plate R (2-10 µm)].

**Mobile phase** water R, methanol R, methylene chloride R (1:6:14 V/V/V).

**Application** 10 µL [or 4 µL] as bands of 10 mm [or 8 mm].

**Development** Over a path of 15 cm [or 6 cm].

**Drying** In air.

**Detection** Treat with a 10 per cent V/V solution of sulfuric acid R in methanol R, heat at 120 °C for 3 min and examine in daylight.

**Results** No brown zone is present in the middle third of the chromatogram obtained with the test solution.

**Foreign matter (2.8.2)**

Maximum 5 per cent of underground organs and maximum 2 per cent of other foreign matter.

**Loss on drying (2.2.32)**

Maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

**Total ash (2.4.16)**

Maximum 12.0 per cent.

**Ash insoluble in hydrochloric acid (2.8.1)**

Maximum 2.0 per cent.

**ASSAY**

Liquid chromatography (2.2.29).

**Test solution** Place 1.000 g of the powdered herbal drug (355) (2.9.12) in a cellulose fingerstall in a continuous extraction apparatus (Soxhlet type). Add 100 mL of methanol R and heat for 8 h. Cool and dilute the extract to 100.0 mL with methanol R. Filter through a membrane filter (nominal pore size 0.45 µm). Dilute 5.0 mL of the filtrate to 10.0 mL with methanol R.

**Reference solution (a)** Dissolve 6.0 mg of *asiaticoside CRS* in methanol R and dilute to 20.0 mL with the same solvent.

**Reference solution (b)** Dissolve 50.0 mg of *centella dry extract HRS* in methanol R, using sonication if necessary, and dilute to 10.0 mL with the same solvent. Filter through a membrane filter (nominal pore size 0.45 µm).

**Column:**

— size:  $l = 0.25$  m,  $\varnothing = 4.6$  mm;

— stationary phase: octadecylsilyl silica gel for chromatography R (5 µm).

**Mobile phase:**

- mobile phase A: 0.3 per cent V/V solution of phosphoric acid R;
- mobile phase B: acetonitrile R1;

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 65	78 → 45	22 → 55
65 - 66	45 → 5	55 → 95
66 - 75	5	95

**Flow rate** 1.0 mL/min.

**Detection** Spectrophotometer at 200 nm.

**Injection** 10 µL.

**Identification of peaks** Use the chromatogram supplied with *centella dry extract HRS* and the chromatogram obtained with reference solution (b) to identify the peaks due to asiaticoside B, madecassoside, asiaticoside, madecassic acid, terminolic acid and asiatic acid.

**System suitability** Reference solution (b):

- peak-to-valley ratio: minimum 10, where  $H_p$  = height above the baseline of the peak due to terminolic acid and  $H_v$  = height above the baseline of the lowest point of the curve separating this peak from the peak due to madecassic acid.

Calculate the percentage content of total triterpenoid derivatives, expressed as asiaticoside, using the following expression:

$$\frac{[A_1 + (A_2 \times 1.017) + (A_3 \times 0.526) + (A_4 \times 0.509)] \times m_2 \times p \times 10}{A_5 \times m_1}$$

- $A_1$  = area of the peak due to asiaticoside in the chromatogram obtained with the test solution;
- $A_2$  = sum of the areas of the peaks due to asiaticoside B and madecassoside in the chromatogram obtained with the test solution;
- $A_3$  = sum of the areas of the peaks due to madecassic acid and terminolic acid in the chromatogram obtained with the test solution;
- $A_4$  = area of the peak due to asiatic acid in the chromatogram obtained with the test solution;
- $A_5$  = area of the peak due to asiaticoside in the chromatogram obtained with reference solution (a);
- $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;
- $m_2$  = mass of *asiaticoside CRS* used to prepare reference solution (a), in grams;
- $p$  = percentage content of asiaticoside in *asiaticoside CRS*;
- 1.017 = molecular mass conversion factor for asiaticoside B and madecassoside;
- 0.526 = molecular mass conversion factor for madecassic acid and terminolic acid;
- 0.509 = molecular mass conversion factor for asiatic acid.

Ph Eur

**Chaenomeles Fruit**

(Ph. Eur. monograph 2713)

Ph Eur

**DEFINITION**

Nearly ripe fruit of *Chaenomeles lagenaria* (Loisel.) Koidz. (syn. *Chaenomeles speciosa* (Sweet) Nakai), collected when it becomes greenish-yellow, split longitudinally into halves or cut into slices, and dried.

**Content**

Minimum 0.50 per cent for the sum of oleanolic acid ( $C_{30}H_{48}O_3$ ;  $M_r$  456.7) and ursolic acid ( $C_{30}H_{48}O_3$ ;  $M_r$  456.7), expressed as ursolic acid (dried drug).

**IDENTIFICATION**

**A. Whole drug.** The fruit, split longitudinally into 2 halves, is oblong, 4-9 cm long, 2-5 cm wide and 1-2.5 cm thick. The outer surface is violet-red or reddish-brown, shiny, with deep, irregular wrinkles and an in-rolled outer margin; it is sometimes covered by a dull, purplish-grey wax-like frosting; the surface is shiny when the frosting is removed. The internal (cut) surface is reddish-brown, dull and finely granular in the region of the septum or slightly lustrous, reddish- or yellowish-brown, finely wrinkled or smooth in the region of the exposed locules. Seeds, if remaining, are brown and flattened, broadly rounded at one end and pointed at the other. The texture is hard and woody, difficult to break.

**Fragmented drug** Narrow sub-crescent-shaped slices with an irregular, convex outer margin, sometimes with in-rolled ends, or irregularly-shaped slices; slices 0.1-0.6 cm thick. The outer surface is violet-red or brownish-red, with deep irregular wrinkles. The mostly concave inner surface is slightly lustrous and reddish- or yellowish-brown in the region of the exposed locules or dull and granular. The cut surface is brownish-red, yellowish-brown or blackish; sclereid clusters may be visible as 2 lighter-coloured layers, one directly beneath the epicarp and the other close to the inner surface. The texture is hard and fragile, easily broken.

**B. Microscopic examination (2.8.23).** The powder is brownish-red to brownish-yellow. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2713.-1): numerous colourless or pale yellow or orange, rounded, elliptical or polygonal, mostly thick-walled sclereids, isolated [D] or in groups [A, E], about 20-80  $\mu$ m in diameter, with distinctly striated and finely channelled walls and a lumen that sometimes contains orange-brown substances; fragments of the epicarp consisting of polygonal cells, up to 35  $\mu$ m in diameter, containing brown or reddish-brown substances [B]; cells of the mesocarp [F], more or less polygonal or rounded, usually collenchymatous; rare fragments of vascular bundles [G] with narrow reticulate or annular vessels [Ga]; rare fibres [C], faintly channelled; parenchymatous cells [Aa] occasionally containing small prisms of calcium oxalate [Ab, C, Gb] associated with sclereid clusters [A], fibres [C] or vascular bundles [G].

**C. High-performance thin-layer chromatography (2.8.25).**

**Test solution** To 0.5 g of the powdered herbal drug (355) (2.9.12) add 5.0 mL of *methanol R*. Sonicate for 10 min, centrifuge and use the supernatant.

**Reference solution (a)** Dissolve 10.0 mg of *oleanolic acid R* in *methanol R* and dilute to 10.0 mL with the same solvent.

**Reference solution (b)** Dilute 2.5 mL of reference solution (a) to 10.0 mL with *methanol R*.

**Reference solution (c)** Dissolve 2.5 mg of  $\beta$ -*sitosterol R* and 2.5 mg of *oleanolic acid R* in *methanol R* and dilute to 10 mL with the same solvent.

**Intensity marker** Oleanolic acid.

**Plate** TLC silica gel  $F_{254}$  plate R (2-10  $\mu$ m).

**Mobile phase** *anhydrous formic acid R*, *methylene chloride R*, *ethyl acetate R*, *cyclohexane R* (1:5:8:20 V/V/V/V).

**Application** 5  $\mu$ L as bands of 8 mm.

**Development** 70 mm from the lower edge of the plate.

Figure 2713.-1. – Illustration for identification test B of powdered herbal drug of chaenomeles fruit

**Drying** In a current of cold air.

**Detection** Treat with *anisaldehyde solution R2* and heat at 100 °C for 3 min; examine in daylight.

**System suitability** Reference solution (c):

— the chromatogram shows in the middle third 2 distinct zones; the upper zone ( $\beta$ -sitosterol) and the lower zone (oleanolic acid) are reddish-violet.

**Results** See below the sequence of zones present in the chromatograms obtained with reference solution (a) and the test solution. Furthermore, in the chromatogram obtained with the test solution, other faint zones may be present.

Top of the plate	
	A reddish-violet zone, faint to equivalent
	A reddish-violet zone, very faint to equivalent
Oleanolic acid: a reddish-violet zone	A reddish-violet zone, equivalent
	A reddish-violet zone, very faint to equivalent
Reference solution (a)	Test solution

**TESTS**

**Loss on drying (2.2.32)**

Maximum 14.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

Total ash (2.4.16)

Maximum 5.0 per cent.

#### ASSAY

Liquid chromatography (2.2.29).

**Test solution** Disperse 2.000 g of the powdered herbal drug (355) (2.9.12) in 80.0 mL of *methanol R*, stopper the flask tightly and weigh. Sonicate for 30 min, weigh again and compensate for the loss of solvent with *methanol R*. Add 20.0 mL of a 10 per cent *V/V* solution of *anhydrous formic acid R* in *methanol R* and mix thoroughly. Filter through a membrane filter (nominal pore size 0.45 µm) and dilute the filtrate to 100.0 mL with a 2 per cent *V/V* solution of *anhydrous formic acid R* in *methanol R*.

**Solution A** Dissolve 10.0 mg of *ursolic acid CRS* in *methanol R* and dilute to 10.0 mL with the same solvent.

**Reference solution (a)** Dilute 1.0 mL of solution A to 10.0 mL with a 2 per cent *V/V* solution of *anhydrous formic acid R* in *methanol R*.

**Reference solution (b)** Dissolve 10 mg of *oleanolic acid R* in *methanol R* and dilute to 10 mL with the same solvent. Mix 1 mL of the solution with 1 mL of solution A and dilute to 10 mL with a 2 per cent *V/V* solution of *anhydrous formic acid R* in *methanol R*.

**Column:**

— size:  $l = 0.15$  m,  $\varnothing = 4.6$  mm;

— stationary phase: end-capped octadecylsilyl silica gel for chromatography R (5 µm);

— temperature: 25 °C.

**Mobile phase** Mix 25 volumes of a 4.6 g/L solution of *ammonium dihydrogen phosphate R* previously adjusted to pH 6.0 with *strong sodium hydroxide solution R*, 35 volumes of *methanol R2* and 40 volumes of *acetonitrile R1*.

**Flow rate** 1.0 mL/min.

**Detection** Spectrophotometer at 205 nm.

**Injection** 20 µL of the test solution and reference solutions (a) and (b).

**Run time** 1.1 times the retention time of *ursolic acid*.

**Relative retention** With reference to *ursolic acid* (retention time = about 42 min): *oleanolic acid* = about 0.95.

**System suitability** Reference solution (b):

— peak-to-valley ratio: minimum 13.0, where  $H_p$  = height above the baseline of the peak due to *ursolic acid* and  $H_v$  = height above the baseline of the lowest point of the curve separating this peak from the peak due to *oleanolic acid*.

Calculate the sum of the percentage contents of *ursolic acid* and *oleanolic acid*, expressed as *ursolic acid*, using the following expression:

$$\frac{A_1 \times m_2 \times p}{A_2 \times m_1} + \frac{A_3 \times m_2 \times p}{A_2 \times m_1}$$

$A_1$	=	area of the peak due to <i>ursolic acid</i> in the chromatogram obtained with the test solution;
$A_2$	=	area of the peak due to <i>ursolic acid</i> in the chromatogram obtained with reference solution (a);
$A_3$	=	area of the peak due to <i>oleanolic acid</i> in the chromatogram obtained with the test solution;
$m_1$	=	mass of the herbal drug to be examined used to prepare the test solution, in grams;
$m_2$	=	mass of <i>ursolic acid CRS</i> used to prepare solution A, in grams;
$p$	=	assigned percentage content of <i>ursolic acid</i> in <i>ursolic acid CRS</i> .

Ph Eur

## Chamomile Flowers

(Roman Chamomile Flower, Ph. Eur. monograph 0380)

Ph Eur

#### DEFINITION

Dried flower-head of the cultivated double variety of *Chamaemelum nobile* (L.) All. (*Anthemis nobilis* L.).

#### Content

Minimum 7 mL/kg of essential oil (dried drug).

#### CHARACTERS

The flower-heads are white or yellowish-grey, composed of solitary hemispherical capitula, made up of a solid conical receptacle bearing the florets, each subtended by a transparent small palea.

#### IDENTIFICATION

A. The capitula have a diameter of 8-20 mm; the receptacle is solid; the base of the receptacle is surrounded by an involucre consisting of 2-3 rows of compact and imbricated bracts with scarious margins. Most florets are ligulate, but a few pale yellow tubular florets occur in the central region. Ligulate florets are white, dull, lanceolate and reflexed with a dark brown, inferior ovary, a filiform style and a bifid stigma; tubular florets have a five-toothed corolla tube, 5 syngenesious, epipetalous stamens and a gynoeceum similar to that of the ligulate florets.

B. Microscopic examination (2.8.23). The powder is pale yellowish-green. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 0380.-1): numerous glandular trichomes, free (side view [D, G]) or on an epidermis (surface view [Ha]), short, biseriate, with a stalk consisting of 2-4 cells and a head usually consisting of 2 cells covered by a swollen cuticle; numerous conical covering trichomes, free or on an epidermis [M], up to 900 µm long, each consisting of 3-4 very short basal cells and a long, thin-walled, terminal cell, about 20 µm wide; all epidermises bear glandular trichomes and whole or fragmented covering trichomes [Ka]; fragments of the involucre bracts [F] with fine spiral vessels [Fb] and cells, some of which are thick-walled, in longitudinal rows [Fa]; bases of the bracts [K] show anomocytic stomata; fragments of paleae [B], with elongated cells and finely pitted sclereids at the base [Ba], the margins of the paleae consist of a single layer of elongated thin-walled cells [E]; fragments of the corolla of the ligulate flowers whose epidermis is covered by a striated cuticle (surface view [H, M]); papillose cells [J] at the apex of the florets; fragments of the ovary [A] which have at their base a sclerous ring [Ab]; cells of the parenchyma of the ovary and the involucre containing small cluster crystals of calcium oxalate [Aa, Fc]; fragments of papillose stigmas [L]; rare rounded or triangular pollen grains about 35 µm in diameter, with 3 germinal pores and a spiny exine [C].

C. High-performance thin-layer chromatography (2.8.25).

**Test solution** To 0.5 g of the powdered herbal drug (355) (2.9.12) add 5.0 mL of *methanol R*. Sonicate for 15 min, then filter or centrifuge the solution and use the filtrate or supernatant.

**Reference solution (a)** Dissolve 3 mg of *chlorogenic acid R* and 5 mg of *apigenin 7-glucoside R* in *methanol R* and dilute to 10.0 mL with the same solvent.

**Reference solution (b)** Dilute 2.5 mL of reference solution (a) to 10.0 mL with *methanol R*.

Figure 0380.-1. – Illustration for identification test B of powdered herbal drug of Roman chamomile flower

**Reference solution (c)** Dissolve 2.5 mg of *hyperoside R* and 3 mg of *chlorogenic acid R* in *methanol R* and dilute to 10.0 mL with the same solvent.

**Intensity marker** Chlorogenic acid.

**Plate** TLC silica gel  $F_{254}$  plate *R* (2–10 µm).

**Mobile phase** *anhydrous formic acid R*, *water R*, *ethyl acetate R* (10:10:80 *V/V/V*).

**Application** 4 µL as bands of 8 mm.

**Development** 70 mm from the lower edge of the plate.

**Drying** In a current of air at room temperature for 5 min.

**Detection** Heat at 100–105 °C for 5 min. Spray the warm plate with a 10 g/L solution of *diphenylboric acid aminoethyl ester R* in *methanol R*, then with a 50 g/L solution of *macrogol 400 R* in *methanol R* or, alternatively, dip the warm plate in a 5 g/L solution of *diphenylboric acid aminoethyl ester R* in *ethyl acetate R*, then in a 50 g/L solution of *macrogol 400 R* in *methylene chloride R*. Allow the plate to dry in air for about 1 min and examine in ultraviolet light at 366 nm.

**System suitability** Reference solution (c):

- the chromatogram shows 2 distinct zones in the middle third which may, however, be touching. The lower zone (chlorogenic acid) shows a light blue fluorescence and the upper zone (hyperoside) shows a yellow or orange fluorescence.

**Results** See below the sequence of zones present in the chromatograms obtained with reference solution (a) and the test solution. Furthermore, in the chromatogram obtained with the test solution, other faint to very faint blue and greenish-blue fluorescent zones may be present, and the greenish-blue fluorescent zone and the brownish-yellow or orange fluorescent to faint fluorescent zone near the solvent front may be overlapped.

## TESTS

### Diameter of the flower-heads

Maximum 3 per cent of flower-heads have a diameter smaller than 8 mm.

### Deteriorated flower-heads

Brown or darkened flower-heads are absent.

### Loss on drying (2.2.32)

Maximum 11.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

### Total ash (2.4.16)

Maximum 8.0 per cent.

## ASSAY

### Essential oil (2.8.12)

Use 20.0 g of whole herbal drug, a 500 mL round-bottomed flask, 250 mL of *water R* as the distillation liquid and 0.50 mL of *xylene R* in the graduated tube. Distil at a rate of 3–3.5 mL/min for 3 h.

Ph Eur

## Chinese Goldthread Rhizome

(Ph. Eur. monograph 2715)

Ph Eur

## DEFINITION

Whole or fragmented, dried rhizome of *Coptis chinensis* Franch., *Coptis deltoidea* C.Y. Cheng & P.K. Hsiao and/or *Coptis teeta* Wall., with roots removed, collected in autumn.

## Content

Minimum 5.0 per cent of berberine ( $C_{20}H_{18}NO_4^+$ ;  $M_r$  336.4) (dried drug).

**IDENTIFICATION**

**A. Whole drug.** Whole rhizome with roots and rootlets removed. The outer surface, yellowish-grey or yellowish-brown, is rough, with irregular nodular protuberances, sometimes with fine, smooth internodes; it is shiny in some parts or covered with a fine powder. Rootlet remains are sometimes present. The apex bears the remains of brown scale leaves and sometimes the remains of stems and petioles. The texture is hard, the fracture uneven with reddish-orange, dark reddish-brown or dark brown bark in transverse section; the wood is bright yellow or orange-yellow, radially arranged and clefts may be present. The pith is often of similar colour to the bark and sometimes hollowed. The rhizome of *C. chinensis*, 3-6 cm long and up to 0.8 cm in diameter (below the crown), may be curved, usually with a few to several rhizomes coming together at the crown; that of *C. deltoidea* is usually singular, somewhat cylindrical and curved with smooth and relatively long internodes, about 4-8 cm long and up to 1 cm in diameter; that of *C. teeta* is singular, distinctly hook-shaped and narrow.

**Fragmented drug** The rhizome is fragmented in transverse or longitudinal slices, 1.2-4.2 cm long, up to 1.1 cm in diameter and up to 4 mm thick. The slices show reddish-orange, dark reddish-brown or dark brown bark, with bright yellow or orange-yellow wood. The wood is radially arranged in transverse section and clefts may be present. The pith is often of similar colour to the bark and sometimes hollowed. The outer surface is yellowish-grey or yellowish-brown, rough, with irregular nodular protuberances; rootlet remains are sometimes present. The slices are easily broken.

**B. Microscopic examination (2.8.23).** The powder is orange or orange-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2715.-1): yellowish-brown or reddish-brown fragments of cork (surface view [B], transverse section [F]); groups of long, often narrow-elliptical, slightly lignified pericyclic fibres with thick channelled walls [C] and a narrow lumen, fibres up to 26 µm in diameter; numerous sclereids (*C. chinensis* or *C. deltoidea*) isolated [D, J] or in groups [E], or also included in parenchyma; sclereids, up to 90 µm in diameter, with thick, yellow lignified walls with pits, channels and striations, cell lumen sometimes with reddish-brown contents; occasional xylem bundles [G]; groups of lignified xylem fibres [A] with slightly thickened walls, 7-28 µm in diameter; the remains of leaves [H] showing an epidermis consisting of cells with beaded walls [Ha] and parenchyma cells with smooth walls [Hb].

**C. Thin-layer chromatography (2.2.27).**

**Test solution** To 0.5 g of the powdered herbal drug (355) (2.9.12) add 5 mL of *methanol R*. Sonicate for 15 min. Centrifuge the solution and use the supernatant.

**Reference solution** Dissolve 5 mg of *berberine chloride R* and 5 mg of *palmitine R* in *methanol R* and dilute to 100 mL with the same solvent.

**Plate** *TLC silica gel plate R* (2-10 µm).

**Mobile phase** *water R*, *methanol R*, *2-propanol R*, *ethyl acetate R*, *toluene R* (1:5:5:10:20 V/V/V/V/V).

**Application** 1 µL as bands of 8 mm.

**Development** In a twin trough tank previously saturated for 20 min without filter paper, over a path of 6 cm.

For saturation, add mobile phase to one trough and *concentrated ammonia R* to the other.

**Drying** In a current of cold air for 10 min.

**Detection** Examine in ultraviolet light at 365 nm.

Figure 2715.-1. – Illustration for identification test B of powdered herbal drug of Chinese goldthread rhizome

**Results** See below the sequence of fluorescent zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other fluorescent zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
	A yellow fluorescent zone
	A yellow fluorescent zone (may be missing)
Berberine: a greenish-yellow fluorescent zone	A greenish-yellow fluorescent zone (berberine)
Palmitine: a greenish-yellow fluorescent zone	A greenish-yellow fluorescent zone (palmitine)
Reference solution	Test solution

**TESTS****Foreign matter (2.8.2)**

Maximum 5 per cent of fragments of roots and leaves and maximum 3 per cent of other foreign matter.

**Loss on drying (2.2.32)**

Maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

**Total ash (2.4.16)**

Maximum 5.0 per cent.

Ash insoluble in hydrochloric acid (2.8.1)

Maximum 2.5 per cent.

### ASSAY

Liquid chromatography (2.2.29).

**Test solution** Disperse 0.100 g of the powdered herbal drug (355) (2.9.12) in 100.0 mL of a mixture of *hydrochloric acid R* and *methanol R* (1:100 V/V). Sonicate for 20 min. Filter 1.5 mL of the solution through a membrane filter (nominal pore size 0.45 µm).

**Reference solution (a)** Dissolve 10.0 mg of *berberine chloride CRS* in a mixture of *hydrochloric acid R* and *methanol R* (1:100 V/V) and dilute to 100.0 mL with the same mixture.

**Reference solution (b)** Dissolve 1 mg of *palmatine R* in reference solution (a) and dilute to 10 mL with reference solution (a).

**Column:**

— size:  $l = 0.25$  m,  $\varnothing = 4$  mm;

— stationary phase: end-capped octadecylsilyl silica gel for chromatography R1 (5 µm).

**Mobile phase:**

— mobile phase A: 0.5 per cent V/V solution of *phosphoric acid R*;

— mobile phase B: 0.5 per cent V/V solution of *phosphoric acid R* in *acetonitrile R*;

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 10	80	20
10 - 20	80 → 79	20 → 21
20 - 35	79 → 65	21 → 35
35 - 40	65	35

**Flow rate** 0.7 mL/min.

**Detection** Spectrophotometer at 344 nm.

**Injection** 10 µL.

**Retention time** *Palmatine* = about 25 min; *berberine* = about 28 min.

**System suitability** Reference solution (b):

— resolution: minimum 1.5 between the peaks due to *palmatine* and *berberine*.

Calculate the percentage content of *berberine* using the following expression:

$$\frac{A_1 \times m_2 \times p}{A_2 \times m_1}$$

- $A_1$  = area of the peak due to *berberine* in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to *berberine* in the chromatogram obtained with reference solution (a);
- $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;
- $m_2$  = mass of *berberine chloride CRS* used to prepare reference solution (a), in grams;
- $p$  = percentage content of *berberine* in *berberine chloride CRS*.

## Cinchona Bark

Cinchona

Red Cinchona Bark

(Ph. Eur. monograph 0174)

### Preparation

Cinchona Liquid Extract, Standardised

When Powdered Cinchona is prescribed or demanded, material complying with the requirements below with the exception of Identification test A and the test for Foreign matter shall be dispensed or supplied.

Ph Eur

### DEFINITION

Whole or cut, dried bark of *Cinchona pubescens* Vahl (*Cinchona succirubra* Pav.), of *Cinchona calisaya* Wedd., of *Cinchona ledgeriana* Moens ex Trimen, or of their varieties or hybrids.

### Content

Minimum 6.5 per cent of total alkaloids, of which 30 per cent to 60 per cent consists of quinine-type alkaloids (dried drug).

### CHARACTERS

Intense bitter, somewhat astringent taste.

### IDENTIFICATION

A. The stem and branch bark is supplied in quilled or curved pieces 2-6 mm thick. The outer surface is dull brownish-grey or grey and frequently bears lichens; it is usually rough, marked with transverse fissures and longitudinally furrowed or wrinkled; exfoliation of the outer surface occurs in some varieties. The inner surface is striated and deep reddish-brown; the fracture is short in the outer part and fibrous in the inner part.

B. Microscopic examination (2.8.23). The powder is reddish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 0174.-1): thin-walled cork cells filled with reddish-brown contents (surface view [K], transverse section [H]); yellow, spindle-shaped striated phloem fibres up to 90 µm in diameter and up to 1300 µm in length, very thick-walled with an uneven lumen and with conspicuous, funnel-shaped pits, whole [A] or fragmented [F, J]; parenchymatous idioblasts filled with microprisms of calcium oxalate [E, G]; clusters of thin-walled phloem parenchyma cells [L] accompanied by medullary rays (tangential section [D]). Examine under a microscope using a 50 per cent V/V solution of *glycerol R*. The powder shows a few starch granules 6-10 µm in diameter, mostly simple but occasionally with 2 or 3 components, free [B] or included in parenchymatous cells [C].

C. Thin-layer chromatography (2.2.27).

**Test solution** To 0.10 g of the powdered herbal drug (180) (2.9.12) in a test-tube add 0.1 mL of *concentrated ammonia R* and 5 mL of *methylene chloride R*. Shake vigorously occasionally during 30 min and filter. Evaporate the filtrate to dryness on a water-bath and dissolve the residue in 1 mL of *anhydrous ethanol R*.

**Reference solution** Dissolve 17.5 mg of *quinine R*, 2.5 mg of *quinidine R*, 10 mg of *cinchonine R* and 10 mg of *cinchonidine R* in 5 mL of *anhydrous ethanol R*.

**Plate** TLC silica gel plate R.

**Mobile phase** *diethylamine R*, *ethyl acetate R*, *toluene R* (10:20:70 V/V/V).

Figure 0174.-1. – Illustration for identification test B of powdered herbal drug of cinchona bark

**Application** 10 μL as bands.

**Development** Twice over a path of 15 cm.

**Drying** At 100-105 °C, then allow to cool.

**Detection A** Spray with *anhydrous formic acid R* and allow to dry in air; examine in ultraviolet light at 365 nm.

**Results A** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other fluorescent zones are present in the chromatogram obtained with the test solution.

Top of the plate	
Quinidine: a distinct blue fluorescent zone	A distinct blue fluorescent zone (quinidine)
Quinine: a distinct blue fluorescent zone	A distinct blue fluorescent zone (quinine)
Reference solution	Test solution

**Detection B** Spray with *iodoplatinate reagent R*.

**Results B** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones are present in the chromatogram obtained with the test solution.

Top of the plate	
Cinchonine: a violet zone that becomes violet-grey	A violet zone that becomes violet-grey (cinchonine)
Quinidine: a violet zone that becomes violet-grey	A violet zone that becomes violet-grey (quinidine)
Cinchonidine: an intense dark blue zone	An intense dark blue zone (cinchonidine)
Quinine: a violet zone that becomes violet-grey	A violet zone that becomes violet-grey (quinine)
Reference solution	Test solution

**TESTS**

**Total ash (2.4.16)**

Maximum 6.0 per cent.

**Loss on drying (2.2.32)**

Maximum 10 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

**ASSAY**

**Test solution** In a 250 mL conical flask mix 1.000 g of the powdered herbal drug (180) (2.9.12) with 10 mL of *water R* and 7 mL of *dilute hydrochloric acid R*. Heat in a water-bath for 30 min, allow to cool and add 25 mL of *methylene chloride R*, 50 mL of *ether R* and 5 mL of a 200 g/L solution of *sodium hydroxide R*. Shake the mixture repeatedly for 30 min, add 3 g of powdered *tragacanth R* and shake until the mixture becomes clear. Filter through a plug of absorbent cotton and rinse the flask and the cotton with 5 quantities, each of 20 mL, of a mixture of 1 volume of *methylene chloride R* and 2 volumes of *ether R*. Combine the filtrate and washings, evaporate to dryness and dissolve the residue in 10.0 mL of *anhydrous ethanol R*. Evaporate 5.0 mL of this solution to dryness, dissolve the residue in 0.1 M *hydrochloric acid* and dilute to 1000.0 mL with the same acid.

**Reference solutions** Dissolve separately 30.0 mg of *quinine R* and 30.0 mg of *cinchonine R* in 0.1 M *hydrochloric acid* and dilute each solution to 1000.0 mL with the same acid.

Measure the absorbances (2.2.25) of the 3 solutions at 316 nm and 348 nm using 0.1 M *hydrochloric acid* as the compensation liquid.

Calculate the percentage content of alkaloids using the following equations:

$$x = \frac{[A_{316} \times A_{348c}] - [A_{316c} \times A_{348}]}{[A_{316q} \times A_{348c}] - [A_{316c} \times A_{348q}]} \times \frac{100}{m} \times \frac{2}{1000}$$

$$y = \frac{[A_{316} \times A_{348q}] - [A_{316q} \times A_{348}]}{[A_{316c} \times A_{348q}] - [A_{316q} \times A_{348c}]} \times \frac{100}{m} \times \frac{2}{1000}$$

- m* = mass of the herbal drug used, in grams;
- x* = percentage content of quinine-type alkaloids;
- y* = percentage content of cinchonine-type alkaloids;
- A*<sub>316</sub> = absorbance of the test solution at 316 nm;
- A*<sub>348</sub> = absorbance of the test solution at 348 nm;
- A*<sub>316c</sub> = absorbance of the reference solution containing cinchonine at 316 nm, corrected to a concentration of 1 mg/1000 mL;
- A*<sub>316q</sub> = absorbance of the reference solution containing quinine at 316 nm, corrected to a concentration of 1 mg/1000 mL;
- A*<sub>348c</sub> = absorbance of the reference solution containing cinchonine at 348 nm, corrected to a concentration of 1 mg/1000 mL;
- A*<sub>348q</sub> = absorbance of the reference solution containing quinine at 348 nm, corrected to a concentration of 1 mg/1000 mL.

Calculate the content of total alkaloids ( $x + y$ ), and calculate the relative content of quinine-type alkaloids using the following expression:

$$\frac{100x}{x + y}$$

Ph Eur

## Standardised Cinchona Liquid Extract

(Ph. Eur. monograph 1818)

Ph Eur

### DEFINITION

Liquid extract produced from *Cinchona bark* (0174).

### Content

Minimum 4.0 per cent and maximum 5.0 per cent of total alkaloids, of which 30 per cent to 60 per cent are alkaloids of the quinine type ( $C_{20}H_{24}N_2O_2$ ;  $M_r$  324.4).

### PRODUCTION

Standardised cinchona liquid extract is produced from the herbal drug by an appropriate procedure using:

- ethanol (30 per cent *V/V* to 90 per cent *V/V*), or;
- a mixture of diluted hydrochloric acid, ethanol (96 per cent *V/V*), glycerol, water (1:2:5:20 *V/V*).

### CHARACTERS

#### Appearance

Brownish-red liquid.

It has a bitter, astringent taste.

### IDENTIFICATION

Thin-layer chromatography (2.2.27).

**Test solution** Dilute 1 mL of the extract to be examined in 1 mL of *anhydrous ethanol R*.

**Reference solution** Dissolve 2.5 mg of *quinidine R*, 10 mg of *cinchonidine R*, 10 mg of *cinchonine R* and 17.5 mg of *quinine R* in 5 mL of *anhydrous ethanol R*.

**Plate** TLC silica gel plate R (5-40  $\mu\text{m}$ ) [or TLC silica gel plate R (2-10  $\mu\text{m}$ )].

**Mobile phase** *diethylamine R*, *ethyl acetate R*, *toluene R* (10:20:70 *V/V/V*).

**Application** 10  $\mu\text{L}$  [or 2  $\mu\text{L}$ ] as bands.

**Development** Twice over a path of 15 cm [or 6 cm].

**Drying** At 100-105 °C then allow to cool.

**Detection A** Spray with a 50 g/L solution of *anhydrous formic acid R* and allow to dry in air; examine in ultraviolet light at 365 nm.

**Results A** See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other fluorescent zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Quinidine: a distinct blue fluorescent zone	A distinct blue fluorescent zone (quinidine)
Quinine: a distinct blue fluorescent zone	A distinct blue fluorescent zone (quinine)
Reference solution	Test solution

**Detection B** Spray with *iodoplatinate reagent R*.

**Results B** See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Cinchonine: a violet-grey zone	A violet-grey zone (cinchonine)
Quinidine: a violet-grey zone	A violet-grey zone (quinidine)
Cinchonidine: an intense dark blue zone	An intense dark blue zone (cinchonidine)
Quinine: a violet-grey zone	A violet-grey zone (quinine)
Reference solution	Test solution

### TESTS

#### Ethanol (2.9.10)

95 per cent to 105 per cent of the content stated on the label.

#### Methanol and 2-propanol (2.9.11)

Maximum 0.05 per cent *V/V* of methanol and maximum 0.05 per cent *V/V* of 2-propanol.

#### Dry residue (2.8.16)

Minimum 12.0 per cent for glycerol-free standardised cinchona liquid extract and minimum 30.0 per cent for glycerol-containing standardised cinchona extract, determined on 2.0 g.

### ASSAY

**Test solution** In a 250 mL conical flask, mix about 1.000 g of the extract to be examined with 10 mL of *water R* and 7 mL of *dilute hydrochloric acid R*. Heat in a water-bath for 30 min, allow to cool and add 25 mL of *methylene chloride R*, 50 mL of *ether R* and 5 mL of a 200 g/L solution of *sodium hydroxide R*. Shake the mixture frequently for 30 min, add 3 g of powdered *tragacanth R* and shake until the mixture becomes clear. Filter through a plug of absorbent cotton, rinse the flask and the cotton with 5 quantities, each of 20 mL, of a mixture of 1 volume of *methylene chloride R* and 2 volumes of *ether R*. Combine the filtrate and washings, evaporate to dryness and dissolve the residue in 10.0 mL of *ethanol (96 per cent) R*. Evaporate 5.0 mL of this solution to dryness, dissolve the residue in 0.1 M *hydrochloric acid* and dilute to 1000.0 mL with the same acid.

**Reference solution (a)** Dissolve 30.0 mg of *cinchonine R* in 0.1 M *hydrochloric acid* and dilute to 1000.0 mL with the same acid.

**Reference solution (b)** Dissolve 30.0 mg of *quinine R* in 0.1 M hydrochloric acid and dilute to 1000.0 mL with the same acid.

Measure the absorbances (2.2.25) of the 3 solutions at 316 nm and 348 nm, using 0.1 M hydrochloric acid as the compensation liquid.

Calculate the percentage content of alkaloids from the following equations:

$$n_1 = \frac{[A_1 \times A_{2a}] - [A_{1a} \times A_2]}{[A_{1b} \times A_{2a}] - [A_{1a} \times A_{2b}]} \times \frac{100}{m} \times \frac{2}{1000}$$

$$n_2 = \frac{[A_1 \times A_{2b}] - [A_{1b} \times A_2]}{[A_{1a} \times A_{2b}] - [A_{1b} \times A_{2a}]} \times \frac{100}{m} \times \frac{2}{1000}$$

- m* = mass of the liquid extract to be examined in grams;  
*n*<sub>1</sub> = percentage content of quinine-type alkaloids;  
*n*<sub>2</sub> = percentage content of cinchonine-type alkaloids;  
*A*<sub>1</sub> = absorbance of the test solution at 316 nm;  
*A*<sub>2</sub> = absorbance of the test solution at 348 nm;  
*A*<sub>1a</sub> = absorbance of reference solution (a) at 316 nm, corrected to a concentration of 1 mg/1000 mL;  
*A*<sub>1b</sub> = absorbance of reference solution (b) at 316 nm, corrected to a concentration of 1 mg/1000 mL;  
*A*<sub>2a</sub> = absorbance of reference solution (a) at 348 nm, corrected to a concentration of 1 mg/1000 mL;  
*A*<sub>2b</sub> = absorbance of reference solution (b) at 348 nm, corrected to a concentration of 1 mg/1000 mL.

Calculate the content of total alkaloids (*n*<sub>1</sub> + *n*<sub>2</sub>), and the relative content of quinine-type alkaloids, from the following expression:

$$\frac{n_1 \times 100}{n_1 + n_2}$$

#### LABELLING

The label states the solvent composition used for the production.

Ph Eur

## Cinnamon

Cinnamon Bark

Ceylon Cinnamon

(Ph. Eur. monograph 0387)

When Powdered Cinnamon is prescribed or demanded, material complying with the requirements below with the exception of Identification test A and containing not less than 1.0% w/w (10 mL/kg) of essential oil shall be dispensed or supplied.

Ph Eur

#### DEFINITION

Dried bark, freed from the outer cork and the underlying parenchyma, of the shoots grown on cut stock of *Cinnamomum verum* J.Presl.

#### Content

Minimum 12 mL/kg of essential oil.

#### CHARACTERS

Characteristic, aromatic odour.

#### IDENTIFICATION

A. The bark is about 0.2-0.8 mm thick and occurs in closely packed compound quills made up of single or double quills. The outer surface is smooth, yellowish-brown with faint scars

marking the position of leaves and axillary buds and has fine, whitish and wavy longitudinal striations. The inner surface is slightly darker and longitudinally striated. The fracture is short and fibrous.

B. Microscopic examination (2.8.23). The powder is yellowish or reddish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 0387.-1): rounded sclereids with pitted, channelled and moderately thickened walls, single [E, F] or in groups [C]; numerous colourless, single fibres, often whole [A], or fragmented [D], with a narrow lumen, thickened, lignified walls and few pits; small acicular crystals of calcium oxalate in parenchymatous cells [J]; very numerous oil droplets [B]. Cork fragments [G] are absent or very rare. Examine under a microscope using a 50 per cent V/V solution of *glycerol R*. The powder shows abundant starch granules [H].

Figure 0387.-1. – Illustration for identification test B of powdered herbal drug of cinnamon

#### C. Thin-layer chromatography (2.2.27).

**Test solution** Shake 0.1 g of the powdered herbal drug (500) (2.9.12) with 2 mL of *methylene chloride R* for 15 min. Filter and evaporate the filtrate carefully almost to dryness on a water-bath. Dissolve the residue in 0.4 mL of *toluene R*.

**Reference solution** Dissolve 50 µL of *cinnamic aldehyde R* and 10 µL of *eugenol R* in *toluene R* and dilute to 10 mL with the same solvent.

**Plate** TLC silica gel GF<sub>254</sub> plate R.

**Mobile phase** *methylene chloride R*.

**Application** 10 µL as bands of 20 mm by 3 mm.

**Development** Over a path of 10 cm.

**Drying** In air.

**Detection A** Examine in ultraviolet light at 254 nm and mark the quenching zones, then examine in ultraviolet light at 365 nm and mark the fluorescent zones.

**Results A** Examined in ultraviolet light at 254 nm, the chromatograms obtained with the test solution and the reference solution show a quenching zone due to cinnamaldehyde in the median part and, just above it, a weaker quenching zone due to eugenol; examined in ultraviolet light at 365 nm, the chromatogram obtained with the test solution shows a fluorescent light blue zone due to *o*-methoxycinnamaldehyde just below the zone due to cinnamaldehyde.

**Detection B** Spray with *phloroglucinol solution R*.

**Results B** The zone due to cinnamaldehyde is yellowish-brown and the zone due to *o*-methoxycinnamaldehyde is violet.

#### TESTS

**Total ash (2.4.16)**

Maximum 6.0 per cent.

#### ASSAY

**Essential oil (2.8.12)**

Use 20.0 g of drug reduced to a powder (710) (2.9.12) immediately before the determination, a 500 mL flask, 200 mL of 0.1 M hydrochloric acid as the distillation liquid, and 0.50 mL of *xylene R* in the graduated tube. Distil at a rate of 2.5-3.5 mL/min for 3 h.

Ph Eur

## Ceylon Cinnamon Bark Oil

Cinnamon Oil

(Ph. Eur. monograph 1501)

#### Preparation

Concentrated Cinnamon Water

Ph Eur

#### DEFINITION

Essential oil obtained by steam distillation of the bark of the shoots of *Cinnamomum verum* J.Presl.

#### CHARACTERS

##### Appearance

Clear, mobile, light yellow liquid becoming reddish over time.

Characteristic odour reminiscent of cinnamic aldehyde.

#### IDENTIFICATION

**First identification: B.**

**Second identification: A.**

**A. Thin-layer chromatography (2.2.27).**

**Test solution** Dissolve 1 mL of the essential oil to be examined in *acetone R* and dilute to 10 mL with the same solvent.

**Reference solution** Dissolve 50 µL of *trans-cinnamic aldehyde R*, 10 µL of *eugenol R*, 10 µL of *linalol R* and 10 µL of *β-caryophyllene R* in *ethanol (96 per cent) R* and dilute to 10 mL with the same solvent.

**Plate** TLC silica gel plate *R*.

**Mobile phase** *methanol R*, *toluene R* (10:90 V/V).

**Application** 10 µL as bands.

**Development** Over a path of 15 cm.

**Drying** In air.

**Detection** Spray with *anisaldehyde solution R*; heat at 100-105 °C for 5-10 min and examine in daylight.

**Results** The zones in the chromatogram obtained with the test solution are similar in position and colour to those in the chromatogram obtained with the reference solution.

**B. Examine the chromatograms obtained in the test for chromatographic profile.**

**Results** The principal peaks in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with the reference solution. Safrole, coumarin and cineole may be absent from the chromatogram obtained with the test solution.

#### TESTS

**Relative density (2.2.5)**

1.000 to 1.030.

**Refractive index (2.2.6)**

1.572 to 1.591.

**Optical rotation (2.2.7)**

-2° to +1°.

#### Chromatographic profile

**Gas chromatography (2.2.28):** use the normalisation procedure.

**Test solution** The essential oil to be examined.

**Reference solution** Dissolve 10 µL of *cineole R*, 10 µL of *linalol R*, 10 µL of *β-caryophyllene R*, 10 µL of *safrole R*, 100 µL of *trans-cinnamic aldehyde R*, 10 µL of *eugenol R*, 20 mg of *coumarin R*, 10 µL of *trans-2-methoxycinnamaldehyde R* and 10 µL of *benzyl benzoate R* in 1 mL of *acetone R*.

#### Column:

— **material:** fused silica;

— **size:** *l* = 60 m,  $\varnothing$  = 0.25 mm;

— **stationary phase:** *macrogol 20 000 R*.

**Carrier gas** *helium for chromatography R*.

**Flow rate** 1.5 mL/min.

**Split ratio** 1:100.

**Temperature:**

	Time (min)	Temperature (°C)
Column	0 - 10	60
	10 - 75	60 → 190
	75 - 200	190
Injection port		200
Detector		240

**Detection** Flame ionisation.

**Injection** 0.2 µL.

**Elution order** Order indicated in the composition of the reference solution; depending on the operating conditions and the state of the column, coumarin may elute before or after *trans-2-methoxycinnamaldehyde*; record the retention times of these substances.

**System suitability** Reference solution:

— **resolution:** minimum 1.5 between the peaks due to *linalol* and *β-caryophyllene*.

**Identification of components** Using the retention times determined from the chromatogram obtained with the reference solution, locate the components of the reference solution in the chromatogram obtained with the test solution.

Determine the percentage content of each of these components. The percentages are within the following ranges:

— **cineole:** maximum 3.0 per cent;

- *linalol*: 1.0 per cent to 6.0 per cent;
- *β-caryophyllene*: 1.0 per cent to 4.0 per cent;
- *safrole*: maximum 0.5 per cent;
- *trans-cinnamic aldehyde*: 55 per cent to 75 per cent;
- *eugenol*: maximum 7.5 per cent;
- *coumarin*: maximum 0.5 per cent;
- *trans-2-methoxycinnamaldehyde*: 0.1 per cent to 1.0 per cent;
- *benzyl benzoate*: maximum 1.0 per cent.

**STORAGE**

Protected from heat.

Ph Eur

**Concentrated Cinnamon Water****DEFINITION**

Cinnamon Oil	20 mL
Ethanol (90 per cent)	600 mL
Water	Sufficient to produce 1000 mL

**Extemporaneous preparation**

The following directions apply.

Dissolve the Cinnamon Oil in the Ethanol (90 per cent) and add gradually, with vigorous shaking after each addition, sufficient Water to produce 1000 mL. Add 50 g of previously sterilised Purified Talc, or other suitable filtering aid, allow to stand for a few hours, shaking occasionally, and filter.

The water complies with the requirements stated under *Aromatic Waters* and with the following requirements.

**TESTS****Ethanol content**

52 to 56% v/v, Appendix VIII F.

**Weight per mL**

0.914 to 0.922 g, Appendix V G.

**Ceylon Cinnamon Leaf Oil**

(Ph. Eur. monograph 1608)

Ph Eur

**DEFINITION**

Oil obtained by steam distillation of the leaves of *Cinnamomum verum* J.S. Presl.

**CHARACTERS****Appearance**

Clear, mobile, reddish-brown or dark brown liquid.

Characteristic odour reminiscent of eugenol.

**IDENTIFICATION***First identification: B.**Second identification: A.*

A. Thin-layer chromatography (2.2.27).

*Test solution* Dilute 1 mL of the substance to be examined in *acetone R* and dilute to 10 mL with the same solvent.

*Reference solution* Dilute about 50 µL of *trans-cinnamic aldehyde R*, 10 µL of *eugenol R*, 10 µL of *linalol R* and 10 µL of *β-caryophyllene R* in *alcohol R* and dilute to 10 mL with the same solvent.

*Plate* TLC silica gel plate R.

*Mobile phase* *methanol R*, *toluene R* (10:90 V/V).

*Application* 10 µL, as bands.

*Development* Over a path of 15 cm.

*Drying* In air.

*Detection* Spray with *anisaldehyde solution R*. Examine in day light while heating at 100-105 °C for 5-10 min.

*Results* The zones in the chromatogram obtained with the test solution are similar in position and colour to those in the chromatogram obtained with the reference solution. The zone due to *trans-cinnamic aldehyde* may be very faint or absent.

B. Examine the chromatogram obtained in the test for chromatographic profile.

*Results* The characteristic peaks in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with the reference solution. The peaks corresponding to *cineole*, *safrole*, *trans-cinnamic aldehyde*, *cinnamyl acetate* and *coumarin* may be absent in the chromatogram obtained with the test solution.

**TESTS****Relative density (2.2.5)**

1.030 to 1.059.

**Refractive index (2.2.6)**

1.527 to 1.540.

**Optical rotation (2.2.7)**

-2.5° to +2.0°.

**Chromatographic profile**

*Gas chromatography (2.2.28):* use the normalisation procedure.

*Test solution* The substance to be examined.

*Reference solution* Dissolve 10 µL of *cineole R*, 10 µL of *linalol R*, 10 µL of *β-caryophyllene R*, 10 µL of *safrole R*, 10 µL of *trans-cinnamic aldehyde R*, 10 µL of *cinnamyl acetate R*, 100 µL of *eugenol R* and 10 mg of *coumarin R* in 1 mL of *acetone R*.

**Column:**

- *material*: fused silica,
- *size*:  $l = 60$  m,  $\varnothing = 0.25$  mm,
- *stationary phase*: *macrogol 20 000 R*.

*Carrier gas* *helium for chromatography R*.

*Flow rate* 1.5 mL/min.

*Split ratio* 1/100.

*Temperature:*

	Time (min)	Temperature (°C)
Column	0 - 10	45
	10 - 78	45 → 180
	78 - 88	180
Injection port		200
Detector		240

*Detection* Flame ionisation.

*Injection* 0.2 µL.

*Elution order* The order indicated in the composition of the reference solution. Record the retention times of these substances.

*System suitability* Reference solution:

- *resolution*: minimum of 1.5 between the peaks due to *linalol* and *β-caryophyllene*.

Using the retention times determined from the chromatogram obtained with the reference solution, locate

the components of the reference solution in the chromatogram obtained with the test solution.

Determine the percentage content of these components.

The percentages are within the following ranges:

- *cineole*: maximum 1.0 per cent,
- *linalol*: 1.5 per cent to 3.5 per cent,
- $\beta$ -*caryophyllene*: 1.5 per cent to 7.0 per cent,
- *safrole*: maximum 3.0 per cent,
- *trans-cinnamic aldehyde*: maximum 3.0 per cent,
- *cinnamyl acetate*: maximum 2.0 per cent,
- *eugenol*: 70 per cent to 85 per cent,
- *coumarin*: maximum 1.0 per cent.

#### STORAGE

## Citronella Oil

(Ph. Eur. monograph 1609)

Ph Eur

#### DEFINITION

Oil obtained by steam distillation from the fresh or partially dried aerial parts of *Cymbopogon winterianus* Jowitt.

#### CHARACTERS

##### Appearance

Pale yellow or brown-yellow liquid.

Very strong odour of citronellal.

#### IDENTIFICATION

First identification: B.

Second identification: A.

A. Thin-layer chromatography (2.2.27).

**Test solution** Dilute 0.1 g of citronella oil in 10.0 mL of alcohol R.

**Reference solution** Dilute 20  $\mu$ L of citronellal R in 10.0 mL of alcohol R.

**Plate** TLC silica gel plate R.

**Mobile phase** ethyl acetate R, toluene R (10:90 V/V).

**Application** 5  $\mu$ L, as bands.

**Development** Over a path of 15 cm.

**Drying** In air.

**Detection** Spray with anisaldehyde solution R and heat at 100–105 °C for 10 min. Examine in ultraviolet light at 365 nm.

**Result** See below the sequence of the zones present in the chromatograms obtained with the reference and test solutions. Furthermore, other zones are present in the chromatogram obtained with the test solution.

Top of the plate	
Citronellal: a violet zone	A zone similar in colour to the citronellal zone An orange zone (citronellol-geraniol)
Reference solution	Test solution

B. Examine the chromatograms obtained in the test for chromatographic profile.

**Results** The characteristic peaks in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with the reference solution. Neral and geraniol may be absent in the chromatogram obtained with the test solution.

#### TESTS

**Relative density (2.2.5)**  
0.881 to 0.895.

**Refractive index (2.2.6)**  
1.463 to 1.475.

**Optical rotation (2.2.7)**  
–4° to +1.5°.

#### Chromatographic profile

**Gas chromatography (2.2.28):** use the normalisation procedure.

**Test solution** The substance to be examined.

**Reference solution** Dilute 25  $\mu$ L of limonene R, 100  $\mu$ L of citronellal R, 25  $\mu$ L of citronellyl acetate R, 25  $\mu$ L of citral R, 25  $\mu$ L of geranyl acetate R, 25  $\mu$ L of citronellol R and 100  $\mu$ L of geraniol R in 5 mL of hexane R.

#### Column:

- **material:** fused silica,
- **size:**  $l = 60$  m,  $\varnothing = 0.25$  mm,
- **stationary phase:** macrogol 20 000 R (0.2  $\mu$ m).

**Carrier gas** helium for chromatography R.

**Flow rate** 1.0 mL/min.

**Split ratio** 1:100.

#### Temperature:

	Time (min)	Temperature (°C)
Column	0 - 2	80
	2 - 26	80 → 150
	26 - 42	150 → 185
	42 - 49	185 → 250
Injection port		260
Detector		260

**Detection** Flame ionisation.

**Injection** 1  $\mu$ L of the reference solution, 0.2  $\mu$ L of the test solution.

**Elution order** The order indicated in the composition of the reference solution. Record the retention times of these substances.

**System suitability** Reference solution:

- **resolution:** minimum of 1.2 between the peaks due to geranyl acetate and citronellol.

Using the retention times determined from the chromatogram obtained with the reference solution, locate the components of the reference solution in the chromatogram obtained with the test solution.

Determine the percentage content of each of these components.

The percentages are within the following values:

- *limonene*: 1.0 per cent to 5.0 per cent,
- *citronellal*: 30.0 per cent to 45.0 per cent,
- *citronellyl acetate*: 2.0 per cent to 4.0 per cent,
- *neral*: maximum 2.0 per cent,
- *geraniol*: maximum 2.0 per cent,
- *geranyl acetate*: 3.0 per cent to 8.0 per cent,
- *citronellol*: 9.0 per cent to 15.0 per cent,
- *geraniol*: 20.0 per cent to 25.0 per cent.

Ph Eur

## Clematis Armandii Stem

(Ph. Eur. monograph 2463)

Ph Eur

### DEFINITION

Whole or fragmented, dried stem of *Clematis armandii* Franch., with cork removed, collected in spring or autumn.

### Content

Minimum 0.30 per cent of oleanolic acid ( $C_{30}H_{48}O_3$ ;  $M_r$  456.7) (dried drug).

### IDENTIFICATION

A. The whole stem is long and cylindrical, slightly twisted on itself, about 1-6.5 cm in diameter. It shows nodes, usually swollen, with leaf and branch scars. The outer surface is brownish-yellow or dull brownish-yellow, showing longitudinal grooves and striations corresponding to the ends of the medullary rays. Rare cork remnants are easily removed as longitudinal strips. The texture is hard. The fracture is difficult.

The fragmented stem occurs in thick or thin slices, about 1-5 mm thick and 1.2-4.6 cm in diameter, with uneven margins; most of the transverse section consists of the pale yellow or slightly brownish-yellow wood and shows numerous radial striations and cracks corresponding to the medullary rays; the vessels are clearly visible in transverse section arranged in groups in more or less discontinuous concentric rings. Narrow, convex-shaped bark remnants are sometimes present with an enclosed lacuna between the bark and wood parts. The bark is easily removed. The pale yellow or whitish, rarely blackened, reduced pith, is sometimes replaced by a hollow.

B. Microscopic examination (2.8.23). The powder is whitish-yellow to brownish-yellow. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2463.-1): very numerous fragments of pitted vessels [B, G] up to 250  $\mu$ m in diameter, isolated or associated with elongated tracheids about 15-25  $\mu$ m in diameter with lignified, thickened and pitted walls [Ba], some groups of vessels [F] show oblique striations [Fa], sometimes associated with xylem parenchyma cells with lignified and pitted walls [Fb]; groups of fusiform pericyclic fibres 25-30  $\mu$ m in diameter, with thick, pitted walls [J]; thin-walled parenchymatous cells of the phloem and of outer parts of the medullary rays [E]; parenchymatous cells of the secondary xylem and the inner parts of the medullary rays and pith, with slightly thickened, pitted and lignified walls [H]; sub-rectangular or fusiform sclereids, about 100  $\mu$ m long and 35  $\mu$ m wide, with thick and pitted walls [C]; rare fragments of orange-brown cork covered by a cuticle showing striations [A]. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows rare starch granules, simple or 2-3 compound, spherical or ovate; individual granules up to 17  $\mu$ m in diameter, with a punctiform or slit-shaped hilum [D].

C. Thin-layer chromatography (2.2.27).

**Test solution** To 1 g of the powdered herbal drug (1400) (2.9.12) add 5 mL of *methanol R* and heat on a water-bath at 60 °C for 5 min. Filter.

**Reference solution** Dissolve 4 mg of *hederagenin R* and 4 mg of *oleanolic acid R* in 10 mL of *methanol R*.

**Plate** TLC silica gel  $F_{254}$  plate R (5-40  $\mu$ m) [or TLC silica gel  $F_{254}$  plate R (2-10  $\mu$ m)].

Figure 2463.-1. – Illustration for identification test B of powdered herbal drug of *Clematis armandii* stem

**Mobile phase** *acetic acid R*, *acetone R*, *toluene R* (2:8:32 *V/V/V*).

**Application** 40  $\mu$ L [or 10  $\mu$ L] as bands of 10 mm [or 8 mm].

**Development** Over a path of 13 cm [or 6 cm].

**Drying** In air.

**Detection** Treat with *vanillin reagent R*, heat at 100 °C for 5 min and examine in daylight.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other mainly grey zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
	A bluish-violet zone
Oleanolic acid: a reddish-violet zone	A reddish-violet zone
	A weak light blue or grey zone
Hederagenin: a greenish-brown zone	
	An orange zone
Reference solution	Test solution

### TESTS

*Aristolochia manshuriensis* Kom. and other species of *Aristolochia*

Examine the powdered herbal drug (355) (2.9.12) under a microscope using *chloral hydrate solution R*; no cluster crystals are visible.

**Aristolochic acids (2.8.21, Method A)**

It complies with the test.

**Loss on drying (2.2.32)**

Maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (1400) (2.9.12) by drying in an oven at 105 °C for 2 h.

**Total ash (2.4.16)**

Maximum 3.0 per cent.

**ASSAY**

Liquid chromatography (2.2.29).

**Test solution** In a 100 mL flask, disperse 1.00 g of the powdered herbal drug (355) (2.9.12) in *methanol R*, add 3 mL of 6 M *hydrochloric acid R* and dilute to 30 mL with *methanol R*. Shake for 2 h. Filter, add to the filtrate 10 mL of *water R* by rinsing the flask and the filter, and extract with 3 quantities, each of 30 mL, of *methylene chloride R*. Combine the methylene chloride extracts and evaporate to dryness. Dissolve the residue in 10.0 mL of *methanol R*, shake and filter through a membrane filter (nominal pore size 0.45 µm).

**Reference solution (a)** Dissolve 10.0 mg of *oleanolic acid CRS* in *methanol R* and dilute to 20.0 mL with the same solvent.

**Reference solution (b)** Dissolve 5.0 mg of *ursolic acid R* in reference solution (a) and dilute to 10.0 mL with the same solution.

**Column:**

— size:  $l = 0.25$  m,  $\varnothing = 4.6$  mm;

— stationary phase: end-capped octadecylsilyl silica gel for chromatography R (5 µm);

— temperature: 30 °C.

**Mobile phase** 0.4 per cent *V/V* solution of *acetic acid R*, *methanol R* (15:85 *V/V*).

**Flow rate** 1.0 mL/min.

**Detection** Spectrophotometer at 210 nm.

**Injection** 20 µL.

**Run time** 1.2 times the retention time of ursolic acid.

**Retention time** Oleanolic acid = about 21 min; ursolic acid = about 22 min.

**System suitability** Reference solution (b):

— resolution: minimum 1.3 between the peaks due to oleanolic acid and ursolic acid.

Calculate the percentage content of oleanolic acid using the following expression:

$$\frac{A_1 \times m_2 \times p}{A_2 \times m_1 \times 2}$$

- $A_1$  = area of the peak due to oleanolic acid in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to oleanolic acid in the chromatogram obtained with reference solution (a);
- $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;
- $m_2$  = mass of *oleanolic acid CRS* used to prepare reference solution (a), in grams;
- $p$  = percentage content of oleanolic acid in *oleanolic acid CRS*.

**Clivers**

Cleavers

**DEFINITION**

Clivers contains the whole herb, or parts of, *Galium aparine* L. collected during the flowering and fruiting period.

**IDENTIFICATION**

A. Stems, which comprise the bulk of the cut herb, are green to brown, branched at nodes, hollow, quadrangular, with a distinct ridge at each corner and up to about 3 mm wide. Remains of leaf whorls may be visible and younger stems have stiff, downward-projecting bristles. Leaves are linear or lanceolate, up to 6 cm long and 5 mm wide, arranged in whorls of 6-8. The upper surface is dark green, with stiff hairs along the entire, revolute margins, and the lower surface pale with a matt, felted appearance and a prominent midrib. Flowers, if present, are small, white, about 3 mm in diameter, consisting of 4 elliptical petals, either solitary or in small cymes of 2-3. At the base of each flower is a pair of carpels, covered with stiff hooked hairs, and at the base of each short peduncle are 1-4 secondary leafy bracts. The fruit is a purplish double achene, covered in stiff, hooked bristles.

B. Reduce to a powder, Appendix XVII A. Examine under a microscope using *chloral hydrate solution*. The powder shows the following characteristics: fragments of stem dominate and are very abundant; thin-walled, elongated epidermal cells, layers of collenchyma from the ridges, parenchyma from the cortex, and lignified xylem vessels and tracheids. The numerous unicellular covering trichomes are characteristic, 70-100 µm long, faintly striated longitudinally and tapering to an acute, hooked apex. Leaf fragments show wavy-walled upper epidermal cells and more sinuous lower epidermal cells, with paracytic stomata on both surfaces but more numerous on the lower. Hooked unicellular trichomes, similar to those on the stem, occur near the margins and midrib on the lower surface of the leaf and covering, usually non-hooked, trichomes occur randomly on the upper surface. Large idioblasts, up to 250 µm long and 30 µm wide, containing bundles of needle crystals of calcium oxalate, occur in the spongy mesophyll. Flower fragments infrequent, outer epidermis of corolla thin-walled and faintly striated, inner epidermis papillose, and calcium oxalate idioblasts similar to those from the leaf. Pollen grains spherical, 30-35 µm in diameter, with up to 8 pores and a faintly warty exine. The fruit pericarp, if present, shows a dense mass of the characteristic hooked trichomes.

C. Carry out the method for *high performance thin-layer chromatography*, Appendix XI W, using the following solutions.

(1) To 0.5 g of the powdered herbal drug add 5.0 mL of *methanol* and mix with the aid of ultrasound for 15 minutes; Centrifuge or filter and use the supernatant liquid or filtrate as the test solution.

(2) 0.020% w/v of *chlorogenic acid*, 0.025% w/v of *rutin*, and 0.05% w/v of *fructose* in *methanol*.

(3) Dilute 1 volume of solution (2) to 4 volumes with *methanol*.

(4) 0.020% w/v of *chlorogenic acid* and 0.030% w/v of *hyperoside* in *methanol*.

**CHROMATOGRAPHIC CONDITIONS**

(a) Use as the coating *high performance silica gel F<sub>254</sub>* (Merck silica gel 60 F<sub>254</sub> plates are suitable).

(b) Use the mobile phase as described below.

Ph Eur

- (c) Apply 5 µL of each solution, as 8 mm bands.  
 (d) Develop the plate to 7 cm.  
 (e) After removal of the plate, dry in a current of air.  
 (f) Heat the plate at 100° for 3 minutes, dip the warm plate in a 0.5% w/v solution of 2-aminoethyl diphenylborinate in ethyl acetate and examine under ultraviolet light (366 nm).  
 (g) Dip the plate in anisaldehyde solution, heat at 100° for 3 minutes and examine under white light.

**MOBILE PHASE**

11 volumes of acetic acid, 11 volumes of formic acid, 26 volumes of water and 100 volumes of ethyl acetate.

**SYSTEM SUITABILITY**

The test is not valid unless the chromatogram obtained with solution (4) shows two clearly separated zones under 366 nm.

**CONFIRMATION**

The chromatogram obtained with solution (1) under 366 nm shows one or two equivalent to very faint red zones at the top of the plate, an intense to faint blue zone above a faint to very faint orange to yellow zone in the middle third of the plate, and an equivalent to very faint orange to yellow zone at the bottom of the plate. Additional faint zones may be present.

There should be no yellow to orange zone above the band corresponding to chlorogenic acid. This would indicate the presence of *Galium verum*.

Table 1: Visualisation under 366 nm

Top of the plate		
An orange to yellow zone (hyperoside)	A blue zone (chlorogenic acid)	One or two equivalent to very faint red zones
A blue zone (chlorogenic acid)	A blue zone (chlorogenic acid)	An intense to faint blue zone (chlorogenic acid)
	An orange to yellow zone (rutin)	A faint to very faint orange to yellow zone (rutin)
		An equivalent to very faint orange to yellow zone
Solution (4) System Suitability	Solution (2) and (3) Intensity marker	Solution (1) Test solution

The chromatogram obtained with solution (1) in white light shows an intense to faint blue zone above two intense to faint brown zones in the bottom third of the plate. Additional bands to very faint zones may be present.

Table 2: Visualisation under white light

Top of the plate		
	A brown zone (fructose)	An intense to faint blue zone
		An intense to faint brown zone (fructose)
		An intense to faint brown zone
Solution (4) System Suitability	Solution (2) and (3) Intensity marker	Solution (1) Test solution

**TESTS****Foreign matter**

Not more than 2.0%, Appendix XI D.

**Acid-insoluble ash**

Not more than 2.0%, Appendix XI K.

**ANNEX**

This section is non-mandatory.

**DNA reference sequence**

A DNA reference sequence for the identity of *Galium aparine* is published in *Supplementary Chapter VII D*.

**Clove**

(Ph. Eur. monograph 0376)

When Powdered Clove is prescribed or demanded, material complying with the requirements below with the exception of Identification test A and the test for Foreign matter and containing not less than 12.0% v/w (120 mL/kg) of essential oil shall be dispensed or supplied.

Ph Eur

**DEFINITION**

Whole flower buds of *Syzygium aromaticum* (L.) Merr. et L. M. Perry (syn. *Eugenia caryophyllus* (Spreng.) Bullock et S.G. Harrison) dried until they become reddish-brown.

**Content**

Minimum 150 mL/kg of essential oil.

**IDENTIFICATION**

A. The flower bud is reddish-brown and consists of a quadrangular stalked portion, the hypanthium, 10-12 mm long and 2-3 mm in diameter, surmounted by 4 divergent lobes of sepals which surround a globular head 4-6 mm in diameter. A bilocular ovary containing numerous ovules is situated in the upper part of the hypanthium. The head is globular and dome-shaped, composed of 4 imbricated petals that enclose numerous incurved stamens and a short, erect style with a nectary disc at the base. The hypanthium exudes essential oil when indented with the finger-nail.

B. Microscopic examination (2.8.23). The powder is dark brown. Examine under a microscope using chloral hydrate solution R. The powder shows the following diagnostic characters (Figure 0376.-1): fragments of the epidermis of

the hypanthium (surface view [A]) consisting of polygonal cells [Aa] and anomocytic stomata (2.8.3) [Ab]; fragments of the hypanthium (surface view [D], transverse section [J]), showing the epidermis [Da, Ja] covered by a thick cuticle [Jb] and an underlying parenchyma [Db, Jc] containing large oil glands [Dd, Jd]; numerous fragments of the parenchyma of the hypanthium [C, Ca] with oil glands [Cd] and with some cells containing one [Cb, Dc] or more cluster crystals of calcium oxalate [Cc]; short fibres occurring singly or in small groups, with thickened, lignified and slightly pitted walls [F] sometimes accompanied by parenchyma with some cells in rows containing cluster crystals of calcium oxalate [Fa]; vascular bundles [G] sometimes included in parenchyma [K]; fragments of the filaments of the stamens with an epidermis consisting of small, elongated cells covered by a finely striated cuticle [H]; fragments of the endothecium of the stamens (surface view [L]); isolated sclereids from the peduncle [B]; numerous triangular pollen grains about 20 µm in diameter with 3 pores in the angles [E].

Figure 0376.-1. – Illustration for identification test B of powdered herbal drug of clove

#### C. Thin-layer chromatography (2.2.27).

**Test solution** Shake 0.1 g of the powdered herbal drug (500) (2.9.12) with 2 mL of *methylene chloride R* for 15 min. Filter and carefully evaporate the filtrate to dryness on a water-bath. Dissolve the residue in 2 mL of *toluene R*.

**Reference solution** Dissolve 20 µL of *eugenol R* in 2 mL of *toluene R*.

**Plate** TLC silica gel GF<sub>254</sub> plate R.

**Mobile phase** *toluene R*.

**Application** 10 µL of the reference solution and 20 µL of the test solution, as bands of 20 mm by 3 mm.

**Development** Twice, in an unsaturated tank over a path of 10 cm; allow the plate to stand for 5 min between the 2 developments.

**Drying** In air.

**Detection A** Examine in ultraviolet light at 254 nm and mark the quenching zones.

**Results A** In the chromatogram obtained with the test solution there is in the median part a quenching zone due to eugenol similar in position to the quenching zone in the chromatogram obtained with the reference solution and there may be a weak quenching zone due to acetyleugenol just below the zone due to eugenol.

**Detection B** Spray with *anisaldehyde solution R* using 10 mL for a plate 200 mm square and heat at 100–105 °C for 5–10 min. Examine in daylight.

**Results B** The zones due to eugenol in the chromatograms obtained with the test and reference solutions are strong brownish-violet and the zone due to acetyleugenol in the chromatogram obtained with the test solution is faint violet-blue. In the chromatogram obtained with the test solution there are other coloured zones, particularly a faint red zone in the lower part and a reddish-violet zone due to caryophyllene in the upper part.

#### TESTS

##### Foreign matter (2.8.2)

Maximum 6 per cent of peduncles, petioles and fruits, maximum 2 per cent of deteriorated cloves and maximum 0.5 per cent of other foreign matter.

##### Total ash (2.4.16)

Maximum 7.0 per cent.

#### ASSAY

##### Essential oil (2.8.12)

Use a 250 mL flask, 100 mL of *water R* as the distillation liquid and 0.50 mL of *xylene R* in the graduated tube. Grind 5.0 g of the herbal drug with 5.0 g of *diatomaceous earth R* to form a fine, homogeneous powder and proceed immediately with the determination using 4.0 g of the mixture. Distil at a rate of 2.5–3.5 mL/min for 2 h.

Ph Eur

## Clove Oil

(Ph. Eur. monograph 1091)

Ph Eur

#### DEFINITION

Essential oil obtained by steam distillation from the dried flower buds of *Syzygium aromaticum* (L.) Merr. et L.M.Perry (syn. *Eugenia caryophyllus* (Spreng.) Bullock et S.G.Harrison).

#### CHARACTERS

##### Appearance

Clear, yellow liquid, which becomes brown when exposed to air.

##### Solubility

Miscible with methylene chloride, with toluene and with fatty oils.

#### IDENTIFICATION

**First identification:** B.

**Second identification:** A.

A. Thin-layer chromatography (2.2.27).

**Test solution** Dissolve 20 µL of the substance to be examined in 2.0 mL of *toluene R*.

**Reference solution** Dissolve 15 µL of *eugenol R* and 15 µL of *acetyeugenol R* in 2.0 mL of *toluene R*.

**Plate** TLC silica gel *F<sub>254</sub>* plate *R*.

**Mobile phase** *toluene R*.

**Application** 20 µL of the test solution and 15 µL of the reference solution, as bands.

**Development** Twice in an unsaturated tank over a path of 10 cm; allow to stand for 5 min between the 2 developments.

**Drying** In air.

**Detection A** Examine in ultraviolet light at 254 nm and mark the quenching zones.

**Results A** The chromatogram obtained with the test solution shows in the middle part a quenching zone (*eugenol*) that is similar in position to the quenching zone in the chromatogram obtained with the reference solution; just below, there is a weak quenching zone (*acetyeugenol*) that is similar in position to the zone of *acetyeugenol* in the chromatogram obtained with the reference solution.

**Detection B** Spray with *anisaldehyde solution R* and examine in daylight while heating at 100-105 °C for 5-10 min.

**Results B** The zone due to *eugenol* in the chromatograms obtained with the test and reference solutions is strong brownish-violet and the zone due to *acetyeugenol* in the chromatogram obtained with the test solution is faint violet-blue; in the chromatogram obtained with the test solution there are other coloured zones, particularly a faint red zone in the lower part and a reddish-violet zone (*β-caryophyllene*) in the upper part.

B. Examine the chromatograms obtained in the test for chromatographic profile.

**Results** The 3 principal peaks in chromatogram obtained with the test solution are similar in retention time to the 3 principal peaks in the chromatogram obtained with the reference solution.

## TESTS

**Relative density (2.2.5)**  
1.030 to 1.063.

**Refractive index (2.2.6)**  
1.528 to 1.537.

**Optical rotation (2.2.7)**  
-2° to 0°.

**Fatty oils and resinified essential oils (2.8.7)**  
It complies with the test.

**Solubility in alcohol (2.8.10)**  
1.0 mL is soluble in 2.0 mL and more of *ethanol (70 per cent V/V) R*.

**Chromatographic profile**  
Gas chromatography (2.2.28): use the normalisation procedure.

**Test solution** Dissolve 0.2 g of the substance to be examined in 10 g of *hexane R*.

**Reference solution** Dissolve 7 mg of *β-caryophyllene R*, 80 mg of *eugenol R* and 4 mg of *acetyeugenol R* in 10 g of *hexane R*.

**Column:**

- **material:** fused silica;
- **size:** *l* = 60 m,  $\varnothing$  = about 0.25 mm;
- **stationary phase:** *macrogol 20 000 R*.

**Carrier gas** *helium for chromatography R*.

**Flow rate** 1.5 mL/min.

**Split ratio** 1:100.

**Temperature:**

	Time (min)	Temperature (°C)
Column	0 - 8	60
	8 - 48	60 → 180
	48 - 53	180
Injection port		270
Detector		270

**Detection** Flame ionisation.

**Injection** 1.0 µL.

**Elution order** Order indicated in the composition of the reference solution. Record the retention times of these substances.

**System suitability** Reference solution:

- **resolution:** minimum 1.5 between the peaks due to *eugenol* and *acetyeugenol*;
- **number of theoretical plates:** minimum 30 000, calculated for the peak due to *β-caryophyllene* at 110 °C.

**Identification of components** Using the retention times determined from the chromatogram obtained with the reference solution, locate the components of the reference solution on the chromatogram obtained with the test solution.

Determine the percentage content of each of these components. The limits are within the following ranges:

- *β-caryophyllene*: 5.0 per cent to 14.0 per cent;
- *eugenol*: 75.0 per cent to 88.0 per cent;
- *acetyeugenol*: 4.0 per cent to 15.0 per cent.

## STORAGE

Protected from heat.

Ph Eur

## Cocoa Butter

Theobroma Oil  
(Ph. Eur. monograph 2607)

Ph Eur

## DEFINITION

Solid fat obtained from the roasted seeds of *Theobroma cacao L.*

## CHARACTERS

**Appearance**  
Yellowish-white, solid mass.

**Solubility**  
Freely soluble in boiling anhydrous ethanol and in light petroleum, slightly soluble in ethanol (96 per cent).

**Relative density**  
About 0.895 at 40 °C.

**Refractive index**  
About 1.457 at 40 °C.

## IDENTIFICATION

A. Melting point (2.2.15): 31 °C to 35 °C.

Introduce 10 g of the substance to be examined into a beaker and melt at 55 °C. Cool in a water-bath to 25 °C and stir continuously until it assumes a paste-like consistency, taking care to avoid the introduction of air bubbles. Place the beaker in a water-bath maintained at 32-33 °C. Continue

stirring for about 30 min until the substance reaches the temperature of the water-bath and changes to a liquid cream. Pour into another beaker, and allow to solidify at room temperature for at least 2 h.

Introduce the substance into the capillary tubes and allow to stand at 2-8 °C for at least 48 h.

B. Composition of fatty acids (see Tests).

### TESTS

Acid value (2.5.1)

Maximum 4.0.

Peroxide value (2.5.5, Method A)

Maximum 3.0.

The starch solution R must be introduced before starting the titration.

Saponification value (2.5.6)

188 to 198, determined on 2.5 g.

### Alkaline impurities

**Solvent mixture** Dilute 15 mL of water R to 500 mL with acetone R and mix. Add 2.5 mL of a 1 g/L solution of bromophenol blue R in ethanol (50 per cent V/V) R and mix again. If the solution is blue or yellow instead of green, neutralise with 0.01 M hydrochloric acid or 0.01 M sodium hydroxide, respectively, to obtain a green solution.

Melt 50 g of the substance to be examined at about 50 °C and mix thoroughly. In a 150 mL conical flask, introduce 10.0 g of the melted substance and add 50 mL of the solvent mixture. Stir vigorously and allow the 2 layers to separate. Not more than 2 mL of 0.01 M hydrochloric acid is required to change the colour of the upper layer to yellow; this coloration must persist after vigorous stirring.

### Composition of fatty acids

Gas chromatography (2.4.22, Method C) with the following modifications.

Use the mixture of calibrating substances in Table 2.4.22.-1.

### Column:

— material: fused silica, glass or quartz;

— size:  $l = 30$  m,  $\varnothing = 0.32$  mm;

— stationary phase: macrogol 20 000 R (film thickness 0.25  $\mu$ m).

Carrier gas helium for chromatography R.

Flow rate 1.3 mL/min.

Split ratio 1:50.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 15	70 → 205
	15 - 25	205
	25 - 27.5	205 → 230
	27.5 - 50	230
Injection port		250
Detector		250

Detection Flame ionisation.

Injection 0.5  $\mu$ L.

Composition of the fatty-acid fraction of the substance:

— lauric acid: maximum 0.5 per cent;

— myristic acid: maximum 0.5 per cent;

— palmitic acid: 24.0 per cent to 31.0 per cent;

— stearic acid: 30.0 per cent to 38.0 per cent;

— oleic acid: 31.0 per cent to 38.0 per cent;

— linoleic acid: maximum 4.5 per cent;

— arachidic acid: maximum 1.5 per cent.

### STORAGE

In an airtight container, protected from light, at a temperature not exceeding 25 °C.

Ph Eur

## Codonopsis Root

(Ph. Eur. monograph 2714)

Ph Eur

### DEFINITION

Whole or fragmented, dried root of *Codonopsis pilosula* (Franch.) Nannf., collected in autumn.

### IDENTIFICATION

A. The whole root is cylindrical, slightly curved and may be up to 35 cm long and 2 cm in diameter, whereas the fragmented root occurs in pieces about 1-2 cm long. The root crown, which is broader than the root, forms an irregular head with a convex centre and consisting of buds and numerous, prominent, rounded verrucose stem scars. The root shows numerous transverse annulations below the root crown, occurring further and further apart until half the length of the root is reached. These transverse annulations may be absent in the cultivated drug. The root shows deep longitudinal wrinkles and prominent scattered protuberances, resembling lenticels, over its entire length; the fracture of the secondary roots is sometimes covered by a blackish gelatinous secretion. The outer surface is brownish-yellow or brownish-grey. The bark adheres tenaciously to the wood and is difficult to remove. The texture is compact and the fracture is relatively short.

B. Microscopic examination (2.8.23). The powder is pale yellow or light brown. Examine under a microscope using lactic reagent R. The powder shows the following diagnostic characters (Figure 2714.-1): cork fragments (surface view [F]), consisting of numerous layers of rectangular or polyhedral cells; very numerous fragments of parenchyma [A, H, J] containing ramified laticiferous vessels (longitudinal section [Aa], transverse section [Ha]), with brown granular contents; numerous rectangular sclereids, with distinctly thickened walls and conspicuous channels, isolated [C] or in groups [B]; granular secretions of the laticiferous vessels, as more or less coiled strands [E]; reticulate or scalariform vessels about 100  $\mu$ m in diameter [D, G]; violet-blue rounded or ovoid starch granules, simple, with a diameter of about 2-10  $\mu$ m, or 2- to 3-compound, either free or included in colourless parenchyma cells [Jb]; colourless pieces of inulin in parenchyma cells [Ja], either fan-shaped or as angular, polyhedral fragments.

C. Examine the chromatograms obtained in the test for *Platycodon grandiflorus*.

Results See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Figure 2714.-1. – Illustration for identification test B of powdered herbal drug of codonopsis root

Top of the plate	
	A brownish zone
Xylose: a yellowish-brown zone	A weak violet zone
	A yellowish-brown zone
Glucose: a yellowish-brown zone	
Reference solution	Test solution

## TESTS

### *Platycodon grandiflorus*

#### Thin-layer chromatography (2.2.27).

**Test solution** To 0.500 g of the powdered herbal drug (355) (2.9.12) add 5.0 mL of ethanol (70 per cent V/V) R. Sonicate for 10 min and centrifuge or filter. Evaporate the supernatant or filtrate to dryness under reduced pressure. Dissolve the residue in 1.0 mL of water R. Prepare a ready-to-use sample preparation cartridge containing 50 mg of octadecylsilyl silica gel (55 µm) using 3 mL of methanol R followed by 3 mL of water R. Apply 1.0 mL of the solution to be analysed to the top of the cartridge. Elute the cartridge with 3 mL of water R; collect the eluate. Under reduced pressure, evaporate the eluate to dryness. Dissolve the residue in 1 mL of methanol R.

**Reference solution** Dissolve 1 mg of glucose R and 1 mg of xylose R in 2 mL of methanol R.

**Plate** TLC silica gel plate R (2-10 µm).

**Mobile phase** water R, methanol R, glacial acetic acid R, methylene chloride R (2:3:8:15 V/V/V/V).

**Application** 10 µL as bands of 8 mm.

**Development** Over a path of 6 cm.

**Drying** In air.

**Detection** Treat with anisaldehyde solution R and heat at 100 °C for 3 min; examine in daylight.

**Results** In the chromatogram obtained with the test solution, the presence of a yellowish-brown zone at, directly above, or directly below the zone due to glucose in the chromatogram obtained with the reference solution indicates adulteration with *Platycodon grandiflorus*.

#### Loss on drying (2.2.32)

Maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

#### Total ash (2.4.16)

Maximum 6.0 per cent.

#### Ash insoluble in hydrochloric acid (2.8.1)

Maximum 2.5 per cent.

#### Extractable matter

Minimum 21.0 per cent.

To 4.00 g of the powdered herbal drug (710) (2.9.12) add 100 g of ethanol (70 per cent V/V) R and allow to macerate for 6 h, shaking frequently. Allow to stand for 18 h. Filter, evaporate 20 g of the filtrate to dryness on a water-bath and dry the residue in an oven at 105 °C for 3 h. The residue weighs a minimum of 0.168 g.

Ph Eur

## Coix Seed

(Ph. Eur. monograph 2454)

Ph Eur

### DEFINITION

Dried, ripe, caryopsis, freed from the shell, of *Coix lacrym-jobi* L. subsp. *ma-yuen* (Rom. Caill.) T.Koyama.

### Content

Minimum 0.50 per cent of triolein (C<sub>57</sub>H<sub>104</sub>O<sub>6</sub>; M<sub>r</sub> 885) (dried drug).

### IDENTIFICATION

**A.** The white or pale yellow caryopsis freed from the shell is roughly ovoid or elongated-elliptical, about 4-8 mm long and 3-6 mm wide. The dorsal surface is rounded, milky white and smooth; the ventral surface shows a deep longitudinal furrow; yellowish-brown remnants of the membranous floral parts may be present. One end is obtusely rounded, the other end is relatively flat and slightly dented with an indistinct, pale brown hilum.

**B.** Microscopic examination (2.8.23). The powder is light grey or light brown. Examine under a microscope using chloral hydrate solution R. The powder shows the following diagnostic characters (Figure 2454.-1): fragments of the endosperm with oval to elongated [B] or rounded [E] thin-walled cells and fragments consisting of elongated cells with thicker walls [F]; fragments of tissue, with light yellow walls, with large, elongated, slightly sinuous cells [A]; cells of the middle layer of the mesocarp are brownish-yellow, irregularly tube-like, slightly curved and irregularly crossed [D]. Examine under a microscope using a 50 per cent V/V

solution of *glycerol R*. The powder shows numerous starch granules, simple or 2-3 compound, spherical or slightly polyhedral, 3-20 µm in diameter, with a stellate, Y-shaped, cleft-like or point-like hilum [C] and fragments of parenchyma containing starch granules [G].

Figure 2454.-1. – Illustration for identification test B of powdered herbal drug of coix seed

**C. Thin-layer chromatography (2.2.27).**

**Test solution** To 1 g of the powdered herbal drug (710) (2.9.12) add 10 mL of *light petroleum R1* and sonicate for 30 min. Filter and reduce *in vacuo* to 1 mL.

**Reference solution** Dissolve 2 mg of *oleic acid R* and 2 mg of *triolein R* in *methanol R* and dilute to 1 mL with the same solvent.

**Plate** TLC octadecylsilyl silica gel plate R (5-40 µm) [or TLC octadecylsilyl silica gel plate R (2-10 µm)].

**Mobile phase** *methylene chloride R*, *glacial acetic acid R*, *acetone R* (20:40:50 V/V/V).

**Application** 10 µL [or 2 µL] as bands of 10 mm [or 8 mm].

**Development** Over a path of 7 cm.

**Drying** In air.

**Detection** Treat with a 100 g/L solution of *phosphomolybdic acid R* in *ethanol (96 per cent) R*, heat at 120 °C for about 3 min and examine in daylight.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Oleic acid: a purple zone	A purple zone A purple zone (oleic acid)
	A faint purple zone A purple zone A purple zone
Triolein: a purple zone	A purple zone (triolein)
Reference solution	Test solution

**TESTS**

**Loss on drying (2.2.32)**

Maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (710) (2.9.12) by drying in an oven at 105 °C for 2 h.

**Total ash (2.4.16)**

Maximum 3.0 per cent.

**ASSAY**

Liquid chromatography (2.2.29).

**Test solution** To 0.600 g of the powdered herbal drug (355) (2.9.12) add 50 mL of the mobile phase and stir with a magnetic stirrer for 2 h. Sonicate for 30 min. Allow to cool, dilute to 50.0 mL with the mobile phase and filter.

**Reference solution (a)** Dissolve 10.0 mg of *triolein CRS* in the mobile phase and dilute to 50.0 mL with the mobile phase.

**Reference solution (b)** To 0.600 g of *coix seed HRS* add 50 mL of the mobile phase and stir with a magnetic stirrer for 2 h. Sonicate for 30 min. Allow to cool, dilute to 50.0 mL with the mobile phase and filter.

**Reference solutions (c), (d), (e), (f), (g), (h)** Dilute reference solution (a) to obtain 6 reference solutions of *triolein*, the concentrations of which span the expected value in the test solution.

**Column:**

— size:  $l = 0.25$  m,  $\varnothing = 4.6$  mm;

— stationary phase: end-capped octadecylsilyl silica gel for chromatography R (5 µm).

**Mobile phase** *methylene chloride R*, *acetonitrile R* (35:65 V/V).

**Flow rate** 2.0 mL/min.

**Detection** Evaporative light-scattering detector; the following settings have been found to be suitable; if the detector has different setting parameters, adjust the detector settings so as to comply with the system suitability criterion for signal-to-noise ratio:

— carrier gas: *nitrogen R*;

— flow rate: 0.8 mL/min;

— evaporator temperature: 100 °C.

**Injection** 10 µL.

**Run time** 30 min.

**Retention time** *Triolein* = about 18 min; peak 2 = about 19 min.

**System suitability:**

- **resolution:** minimum 1.5 between the peak due to triolein and peak 2 in the chromatogram obtained with reference solution (b); use the chromatogram supplied with *coix seed HRS* to identify peak 2;
- **signal-to-noise ratio:** minimum 30 for the peak due to triolein in the chromatogram obtained with reference solution (a).

Establish a calibration curve with the logarithm of the mass of triolein (in milligrams) per 50 mL of reference solutions (c), (d), (e), (f), (g) and (h) (corrected by the assigned percentage content of *triolein CRS*) as the abscissa and the logarithm of the corresponding peak area as the ordinate.

Calculate the percentage content of triolein using the following expression:

$$\frac{10^A}{m \times 10}$$

- A* = logarithm of the mass of triolein in the test solution, determined from the calibration curve and the area of the corresponding peak in the chromatogram obtained with the test solution;
- m* = mass of the herbal drug to be examined used to prepare the test solution, in grams.

Ph Eur

**Cola**

(Ph. Eur. monograph 1504)

Ph Eur

**DEFINITION**

Whole or fragmented dried seeds, freed from the testa, of *Cola nitida* (Vent.) Schott et Endl. (*C. vera* K. Schum.) and its varieties, as well as of *Cola acuminata* (P. Beauv.) Schott et Endl. (*Sterculia acuminata* P. Beauv.).

**Content**

Minimum 1.5 per cent of caffeine (*M<sub>r</sub>* 194.2) (dried drug).

**IDENTIFICATION**

A. The kernels have an oblong, somewhat obtuse, sub-tetragonal shape, with deformations resulting from mutual pressure inside the fruit; they vary in size and mass, ranging from 5-15 g; the outside is hard, smooth and very dark brown, the inside is more reddish-brown. In *C. nitida* and its varieties, the kernels are divided in 2 parts, almost plano-convex, corresponding to the cotyledons and usually occurring separated in the commercial drug; the cotyledons are 3-4 cm long, 2-2.5 cm wide and 1-2 cm thick.

In *C. acuminata*, the cotyledons are smaller and divided into 4-6 irregular parts.

B. Microscopic examination (2.8.23). The powder is reddish-brown. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows the following diagnostic characters: numerous ovoid or reniform starch granules, 5-25 µm in size, with concentric striations and a stellate, slightly eccentric hilum; fragments of cotyledon tissue showing large, thick-walled, reddish polygonal cells filled with starch granules; occasional fragments of the external epidermis of the cotyledons.

C. Thin-layer chromatography (2.2.27).

**Test solution** To 1.0 g of the powdered herbal drug (355) (2.9.12) add 5 mL of *ethanol (60 per cent V/V) R*. Shake mechanically at 40 °C for 30 min and filter.

**Reference solution (a)** Dissolve 25 mg of *caffeine R* in 10 mL of *ethanol (60 per cent V/V) R*.

**Reference solution (b)** Dissolve 50 mg of *theobromine R* in 10 mL of the mobile phase. Filter.

**Plate** TLC silica gel *F<sub>254</sub>* plate *R*.

**Mobile phase** *water R*, *methanol R*, *ethyl acetate R* (10:13:77 *V/V/V*).

**Application** 20 µL, as bands.

**Development** Over a path of 10 cm.

**Drying** In air for 5 min.

**Detection A** Examine in ultraviolet light at 254 nm.

**Results A** The chromatogram obtained with the test solution shows 2 principal quenching zones which are similar in position to the zones in the chromatograms obtained with reference solutions (a) and (b).

**Detection B** Spray with a mixture of equal volumes of *ethanol (96 per cent) R* and *hydrochloric acid R* and then with a solution prepared immediately before use by dissolving 1 g of *iodine R* and 1 g of *potassium iodide R* in 100 mL of *ethanol (96 per cent) R*.

**Results B** The chromatogram obtained with the test solution shows a reddish-brown principal zone similar in position and colour to the zone in the chromatogram obtained with reference solution (a).

**TESTS****Loss on drying (2.2.32)**

Maximum 12.0 per cent, determined on 2.00 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

**Total ash (2.4.16)**

Maximum 9.0 per cent.

**ASSAY****Liquid chromatography (2.2.29).**

**Test solution** To 1.00 g (*m<sub>1</sub>*) of the powdered herbal drug (355) (2.9.12), add 50 mL of *methanol R*. Heat under a reflux condenser on a water-bath for 30 min. Allow to cool and filter. Rinse the filter with 10 mL of *methanol R*. Take up the residue with 50 mL of *methanol R*. Proceed as before. Combine the filtrates and the washings in a 200.0 mL volumetric flask and dilute to 200.0 mL with *methanol R*. Transfer 20.0 mL of this solution into a round-bottomed flask and evaporate to dryness under reduced pressure. Take up the residue with the mobile phase, transfer to a 50.0 mL volumetric flask and dilute to 50.0 mL with the mobile phase.

**Reference solution** In a 100.0 mL volumetric flask, dissolve 30.0 mg (*m<sub>2</sub>*) of *caffeine CRS* and 15.0 mg of *theobromine R* in the mobile phase and dilute to 100.0 mL with the mobile phase. Transfer 10.0 mL of this solution to a 100.0 mL volumetric flask and dilute to 100.0 mL with the mobile phase.

**Column:**

— **size:** *l* = 0.25 m,  $\varnothing$  = 4.6 mm;

— **stationary phase:** *octadecylsilyl silica gel for chromatography R* (5 µm).

**Mobile phase** *methanol R*, *water R* (25:75 *V/V*).

**Flow rate** 1 mL/min.

**Detection** Spectrophotometer at 272 nm.

**Injection** The chosen volume of each solution; loop injector.

**System suitability** Reference solution:

- **resolution:** minimum 2.5 between the peaks due to caffeine and theobromine. If necessary, adjust the volume of *water R* in the mobile phase.

Calculate the caffeine content using the following expression:

$$\frac{m_2 \times A_1 \times 50}{m_1 \times A_2}$$

- $A_1$  = area of the peak due to caffeine in the chromatogram obtained with the test solution;  
 $A_2$  = area of the peak due to caffeine in the chromatogram obtained with the reference solution;  
 $m_1$  = mass of the herbal drug to be examined in the test solution, in grams;  
 $m_2$  = mass of caffeine CRS in the reference solution, in grams.

Ph Eur

## Colophony

(Ph. Eur. monograph 1862)

### Preparation

Flexible Collodion

Ph Eur

### DEFINITION

Residue remaining after distillation of the volatile oil from the oleoresin obtained from various species of *Pinus*.

### IDENTIFICATION

A. Translucent, pale yellow to brownish-yellow, angular, irregularly-shaped, brittle, glassy pieces of different sizes the surfaces of which bear conchoidal markings.

B. Thin-layer chromatography (2.2.27).

**Test solution** Dissolve 1 g in 10 mL of methanol R by gently warming.

**Reference solution** Dissolve 10 mg of thymol R and 10 mg of linalol R in 10 mL of methanol R.

**Plate** TLC silica gel plate R.

**Mobile phase** methylene chloride R.

**Application** 10  $\mu$ L, as bands.

**Development** Over a path of 15 cm.

**Drying** In air.

**Detection** Spray with anisaldehyde solution R and heat at 100-105 °C for 10 min; examine in daylight.

**Results** See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other coloured zones are present in the chromatogram obtained with the test solution.

Top of the plate	
	A purple band
	A purple band
	2 purple bands
Thymol: an orange band	
Linalol: a purple band	Sequence of narrow purple bands
	Purple extended baseline band
Reference solution	Test solution

## TESTS

**Acid value (2.5.1)**

145 to 180, determined on 1.0 g.

**Total ash (2.4.16)**

Maximum 0.2 per cent.

## STORAGE

Do not reduce to a powder.

Ph Eur

## Coriander

(Ph. Eur. monograph 1304)

When Powdered Coriander is prescribed or demanded, material complying with the appropriate requirements below but containing not less than 0.2% v/w of essential oil shall be dispensed or supplied.

Ph Eur

### DEFINITION

Dried cremocarp of *Coriandrum sativum* L.

### Content

Minimum 3 mL/kg of essential oil (dried drug).

### IDENTIFICATION

A. The fruit is brown or light brown, more or less spherical, about 1.5-5 mm in diameter, or oval and 2-6 mm long. It consists of the entire cremocarp, with the mericarps usually tightly connected. The fruit is glabrous and has 10 wavy, slightly raised primary ridges and 8 straight, more prominent secondary ridges. The mericarps are concave on the internal surface. The stylopod crowns the apex and a small fragment of the pedicel may be present.

B. Microscopic examination (2.8.23). The powder is brown. Examine under a microscope using chloral hydrate solution R. The powder shows the following diagnostic characters (Figure 1304.-1): numerous oil droplets [B]; fragments of endosperm [A] with small, thick-walled, regular cells containing microrosettes [Aa] and microcrystals of calcium oxalate and oil droplets [Ab]; fragments of endocarp (surface view [C, J], transverse section [H]), with very narrow cells having a parquetry arrangement [Ca, Ha] and usually associated with a layer of thin-walled [Cb, Hb] or thicker-walled [Ja] rectangular sclereids of the mesocarp; fragments from the sclerenchymatous layer of the mesocarp [G] with short, strongly thickened, pitted, fusiform cells occurring in layers with the cells of adjacent layers approximately at right angles to one another; fragments of parenchyma of the mesocarp (transverse section [E]) with small cells with slightly thickened walls [Ea], the remains of secretory canals [Eb] and sclereids [Ec]; fragments of epicarp (surface view [F]) with thin-walled polyhedral cells, some of which contain small prisms of calcium oxalate [Fa]; rare fragments of secretory canals with brown cells, (surface view [D]); occasional fragments of vascular bundles [K].

C. Thin-layer chromatography (2.2.27).

**Test solution** To 0.5 g of the freshly powdered herbal drug (355) (2.9.12) add 5 mL of methanol R. Sonicate for 10 min and centrifuge or filter; use the supernatant or filtrate.

**Reference solution** Dissolve 10  $\mu$ L of linalol R and 2  $\mu$ L of geranyl acetate R in 1.0 mL of toluene R.

**Plate** TLC silica gel F<sub>254</sub> plate R (5-40  $\mu$ m) [or TLC silica gel F<sub>254</sub> plate R (2-10  $\mu$ m)].

Figure 1304.-1. - Illustration for identification test B of powdered herbal drug of coriander

**Mobile phase** ethyl acetate R, toluene R (5:95 V/V).  
**Application** 10 μL [or 2 μL] as bands of 15 mm [or 8 mm].  
**Development** Over a path of 10 cm [or 6 cm].  
**Drying** In air for 5 min.  
**Detection** Treat with anisaldehyde solution R and heat at 100-105 °C for 5 min; examine in daylight.  
**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
	A bluish-violet zone
Geranyl acetate: a violet-blue zone	
Linalol: an intense violet zone	A violet zone (linalol) A violet-blue zone
Reference solution	Test solution

**TESTS**

**Foreign matter (2.8.2)**

It complies with the test. None of the cremocarps show perforations due to insects.

**Loss on drying (2.2.32)**

Maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

**Total ash (2.4.16)**  
 Maximum 8.0 per cent.

**ASSAY**

**Essential oil (2.8.12)**

Use a 500 mL round-bottomed flask, 200 mL of water R as the distillation liquid and 0.5 mL of xylene R in the graduated tube. Reduce the herbal drug to a coarse powder and immediately use 30.0 g for the determination. Distil at a rate of 2-3 mL/min for 2 h.

Ph Eur

**Coriander Oil**

(Ph. Eur. monograph 1820)

Ph Eur

**DEFINITION**

Essential oil obtained by steam distillation from the fruits of *Coriandrum sativum* L.

**CHARACTERS**

**Appearance**

Clear, colourless or pale yellow liquid.

**IDENTIFICATION**

**First identification: B.**

**Second identification: A.**

**A.** Examine by thin-layer chromatography (2.2.27).

**Test solution** Dissolve 10 μL of the substance to be examined in 1.0 mL of toluene R.

**Reference solution** Dissolve 10 μL of linalol R and 2 μL of geranyl acetate R in 1.0 mL of toluene R.

**Plate** TLC silica gel F<sub>254</sub> plate R (5-40 μm) [or TLC silica gel F<sub>254</sub> plate R (2-10 μm)].

**Mobile phase** ethyl acetate R, toluene R (5:95 V/V).

**Application** 10 μL [or 2 μL] as bands of 15 mm [or 8 mm].

**Development** Over a path of 10 cm [or 6 cm].

**Drying** In air for 5 min.

**Detection** Treat with anisaldehyde solution R and heat at 100-105 °C for 5 min; examine in daylight.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
	A bluish-violet zone
Geranyl acetate: a violet-blue zone	
Linalol: an intense violet zone	An intense violet zone (linalol) A violet-blue zone
Reference solution	Test solution

**B.** Examine the chromatograms obtained in the test for chromatographic profile.

**Results** The characteristic peaks in the chromatogram obtained with the test solution are similar in retention time to

those in the chromatogram obtained with the reference solution.

### TESTS

**Relative density (2.2.5)**  
0.860 to 0.880.

**Refractive index (2.2.6)**  
1.462 to 1.470.

**Optical rotation (2.2.7)**  
+ 7° to + 13°.

**Acid value (2.5.1)**  
Maximum 3.0, determined on 5.00 g of the substance to be examined.

### Chromatographic profile

**Gas chromatography (2.2.28):** use the normalisation procedure.

**Test solution** The substance to be examined.

**Reference solution (a)** Dissolve 10 µL of *α-pinene R*, 10 µL of *limonene R*, 10 µL of *γ-terpinene R*, 10 µL of *p-cymene R*, 10 mg of *camphor R*, 20 µL of *linalol R*, 10 µL of *α-terpineol R*, 10 µL of *geranyl acetate R* and 10 µL of *geraniol R* in 1 mL of *heptane R*.

**Reference solution (b)** Dissolve 5 µL of *geraniol R* in *heptane R* and dilute to 10 mL with the same solvent.

#### Column:

- **material:** fused silica;
- **size:** *l* = 60 m, Ø = 0.25 mm;
- **stationary phase:** *macrogol 20 000 R* (film thickness 0.25 µm).

**Carrier gas** *helium for chromatography R*.

**Flow rate** 1 mL/min.

**Split ratio** 1:65.

**Temperature:**

	Time (min)	Temperature (°C)
Column	0 - 10	60
	10 - 75	60 → 190
	75 - 120	190
Injection port		220
Detector		240

**Detection** Flame ionisation.

**Injection** 0.2 µL.

**Elution order** Order indicated in the composition of reference solution (a). Record the retention times of these substances.

**System suitability** Reference solution (a):

- **resolution:** minimum 1.5 between the peaks due to *linalol* and *camphor*.

Using the retention times determined from the chromatogram obtained with reference solution (a), locate the components of reference solution (a) in the chromatogram obtained with the test solution.

Determine the percentage content of each of these components. The percentages are within the following ranges:

- *α-pinene*: 3.0 per cent to 7.0 per cent;
- *limonene*: 1.5 per cent to 5.0 per cent;
- *γ-terpinene*: 1.5 per cent to 8.0 per cent;
- *p-cymene*: 0.5 per cent to 4.0 per cent;
- *camphor*: 3.0 per cent to 6.0 per cent;
- *linalol*: 65.0 per cent to 78.0 per cent;

- *α-terpineol*: 0.1 per cent to 1.5 per cent;
- *geranyl acetate*: 0.5 per cent to 4.0 per cent;
- *geraniol*: 0.5 per cent to 3.0 per cent;
- **disregard limit:** area of the peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

### Chiral purity

**Gas chromatography (2.2.28).**

**Test solution** Dissolve 0.02 g of the substance to be examined in *pentane R* and dilute to 10 mL with the same solvent.

**Reference solution** Dissolve 10 µL of *linalol R* and 5 mg of *borneol R* in *pentane R* and dilute to 10 mL with the same solvent.

#### Column:

- **material:** fused silica;
- **size:** *l* = 25 m, Ø = 0.25 mm;
- **stationary phase:** *modified β-cyclodextrin for chiral chromatography R* (film thickness 0.25 µm).

**Carrier gas** *helium for chromatography R*.

**Flow rate** 1.3 mL/min.

**Split ratio** 1:30.

**Temperature:**

	Time (min)	Temperature (°C)
Column	0 - 65	50 → 180
Injection port		230
Detector		230

**Detection** Flame ionisation.

**Injection** 1 µL.

**System suitability** Reference solution:

- **resolution:** minimum 5.5 between the peaks due to (*R*)-*linalol* (1<sup>st</sup> peak) and (*S*)-*linalol* (2<sup>nd</sup> peak) and minimum 2.9 between the peaks due to (*S*)-*linalol* and *borneol* (3<sup>rd</sup> peak).

**Limit** Calculate the percentage content of (*R*)-*linalol* using the expression:

$$\frac{A_R}{A_S + A_R} \times 100$$

- $A_S$  = area of the peak due to (*S*)-*linalol*;
- $A_R$  = area of the peak due to (*R*)-*linalol*.

- (*R*)-*linalol*: maximum 14 per cent.

### STORAGE

At a temperature not exceeding 25 °C.

Ph Eur

## Corydalis Rhizome

(Ph. Eur. monograph 2976)

Ph Eur

### DEFINITION

Whole or fragmented tuber of *Corydalis yanhusuo* (Y.H.Chou & Chun C.Hsu) W.T.Wang ex Z.Y.Su & C.Y.Wu, with roots removed, treated with boiling water until no white core is visible and then dried.

### Content

Minimum 0.20 per cent for the sum of tetrahydropalmatine and corydaline, expressed as tetrahydropalmatine ( $C_{21}H_{25}NO_4$ ;  $M_r$  355.4) (dried drug).

**IDENTIFICATION**

**A. Whole drug.** The whole tuber is irregularly obovate, 0.5-1.8 cm in diameter and 0.5-1.3 cm (rarely 1.7 cm) thick. Occasionally, 2-3 tubers are grouped together. The apex usually shows a slightly depressed stem scar and occasional remains of aerial parts. The base is tuberculate or with a slight navel-like depression from which shallow furrows may radiate. The external surface is yellow or yellowish-brown to greenish-yellow with coarse or fine reticulate wrinkles. The underlying cortex, when exposed, is blackish-green or brownish-yellow. The texture is hard, mostly difficult to break. The fracture is horny, slightly shiny and translucent with a yellow, yellowish-brown or dark brown surface. The pith, if present, is whitish-yellow.

**Fragmented drug** The fragmented tuber occurs as thick or thin, sub-rounded or sub-oval transversal or longitudinal slices or as irregular pieces. The slices are 0.5-1.9 cm in diameter and 0.1-0.5 cm thick. Occasionally, slices consist of 2-3 tubers grouped together. Rare slices from the tuber apex or base are present, with those from the apex having a slightly depressed stem scar and occasional remains of aerial parts, while those from the base have tuberculate protrusions or have a slight navel-like depression from which shallow furrows may radiate. The external surface is yellow or yellowish-brown with coarse or fine wrinkles. The underlying cortex, when exposed, is blackish-green or brownish-yellow. The texture is hard and fragile. The fracture is horny and slightly shiny. The cut surface is horny, slightly shiny and translucent with occasional fissures; the surface is yellow, yellowish-brown, reddish-brown or dark blackish-brown and occasionally shows a gradient of colours. The pith, if present, is a lighter colour than the surrounding tissue, or if absent, it is replaced by a central cavity.

**B. Microscopic examination (2.8.23).** The powder is greenish-yellow to brownish-yellow. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2976.-1): greenish-yellow to brownish-yellow fragments of cortical sclerenchyma [F], consisting of elongated, polygonal, sub-square or irregularly shaped cells 35-321  $\mu\text{m}$  long and 15-127  $\mu\text{m}$  in diameter with lignified, often sinuous and beaded cell walls having fine, sparse pits and large cell lumens; some fragments [A] of cortical parenchyma [Ab] are covered by dermal tissue consisting of a layer of rectangular or polygonal thin-walled cells [Aa]; sclereids [D] isolated or in groups [Db], sub-square to sub-rounded, sub-polygonal, sub-triangular or irregular in shape, 32-290  $\mu\text{m}$  long and 22-103  $\mu\text{m}$  in diameter, with yellowish-green to brownish-yellow cell walls; sclereids with lignified cell walls having dense, fine pits and occasional striations; some sclereids have irregularly thickened cell walls, with one thinner wall [Da]; rare, inconspicuous fragments of xylem vessels, often embedded in parenchyma tissue, colourless or pale yellow, irregularly spiral, annular or reticulate and 10-43  $\mu\text{m}$  in diameter [B]. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows the following diagnostic characters: abundant large and small colourless or pale yellow masses of gelatinised starch granules [C], varying in shape, but often polygonal, elongate oval or rectangular (up to 530  $\mu\text{m}$  long and 332  $\mu\text{m}$  in diameter) and surrounded by colourless parenchyma [E]; rare free starch granules, single or 2-5 compound, with single granules being sub-rounded or irregular with a distinct hilum.

**C. High-performance thin-layer chromatography (2.8.25).**

**Test solution** To 0.5 g of the powdered herbal drug (355) (2.9.12) add 10.0 mL of *ethanol (50 per cent V/V) R* and sonicate for 15 min. Centrifuge or filter the solution and use the supernatant or filtrate.

**Reference solution (a)** Dissolve 2.5 mg of *corydaline R* and 2.5 mg of *tetrahydropalmatine R* in *methanol R* and dilute to 20.0 mL with the same solvent.

**Reference solution (b)** Dilute 2.5 mL of reference solution (a) to 10.0 mL with *methanol R*.

**Intensity marker** Tetrahydropalmatine.

**Plate** TLC silica gel *F<sub>254</sub>* plate *R* (2-10  $\mu\text{m}$ ).

**Mobile phase** *glacial acetic acid R*, *water R*, *butanol R*, *ethyl acetate R* (10:10:50:50 *V/V/V/V*).

**Application** 2  $\mu\text{L}$  as bands of 8 mm. -

**Development** 70 mm from the lower edge of the plate.

**Drying** In a current of cold air for 5 min.

**Detection** Expose the plate for 3 min to iodine vapour using a chromatographic tank previously saturated with iodine for 30 min; remove the excess of absorbed iodine in air for 10 min and examine in ultraviolet light at 366 nm.

**System suitability** Reference solution (a):

- the chromatogram shows near the border between the lower and middle thirds 2 distinct zones, which may be touching; the lower zone (tetrahydropalmatine) shows a green fluorescence and the upper zone (corydaline) shows a light blue fluorescence.

**Results** See below the sequence of zones present in the chromatograms obtained with reference solution (a) and the test solution. Furthermore, other faint blue, yellow or green fluorescent zones may be present in the chromatogram obtained with the test solution.

Figure 2976.-1. - Illustration for identification test B of powdered herbal drug of *corydalis rhizome*

Top of the plate	
	A green fluorescent zone, faint to equivalent
	A green fluorescent zone, faint
Corydaline: a light blue fluorescent zone	A light blue fluorescent zone (corydaline)
Tetrahydropalmatine: a green fluorescent zone	A green fluorescent zone (tetrahydropalmatine)
	A green fluorescent zone, faint
	A green or yellow fluorescent zone, equivalent to intense
Reference solution (a)	Test solution

**TESTS****Loss on drying (2.2.32)**

Maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 5 h.

**Total ash (2.4.16)**

Maximum 3.0 per cent.

**Ash insoluble in hydrochloric acid (2.8.1)**

Maximum 0.5 per cent.

**Aflatoxins (2.8.18)**

Maximum 2 µg/kg (aflatoxin B<sub>1</sub>) and maximum 4 µg/kg (sum of aflatoxins B<sub>1</sub>, B<sub>2</sub>, G<sub>1</sub> and G<sub>2</sub>).

**ASSAY**

Liquid chromatography (2.2.29).

**Test solution** To 1.00 g of the powdered herbal drug (355) (2.9.12) add 25.0 mL of ethanol (50 per cent V/V) R. Weigh and sonicate for 30 min. Allow to cool, weigh and compensate for the loss of solvent with ethanol (50 per cent V/V) R; shake thoroughly. Filter through a membrane filter (nominal pore size 0.45 µm).

**Reference solution (a)** Dissolve 5.0 mg of tetrahydropalmatine CRS in ethanol (50 per cent V/V) R and dilute to 25.0 mL with the same solvent. Sonicate for 1 h. Dilute 2.0 mL of the solution to 10.0 mL with ethanol (50 per cent V/V) R.

**Reference solution (b)** To 0.10 g of corydalis rhizome dry extract HRS add 5.0 mL of ethanol (50 per cent V/V) R. Weigh and sonicate for 10 min. Allow to cool, weigh and compensate for the loss of solvent with ethanol (50 per cent V/V) R; shake thoroughly. Centrifuge and filter through a membrane filter (nominal pore size 0.45 µm).

**Column:**

— size:  $l = 0.25$  m,  $\varnothing = 4.6$  mm;

— stationary phase: end-capped octadecylsilyl silica gel for chromatography R (5 µm);

— temperature: 35 °C.

**Mobile phase:**

- mobile phase A: mix 0.05 volumes of anhydrous acetic acid R and 99.95 volumes of water for chromatography R and adjust to pH 6 with triethylamine R;
- mobile phase B: acetonitrile R;

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 3	60	40
3 - 31	60 → 38	40 → 62
31 - 32	38 → 5	62 → 95
32 - 37	5	95

**Flow rate** 1.0 mL/min.

**Detection** Spectrophotometer at 282 nm.

**Injection** 20 µL.

**Identification of peaks** Use the chromatogram supplied with corydalis rhizome dry extract HRS and the chromatogram obtained with reference solution (b) to identify the peaks due to corydaline and peak 2; use the chromatogram obtained with reference solution (a) to identify the peak due to tetrahydropalmatine.

**Relative retention** With reference to tetrahydropalmatine (retention time = about 16.4 min): peak 2 (unknown) = about 1.54; corydaline = about 1.65.

**System suitability** Reference solution (b):

— resolution: minimum 2.0 between peak 2 and the peak due to corydaline.

Calculate the percentage content of the sum of tetrahydropalmatine and corydaline, expressed as tetrahydropalmatine, using the following expression:

$$\frac{A_1 \times m_2 \times p}{A_2 \times m_1 \times 5}$$

- $A_1$  = sum of the areas of the peaks due to tetrahydropalmatine and corydaline in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to tetrahydropalmatine in the chromatogram obtained with reference solution (a);
- $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;
- $m_2$  = mass of tetrahydropalmatine CRS used to prepare reference solution (a), in grams;
- $p$  = percentage content of tetrahydropalmatine in tetrahydropalmatine CRS.

Ph Eur

**Couch Grass Rhizome**

(Ph. Eur. monograph 1306)

Ph Eur

**DEFINITION**

Whole or cut, washed and dried rhizome of *Agropyron repens* (L.) P.Beauv. (*Elymus repens* (L.) Gould); the adventitious roots are removed.

**IDENTIFICATION**

A. The shiny yellowish, light brown or yellowish-brown pieces of the rhizome are 2-3 mm thick and longitudinally furrowed. At the nodes are the remains of very thin, more or less branched roots and whitish or brownish scale-like leaves; the internodes, up to 6 cm long, are furrowed and hollow

inside. The transverse section of the nodes shows a yellowish medulla.

**B. Microscopic examination (2.8.23).** The powder is whitish-yellow. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 1306.-1): fragments of the epidermis (surface view [A]) covered with a thick cuticle and composed of rectangular and elongated, thick-walled cells with pitted, slightly wavy walls, which usually alternate with small, thin-walled, rounded or almost square twin cells; fragments (transverse section [B]) showing the epidermis [Ba] associated with thick-walled cells of the hypodermis; fragments in transverse section [F] consisting of endodermic cells with U-shaped thickening of the walls [Fa] accompanied by pericyclic fibres [Fb]; numerous fragments of moderately thickened fibres [C]; groups of vessels [D, G] with slit-shaped pits [Da] or with spiral and annular thickening [Ga], accompanied by fibres [Db, Gb]; numerous fragments of the cortical parenchyma and the pith with slightly thickened and pitted cells [E].

Figure 1306.-1. -- Illustration for identification test B of powdered herbal drug of couch grass rhizome

#### TESTS

##### *Cynodon dactylon*, *Imperata cylindrica*

Examine under a microscope using *iodine solution R1*.

No blue starch grains are visible.

##### Foreign matter (2.8.2)

Maximum 15 per cent of blackish-grey pieces of rhizome in the cut herbal drug.

##### Water-soluble extractive

Minimum 25 per cent.

To 5.0 g of the powdered herbal drug (355) (2.9.12) add 200 mL of boiling *water R*. Allow to stand for 10 min, shaking occasionally. Allow to cool, dilute to 200.0 mL with *water R* and filter. Evaporate 20.0 mL of the filtrate to

dryness on a water-bath. Dry the residue in an oven at 100-105 °C. The residue weighs a minimum of 0.125 g.

##### Loss on drying (2.2.32)

Maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

##### Total ash (2.4.16)

Maximum 5.0 per cent.

##### Ash insoluble in hydrochloric acid (2.8.1)

Maximum 1.5 per cent.

Ph Eur

## Cyathula Root

(Ph. Eur. monograph 2998)

Ph Eur

#### DEFINITION

Whole or fragmented, dried root of *Cyathula officinalis* K.C. Kuan, with rootlets removed.

#### Content

Minimum 0.065 per cent of cyasterone ( $C_{29}H_{44}O_8$ ;  $M_r$  520.7) (dried drug).

#### IDENTIFICATION

**A.** The whole root is cylindrical, straight or slightly curved, somewhat twisted, tapering slightly from the upper part to the lower part, sometimes branched, 14-60 cm long and 0.5-5 cm in diameter. The fragmented root occurs as transverse or oblique slices, rounded to elliptical, 0.5-1.8 cm in diameter. The outer surface is yellowish-brown or greyish-brown, with distinct fine longitudinal wrinkles, frequent transverse lenticel-like protuberances and a few rootlet scars. The texture is firm; the whole root is difficult to break. The fracture is horny and slightly uneven. The cut surface (slices) and fracture are brownish-yellow and show numerous vascular bundles, mostly appearing as yellowish-white dots arranged in several concentric rings; the central bundles are larger than the surrounding bundles. The cortex is narrow and dark brown.

**B.** Microscopic examination (2.8.23). The powder is greyish-brown to brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2998.-1): abundant microcrystals of calcium oxalate, 1-18 µm in diameter, triangular, pointed, sub-square or irregularly shaped; the crystals are free [E] or are scattered in or completely fill parenchyma cells [F, Ha]; vessels, 12-73 µm in diameter, usually with bordered pits [C]; fibres commonly in bundles, whole [B] or fragmented [D], elongated, with curved or tapering ends, 6-26 µm in diameter, with mostly weakly lignified, thickened walls and oblique-slit-shaped, cross-shaped or V-shaped pits; the pit canals are distinct and vary in size [Ba]; numerous fragments of colourless parenchyma with ovoid or rectangular cells [H]; fragments of brownish-yellow cork appearing as sub-square, polyhedral or rectangular cells (surface view [A]) or superimposed, flattened, rectangular cells (side view [G]).

**C.** High-performance thin-layer chromatography (2.8.25) as described in the test for *Cyathula capitata* Moq. and *Achyranthes bidentata* Blume with the following modification.

Figure 2998-1. – Illustration for identification test B of powdered herbal drug of *cyathula* root

**Results** See below the sequence of zones present in the chromatograms obtained with reference solution (a) and the test solution. Furthermore, in the chromatogram obtained with the test solution, other faint blue, faint green or faint reddish zones may be present.

Top of the plate	
Cyasterone: a bright blue fluorescent zone	A blue fluorescent zone
	A reddish zone, faint
	A reddish zone, faint
	A bright blue fluorescent zone (cyasterone)
Ginsenoside Ro: a green zone	A bright blue fluorescent zone
	A green zone, faint
	A green zone, faint
	A green zone, faint
Reference solution (a)	Test solution

**TESTS**

*Cyathula capitata* Moq. and *Achyranthes bidentata* Blume

High-performance thin-layer chromatography (2.8.25).

**Test solution** To 1.0 g of the powdered herbal drug (710) (2.9.12) add 5 mL of a mixture of 2 volumes of *water R* and 8 volumes of *methanol R*. Sonicate for 30 min and centrifuge. Decant the supernatant. Take up the residue with 8 mL of *water R*. Sonicate (or shake) for 1 min, centrifuge and combine the supernatants. Condition a 4 mL solid phase extraction column containing 0.200 g of *octadecylsilyl silica gel for chromatography R* with 5 mL of *methanol R* and then with 3 mL of *water R* at a rate of 1 drop per second, ensuring that the column does not dry out. Transfer the combined supernatants to the column. Allow to drain ensuring that the column does not dry out and discard the eluate. Wash the column with 2 mL of *water R* and discard the washings. Elute the column with 1 mL of *methanol R* and collect the eluate.

**Reference solution (a)** Dissolve 1.0 mg of *cyasterone R* and 1.0 mg of *ginsenoside Ro R* in 2.0 mL of *methanol R*.

**Reference solution (b)** Mix 1.0 mL of reference solution (a) and 3.0 mL of *methanol R*.

**Reference solution (c)** Dissolve 1 mg of  $\beta$ -*ecdysterone R* and 1 mg of *cyasterone R* in 2 mL of *methanol R*.

**Intensity marker** *Cyasterone*.

**Plate** *TLC silica gel F<sub>254</sub> plate R* (2-10 µm).

**Mobile phase** *anhydrous formic acid R, water R, methanol R, methylene chloride R* (5:5:25:70 *V/V/V/V*).

**Application** 3 µL as bands of 8 mm.

**Development** 70 mm from the lower edge of the plate.

**Drying** In a current of cold air for 5 min.

**Detection** Treat with a 100 g/L solution of *sulfuric acid R* in *ethanol (96 per cent) R* and heat at 100 °C for 5 min; examine in ultraviolet light at 366 nm.

**System suitability** Reference solution (c):

— the chromatogram shows in the middle and upper thirds 2 distinct zones, which may be touching; the lower zone ( $\beta$ -*ecdysterone*) shows a blue fluorescence and the upper zone (*cyasterone*) shows a bright blue fluorescence.

**Results** The chromatogram obtained with the test solution shows no intense reddish zones in the lower half or just below the zone due to *cyasterone* in the chromatogram obtained with reference solution (a).

**Loss on drying** (2.2.32)

Maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (710) (2.9.12) by drying in an oven at 105 °C for 2 h.

**Total ash** (2.4.16)

Maximum 8.0 per cent.

**Ash insoluble in hydrochloric acid** (2.8.1)

Maximum 2.0 per cent.

**ASSAY**

Liquid chromatography (2.2.29).

**Test solution** To 1.00 g of the powdered herbal drug (710) (2.9.12) add 20.0 mL of an 80 per cent *V/V* solution of *methanol R*. Weigh and sonicate for 60 min. Allow to cool and weigh again. Compensate for the loss of solvent with an 80 per cent *V/V* solution of *methanol R* and shake thoroughly. Filter through a membrane filter (nominal pore size 0.45 µm).

**Reference solution** Dissolve 4.0 mg of *cyasterone CRS* in an 80 per cent *V/V* solution of *methanol R* and dilute to 10.0 mL with the same solvent. Dilute 1.0 mL of the solution to 10.0 mL with an 80 per cent *V/V* solution of *methanol R*.

**Column:**

- size:  $l = 0.15$  m,  $\varnothing = 4.6$  mm;
- stationary phase: solid core octylsilyl silica gel for chromatography *R* (2.7  $\mu$ m);
- temperature: 35 °C.

**Mobile phase:**

- mobile phase A: phosphoric acid *R*, water for chromatography *R* (0.1:99.9 *V/V*);
- mobile phase B: *methanol RI*;

Time (min)	Mobile phase A (per cent <i>V/V</i> )	Mobile phase B (per cent <i>V/V</i> )
0 - 3	88	12
3 - 5	88 → 67	12 → 33
5 - 35	67 → 64	33 → 36
35 - 39	64 → 5	36 → 95

**Flow rate** 0.6 mL/min.

**Detection** Spectrophotometer at 248 nm.

**Injection** 10  $\mu$ L.

**Identification of peaks** Use the chromatogram supplied with *cyasterone CRS* and the chromatogram obtained with the reference solution to identify the peak due to *cyasterone* and peak 2.

**Retention time** *Cyasterone* = about 32.6 min; peak 2 (unknown) = about 34 min.

**System suitability** Reference solution:

- resolution: minimum 1.7 between the peak due to *cyasterone* and peak 2.

Calculate the percentage content of *cyasterone* using the following expression:

$$\frac{A_1 \times m_2 \times p}{A_2 \times m_1 \times 5}$$

- $A_1$  = area of the peak due to *cyasterone* in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to *cyasterone* in the chromatogram obtained with the reference solution;
- $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;
- $m_2$  = mass of *cyasterone CRS* used to prepare the reference solution, in grams;
- $p$  = percentage content of *cyasterone* in *cyasterone CRS*.

Ph Eur

## Dandelion Herb with Root

(Ph. Eur. monograph 1851)

Ph Eur

### DEFINITION

Mixture of whole or fragmented, dried aerial and underground parts of *Taraxacum officinale* F.H. Wigg.

### CHARACTERS

Bitter taste.

### IDENTIFICATION

A. The underground parts consist of dark brown or blackish fragments 2-3 cm long, deeply wrinkled longitudinally on the

outer surface. The thickened crown shows many scars left by the rosette of leaves. The fracture is short. A transverse section shows a greyish-white or brownish cortex containing concentric layers of brownish laticiferous vessels and a porous, pale yellow, non-radiate wood. Leaf fragments are green, glabrous or densely pilose. They are crumpled and usually show a clearly visible midrib on the inner surface. The lamina, with deeply dentate margins, is crumpled. The solitary flower heads, on hollow stems, consist of an involucre of green, foliaceous bracts surrounding the yellow florets, all of which are ligulate; a few achenes bearing a white, silky, outspread pappus may be present.

B. Microscopic examination (2.8.23). The powder is yellowish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 1851.-1): fragments of cork [G] with flattened, thin-walled cells; reticulate lignified vessels [H] from the roots; fragments of parenchyma containing branched laticiferous vessels [F]; fragments of leaves, in surface view, showing upper [E] and lower [C] epidermises consisting of interlocking lobed cells and anomocytic stomata (2.8.3) [Ca, Ea]; elongated, multicellular covering trichomes with constrictions, which are more or less abundant depending on the variety or sub-variety [B, D]; fragments of the upper [E] epidermis usually accompanied by underlying palisade parenchyma [Eb] and fragments of the lower [C] epidermis accompanied by underlying spongy parenchyma [Cb]; lignified, spirally or annularly thickened vessels; fragments of flower-stem epidermis with stomata and rigid-walled, elongated cells [A]; pollen grains with a pitted exine [J]. Examine under a microscope using *glycerol R*.

The powder shows angular, irregular inulin fragments, free or included in the parenchyma cells.

Figure 1851.-1. — Illustration for identification test B of powdered herbal drug of dandelion herb with root

## C. Thin-layer chromatography (2.2.27).

**Test solution** To 2.0 g of the powdered herbal drug (355) (2.9.12) add 10 mL of *methanol R*. Heat in a water-bath at 60 °C or sonicate for 10 min. Cool and filter.

**Reference solution** Dissolve 2 mg of *chlorogenic acid R* and 2 mg of *rutoside trihydrate R* in *methanol R* and dilute to 20 mL with the same solvent.

**Plate** TLC silica gel plate R (5-40 µm) [or TLC silica gel plate R (2-10 µm)].

**Mobile phase** *anhydrous formic acid R*, *water R*, *ethyl acetate R* (10:10:80 V/V/V).

**Application** 20 µL [or 5 µL] as bands of 10 mm [or 8 mm].

**Development** Over a path of 12 cm [or 7 cm].

**Drying** In air.

**Detection** Heat at 100 °C for 5 min; spray with or dip briefly into a 10 g/L solution of *diphenylboric acid aminoethyl ester R* in *methanol R* and dry at 100 °C for 5 min; spray with or dip briefly into a 50 g/L solution of *macrogol 400 R* in *methanol R*; heat at 100 °C for 5 min and examine in ultraviolet light at 365 nm.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
	A faint red zone
	A faint yellow zone
Chlorogenic acid: a blue zone	2 light blue zones
Rutoside: a yellowish-brown zone	A light blue zone
Reference solution	Test solution

## TESTS

## Loss on drying (2.2.32)

Maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

## Total ash (2.4.16)

Maximum 17.0 per cent.

## Ash insoluble in hydrochloric acid (2.8.1)

Maximum 5.0 per cent.

## Extractable matter

Minimum 30.0 per cent.

To 2.000 g of the powdered herbal drug (250) (2.9.12) add 40 g of *water R*. Stir for 1 h and filter. Evaporate 10 g of the filtrate to dryness on a water-bath and dry in an oven at 100-105 °C for 2 h. The residue weighs a minimum of 0.15 g.

## Bitterness value (2.8.15)

Minimum 100.

## Dandelion Root

(Ph. Eur. monograph 1852)

Ph Eur

## DEFINITION

Whole or cut, dried underground parts of *Taraxacum officinale* F.H.Wigg.

## CHARACTERS

Bitter taste.

## IDENTIFICATION

A. The dark brown or blackish taproot shows little branching and is deeply wrinkled longitudinally on the outer surface. The thickened crown shows many scars left by the rosette of leaves. The fracture is short. A transverse section shows a greyish-white or brownish cortex containing concentric layers of brownish laticiferous vessels and a porous, pale yellow, non-radiate wood.

B. Microscopic examination (2.8.23). The powder is yellowish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 1852.-1): fragments of brown or reddish-brown cork (surface view [G], transverse section [C]) with flattened, thin-walled cells [Ca], sometimes accompanied by parenchyma [Cb]; reticulate lignified vessels [E, J, M]; fragments of parenchyma [A, D, K, L], some containing branched laticiferous vessels (longitudinal section [Ka]), transverse section [Da]); granular contents of laticiferous vessels [B, H]. Examine under a microscope using *glycerol R*. The powder shows numerous irregular, angular inulin fragments, free [F] or included in the parenchyma cells [La].

## TESTS

**Loss on drying** (2.2.32)

Maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

**Total ash** (2.4.16)

Maximum 10.0 per cent.

**Ash insoluble in hydrochloric acid** (2.8.1)

Maximum 3.0 per cent.

**Extractable matter**

Minimum 20.0 per cent.

To 2.000 g of the powdered herbal drug (250) (2.9.12) add 40 g of *water R*. Stir for 1 h and filter. Evaporate 10 g of the filtrate to dryness on a water-bath and dry in an oven at 100-105 °C for 2 h. The residue weighs a minimum of 0.10 g.

**Bitterness value** (2.8.15)

Minimum 100.

Ph Eur

## Devil's Claw

## Harpagophytum

(*Devil's Claw Root*, Ph. Eur. monograph 1095)

## Preparation

Devil's Claw Dry Extract

Ph Eur

## DEFINITION

Cut and dried, tuberous secondary roots of *Harpagophytum procumbens* DC. and/or *Harpagophytum zeyheri* Decne.

## Content

Minimum 1.2 per cent of harpagoside ( $\text{C}_{24}\text{H}_{30}\text{O}_{11}$ ;  $M_r$  494.5) (dried drug).

## CHARACTERS

The root is greyish-brown or dark brown.

## IDENTIFICATION

A. It consists of thick, fan-shaped or rounded slices or of roughly crushed discs. The darker outer surface is traversed by tortuous longitudinal wrinkles. The paler cut surface shows a dark cambial zone and xylem bundles distinctly aligned in radial rows. The central cylinder shows fine concentric striations. Seen under a lens, the cut surface presents yellow or brownish-red granules.

B. Microscopic examination (2.8.23). The powder is brownish-yellow. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 1095.-1): fragments of cork consisting of yellowish-brown, thin-walled cells (surface view [B], transverse section [C]); fragments of cortical parenchyma consisting of large, thin-walled cells [E, K, N, P], sometimes containing reddish-brown granular inclusions and isolated yellow droplets [P]; fragments of reticulately thickened or pitted vessels [D, F, G, M] and fragments of lignified parenchyma [L], sometimes associated with vessels, from the central cylinder; prism crystals [A] and rare small needles of calcium oxalate in the parenchyma. The powder may also show rectangular or polygonal sclereids with dark reddish-brown contents [H, J]. With a solution of phloroglucinol in hydrochloric acid, the parenchyma turns green.

## C. Thin-layer chromatography (2.2.27).

**Test solution** Heat 1.0 g of the powdered herbal drug (355) (2.9.12) with 10 mL of *methanol R* on a water-bath at 60 °C for 10 min. Filter and reduce the filtrate to about 2 mL under reduced pressure at a temperature not exceeding 40 °C.

**Reference solution** Dissolve 1 mg of *harpagoside R* and 2.5 mg of *fructose R* in 1 mL of *methanol R*.

**Plate** TLC silica gel  $F_{254}$  plate R (5-40  $\mu\text{m}$ ) [or TLC silica gel  $F_{254}$  plate R (2-10  $\mu\text{m}$ )].

**Mobile phase** water R, *methanol R*, *ethyl acetate R* (8:15:77 V/V/V).

**Application** 20  $\mu\text{L}$  [or 5  $\mu\text{L}$ ] as bands.

**Development** Over a path of 10 cm [or 7.5 cm].

**Drying** In a current of warm air.

**Detection A** Examine in ultraviolet light at 254 nm.

**Results A** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution; the chromatogram obtained with the test solution shows other distinct zones, mainly above the zone due to harpagoside. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Figure 1095.-1. – Illustration for identification test B of powdered herbal drug of devil's claw root

Top of the plate

Reference solution	Test solution

### TESTS

#### Starch

Examine the powdered herbal drug (355) (2.9.12) under a microscope using *water R*. Add *iodine solution R1*. No blue colour develops.

#### Loss on drying (2.2.32)

Maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C.

#### Total ash (2.4.16)

Maximum 10.0 per cent.

### ASSAY

Liquid chromatography (2.2.29).

**Test solution** To 0.500 g of the powdered herbal drug (355) (2.9.12) add 100.0 mL of *methanol R*. Shake for 4 h and filter through a membrane filter (nominal pore size 0.45 μm).

**Reference solution** Dissolve the contents of a vial of *harpagoside GRS* in *methanol R* and dilute to 10.0 mL with the same solvent.

#### Column:

— size:  $l = 0.10$  m,  $\varnothing = 4.0$  mm;

— stationary phase: end-capped octadecylsilyl silica gel for chromatography R (5 μm).

**Mobile phase** *methanol R*, *water for chromatography R* (50:50 V/V).

**Flow rate** 1.5 mL/min.

**Detection** Spectrophotometer at 278 nm.

**Injection** 10 μL.

**Run time** 3 times the retention time of harpagoside.

**Retention time** Harpagoside = about 7 min.

Calculate the percentage content of harpagoside using the following expression:

$$\frac{m_2 \times A_1 \times 1000}{A_2 \times m_1}$$

$A_1$  = area of the peak due to harpagoside in the chromatogram obtained with the test solution;

$A_2$  = area of the peak due to harpagoside in the chromatogram obtained with the reference solution;

$m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;

$m_2$  = mass of *harpagoside GRS* in the reference solution, in grams.

## Devil's Claw Dry Extract

(Ph. Eur. monograph 1871)

Ph Eur

### DEFINITION

Dry extract obtained from *Devil's claw root* (1095).

### Content

Minimum 1.5 per cent of harpagoside (C<sub>24</sub>H<sub>30</sub>O<sub>11</sub>; M<sub>r</sub> 494.5) (dried extract).

### PRODUCTION

The extract is produced from the herbal drug by an appropriate procedure using either water or a hydroalcoholic solvent that is at most equivalent in strength to ethanol (95 per cent V/V).

### CHARACTERS

#### Appearance

Light brown powder.

### IDENTIFICATION

Thin-layer chromatography (2.2.27).

**Test solution** To 1.0 g of the extract to be examined add 10 mL of *methanol R* and heat in a water-bath at 60 °C for 10 min. Cool and filter.

**Reference solution** Dissolve 1.0 mg of *harpagoside R* and 2.5 mg of *fructose R* in 1.0 mL of *methanol R*.

**Plate** TLC silica gel plate R.

**Mobile phase** *water R, methanol R, ethyl acetate R* (8:15:77 V/V/V).

**Application** 20 µL as bands.

**Development** Over a path of 10 cm.

**Drying** In a current of warm air.

**Detection** Spray with a 10 g/L solution of *phloroglucinol R* in *ethanol (96 per cent) R* and then with *hydrochloric acid R*; heat at 80 °C for 5-10 min and examine in daylight.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Harpagoside: a green zone	A green zone (harpagoside)
	A yellow zone
	A light green zone
Fructose: a yellowish-grey zone	A yellowish-grey zone may be present (fructose)
	A brown zone
Reference solution	Test solution

### ASSAY

Liquid chromatography (2.2.29).

**Test solution** Introduce 0.350 g of the extract to be examined into a 100 mL volumetric flask, add 90 mL of *methanol R* and sonicate for 20 min. Cool to room temperature, dilute to 100.0 mL with *methanol R* and filter through a membrane filter (nominal pore size 0.2 µm).

**Reference solution** Dissolve the contents of 1 vial of *harpagoside CRS* in *methanol R* and dilute to 10.0 mL with the same solvent.

#### Column:

— size:  $l = 0.10$  m,  $\varnothing = 4.0$  mm;

— stationary phase: *octadecylsilyl silica gel for chromatography R* (5 µm).

**Mobile phase** *methanol R, water R* (50:50 V/V).

**Flow rate** 1.5 mL/min.

**Detection** Spectrophotometer at 278 nm.

**Injection** 10 µL.

**Run time** 3 times the retention time of harpagoside.

**Retention time** Harpagoside = about 7 min.

Calculate the percentage content of harpagoside using the following expression:

$$\frac{A_1 \times m_2 \times 1000}{A_2 \times m_1}$$

$A_1$  = area of the peak due to harpagoside in the chromatogram obtained with the test solution;

$A_2$  = area of the peak due to harpagoside in the chromatogram obtained with the reference solution;

$m_1$  = mass of the extract to be examined used to prepare the test solution, in grams;

$m_2$  = mass of harpagoside contained in 1 vial of *harpagoside CRS*, in grams.

Ph Eur

## Digitalis Leaf

(Ph. Eur. monograph 0117)

When Powdered Digitalis is prescribed or demanded, material complying with the requirements below with the exception of Identification test A and the test for Foreign matter shall be dispensed or supplied.

Ph Eur

### DEFINITION

Dried leaf of *Digitalis purpurea L.*

### Content

Minimum 0.3 per cent of cardenolic glycosides, expressed as digitoxin (M<sub>r</sub> 765) (dried drug).

### CHARACTERS

Faint but characteristic odour.

The whole leaf is about 10-40 cm long and 4-15 cm wide.

The lamina is ovate lanceolate or broadly ovate. The winged petiole is from 1/4 as long as to equal in length to the lamina.

### IDENTIFICATION

A. The leaf is brittle and often occurs broken. The upper surface is green and the lower surface is greyish-green. The apex is subacute and the margin is irregularly crenate, dentate or serrate. The base is decurrent. The venation is pinnate, the lateral veins being prominent especially on the lower surface, leaving the midrib at about 45° and anastomosing near the margin; a veinlet terminates in each tooth of the margin and the lower veins run down the winged petiole. The upper surface is rugose and pubescent; the lower surface shows a network of raised veinlets and is densely pubescent.

**B. Microscopic examination (2.8.23).** Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 0117.-1): fragments of the upper epidermis (surface view [K, L]), with cells with a smooth cuticle and anticlinal walls that are slightly thickened, are straight or slightly sinuous, and may show slight beading and pitting [La] and sometimes scars of covering trichomes [Ka], accompanied by underlying palisade parenchyma [Lb]; fragments of the lower epidermis (surface view [G]), with markedly sinuous cells and anomocytic stomata (2.8.3) [Ga]; trichomes are of 2 types: a) uniseriate covering trichomes with blunt apex, usually consisting of 3-5 cells [H, J], often with 1 or more collapsed cells [Ja], walls mostly finely warty or faintly striated; b) glandular trichomes usually with a unicellular [C, D], sometimes a multicellular, uniseriate [A, B, E] stalk and a unicellular head [A, B, C, E] or bicellular head (side view [D]), surface view [F]) or exceptionally a tetracellular head.

Figure 0117.-1. – Illustration for identification test B of powdered herbal drug of digitalis leaf

**C. Thin-layer chromatography (2.2.27).**

**Test solution** To 1.0 g of the powdered herbal drug (180) (2.9.12) add a mixture of 20 mL of *ethanol (50 per cent V/V) R* and 10 mL of *lead acetate solution R*. Boil for 2 min, allow to cool and centrifuge. Shake the supernatant solution with 2 quantities, each of 15 mL, of *chloroform R*; separate the 2 layers by centrifugation if necessary. Dry the chloroform layers over *anhydrous sodium sulfate R* and filter. Evaporate 10 mL of the solution to dryness on a water-bath and dissolve the residue in 1 mL of a mixture of equal volumes of *chloroform R* and *methanol R*.

**Reference solution** Dissolve 5 mg of *purpureaglycoside A CRS*, 2 mg of *purpureaglycoside B CRS*, 5 mg of *digitoxin R* and 2 mg of *gitoxin R* in a mixture of equal volumes of

*chloroform R* and *methanol R*, then dilute to 10 mL with the same mixture of solvents.

**Plate** *TLC silica gel G plate R*.

**Mobile phase** *water R, methanol R, ethyl acetate R (7.5:10:75 V/V/V)*.

**Application** 20 μL as bands of 2 cm by 0.3 cm.

**Development** Over a path of 10 cm.

**Drying** Until the solvents have evaporated.

**Detection** Treat with a mixture of 2 volumes of a 10 g/L solution of *chloramine R* and 8 volumes of a 250 g/L solution of *trichloroacetic acid R in ethanol (96 per cent) R*, then heat at 100-105 °C for 10 min; examine in ultraviolet light at 365 nm.

**Results** The chromatogram obtained with the reference solution shows a zone of light blue fluorescence in the lower part of the chromatogram, due to purpureaglycoside B, and, just above it, a zone of brownish-yellow fluorescence due to purpureaglycoside A; a zone of light blue fluorescence, due to gitoxin, appears in the middle of the chromatogram and above it a zone of brownish-yellow fluorescence, due to digitoxin; the zones in the chromatogram obtained with the test solution are similar in position, colour and size to the zones in the chromatogram obtained with the reference solution. Other zones of fluorescence may also appear in the chromatogram obtained with the test solution.

**D.** Evaporate 5 mL of the chloroformic solution obtained in identification test C to dryness on a water-bath. To the residue add 2 mL of *dinitrobenzoic acid solution R* and 1 mL of 1 M *sodium hydroxide*. A reddish-violet colour develops within 5 min.

**E.** Evaporate 5 mL of the chloroformic solution obtained in identification test C to dryness on a water-bath. To the residue add 3 mL of *xanthydrol solution R* and heat on a water-bath for 3 min. A red colour develops.

**TESTS**

***Digitalis lanata* Ehrh.**

The presence of leaves with few or no trichomes and with parallel venation or the presence of cells of the abaxial epidermis with beaded anticlinal walls and of cells of the adaxial epidermis with numerous stomata indicates adulteration by *Digitalis lanata* Ehrh.

**Loss on drying (2.2.32)**

Maximum 6.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C.

**Total ash (2.4.16)**

Maximum 12.0 per cent.

**Ash insoluble in hydrochloric acid (2.8.1)**

Maximum 5.0 per cent.

**ASSAY**

Shake 0.250 g of the powdered herbal drug (180) (2.9.12) with 50.0 mL of *water R* for 1 h. Add 5.0 mL of a 150 g/L solution of *lead acetate R*, shake, and after a few minutes add 7.5 mL of a 40 g/L solution of *disodium hydrogen phosphate dodecahydrate R*. Filter through a pleated paper filter. Heat 50.0 mL of the filtrate with 5 mL of hydrochloric acid (150 g/L HCl) under a reflux condenser on a water-bath for 1 h. Transfer to a separating funnel, rinse the flask with 2 quantities, each of 5 mL, of *water R* and shake with 3 quantities, each of 25 mL, of *chloroform R*. Dry the combined chloroform layers over *anhydrous sodium sulfate R* and dilute to 100.0 mL with *chloroform R*. Evaporate 40.0 mL of the chloroformic solution to dryness, dissolve the

residue in 7 mL of *ethanol* (50 per cent V/V) R, add 2 mL of *dinitrobenzoic acid solution R* and 1 mL of 1 M *sodium hydroxide*. At the same time prepare a reference solution as follows. Dissolve 50.0 mg of *digitoxin CRS* in *ethanol* (96 per cent) R and dilute to 50.0 mL with the same solvent. Dilute 5.0 mL of the solution to 50.0 mL with *ethanol* (96 per cent) R. To 5.0 mL of the resulting solution add 25 mL of *water R* and 3 mL of *hydrochloric acid* (150 g/L HCl). Heat the solution under a reflux condenser on a water-bath for 1 h and complete the preparation as described above. Measure the absorbance (2.2.25) of the 2 solutions at 540 nm several times during the first 12 min until the maximum is reached, using as the compensation liquid a mixture of 7 mL of *ethanol* (50 per cent V/V) R, 2 mL of *dinitrobenzoic acid solution R* and 1 mL of 1 M *sodium hydroxide*.

From the absorbances measured and the concentrations of the solutions, calculate the content of cardenolic glycosides, expressed as *digitoxin*.

#### STORAGE

Protected from moisture.

Ph Eur

## Dill Oil

#### DEFINITION

Dill Oil is obtained by distillation from the dried ripe fruits of *Anethum graveolens* L.

#### CHARACTERISTICS

A clear, colourless or pale yellow liquid, visibly free from water; odour, characteristic of the crushed fruit.

#### TESTS

##### Optical rotation

+70° to +80°, Appendix V F.

##### Refractive index

1.481 to 1.492, Appendix V E.

##### Solubility in ethanol

Soluble, at 20°, in 1 volume or more of *ethanol* (90%) and in 10 volumes or more of *ethanol* (80%), Appendix X M.

##### Weight per mL

0.895 to 0.910 g, Appendix V G.

##### Content of carvone

43.0 to 63.0% w/w when determined by the following method. To 1.5 g in a glass-stoppered tube (approximately 150 mm × 25 mm) add 10 mL of a solution prepared in the following manner. Dissolve 7.0 g of *hydroxylamine hydrochloride* in 90 mL of *ethanol* (90%), warming gently if necessary, add 1.6 mL of *dimethyl yellow solution* and sufficient 1M *potassium hydroxide* in *ethanol* (90%) to produce a pure yellow colour and dilute to 100 mL with *ethanol* (90%). Titrate with 1M *potassium hydroxide* in *ethanol* (90%) VS until the red colour changes to yellow. Place the tube in a water bath at 75° to 80° and, at 5-minute intervals, neutralise with 1M *potassium hydroxide* in *ethanol* (90%) VS; after 40 minutes complete the titration to the full yellow colour of the indicator. This procedure gives an approximate value for the carvone content of the oil. Repeat the procedure, using as the colour standard for the end point of the titration the titrated liquid of the first determination with the addition of 0.5 mL of 1M *potassium hydroxide* in *ethanol* (90%) VS. Calculate the content of carvone from the second

determination. Each mL of 1M *potassium hydroxide* in *ethanol* (90%) VS is equivalent to 151.4 mg of carvone, C<sub>10</sub>H<sub>14</sub>O.

#### STORAGE

Dill Oil should be kept in a well-filled container and protected from light. It darkens in colour on storage.

## Dioscorea Nipponica Rhizome

(Ph. Eur. monograph 2890)

Ph Eur

#### DEFINITION

Dried, whole or fragmented, scraped rhizome of *Dioscorea nipponica* Makino, with roots removed.

#### Content

Minimum 1.0 per cent of *diosgenin* (C<sub>27</sub>H<sub>42</sub>O<sub>3</sub>; M<sub>r</sub> 414.6) (dried drug).

#### IDENTIFICATION

A. *Whole drug*. The rhizome is subcylindrical, slightly curved, up to 15-20 cm long and 1.0-1.5 cm in diameter. The outer surface is yellowish-white or brownish-yellow, irregularly and longitudinally furrowed, bearing spinous remains of roots and protuberant stem scars.

*Fragmented drug*. Transverse slices of the rhizome, oblique or more or less longitudinal, circular, oval or elongated, whole or broken, up to 0.7 cm thick. The outer surface is light brown or yellowish-brown, irregularly and longitudinally furrowed; spinous remains of roots and protuberant stem scars may be visible. A transverse section is yellowish-white, can easily be imprinted with one's nail due to an abundance of starch, and shows numerous light yellowish-brown pits corresponding to the vascular bundles.

B. Microscopic examination (2.8.23). The powder is whitish or light yellow. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2890.-1): vessels up to 50 µm in diameter with numerous fine, dense and elliptical pits [G]; numerous fragments of parenchyma with polyhedral or ovoid cells with slightly thickened and pitted walls (transverse section [B], longitudinal section [C]); cells containing raphides of calcium oxalate up to 110 µm long [D]; free needles of calcium oxalate [A]; rare cork fragments with polyhedral cells (surface view [F]). Examine under a microscope using a 50 per cent V/V solution of *glycerol R*. The powder shows extremely abundant starch granules, simple, irregular, ovoid, oblong, sub-triangular, with a maximum dimension of up to 30 µm; the hilum is usually eccentric and slit-shaped [E].

C. Thin-layer chromatography (2.2.27).

*Test solution*. To 0.5 g of the powdered herbal drug (355) (2.9.12) add 5 mL of *methanol R*. Sonicate for 10 min. Centrifuge and use the supernatant.

*Reference solution*. Dissolve 1 mg of *aescin R* and 1 mg of *glucose R* in 1 mL of *methanol R*.

*Plate*. TLC silica gel plate R (2-10 µm).

*Mobile phase*. *water R*, *methanol R*, *methylene chloride R* (10:50:64 V/V/V).

*Application*. 8 µL as bands of 8 mm.

*Development*. Over a path of 6 cm.

*Drying*. In air.

*Detection*. Treat with *anisaldehyde solution R*, heat at 100 °C for 3 min, allow to cool for 10 min and examine in daylight.

Figure 2890.-1. – Illustration for identification test B of powdered herbal drug of *Dioscorea nipponica* rhizome

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
	3 olive-green zones
Aescin: a violet zone	A green zone
	A faint to strong green zone
Glucose: a yellow or brown zone	A yellowish-brown zone
	A faint brown zone
	A yellow zone
Reference solution	Test solution

#### TESTS

##### Loss on drying (2.2.32)

Maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

##### Total ash (2.4.16)

Maximum 5.0 per cent.

##### Ash insoluble in hydrochloric acid (2.8.1)

Maximum 1.0 per cent.

#### ASSAY

Liquid chromatography (2.2.29).

**Test solution** To 2.000 g of the powdered herbal drug (355) (2.9.12) in a round-bottomed flask add 40 mL of a 15 per cent *V/V* solution of sulfuric acid *R*. Heat in a water-bath under a reflux condenser for 3 h. Allow to cool and filter. Wash the residue with water *R* until the filtrate is neutral. Sonicate the residue for 30 min in 80 mL of methanol *R* and filter. Wash the residue with 20 mL of methanol *R*, combine the filtrate and the washing and dilute to 100.0 mL with methanol *R*.

**Reference solution (a)** Dissolve 5.0 mg of diosgenin *CRS* in methanol *R* and dilute to 25.0 mL with the same solvent.

**Reference solution (b)** Dissolve 2 mg of (25*R*)-spirost-5-en-3-one *CRS* in reference solution (a) and dilute to 10.0 mL with the same solution.

#### Column:

— size:  $l = 0.15$  m,  $\varnothing = 4.6$  mm;

— stationary phase: end-capped octadecylsilyl silica gel for chromatography *R* (5 µm).

**Mobile phase** water for chromatography *R*, acetonitrile for chromatography *R* (15:85 *V/V*).

**Flow rate** 1.5 mL/min.

**Detection** Spectrophotometer at 205 nm.

**Injection** 5 µL.

**Run time** 20 min.

**Retention time** Diosgenin = about 8 min; (25*R*)-spirost-5-en-3-one = about 10 min.

**System suitability** Reference solution (b):

— resolution: minimum 1.9 between the peaks due to diosgenin and (25*R*)-spirost-5-en-3-one.

Calculate the percentage content of diosgenin using the following expression:

$$\frac{A_1 \times m_2 \times 4 \times p}{A_2 \times m_1}$$

$A_1$  = area of the peak due to diosgenin in the chromatogram obtained with the test solution;

$A_2$  = area of the peak due to diosgenin in the chromatogram obtained with reference solution (a);

$m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;

$m_2$  = mass of diosgenin *CRS* used to prepare reference solution (a), in grams;

$p$  = percentage content of diosgenin in diosgenin *CRS*.

Ph Eur

## Dioscorea Oppositifolia Rhizome

(Ph. Eur. monograph 2473)

Ph Eur

#### DEFINITION

Dried, scraped, whole or fragmented rhizome of *Dioscorea oppositifolia* L. (syn. *Dioscorea opposita* Thunb.), with roots removed, collected in winter when the stem and leaves are withered.

#### IDENTIFICATION

A. The rhizome occurs in subcylindrical pieces, sometimes flattened, about 15-30 cm long and 1.5-6 cm thick; the outer surface is yellowish-white or pale yellow, longitudinally furrowed and wrinkled, and bearing slit-shaped root scars with occasional patches of brownish cork. The fragmented rhizome occurs in whole or fragmented slices, about

0.2-0.5 cm thick; some slices still bear slit-shaped root scars. The texture is heavy, compact and tough; the fracture is white and starchy.

**B. Microscopic examination (2.8.23).** The powder is whitish or yellowish-white. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2473.-1): reticulate or pitted vessels (longitudinal section [C, E]); fragments of xylem (transverse section [G]) consisting of vessels up to 80 µm in diameter [Ga] and ligneous parenchyma with distinctly pitted cells [Gb]; numerous fragments of parenchyma consisting of polyhedral or ovoid cells with thin walls [B]; cells containing calcium oxalate raphides up to 250 µm long and up to 5 µm in diameter [F]; free needles of calcium oxalate [A]. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows extremely abundant starch granules [D], simple, ovoid or oblong, flattened with rounded extremities, with a maximum dimension of up to 50 µm; the hilum is usually eccentric and punctiform; rare 2- to 4-compound starch granules may be present.

Figure 2473.-1. – Illustration for identification test B of powdered herbal drug of *Dioscorea oppositifolia* rhizome

C. Examine the chromatograms obtained in the test for *Dioscorea bulbifera* L.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
	3-5 violet zones
Aescin: a violet zone	A violet zone
Glucose: a yellow or green zone	A yellow or brown zone
	A violet zone
Reference solution	Test solution

## TESTS

### *Dioscorea bulbifera* L

Thin-layer chromatography (2.2.27).

**Test solution** To 0.5 g of the powdered herbal drug (355) (2.9.12) add 5 mL of *methanol R*. Sonicate for 10 min. Centrifuge and use the supernatant.

**Reference solution** Dissolve 1 mg of *aescin R* and 3 mg of *glucose R* in 7 mL of *methanol R*.

**Plate** TLC silica gel plate R (2-10 µm).

**Mobile phase** *water R*, *methanol R*, *methylene chloride R* (8:40:52 *V/V/V*).

**Application** 15 µL as bands of 8 mm.

**Development** Over a path of 6 cm.

**Drying** In air.

**Detection** Treat with *anisaldehyde solution R*, heat at 100 °C for 3 min, allow to cool for 10 min and examine in daylight.

**Results** The chromatogram obtained with the test solution shows no brownish-green or orange-brown zones in the upper third of the chromatogram.

**Loss on drying (2.2.32)**

Maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

**Total ash (2.4.16)**

Maximum 4.0 per cent.

**Ash insoluble in hydrochloric acid (2.8.1)**

Maximum 0.5 per cent.

**Extractable matter**

Minimum 7.0 per cent (dried drug).

To 1.00 g of the powdered herbal drug (355) (2.9.12) add 25 mL of *water R*, shake for 6 h and allow to macerate for 18 h. Filter, evaporate the filtrate to dryness on a water-bath under reduced pressure and dry in an oven at 100-105 °C for 2 h. The residue weighs a minimum of 70 mg.

Ph Eur

## Dog Rose

(Ph. Eur. monograph 1510)

Ph Eur

## DEFINITION

Rose hips made up of the receptacle and the remains of the dried sepals of *Rosa canina* L., *Rosa pendulina* L. and other *Rosa* species, with the achenes removed.

**Content**

Minimum 0.3 per cent of ascorbic acid (C<sub>6</sub>H<sub>8</sub>O<sub>6</sub>; M<sub>r</sub> 176.1) (dried drug).

**IDENTIFICATION**

**A.** It consists of fragments of the fleshy, hollow, urceolate receptacle, bearing the remains of the reduced sepals, light pink or orange-pink, the convex outer surface shiny and strongly wrinkled; bearing on its lighter inner surface abundant bristle-like hairs.

**B.** Microscopic examination (2.8.23). The powder is orange-yellow. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 1510.-1): numerous fragments of the outer surface of the receptacle (transverse section [B], surface view [D]) consisting of the outer epidermis with irregularly thickened polyhedral cells [Ba] and a thick cuticle, sometimes accompanied by parenchyma [Bb]; fragments of the inner epidermis of the receptacle (transverse section [C], surface view [G]) with slightly wavy cells [Ca, Ga] and lignified bases of the covering trichomes [Cc, Gb], covered in a finely wrinkled cuticle around the basal cell of the trichomes, usually accompanied by the inner layers of the parenchyma [Cd, Gc]; fragments of the inner layers of the parenchyma [H], whose cells almost all contain crystals of calcium oxalate (mostly cluster crystals [Ce, Gd, Ha] but also prisms [Cb, Ge, Hb]); scattered lignified cells, isodiametric or oval, with thickened and pitted walls corresponding to the trichome bases [E]; abundant unicellular trichomes [A], up to 2 mm long and 30-45  $\mu\text{m}$  thick, tapering towards each end (apical end [Aa], distal end [Ab, K]), with walls heavily thickened and with a waxy cuticle that may show fissures in a spiral arrangement [Ac, Ka]; fragments of parenchyma [J] consisting of large ovoid cells with irregularly thickened walls and granular contents with small oil droplets [Ja], and small cells each containing a cluster crystal of calcium oxalate [Jb]; scattered cluster crystals of calcium oxalate [F].

Figure 1510.-1. – Illustration for identification test B of powdered herbal drug of dog rose

**C.** Thin-layer chromatography (2.2.27).

**Test solution** To 5 g of the powdered herbal drug (355) (2.9.12) add 25 mL of *ethanol (96 per cent) R*, shake for 30 min and filter.

**Reference solution** Dissolve 10 mg of *ascorbic acid R* in 5 mL of *ethanol (60 per cent V/V) R*.

**Plate** TLC silica gel F<sub>254</sub> plate R.

**Mobile phase** *acetone R*, *glacial acetic acid R*, *methanol R*, *toluene R* (5:5:20:70 V/V/V/V).

**Application** 20  $\mu\text{L}$  of the test solution and 2  $\mu\text{L}$  of the reference solution.

**Development** Over a path of 15 cm.

**Drying** In air.

**Detection A** Examine in ultraviolet light at 254 nm.

**Results A** The chromatogram obtained with the test solution shows a quenching zone similar in position to the principal zone in the chromatogram obtained with the reference solution.

**Detection B** Spray with a 0.2 g/L solution of *dichlorophenolindophenol, sodium salt R* in *ethanol (96 per cent) R* and examine in daylight.

**Results B** The chromatogram obtained with the test solution shows a white zone on a pink background (*ascorbic acid*) similar in position and colour to the principal zone in the chromatogram obtained with the reference solution; the chromatogram also shows an intense orange-yellow zone near the solvent front and a yellow zone in the upper third (*carotenoids*).

**TESTS**

**Foreign matter (2.8.2)**

Maximum 1 per cent.

**Loss on drying (2.2.32)**

Maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C.

**Total ash (2.4.16)**

Maximum 7.0 per cent.

**ASSAY**

**Test solution** In a round-bottomed flask, weigh 0.500 g of the freshly powdered herbal drug (710) (2.9.12). Add a solution of 1.0 g of *oxalic acid R* in 50.0 mL of *methanol R*. Boil under a reflux condenser for 10 min, and cool in iced water until the temperature reaches 15-20 °C. Filter. Transfer 2.0 mL of the filtrate to a 50 mL conical flask. Add successively, with gentle shaking after each addition, 2.0 mL of *dichlorophenolindophenol standard solution R* and then, exactly 60 s later, 0.5 mL of a 100 g/L solution of *thiourea R* in *ethanol (50 per cent V/V) R* and 0.7 mL of *dinitrophenylhydrazine-sulfuric acid solution R*. Heat under a reflux condenser at 50 °C for 75 min, and place immediately in iced water for 5 min. Add dropwise 5.0 mL of a mixture of 12 mL of *water R* and 50 mL of *sulfuric acid R*, taking care to carry out the addition over a period of minimum 90 s and maximum 120 s while maintaining vigorous stirring in iced water. Allow to stand for 30 min at room temperature and measure the absorbance (2.2.25) at 520 nm using solution A as compensation liquid.

**Solution A** Treat 2.0 mL of the filtrate obtained during the preparation of the test solution as described but adding the *dinitrophenylhydrazine-sulfuric acid solution R* just before the absorbance is measured.

**Reference solution** Dissolve 40.0 mg of *ascorbic acid R* in a freshly prepared 20 g/L solution of *oxalic acid R* in *methanol R* and dilute to 100.0 mL with the same solvent. Dilute 5.0 mL of this solution to 100.0 mL with a freshly prepared 20 g/L solution of *oxalic acid R* in *methanol R*. Treat 2.0 mL of the solution as described above for the filtrate obtained during the preparation of the test solution. Measure the absorbance (2.2.25) at 520 nm using solution B as the compensation liquid.

**Solution B** Treat 2.0 mL of the reference solution as described above for solution A.

Calculate the percentage content of ascorbic acid from the following expression:

$$\frac{2.5 \times A_1 \times m_2}{A_2 \times m_1}$$

- $A_1$  = absorbance of the test solution;  
 $A_2$  = absorbance of the reference solution;  
 $m_1$  = mass of the substance to be examined, in grams;  
 $m_2$  = mass of ascorbic acid used, in grams.

Ph Eur

## Drynaria Rhizome

(Ph. Eur. monograph 2563)

Ph Eur

### DEFINITION

Dried rhizome of *Drynaria fortunei* (Kunze) J. Sm. The ramenta may be removed.

### Content

Minimum 0.5 per cent of naringin ( $C_{27}H_{32}O_{14}$ ;  $M_r$  580.5) (dried drug).

### IDENTIFICATION

A. Long, flattened, spat-shaped rhizome, often curved and branched, 5-15 cm long and 1-1.5 cm thick. The surface is either completely covered in scaly, dark brown hairs (rhizome with ramenta) or glabrous with dark brown dots (rhizome without ramenta). The upper surface and both sides show circular frond scars, rarely the frond bases. The lower surface shows scars or the remains of fibrous roots. The texture is light, fragile, easily broken. The section is reddish-brown; the steles form a ring of small yellow dots.

B. Microscopic examination (2.8.23). The powder is reddish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2563.-1): numerous polyhedral parenchymatous cells [A] or fragments of parenchymatous cells [E, F, G] with slightly and regularly thickened pitted walls; scalariform vessels of variable diameter up to 60  $\mu$ m [D]; fragments of reddish-brown scaly hairs forming a tissue consisting of cells with thickened, somewhat sinuous walls [B]; the margins of the scaly hairs [C] have elongated cells with rigid walls [Ca] and expansions, usually bicellular [Cb].

C. Thin-layer chromatography (2.2.27).

**Test solution** To 0.5 g of the powdered herbal drug (355) (2.9.12) add 5 mL of *methanol R* and sonicate for 10 min. Cool, centrifuge and use the supernatant.

**Reference solution** Dissolve 1 mg of *naringin R* and 1 mg of *hyperoside R* in 2 mL of *methanol R*.

**Plate** TLC silica gel plate R (2-10  $\mu$ m).

Figure 2563.-1. – Illustration for identification test B of powdered herbal drug of *drynaria rhizome*

**Mobile phase** *acetic acid R*, *anhydrous formic acid R*, *water R*, *ethyl acetate R* (11:11:26:100 V/V/V/V).

**Application** 10  $\mu$ L as bands of 8 mm.

**Development** Over a path of 6 cm.

**Drying** In air.

**Detection** Treat with *aluminium chloride reagent R*; examine in ultraviolet light at 365 nm.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Hyperoside: a yellow zone	
Naringin: a bluish-white zone	A bluish-white zone (naringin)
	A bluish-white zone

### TESTS

#### Loss on drying (2.2.32)

Maximum 13.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

#### Total ash (2.4.16)

Maximum 7.0 per cent.

**Ash insoluble in hydrochloric acid (2.8.1)**

Maximum 2.0 per cent.

**ASSAY**

Liquid chromatography (2.2.29).

**Test solution** Disperse 0.100 g of the powdered herbal drug (355) (2.9.12) in a 50 per cent *V/V* solution of *methanol R* and dilute to 10.0 mL with the same solvent. Weigh, sonicate for 45 min. Allow to cool, weigh and compensate the loss of solvent with a 50 per cent *V/V* solution of *methanol R*, shake well. Filter through a membrane filter (nominal pore size 0.45 µm).

**Reference solution (a)** Dissolve 10.0 mg of *naringin CRS* in *methanol R* and dilute to 20.0 mL with the same solvent.

**Reference solution (b)** Dissolve 5.0 mg of *neohesperidin R* in reference solution (a) and dilute to 10.0 mL with reference solution (a).

**Reference solution (c)** Dilute 1.0 mL of reference solution (a) to 10.0 mL with *methanol R*.

**Column:**— size:  $l = 0.15$  m,  $\varnothing = 4.6$  mm;— stationary phase: octadecylsilyl silica gel for chromatography *R* (5 µm).

**Mobile phase** *acetonitrile R*, 0.4 per cent *V/V* solution of *acetic acid R* (18:82 *V/V*).

Flow rate 1.0 mL/min.

Detection Spectrophotometer at 283 nm.

**Injection** 20 µL of the test solution and reference solutions (b) and (c).

**Run time** Twice the retention time of naringin.

**Retention time** Naringin = about 9 min;

neohesperidin = about 12 min.

**System suitability** Reference solution (b):

— resolution: minimum 5.0 between the peaks due to naringin and neohesperidin.

Calculate the percentage content of naringin using the following expression:

$$\frac{A_1 \times m_2 \times p}{A_2 \times m_1 \times 20}$$

- $A_1$  = area of the peak due to naringin in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to naringin in the chromatogram obtained with reference solution (c);
- $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;
- $m_2$  = mass of *naringin CRS* used to prepare reference solution (a), in grams;
- $p$  = percentage content of naringin in *naringin CRS*.

Ph Eur

**IDENTIFICATION**

A. It is fusiform with both ends slightly tapered, 1.5-3 cm long and 3-6 mm in diameter. The outer surface is whitish-yellow, fine and longitudinally wrinkled. The texture is hard, the fracture is yellowish-white and translucent, and the vascular system appears as a small ring in the centre.

B. Microscopic examination (2.8.23). The powder is yellowish-white. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 3000.-1): numerous fragments of parenchyma consisting of suborbicular or elliptical cells [A]; different sized raphides of calcium oxalate, free [F] or included in parenchymatous cells [Aa], either fine, 12-65 µm long [Aa], or thicker, up to 130 µm long [F]; sclereids, usually in groups (surface view [E]), subsquare, rectangular or polygonal (20-57 µm in diameter) with distinct, dense channels; fragments of the endodermis with rectangular or elongated cells, with channelled and pitted walls (surface view [C]); fragments (transverse section [B]) showing the endodermis [Ba], sclereids with unevenly thickened walls [Bb] and parenchymatous cells [Bc]; thin xylem fibres [G], with oblique or square ends, slightly thickened walls, and oblique, cross-shaped or V-shaped pits; fragments of xylem [D] consisting of spiral or reticulate vessels [Da] and fibres [Db, Dc].

Figure 3000.-1. – Illustration for identification test B of powdered herbal drug of dwarf lilyturf tuber

C. High-performance thin-layer chromatography (2.8.25).

**Test solution** To 2.0 g of the powdered herbal drug (355) (2.9.12) add 20 mL of *anhydrous ethanol R*. Sonicate for 30 min, filter and evaporate to dryness. Dissolve the residue in 0.5 mL of *anhydrous ethanol R*, centrifuge and use the supernatant.

**Dwarf Lilyturf Tuber**

(Ph. Eur. monograph 3000)

Ph Eur

**DEFINITION**

Dried root tuber of *Ophiopogon japonicus* (Thunb.) Ker Gawl., with the spindly roots removed.

**Content**

Minimum 0.12 per cent of total saponins, expressed as ruscogenin ( $C_{27}H_{42}O_4$ ;  $M_r$  430.6) (dried drug).

**Reference solution (a)** Dissolve 1 mg of  $\beta$ -sitosterol R and 1 mg of methylophipogonanone A R in 2.0 mL of anhydrous ethanol R.

**Reference solution (b)** Mix 1.0 mL of reference solution (a) and 3.0 mL of anhydrous ethanol R.

**Reference solution (c)** Dilute 3  $\mu$ L of isoeugenol R and 6  $\mu$ L of methyleugenol R in 20 mL of toluene R.

**Intensity markers**  $\beta$ -sitosterol and methylophipogonanone A.

**Plate** TLC silica gel F<sub>254</sub> plate R (2-10  $\mu$ m).

**Mobile phase** ethyl acetate R, toluene R (10:90 V/V).

**Application** 5  $\mu$ L as bands of 8 mm.

**Development** 70 mm from the lower edge of the plate.

**Drying** In a current of cold air for 5 min.

**Detection** Dip the plate in a 10 per cent V/V solution of sulfuric acid R in anhydrous ethanol R; heat the plate at 105 °C for 10 min and examine under white light.

**System suitability** Reference solution (c):

- the chromatogram shows 2 distinct zones in the middle third; the lower zone (isoeugenol) and the upper zone (methyleugenol) show a violet-red fluorescence.

**Results** See below the sequence of zones present in the chromatograms obtained with reference solution (a) and the test solution. Furthermore, in the chromatogram obtained with the test solution, other faint fluorescent zones may be present.

Top of the plate	
	2 violet-red zones
Methylophipogonanone A: a brownish-yellow zone	A brownish-yellow zone, faint to equivalent
$\beta$ -sitosterol: a violet-red zone	1 or 2 violet-red or reddish zones, faint to equivalent (possibly overlapping) A violet-red zone A broad, intense violet-red zone
Reference solution (a)	Test solution

#### TESTS

##### Loss on drying (2.2.32)

Maximum 15.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

##### Total ash (2.4.16)

Maximum 2.5 per cent.

##### Ash insoluble in hydrochloric acid (2.8.1)

Maximum 0.5 per cent.

#### ASSAY

**Test solution** Introduce 1.20 g of the powdered herbal drug (355) (2.9.12) into a 50 mL round-bottomed flask, add 20.0 mL of methanol R and weigh. Boil under a reflux condenser for 2 h. Allow to cool to room temperature, weigh again and adjust to the original mass with methanol R. Mix thoroughly and filter through a membrane filter (nominal pore size 0.22  $\mu$ m). Evaporate 12.5 mL of the filtrate to dryness under a current of nitrogen R. Dissolve the residue in 5 mL of water R and extract with 5 quantities, each of 5 mL, of butanol R saturated with water R using a separating funnel. Combine the butanol extracts in a separating funnel and wash with 2 quantities, each of 2.5 mL, of dilute ammonia R1. Evaporate to dryness under a current of nitrogen R. Dissolve the residue in a mixture of 20 volumes of water R and 80 volumes of methanol R and dilute to 25.0 mL with the same mixture of solvents. Evaporate 2.5 mL of the solution to dryness under a current of nitrogen R. Dissolve the residue in perchloric acid R and dilute to 10.0 mL with the same solvent. Transfer the solution to a test tube, stopper and heat at 80 °C in a water-bath for 15 min. Cool to room temperature.

Measure the absorbance (2.2.25) of the test solution at 397 nm using perchloric acid R as the compensation liquid. Calculate the percentage content of total saponins, expressed as ruscogenin, using the following expression:

$$\frac{A \times 160}{m \times 196}$$

i.e. taking the specific absorbance of ruscogenin to be 196.

$A$  = absorbance at 397 nm;  
 $m$  = mass of the herbal drug to be examined used to prepare the test solution, in grams.

Ph Eur

## Echinacea Angustifolia Root

(Narrow-leaved Coneflower Root, Ph. Eur. monograph 1821)

Ph Eur

#### DEFINITION

Dried, whole or cut underground parts of *Echinacea angustifolia* DC.

#### Content

Minimum 0.5 per cent of echinacoside (C<sub>35</sub>H<sub>46</sub>O<sub>20</sub>; M<sub>r</sub> 787) (dried drug).

#### IDENTIFICATION

**First identification:** A, B, C.

**Second identification:** A, B, D.

A. The root crown is up to about 30 mm in diameter and shows only a few stem bases. The roots are not very numerous, up to about 15 mm in diameter, cylindrical or slightly tapering and sometimes spirally twisted; the outer surface is pale brown to yellowish-brown, longitudinally wrinkled or deeply furrowed. The fracture is short, dark brown with a radiate structure.

B. Microscopic examination (2.8.23). The powder is greyish-brown. Examine under a microscope using chloral hydrate solution R. The powder shows the following diagnostic characters (Figure 1821.-1): narrow lignified fibres up to

about 800  $\mu\text{m}$  in length and 50  $\mu\text{m}$  in diameter joined together in long bundles surrounded by black phytomelanin deposits [B]; lignified vessels up to about 60  $\mu\text{m}$  in diameter, with reticulate, scalariform or bordered-pitted thickenings [J, L]; abundant sclereids occurring singly [D, H] or, more usually, in groups of 2-10, mostly elongated to rectangular, up to about 150  $\mu\text{m}$  in length and 40  $\mu\text{m}$  wide, with intercellular spaces filled with black phytomelanin deposits [E, F]; fragments of oleoresin canals 80-150  $\mu\text{m}$  in diameter, with orange-yellow to reddish-brown contents [A]; fragments of the outer layers of the roots with groups of squarish to rectangular cells, about 30-45  $\mu\text{m}$  [C]; abundant fine-walled pitted parenchyma (transverse section [K], longitudinal section [G]).

Figure 1821-1. – Illustration for identification test B of powdered herbal drug of narrow-leaved coneflower root

C. Examine the chromatograms obtained in the test for *Echinacea purpurea*.

**Results** See below the sequence of fluorescent zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint dark blue fluorescent zones may be present between the zones of echinacoside and cynarin in the chromatogram obtained with the test solution.

Top of the plate	
Caffeic acid: an intense blue zone	
Cynarin: an intense greenish zone	A greenish zone (cynarin)
Echinacoside: an intense greenish zone	An intense greenish zone (echinacoside)
Reference solution	Test solution

D. Examine the chromatograms obtained in the assay.

**Results** The chromatogram obtained with the test solution shows a principal peak due to echinacoside and a minor peak due to cynarin. Peaks due to caffeic acid, caftaric acid, chlorogenic acid and cichoric acid are minor or may be absent.

#### TESTS

**Foreign matter (2.8.2)**

Maximum 3 per cent.

*Echinacea purpurea*

Thin-layer chromatography (2.2.27).

**Test solution** To 1.0 g of the powdered herbal drug (355) (2.9.12) add 10 mL of methanol R and sonicate for 5 min. Centrifuge and use the supernatant.

**Reference solution** Dissolve 1 mg of echinacoside R, 1 mg of cynarin R and 0.5 mg of caffeic acid R in methanol R and dilute to 5 mL with the same solvent.

**Plate** TLC silica gel F<sub>254</sub> plate R (5-40  $\mu\text{m}$ ) [or TLC silica gel F<sub>254</sub> plate R (2-10  $\mu\text{m}$ )].

**Mobile phase** anhydrous formic acid R, water R, methyl ethyl ketone R, ethyl acetate R (10:10:30:50 V/V/V/V).

**Application** 25  $\mu\text{L}$  [or 5  $\mu\text{L}$ ] of the test solution and 10  $\mu\text{L}$  [or 2  $\mu\text{L}$ ] of the reference solution, as bands.

**Development** Over a path of 15 cm [or 5 cm].

**Drying** In a stream of cold air for about 10 min, then at 100-105 °C for 2 min.

**Detection** Treat the hot plate using a 5 g/L solution of diphenylboric acid aminoethyl ester R in ethyl acetate R; examine in ultraviolet light at 365 nm after 30 min.

**Results** The chromatogram obtained with the test solution shows no greenish fluorescent zone just below the zone due to caffeic acid in the chromatogram obtained with the reference solution and no greenish fluorescent zone below the zone due to cynarin in the chromatogram obtained with the reference solution. In the chromatogram obtained with the test solution no zones apart from faint dark blue fluorescent zones are visible between the zones due to echinacoside and cynarin.

**Loss on drying (2.2.32)**

Maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

**Total ash (2.4.16)**

Maximum 9.0 per cent.

**Ash insoluble in hydrochloric acid (2.8.1)**

Maximum 3.0 per cent.

Figure 1821.-2. -- Chromatogram for the assay of echinacoside in narrow-leaved coneflower root

#### ASSAY

Liquid chromatography (2.2.29).

**Solvent mixture** acetonitrile R, 0.1 per cent V/V solution of phosphoric acid R (10:90 V/V).

**Test solution** In a 200 mL volumetric flask place 0.500 g of the powdered herbal drug (355) (2.9.12) and add 80 mL of ethanol (70 per cent V/V) R. Sonicate for 15 min and dilute to 200.0 mL with the solvent mixture. Mix the suspension and allow to stand for a few minutes to allow visible solids to settle. Filter a suitable proportion of the solution through a membrane filter (nominal pore size 0.45 µm) before injection.

**Reference solution** Dissolve 10.0 mg of chlorogenic acid CRS and 10.0 mg of caffeic acid R in the solvent mixture, sonicate for 15 min and dilute to 10.0 mL with the solvent mixture. Dilute 2.0 mL of the solution to 50.0 mL with the solvent mixture.

#### Column:

— size:  $l = 0.25$  m,  $\varnothing = 4.6$  mm;

— stationary phase: octadecylsilyl silica gel for chromatography R (5 µm);

— temperature: 35 °C.

#### Mobile phase:

— mobile phase A: 0.1 per cent V/V solution of phosphoric acid R;

— mobile phase B: acetonitrile R;

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 13	90 → 78	10 → 22
13 - 14	78 → 60	22 → 40
14 - 20	60	40

**Flow rate** 1.5 mL/min.

**Detection** Spectrophotometer at 330 nm.

**Injection** 10 µL.

**Identification of peaks** Use the chromatogram obtained with the reference solution to identify the peaks due to caffeic acid and chlorogenic acid; use the chromatogram shown in Figure 1821.-2 to identify the peaks due to caftaric acid, cichoric acid, cynarin and echinacoside.

**Relative retention** With reference to chlorogenic acid (retention time = about 7 min): caftaric acid = about 0.8; caffeic acid = about 1.5; cynarin = about 1.6; echinacoside = about 1.7; cichoric acid = about 2.3.

**System suitability** Reference solution:

— resolution: minimum 5.0 between the peaks due to chlorogenic acid and caffeic acid.

Calculate the percentage content of echinacoside using the following expression:

$$\frac{A_1 \times C_2 \times 100 \times 2.221}{A_2 \times C_1}$$

- $A_1$  = area of the peak due to echinacoside in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to chlorogenic acid in the chromatogram obtained with the reference solution;
- $C_1$  = concentration of the test solution, in milligrams per millilitre;
- $C_2$  = concentration of chlorogenic acid in the reference solution, in milligrams per millilitre;
- 2.221 = peak correlation factor between chlorogenic acid and echinacoside.

Ph Eur

## Echinacea Pallida Root

(Pale Coneflower Root, Ph. Eur. monograph 1822)

Ph Eur

### DEFINITION

Dried, whole or cut underground parts of *Echinacea pallida* (Nutt.) Nutt.

### Content

Minimum 0.2 per cent of echinacoside ( $C_{35}H_{46}O_{20}$ ;  $M_r$  787) (dried drug).

### IDENTIFICATION

A. The rhizome and roots are 4-20 mm in diameter, cylindrical and sometimes spirally twisted; the outer surface is reddish-brown to greyish-brown, longitudinally wrinkled or deeply furrowed.

B. Microscopic examination (2.8.23). The powder is greyish-brown to light yellow. Examine under a microscope using chloral hydrate solution R. The powder shows the following diagnostic characters (Figure 1822.-1): short lignified fibres, 100-300  $\mu$ m in length, occurring singly or joined together in long bundles, sometimes with black phytomelanin deposits [G]; xylem vessels (longitudinal section [C, M], transverse section [Kb]) up to about 50  $\mu$ m in diameter with reticulate, scalariform or areolate thickenings sometimes accompanied by ligneous fibres (longitudinal section [Ca], transverse section [Ka]); abundant sclereids, occurring singly or in small groups of not more than 10 with black phytomelanin deposits, varying considerably in shape from rounded [E] to rectangular or irregular [D; J], sometimes very elongated and fibre-like and measuring up to 400  $\mu$ m in length [F]; fragments of oleoresin canals up to 240  $\mu$ m in diameter, with orange-yellow contents [B]; groups of squarish to rectangular cells of the outer layers [A]; abundant thin-walled and pitted parenchyma [H]; small isolated fragments of phytomelanin [L].

C. Examine the chromatograms obtained in the test for other *Echinacea* species and *Parthenium integrifolium*.

Results See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, a faint zone close to the solvent front may be present in the chromatogram obtained with the test solution.

Top of the plate	
	A greenish-brown to brown zone
	A yellow zone
	A violet zone
$\beta$ -Sitosterol: a violet to pink zone	A violet to pink zone ( $\beta$ -sitosterol)
N-Isobutyldodecatetraenamamide: a greyish-blue zone	
	A dark greyish-blue zone
Reference solution	Test solution

D. Examine the chromatograms obtained in the assay.

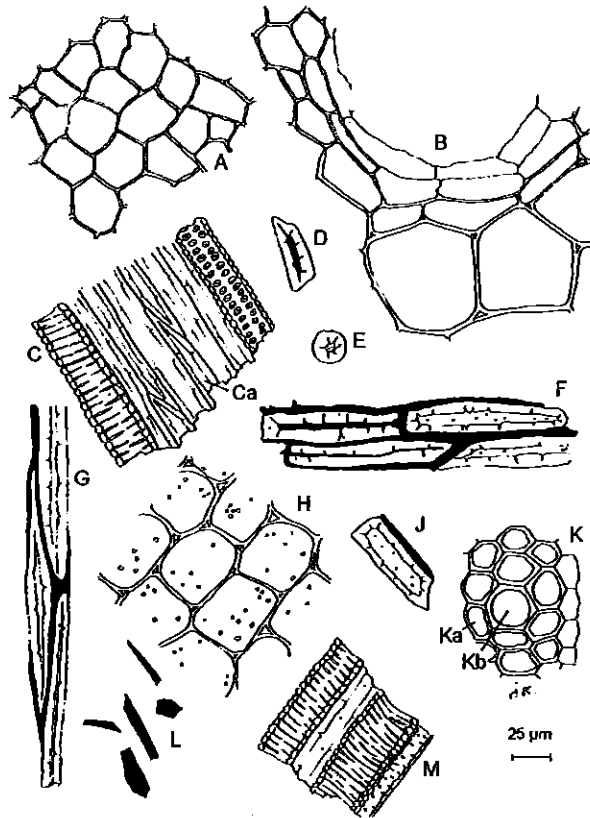

Figure 1822.-1. – Illustration for identification test B of powdered herbal drug of pale coneflower root

Results The principal peak in the chromatogram obtained with the test solution is due to echinacoside. Peaks due to caftaric acid, caffeic acid, cynarin, chlorogenic acid and cichoric acid are minor or may be absent.

### TESTS

#### Foreign matter (2.8.2)

Maximum 3 per cent.

#### Other *Echinacea* species and *Parthenium integrifolium* Thin-layer chromatography (2.2.27).

Test solution To 1.0 g of the powdered herbal drug (355) (2.9.12) add 10 mL of methylene chloride R and sonicate for 5 min. Centrifuge and use the supernatant.

Reference solution Dissolve 1 mg of  $\beta$ -sitosterol R and a volume of N-isobutyldodecatetraenamamide solution R corresponding to 1 mg of N-isobutyldodecatetraenamamide R in methanol R and dilute to 5 mL with the same solvent.

Plate TLC silica gel F<sub>254</sub> plate R (5-40  $\mu$ m) [or TLC silica gel F<sub>254</sub> plate R (2-10  $\mu$ m)].

Mobile phase anhydrous formic acid R, cyclohexane R, ethyl acetate R, toluene R (3:10:20:80 V/V/V/V).

Application 25  $\mu$ L [or 5  $\mu$ L] of the test solution and 10  $\mu$ L [or 4  $\mu$ L] of the reference solution, as bands.

Development Over a path of 15 cm [or 5 cm].

Drying In a stream of cold air for about 10 min.

Detection Treat with anisaldehyde solution R and heat at 105 °C for 3 min; examine in daylight.

Results The chromatogram obtained with the test solution shows no greyish-blue zone at the position of N-isobutyldodecatetraenamamide in the chromatogram obtained with the reference solution, and no blue zone at the position

Figure 1822.-2. — Chromatogram for the assay of echinacoside in pale coneflower root

of the violet zone due to  $\beta$ -sitosterol in the chromatogram obtained with the reference solution.

#### Loss on drying (2.2.32)

Maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

#### Total ash (2.4.16)

Maximum 7.0 per cent.

#### Ash insoluble in hydrochloric acid (2.8.1)

Maximum 2.0 per cent.

#### ASSAY

Liquid chromatography (2.2.29).

**Solvent mixture** acetonitrile R, 0.1 per cent V/V solution of phosphoric acid R (10:90 V/V).

**Test solution** In a 200 mL volumetric flask place 0.500 g of the powdered herbal drug (355) (2.9.12) and add 80 mL of ethanol (70 per cent V/V) R. Sonicate for 15 min and dilute to 200.0 mL with the solvent mixture. Mix the suspension and allow to stand for a few minutes to allow visible solids to settle. Filter a suitable proportion of the solution through a membrane filter (nominal pore size 0.45  $\mu$ m) before injection.

**Reference solution** Dissolve 10.0 mg of chlorogenic acid GRS and 10.0 mg of caffeic acid R in the solvent mixture, sonicate for 15 min and dilute to 10.0 mL with the solvent mixture. Dilute 2.0 mL of the solution to 50.0 mL with the solvent mixture.

#### Column:

- size:  $l = 0.25$  m,  $\varnothing = 4.6$  mm;
- stationary phase: octadecylsilyl silica gel for chromatography R (5  $\mu$ m);
- temperature: 35 °C.

#### Mobile phase:

- mobile phase A: 0.1 per cent V/V solution of phosphoric acid R;
- mobile phase B: acetonitrile R;

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 13	90 → 78	10 → 22
13 - 14	78 → 60	22 → 40
14 - 20	60	40

Flow rate 1.5 mL/min.

Detection Spectrophotometer at 330 nm.

Injection 10  $\mu$ L.

**Identification of peaks** Use the chromatogram obtained with the reference solution to identify the peaks due to caffeic acid and chlorogenic acid; use the chromatogram shown in Figure 1822.-2 to identify the peaks due to caftaric acid, cichoric acid, cynarin and echinacoside.

**Relative retention** With reference to chlorogenic acid (retention time = about 7 min): caftaric acid = about 0.8; caffeic acid = about 1.5; cynarin = about 1.6; echinacoside = about 1.7; cichoric acid = about 2.3.

**System suitability** Reference solution:

— resolution: minimum 5.0 between the peaks due to chlorogenic acid and caffeic acid.

Calculate the percentage content of echinacoside using the following expression:

$$\frac{A_1 \times C_2 \times 100 \times 2.221}{A_2 \times C_1}$$

- $A_1$  = area of the peak due to echinacoside in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to chlorogenic acid in the chromatogram obtained with the reference solution;
- $C_1$  = concentration of the test solution, in milligrams per millilitre;
- $C_2$  = concentration of chlorogenic acid in the reference solution, in milligrams per millilitre;
- 2.221 = peak correlation factor between chlorogenic acid and echinacoside.

Ph Eur

## Echinacea Purpurea Herb

(Purple Coneflower Herb, Ph. Eur. monograph 1823)

Ph Eur

### DEFINITION

Dried, whole or cut flowering aerial parts of *Echinacea purpurea* (L.) Moench.

### Content

Minimum 0.1 per cent for the sum of caffeic acid ( $C_{13}H_{12}O_9$ ;  $M_r$  312.2) and cichoric acid ( $C_{22}H_{18}O_{12}$ ;  $M_r$  474.4) (dried drug).

### IDENTIFICATION

First identification: A, B, C.

Second identification: A, B, D.

A. The herbaceous perennial plant is 60-150 cm, rarely up to 180 cm high. The stem is green to red, upright and slightly branched. The leaves are alternate, ovate to ovate-lanceolate, irregularly serrate, rugose on both surfaces, dark green with prominent light green veins; the lamina is thick and shiny. The involucre bracts of the large capitulum are arranged in 2 or 3 rows. The solid receptacle is slightly convex. Each of the outer violet ligulate florets (4-6 cm) and of the inner violet-pink tubular florets is attached to a reddish acute and coriaceous bract, which overtops the tubular florets. The calyx is reduced to a very short crown.

B. Microscopic examination (2.8.23). The powder is green to brownish-green. Examine under a microscope using chloral hydrate solution R. The powder shows the following diagnostic characters (Figure 1823.-1): groups of fibres, 150-200  $\mu$ m in length, 10-20  $\mu$ m in diameter (longitudinal section [G]), sometimes with black phytomelanin deposits [L], from the stems; numerous fragments of vascular tissue [E]; rare fragments of parenchyma [D] containing secretory canals (longitudinal section [Da]) with yellow granular contents, sometimes accompanied by vascular bundles; fragments of leaf epidermis (surface view [A, C, N]) with more or less wavy cells in the area of the lamina [Ac, Nc] or elongated cells with beaded walls near the veins [Nd], with anomocytic [Ab, Nb] or anisocytic [Aa, Na] stomata (2.8.3); some of these fragments are accompanied by palisade parenchyma [Ad]; uniseriate covering trichomes [Ca] or fragments [O] thereof, consisting mainly of 3 or 4 thick-walled cells of which the apical cell is markedly longer than the others; fragments of leaves with epidermal cells in a rosette arrangement around the base of the covering trichomes [C]; uniseriate glandular trichomes [Ne] composed of very thin-walled cells; pitted parenchymatous cells from the pith of the stem [J]; fragments of the epidermis of ligulate florets composed of red to violet papillose cells [B]; finely pitted, elongated cells [M] and fibres surrounded by black phytomelanin deposits [L], from the mesocarp of the achenes; fragments of the cotyledons of the seeds with oil droplets [K]; spheroidal pollen grains about 30  $\mu$ m in diameter each with 3 pores and a spiny exine [F, H].

C. Thin-layer chromatography (2.2.27).

**Test solution** To 1.0 g of the powdered herbal drug (355) (2.9.12) add 10 mL of methanol R and sonicate for 5 min. Centrifuge and use the supernatant.

**Reference solution** Dissolve 0.5 mg of caffeic acid R and 0.5 mg of chlorogenic acid R in methanol R and dilute to 5 mL with the same solvent.

**Plate** TLC silica gel  $F_{254}$  plate R (5-40  $\mu$ m) [or TLC silica gel  $F_{254}$  plate R (2-10  $\mu$ m)].

Figure 1823.-1. – Illustration for identification test B of powdered herbal drug of purple coneflower herb

**Mobile phase** anhydrous formic acid R, water R, methyl ethyl ketone R, ethyl acetate R (10:10:30:50 V/V/V/V).

**Application** 25  $\mu$ L [or 5  $\mu$ L] of the test solution and 10  $\mu$ L [or 2  $\mu$ L] of the reference solution, as bands.

**Development** Over a path of 15 cm [or 5 cm].

**Drying** In a stream of cold air for about 10 min, then at 100 °C for 2 min.

**Detection** Treat the warm plate with a 5 g/L solution of diphenylboric acid aminoethyl ester R in ethyl acetate R; after 30 min, examine in ultraviolet light at 365 nm.

**Results** See below the sequence of fluorescent zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint blue fluorescent zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Caffeic acid: an intense blue zone	An intense red zone A blue zone
Chlorogenic acid: an intense blue zone	A blue zone A faint yellow-orange zone
Reference solution	Test solution

Figure 1823.-2. – Chromatogram for the assay of caftaric acid and cichoric acid in purple coneflower herb

D. Examine the chromatograms obtained in the assay.

**Results** The principal peak in the chromatogram obtained with the test solution is due to cichoric acid and a smaller peak is due to caftaric acid. Peaks due to caffeic acid and chlorogenic acid are minor or may be absent.

**TESTS**

**Loss on drying (2.2.32)**

Maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

**Total ash (2.4.16)**

Maximum 12.0 per cent.

**ASSAY**

Liquid chromatography (2.2.29).

**Solvent mixture** acetonitrile R, 0.1 per cent V/V solution of phosphoric acid R (10:90 V/V).

**Test solution** In a 200 mL volumetric flask place 0.500 g of the powdered herbal drug (355) (2.9.12) and add 80 mL of ethanol (70 per cent V/V) R. Sonicate for 15 min and dilute to 200.0 mL with the solvent mixture. Mix the suspension and allow to stand for a few minutes to allow visible solids to settle. Filter a suitable proportion of the solution through a membrane filter (nominal pore size 0.45 µm) before injection.

**Reference solution** Dissolve 10.0 mg of chlorogenic acid CRS and 10.0 mg of caffeic acid R in the solvent mixture, sonicate for 15 min and dilute to 10.0 mL with the solvent mixture. Dilute 2.0 mL of the solution to 50.0 mL with the solvent mixture.

**Column:**

- size:  $l = 0.25$  m,  $\varnothing = 4.6$  mm;
- stationary phase: octadecylsilyl silica gel for chromatography R (5 µm);
- temperature: 35 °C.

**Mobile phase:**

- mobile phase A: 0.1 per cent V/V solution of phosphoric acid R;
- mobile phase B: acetonitrile R;

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 13	90 → 78	10 → 22
13 - 14	78 → 60	22 → 40
14 - 20	60	40

**Flow rate** 1.5 mL/min.

**Detection** Spectrophotometer at 330 nm.

**Injection** 10 µL.

**Identification of peaks** Use the chromatogram obtained with the reference solution to identify the peaks due to caffeic acid and chlorogenic acid; use the chromatogram shown in Figure 1823.-2 to identify the peaks due to caftaric acid and cichoric acid.

**Relative retention** With reference to chlorogenic acid (retention time = about 7 min): caftaric acid = about 0.8; caffeic acid = about 1.5; cichoric acid = about 2.3.

**System suitability** Reference solution:

- resolution: minimum 5.0 between the peaks due to chlorogenic acid and caffeic acid.

Calculate the percentage content of caftaric acid using the following expression:

$$\frac{A_1 \times C_2 \times 100 \times 0.881}{A_2 \times C_1}$$

Calculate the percentage content of cichoric acid using the following expression:

$$\frac{A_3 \times C_2 \times 100 \times 0.695}{A_2 \times C_1}$$

- $A_1$  = area of the peak due to caftaric acid in the chromatogram obtained with the test solution;  
 $A_2$  = area of the peak due to chlorogenic acid in the chromatogram obtained with the reference solution;  
 $A_3$  = area of the peak due to cichoric acid in the chromatogram obtained with the test solution;  
 $C_1$  = concentration of the test solution, in milligrams per millilitre;  
 $C_2$  = concentration of chlorogenic acid in the reference solution, in milligrams per millilitre;  
 0.695 = peak correlation factor between cichoric acid and chlorogenic acid, based upon the liquid chromatography response observed;  
 0.881 = peak correlation factor between caftaric acid and chlorogenic acid.

Ph Eur

## Echinacea Purpurea Root

(Purple Coneflower Root, Ph. Eur. monograph 1824)

Ph Eur

### DEFINITION

Dried, whole or cut underground parts of *Echinacea purpurea* (L.) Moench.

### Content

Minimum 0.5 per cent for the sum of caftaric acid ( $C_{13}H_{12}O_9$ ;  $M_r$  312.2) and cichoric acid ( $C_{22}H_{18}O_{12}$ ;  $M_r$  474.4) (dried drug).

### IDENTIFICATION

First identification: A, B, C, E.

Second identification: A, B, D, E.

A. The rhizome is up to 15 cm long, branched, reddish-brown to dark brown on the surface and carries many stem bases; the inside is fibrous and white. The numerous roots are spirally twisted, light to dark brown and show a fine cross structuring on the surface.

B. Microscopic examination (2.8.23). The powder is light yellow to light pinkish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 1824.-1): numerous spindle-shaped fibres that are joined together in long bundles without black phytomelanin deposits [F]; sclereids from the rhizomes and roots, usually occurring singly, those from the rhizomes being isodiametric, about 60  $\mu$ m in diameter, with black phytomelanin deposits [B, D], those from the roots being about 50-120  $\mu$ m in length with no black phytomelanin deposits [H]; secretory canals up to 180  $\mu$ m in diameter with yellow oil droplets (transverse section [E]); fragments of cork with squarish to rectangular cells, some with reddish walls (surface view [J], transverse section [A]); reticulate [C] or pitted [G] vessels with a diameter up to 30-40  $\mu$ m.

C. Examine the chromatogram obtained in the test for other *Echinacea* species and *Parthenium integrifolium*.

Results See below the sequence of fluorescent zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, faint greenish fluorescent zones may be present just below the zone situated in the middle of the chromatogram obtained with the test solution.

Figure 1824.-1. – Illustration for identification test B of powdered herbal drug of purple coneflower root

Top of the plate	
Caffeic acid: an intense blue zone	An intense blue zone
Cynarin: an intense greenish zone	
	A blue zone
Echinacoside: an intense greenish zone	
Reference solution	Test solution

D. Examine the chromatograms obtained in the assay.

Results The principal peak in the chromatogram obtained with the test solution is due to cichoric acid and a smaller peak is due to caftaric acid. Peaks due to caffeic acid and chlorogenic acid are minor or may be absent.

E. Thin-layer chromatography (2.2.27).

Test solution To 1.0 g of the powdered herbal drug (355) (2.9.12) add 10 mL of *methylene chloride R* and sonicate for 5 min. Centrifuge and use the supernatant.

Reference solution Dissolve 1 mg of  $\beta$ -sitosterol R and a volume of *N-isobutyldodecatetraenamide solution R* corresponding to 1 mg of *N-isobutyldodecatetraenamide R* in *methanol R*, and dilute to 5 mL with the same solvent.

Plate TLC silica gel plate R (5-40  $\mu$ m) [or TLC silica gel plate R (2-10  $\mu$ m)].

Mobile phase anhydrous formic acid R, cyclohexane R, ethyl acetate R, toluene R (3:10:20:80 V/V/V/V).

ethanol (70 per cent V/V) R. Sonicate for 15 min and dilute to 200.0 mL with the solvent mixture. Mix the suspension and allow to stand for a few minutes to allow visible solids to settle. Filter a suitable proportion of the solution through a membrane filter (nominal pore size 0.45 µm) before injection.

**Reference solution** Dissolve 10.0 mg of chlorogenic acid CRS and 10.0 mg of caffeic acid R in the solvent mixture, sonicate for 15 min and dilute to 10.0 mL with the solvent mixture. Dilute 2.0 mL of the solution to 50.0 mL with the solvent mixture.

**Column:**

- size:  $l = 0.25$  m,  $\varnothing = 4.6$  mm;
- stationary phase: octadecylsilyl silica gel for chromatography R (5 µm);
- temperature: 35 °C.

**Mobile phase:**

- mobile phase A: 0.1 per cent V/V solution of phosphoric acid R;
- mobile phase B: acetonitrile R;

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 13	90 → 78	10 → 22
13 - 14	78 → 60	22 → 40
14 - 20	60	40

**Flow rate** 1.5 mL/min.

**Detection** Spectrophotometer at 330 nm.

**Injection** 10 µL.

**Identification of peaks** Use the chromatogram obtained with the reference solution to identify the peaks due to caffeic acid and chlorogenic acid; use the chromatogram shown in Figure 1824.-2 to identify the peaks due to caftaric acid and cichoric acid.

**Relative retention** With reference to chlorogenic acid (retention time = about 7 min): caftaric acid = about 0.8; caffeic acid = about 1.5; cichoric acid = about 2.3.

**System suitability** Reference solution:

- resolution: minimum 5.0 between the peaks due to chlorogenic acid and caffeic acid.

Calculate the percentage content of caftaric acid using the following expression:

$$\frac{A_1 \times C_2 \times 100 \times 0.881}{A_2 \times C_1}$$

Calculate the percentage content of cichoric acid using the following expression:

$$\frac{A_3 \times C_2 \times 100 \times 0.695}{A_2 \times C_1}$$

- $A_1$  = area of the peak due to caftaric acid in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to chlorogenic acid in the chromatogram obtained with the reference solution;
- $A_3$  = area of the peak due to cichoric acid in the chromatogram obtained with the test solution;
- $C_1$  = concentration of the test solution, in milligrams per millilitre;
- $C_2$  = concentration of chlorogenic acid in the reference solution, in milligrams per millilitre;
- 0.695 = peak correlation factor between cichoric acid and chlorogenic acid based upon the liquid chromatography response observed;
- 0.881 = peak correlation factor between caftaric acid and chlorogenic acid.

## Eclipta Herb

(Ph. Eur. monograph 2564)

Ph Eur

### DEFINITION

Dried, whole or fragmented, flowering aerial parts of *Eclipta prostrata* (L.) L.

### Content

Minimum 0.04 per cent of wedelolactone ( $C_{16}H_{10}O_7$ ;  $M_r$  314.2) (dried drug).

### IDENTIFICATION

A. The cylindrical stems are striated longitudinally and are 2-5 mm in diameter. The external surface is brownish-green or dark green and bears covering trichomes, flattened against the stem and all pointing upwards. The hairy, dark green leaves are opposite, always sessile, elongate, lanceolate, with entire or slightly dentate margins. The capitula are 2-6 mm in diameter, with whitish flowers that do not extend beyond the bracts of the involucre. The fruits are elliptical, flattened achenes, brown or pale brown, 2-3 mm long.

B. Microscopic examination (2.8.23). The powder is greenish-brown. Examine under a microscope using chloral hydrate solution R. The powder shows the following diagnostic characters (Figure 2564.-1): numerous isolated, whole [H] or broken [D] covering trichomes, usually tricellular, up to 700 µm long, with a broad basal cell, a relatively long median cell with thick warty walls, and a very short, pointed, sub-triangular distal cell; fragments of lamina [B, C] with sinuous epidermal cells [Ca, Ba] and anomocytic stomata (2.8.3) with 3-4 subsidiary cells [Cb, Bb]; some fragments of epidermis showing covering trichomes similar to those previously described, whole [Bc] or broken [Cc], and subsidiary cells with slightly thickened walls [Bd, Cd]; fragments of the upper epidermis usually accompanied by palisade parenchyma [Ce]; fragments of stem with different types of vascular bundles [A]; rare fragments of parenchyma (longitudinal section [F]) containing secretory canals with orange-brown contents [Fa]; bundles of fibres with thickened walls [E]; pollen grains [G] about 20-25 µm in diameter, with 3 pores and a spiny exine.

C. Thin-layer chromatography (2.2.27).

**Test solution** To 0.5 g of the powdered herbal drug (355) (2.9.12) add 5 mL of methanol R and sonicate at 60 °C for 10 min. Allow to cool, centrifuge and use the supernatant.

**Reference solution** Dissolve 1 mg of wedelolactone R and 1 mg of rosmarinic acid R in 1 mL of methanol R.

**Plate** TLC silica gel F<sub>254</sub> plate R (2-10 µm).

**Mobile phase** anhydrous formic acid R, acetone R, toluene R (1:6:11 V/V/V).

**Application** 10 µL as bands of 8 mm.

**Development** Over a path of 6 cm.

**Drying** In air.

**Detection** Heat at 100 °C for 5 min and treat the plate whilst still hot with a 0.5 per cent V/V solution of diphenylboric acid aminoethyl ester R in ethyl acetate R; examine in ultraviolet light at 365 nm.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint fluorescent zones may be present in the chromatogram obtained with the test solution.

**TESTS**

**Loss on drying (2.2.32)**

Maximum 11.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

**Total ash (2.4.16)**

Maximum 13.0 per cent.

**Ash insoluble in hydrochloric acid (2.8.1)**

Maximum 2.0 per cent.

**ASSAY**

Liquid chromatography (2.2.29).

**Test solution** Disperse 0.300 g of the powdered herbal drug (355) (2.9.12) in 10 mL of ethanol (70 per cent V/V) R in a conical flask and weigh. Heat under a reflux condenser for 1 h, cool and weigh again. Compensate the loss of solvent with ethanol (70 per cent V/V) R, mix well and allow to stand. Filter through a membrane filter (nominal pore size 0.22 µm).

**Reference solution (a)** Dissolve 4.0 mg of wedelolactone CRS in methanol R and dilute to 100.0 mL with the same solvent.

**Reference solution (b)** Dissolve 2 mg of ethyl parahydroxybenzoate R in reference solution (a) and dilute to 50 mL with reference solution (a).

**Column:**

— size: l = 0.15 m, Ø = 4.6 mm;

— stationary phase: end-capped octadecylsilyl silica gel for chromatography R (5 µm).

**Mobile phase** acetonitrile R, 0.2 per cent V/V solution of phosphoric acid R (24:76 V/V).

**Flow rate** 1.0 mL/min.

**Detection** Spectrophotometer at 249 nm.

**Injection** 20 µL.

**Run time** 1.5 times the retention time of wedelolactone.

**Relative retention** With reference to wedelolactone (retention time = about 17 min): ethyl parahydroxybenzoate = about 1.1.

**System suitability** Reference solution (b):

— resolution: minimum 2.0 between the peaks due to wedelolactone and ethyl parahydroxybenzoate.

Calculate the percentage content of wedelolactone using the following expression:

$$\frac{A_1 \times m_2 \times p}{A_2 \times m_1 \times 10}$$

$A_1$  = area of the peak due to wedelolactone in the chromatogram obtained with the test solution;

$A_2$  = area of the peak due to wedelolactone in the chromatogram obtained with reference solution (a);

$m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;

$m_2$  = mass of wedelolactone CRS used to prepare reference solution (a), in grams;

$p$  = percentage content of wedelolactone in wedelolactone CRS.

Ph Eur

**Eclipta Prostrata Whole Plant**

**DEFINITION**

Eclipta Prostrata Whole Plant is the dried whole plant, either entire or fragmented, of *Eclipta prostrata* (L.) L.

It contains not less than 0.04% of wedelolactone (C<sub>16</sub>H<sub>10</sub>O<sub>7</sub>), calculated with reference to the dried material.

**IDENTIFICATION**

A. Stems cylindrical, four sided or flattened, 2 to 5 mm in diameter, greyish; with appressed, whitish hairs pointing towards the tip, longitudinally striated, occasionally branching and nodes distinct. Leaves dark green, sessile or subsessile, opposite, lanceolate, 2 to 8.5 cm long and 1 to 2.5 cm wide with an entire or slightly dentate margin and appressed trichomes on both surfaces. Flowerheads 2 to 6 mm in diameter, greenish-brown, solitary or in pairs on unequal axillary peduncles, up to 8 involucral bracts, ovate, with appressed hairs; ray florets spreading, no longer than the

bracts, not toothed; disc florets with 4-toothed corolla, pappus usually absent or reduced to minute teeth; 5 stamens, filaments epipetalous and anthers united into a tube; pistil bicarpellary, ovary inferior, unilocular with one basal ovule. Fruits 2 to 3 mm long, pappi persistent and coroniform; unfertilised achenes pale yellow, flattened and smooth; fertilised achenes pale to dark brown, 3 to 4 angled, tuberculate and bulbous. Root, if present, cylindrical, greyish, main root up to about 7 mm in diameter, with secondary branching.

B. Reduce to a powder (355). The powder is greenish brown. Examine under a microscope using *chloral hydrate solution*. The main diagnostic characters include numerous free, whole or broken, large covering trichomes, with warty or spiny walls, up to 700 µm long, uniseriate, usually tricellular, with a broad basal cell, a long median cell and a short, pointed sub-triangular apical cell; less frequently, smaller, unicellular, pointed covering trichomes from the midrib and stem. Fragments of leaf show sinuous walled epidermal cells, underlying palisade, anomocytic stomata, cuticular striations and covering trichomes on both surfaces. Stem fragments with unicellular and multicellular trichomes, epidermis of elongated cells, or in mature stem, poorly developed rectangular cork cells; secondary cortex of parenchyma with numerous air-spaces, pericyclic fibres thick-walled, lignified, simple pitted; secretory canals may be visible; xylem vessels usually simple pitted or spirally thickened, xylem parenchyma lignified and pitted. Fragments of root, if present, show poorly developed cork, consisting of 3-5 rows of thin-walled elongated cells, a secondary cortex of parenchyma, with scattered stone cells and fibres either singly or in groups, xylem vessels and tracheids, and fibres with peg-like projections. Pollen grains with spiny exine and 3 pores.

C. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Reduce to a powder (355). To 2.0 g of powdered sample add 40 mL of *methanol*. Mix with the aid of ultrasound for 2 hours at 50° with occasional shaking and allow to cool. Dilute to 50 mL with *methanol* and filter.

(2) 0.05% w/v each of *wedelolactone EPCRS* and *rosmarinic acid* in *methanol*.

#### CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel F<sub>254</sub>* (Merck silica gel HPTLC plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution as 8 mm bands.

(d) Develop the plate to 6 cm.

(e) After removal of the plate, dry in air, heat at 100° for 5 minutes, treat the plate whilst still hot with a 0.5% v/v solution of *diphenylboric acid aminoethyl ester* in *ethyl acetate* and examine under *ultraviolet light* (365 nm).

#### MOBILE PHASE

1 volume of *anhydrous formic acid*, 6 volumes of *acetone* and 11 volumes of *toluene*.

#### SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (2) shows two clearly separated spots.

Top of the plate	
A red zone	
A diffuse pale blue zone	
A greenish-white zone	
A pale blue zone	
A blue-white zone (wedelolactone)	A blue-white zone (wedelolactone)
A blue-white zone	
	Rosmarinic acid: A blue-white zone
A blue-white zone	
<b>Solution (1)</b>	<b>Solution (2)</b>

#### CONFIRMATION

The chromatogram obtained with solution (1) shows a fluorescent band corresponding to wedelolactone and several other fluorescent bands as shown in the table. Other fluorescent bands may be present.

#### TESTS

##### Loss on drying

When dried at 100° to 105° for 2 hours, loses not more than 11.0% of its weight. Use 1 g.

##### Total Ash

Not more than 22.0%, Appendix XI J, Method II.

##### Acid-insoluble Ash

Not more than 11.0%, Appendix XI K.

#### ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Reduce to a powder (355). To 2.0 g of powdered sample add 40 mL of *methanol*. Mix with the aid of ultrasound for 2 hours at 50° with occasional shaking and allow to cool. Dilute to 50 mL with *methanol* and filter.

(2) 0.005% w/v each of *wedelolactone EPCRS* and *coumestrol* in *methanol*.

#### CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5µm) (Waters Symmetry C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.0 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 249 nm.

(f) Inject 10 µL of each solution.

#### MOBILE PHASE

24 volumes of *acetone* and 76 volumes of a 0.2% v/v solution of *orthophosphoric acid*.

#### SYSTEM SUITABILITY

The assay is not valid unless, in the chromatogram obtained with solution (2):

the *symmetry factor* of the peak due to *wedelolactone* is less than 1.2;

the *symmetry factor* of the peak due to *coumestrol* is less than 1.1.

#### DETERMINATION OF CONTENT

Calculate the content of wedelolactone in the sample using the declared content of wedelolactone (C<sub>16</sub>H<sub>10</sub>O<sub>7</sub>) in *wedelolactone EPCRS* and the following expression:

$$\frac{A_1}{A_2} \times \frac{m_2}{V_2} \times \frac{V_1}{m_1} \times p \times \frac{100}{100 - d}$$

- A<sub>1</sub> = area of the peak due to wedelolactone in the chromatogram obtained with solution (1);
- A<sub>2</sub> = area of the peak due to wedelolactone in the chromatogram obtained with solution (2);
- m<sub>1</sub> = weight of the herbal drug being examined in mg;
- m<sub>2</sub> = weight of wedelolactone EPCRS in mg;
- V<sub>1</sub> = dilution volume of solution (1) in mL;
- V<sub>2</sub> = dilution volume of solution (2) in mL;
- p = percentage content of wedelolactone (C<sub>16</sub>H<sub>16</sub>O<sub>7</sub>) in wedelolactone EPCRS;
- d = percentage loss on drying of the herbal drug being examined.

### Elder Flower

(Ph. Eur. monograph 1217)

Ph Eur

#### DEFINITION

Dried flowers of *Sambucus nigra* L.

#### Content

Minimum 0.80 per cent of flavonoids, expressed as isoquercitroside (C<sub>21</sub>H<sub>20</sub>O<sub>12</sub>; M<sub>r</sub> 464.4) (dried drug).

#### IDENTIFICATION

A. The flower, about 5 mm in diameter, has 3 small bracts, visible under a lens, and may have a peduncle. The 5-toothed calyx is small; the corolla is light yellow, with 5 broadly oval petals fused at their bases into a tube. The filaments of the 5 yellow stamens alternate with the petals. The corolla is often isolated or attached to the stamens, to which it is fused at the base. The ovary is inferior and it bears a short style with 3 obtuse stigmata.

B. Microscopic examination (2.8.23). The powder is greenish-yellow. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 1217.-1): numerous spherical, sometimes ellipsoidal, pollen grains about 30 µm in diameter, with 3 germinal pores and very finely pitted exine [G]; cells of the lower epidermis of the sepals often containing oil globules and covered by a striated cuticle (surface view [A]); rare fragments of the rim of the sepal showing unicellular marginal teeth (transverse section [E]); petal fragments with numerous small globules of essential oil [H]; fragments of upper epidermis of the sepals [B] or petals [F], in surface view, with slightly and irregularly thickened walls [Ba, Fa], anomocytic stomata (2.8.3) [Bb, Fb] and a striated cuticle; mesophyll cells of petals and sepals with idioblasts containing numerous microsphenoid crystals of calcium oxalate [Bc]; fragments of anthers (transverse section [C], surface view [D]) showing the outer layer [Ca] and the cells of the fibrous layer [Cb, Cc, D].

C. Thin-layer chromatography (2.2.27).

**Test solution** To 0.5 g of the powdered herbal drug (355) (2.9.12) add 5 mL of *methanol R* and sonicate for 10 min. Centrifuge for 5 min.

**Reference solution** Dissolve 1 mg of *caffeic acid R*, 1 mg of *chlorogenic acid R*, 2.5 mg of *hyperoside R* and 2.5 mg of *rutoside trihydrate R* in 10 mL of *methanol R*.

**Plate** TLC silica gel plate R (2-10 µm).

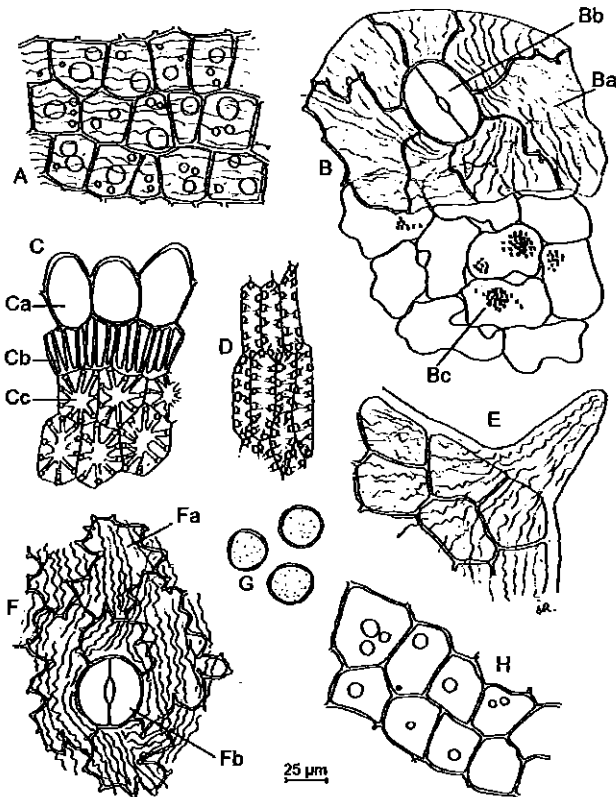

Figure 1217.-1. – Illustration for identification B of powdered herbal drug of elder flower

**Mobile phase** anhydrous formic acid R, water R, methyl ethyl ketone R, ethyl acetate R (10:10:30:50 V/V/V/V).

**Application** 4 µL as bands of 8 mm.

**Development** Over a path of 6 cm.

**Drying** In air.

**Detection** Heat the plate for 5 min at 100 °C and treat with a 1 g/L solution of *diphenylboric acid aminoethyl ester R* in *ethyl acetate R*, then treat with a 5 g/L solution of *macrogol 400 R* in *methylene chloride R*; allow to dry in air for 30 min. Examine in daylight (results A) and in ultraviolet light at 365 nm (results B).

**Results A** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

## TESTS

### Foreign matter (2.8.2)

Maximum 8 per cent of fragments of coarse pedicels and other foreign matter and maximum 15 per cent of discoloured, brown flowers. Carry out the determination on 10 g.

### *Sambucus ebulus* L

Examine the chromatograms obtained in identification C.

**Results B** The chromatogram obtained with the test solution does not show a greenish-white zone above the zone due to caffeic acid in the chromatogram obtained with the reference solution; in the chromatogram obtained with the test solution, no green fluorescent zone is seen just below the orange fluorescent zone due to rutoside in the chromatogram obtained with the reference solution.

### Loss on drying (2.2.32)

Maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

### Total ash (2.4.16)

Maximum 10.0 per cent.

## ASSAY

**Stock solution** In a 100 mL round-bottomed flask, introduce 0.600 g of the powdered herbal drug (355) (2.9.12), add 1 mL of a 5 g/L solution of hexamethylenetetramine R, 20 mL of acetone R and 2 mL of hydrochloric acid R1. Boil the mixture under a reflux condenser for 30 min. Filter the mixture through a plug of absorbent cotton into a flask. Add the absorbent cotton to the residue in the round-bottomed flask and extract with 2 quantities, each of 20 mL, of acetone R, each time boiling under a reflux condenser for 10 min. Allow to cool, filter each extract through the plug of absorbent cotton into the flask. After cooling, filter the combined acetone extracts through a filter paper into a

volumetric flask and dilute to 100.0 mL with acetone R by rinsing the flask and the filter paper. Introduce 20.0 mL of this solution into a separating funnel, add 20 mL of water R and shake the mixture with 1 quantity of 15 mL and then 3 quantities, each of 10 mL, of ethyl acetate R. Combine the ethyl acetate extracts in a separating funnel, wash with 2 quantities, each of 50 mL, of water R, and filter the extracts over 10 g of anhydrous sodium sulfate R into a volumetric flask and dilute to 50.0 mL with ethyl acetate R.

**Test solution** To 10.0 mL of the stock solution add 1 mL of aluminium chloride reagent R and dilute to 25.0 mL with a 5 per cent V/V solution of glacial acetic acid R in methanol R.

**Compensation liquid** Dilute 10.0 mL of the stock solution to 25.0 mL with a 5 per cent V/V solution of glacial acetic acid R in methanol R.

After 30 min, measure the absorbance (2.2.25) of the test solution at 425 nm, by comparison with the compensation liquid.

Calculate the percentage content of flavonoids, expressed as isoquercitroside, using the following expression:

$$\frac{A \times 1.25}{m}$$

i.e. taking the specific absorbance of isoquercitroside to be 500.

*A* = absorbance at 425 nm;  
*m* = mass of the herbal drug to be examined, in grams.

Ph Eur

## Eleutherococcus

Siberian Ginseng

(Ph. Eur. monograph 1419)

Ph Eur

## DEFINITION

Dried, whole or cut underground organs of *Eleutherococcus senticosus* (Rupr. et Maxim.) Maxim.

## Content

Minimum 0.08 per cent for the sum of eleutheroside B (*M*<sub>r</sub> 372.4) and eleutheroside E (*M*<sub>r</sub> 742.7).

## IDENTIFICATION

**A.** The rhizome is knotty, of irregular cylindrical shape, 1.5 cm to 4.0 cm in diameter; the surface is rugged, longitudinally wrinkled and greyish-brown to blackish-brown; the bark, about 2 mm thick, closely adheres to the xylem; the heartwood is light brown and the sapwood is pale yellow; the fracture shows short thin fibres in the bark and is coarsely fibrous, especially in the internal part of the xylem. The lower surface bears numerous cylindrical and knotty roots, 3.5 cm to 15 cm long and 0.3 cm to 1.5 cm in diameter; with a smooth, greyish-brown to blackish-brown surface; the bark is about 0.5 mm thick, closely adhering to the pale yellow xylem; the fracture is slightly fibrous; in places where the outer layer has been removed, the outer surface is yellowish-brown.

**B.** Microscopic examination (2.8.23). The powder is yellowish-brown. Examine under a microscope, using chloral hydrate solution R. The powder shows numerous groups of

thick-walled, lignified fibres; fragments of reticulate and bordered pitted vessels with a wide lumen; groups of secretory canals, up to 20 µm in diameter with brown contents; parenchymatous cells containing cluster crystals of calcium oxalate 10 µm to 50 µm in diameter. Examine under a microscope, using a 50 per cent *VIV* solution of *glycerol R*. The powder shows small starch granules, rounded to slightly angular in outline, single compounds or with 2 or 3 components.

**C. Thin-layer chromatography (2.2.27).**

**Test solution** To 1.0 g of the powdered herbal drug (355) (2.9.12) add 10 mL of *alcohol (50 per cent VIV) R* and boil under reflux for 1 h. Cool and filter. Evaporate the filtrate to dryness on a water-bath. Dissolve the residue in 2.5 mL of a mixture of 5 volumes of *water R* and 20 volumes of *alcohol (50 per cent VIV) R* and filter.

**Reference solution** Dissolve 2.0 mg of *esculin R* and 2.0 mg of *catalpol R* in 20 mL of a mixture of 2 volumes of *water R* and 8 volumes of *alcohol (50 per cent VIV) R*.

**Plate** TLC silica gel plate *R*.

**Mobile phase** *water R, methanol R, methylene chloride R (4:30:70 VIV/V)*.

**Application** 20 µL, as bands.

**Development** Over a path of 10 cm.

**Drying** In air.

**Detection A** Examine in ultraviolet light at 365 nm.

**Results A** The chromatogram obtained with the reference solution shows in the upper half a blue fluorescent zone (esculin).

**Detection B** Spray with *anisaldehyde solution R* and examine in daylight while heating at 100-105 °C for 5-10 min.

**Results B** See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones are present in the chromatogram obtained with the test solution.

Top of the plate	
Esculin: a blue fluorescent zone (marked at 365 nm)	A brown zone (eleutheroside B)
	A reddish-brown zone (eleutheroside E)
Catalpol: a violet-brown zone	2 brown zones
Reference solution	Test solution

**TESTS**

**Foreign matter (2.8.2)**  
Maximum 3 per cent.

**Loss on drying (2.2.32)**

Maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

**Total ash (2.4.16)**

Maximum 8.0 per cent.

**ASSAY**

Liquid chromatography (2.2.29).

**Test solution** To 0.500 g of the powdered herbal drug (355) (2.9.12) in a 100 mL round-bottomed flask, add 30 mL of a mixture of equal volumes of *alcohol R* and *water R*. Heat in a water-bath at 60 °C for 30 min. Allow to cool and filter through a sintered-glass filter (2.1.2). Collect the liquid in a 250 mL round-bottomed flask. Repeat this operation twice, using the residue obtained in the filtration step instead of the powdered herbal drug. Add both fractions of supernatant to the 250 mL round-bottomed flask. Evaporate under reduced pressure until about 10 mL of supernatant is left in the flask. Transfer the supernatant quantitatively to a 20.0 mL volumetric flask and dilute to 20.0 mL with a mixture of equal volumes of *alcohol R* and *water R*. Filter through a nylon filter (pore size 0.45 µm).

**Reference solution (a)** Dissolve 10 mg of *ferulic acid R* in a mixture of equal volumes of *methanol R* and *water R* and dilute to 20.0 mL with the same mixture of solvents.

**Reference solution (b)** Dissolve 10 mg of *caffeic acid R* in a mixture of equal volumes of *methanol R* and *water R* and dilute to 20.0 mL with the same mixture of solvents.

Figure 1419.-1. – UV spectrum of eleutheroside B for the assay of eleutherococcus

Figure 1419.-2. – UV spectrum of eleutheroside E for the assay of eleutherococcus

**Reference solution (c)** Transfer 1 mL of reference solution (a) to a 25 mL volumetric flask and dilute to 25.0 mL with a mixture of equal volumes of *methanol R* and *water R*. Filter through a nylon filter (pore size 0.45 µm).

**Reference solution (d)** Transfer 1 mL of reference solution (a) and 1 mL of reference solution (b) in a mixture of equal volumes of *methanol R* and *water R* and dilute to 25.0 mL with the same mixture of solvents. Filter through a nylon filter (pore size 0.45 µm).

**Precolumn:**

- size:  $l = 4$  mm,  $\varnothing = 4.6$  mm,
- stationary phase: octadecylsilyl silica gel for chromatography R (5 µm).

**Column:**

- size:  $l = 0.25$  m,  $\varnothing = 4.6$  mm,
- stationary phase: octadecylsilyl silica gel for chromatography R (5 µm).

**Mobile phase:**

- mobile phase A: phosphoric acid R, water R (0.5:99.5 V/V),
- mobile phase B: acetonitrile for chromatography R,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 5	90	10
5 - 27	90 → 80	10 → 20
27 - 30	80 → 50	20 → 50
30 - 35	50	50

**Flow rate** 1.0 mL/min.

**Detection** Spectrophotometer at 220 nm.

**Injection** 20 µL of the test solution and reference solutions (c) and (d).

**Retention time** Eleutheroside B = about 10 min; eleutheroside E = about 22 min.

Locate the peaks due to eleutheroside B and eleutheroside E using the UV spectra shown in Figures 1419.-1 and 1419.-2.

**System suitability** Reference solution (d):

- resolution: minimum 15 between the peaks due to caffeic acid and ferulic acid.

Calculate the total percentage content of eleutheroside B and eleutheroside E from the expression:

$$\frac{(A_B \times C \times 0.73 \times 2)}{(A_R \times m)} + \frac{(A_E \times C \times 1.90 \times 2)}{(A_R \times m)}$$

- $A_B$  = area of the peak due to eleutheroside B in the chromatogram obtained with the test solution,
- $A_E$  = area of the peak due to eleutheroside E in the chromatogram obtained with the test solution,
- $A_R$  = area of the peak due to ferulic acid in the chromatogram obtained with reference solution (c),
- $C$  = concentration of ferulic acid in reference solution (c), in micrograms per millilitre,
- $m$  = mass of the herbal drug to be examined, in milligrams.

Ph Eur

## Ephedra Herb

(Ph. Eur. monograph 2451)

Ph Eur

### DEFINITION

Whole or fragmented, dried sterile aerial part of *Ephedra sinica* Stapf, *Ephedra intermedia* Schrenk and C.A.Mey. or *Ephedra equisetina* Bunge or a mixture of these.

### Content

Minimum 1.0 per cent of ephedrine ( $C_{10}H_{15}NO$ ;  $M_r$  165.2) (dried drug).

### IDENTIFICATION

A. The stems are pale green, yellowish green or light brown in colour, thin, cylindrical, branched or unbranched, and up to 30 cm long (whole drug) or in fragments up to 5 cm long (fragmented drug) and 1-3 mm in diameter; they are longitudinally striated and slightly rough, with internodes varying in length from 1-6 cm. The leaves, opposite and decussate, are reduced to sheaths surrounding the stem at the

nodes, carrying diminutive laminae 1.5-4 mm long with 2 (rarely 3) acutely triangular lobes with a greyish-white apex and a reddish-brown or blackish-brown tubular base (laminae can also be shorter, with a more rounded apex). The fracture is fibrous with a light or dark reddish-brown pith.

**B. Microscopic examination (2.8.23).** The powder is greenish-yellow, greenish-brown or light brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2451.-1): fragments of the epidermis (surface view [A, F]) consisting of elongated, more or less thick-walled cells [Aa] and stomata partially covered by an occasionally speckle-patterned cuticle [Ab] so that only the pore is visible; anomocytic stomata clearly visible below the cuticle (surface view [F]), with guard cells with thickened end walls [Fa]; fragments of the stem (transverse section [D]) showing the epidermis covered by a thick cuticle [Da] with papillose thickenings above some cells [Db] and composed of thick-walled epidermal cells [Dc] and sunken stomata [Dd] sometimes accompanied by cortical parenchyma with palisade cells containing small prisms of calcium oxalate [Df] and groups of fibres [De]; fibres, isolated or in groups [B], long, thick-walled and with a reduced lumen; fragments of vascular tissue [C, E] composed of pitted tracheids [Ca, Ea] and annular, spiral [Cb] or rarely reticulate vessels; groups of more or less rectangular parenchymatous cells from the pith with slightly thickened walls and often with orange or brown contents [Eb]; numerous fragments of the orange or brown contents of parenchymatous cells [G]; numerous small crystals of calcium oxalate occurring as prisms or cluster crystals [Ba], frequently agglutinated along fibres or in parenchymatous cells [H] or isolated.

Figure 2451.-1. – Illustration for identification test B of powdered herbal drug of ephedra herb

**C. Thin-layer chromatography (2.2.27).**

**Test solution** To 0.2 g of the powdered herbal drug (355) (2.9.12) add 0.5 mL of *concentrated ammonia R* and 10 mL of

*methylene chloride R*. Boil in a water-bath under a reflux condenser for 1 h. Allow to cool, filter and evaporate the filtrate to dryness; dissolve the residue in 2 mL of *methanol R*.

**Reference solution** Dissolve 1 mg of *ephedrine hydrochloride CRS* and 1 mg of *2-indanamine hydrochloride R* in 2 mL of *methanol R*.

**Plate** *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

**Mobile phase** *concentrated ammonia R*, *methanol R*, *methylene chloride R* (1:10:40 *V/V/V*).

**Application** 10 µL [or 1 µL] as spots with a diameter of 5 mm [or 2 mm].

**Development** Over a path of 10 cm [or 6 cm].

**Drying** In air.

**Detection** Spray with a 2 g/L solution of *ninhydrin R* in *ethanol (96 per cent) R*; heat at 110 °C for 10 min and examine immediately in daylight.

**Results** See below the sequence of spots present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint spots may be present in the chromatogram obtained with the test solution.

Top of the plate	
2-Indanamine: a purple spot	A purple spot may be present
Ephedrine: a purple spot at the border between the middle and lower thirds	A purple spot (ephedrine) at the border between the middle and lower thirds
Reference solution	Test solution

**TESTS**

**Loss on drying (2.2.32)**

Maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

**Total ash (2.4.16)**

Maximum 9.0 per cent.

**ASSAY**

**Liquid chromatography (2.2.29).**

**Test solution** To 0.200 g of the powdered herbal drug (355) (2.9.12) add 25.0 mL of *methanol R*, weigh and sonicate for 45 min. Allow to cool, weigh and adjust to the original mass with *methanol R*, shake well and filter. Transfer 1.0 mL of the filtrate to a small column (1 cm in diameter) packed with 1.50 g of *neutral aluminium oxide R* (60-210 µm). Elute with a mixture of equal volumes of *methanol R* and *water R*. Collect about 9 mL of the eluate, add 0.5 mL of *phosphoric acid R* and dilute to 10.0 mL with a mixture of equal volumes of *methanol R* and *water R*.

**Reference solution (a)** Dissolve 10.0 mg of *ephedrine hydrochloride CRS* in *methanol R* and dilute to 100.0 mL with the same solvent. Dilute 2.0 mL of the solution to 25.0 mL with the mobile phase.

**Reference solution (b)** Dissolve 1 mg of *ephedrine hydrochloride CRS* and 1 mg of *terbutaline sulfate CRS* in *methanol R* and dilute to 10 mL with the same solvent. Dilute 2 mL of the solution to 25 mL with the mobile phase.

**Column:**

- size:  $l = 0.25$  m,  $\varnothing = 4.6$  mm;
- stationary phase: octadecylsilyl silica gel for chromatography R (5  $\mu$ m).

**Mobile phase** acetone R1, 0.1 per cent V/V solution of phosphoric acid R (15:85 V/V).

**Flow rate** 2.0 mL/min.

**Detection** Spectrophotometer at 207 nm.

**Injection** 10  $\mu$ L.

**Run time** 3 times the retention time of ephedrine.

**System suitability** Reference solution (b):

- resolution: minimum 3.5 between the peaks due to terbutaline and ephedrine.

Calculate the percentage content of ephedrine using the following expression:

$$\frac{A_1 \times m_2 \times p \times 165.2}{A_2 \times m_1 \times 5 \times 201.7}$$

- $A_1$  = area of the peak due to ephedrine in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to ephedrine in the chromatogram obtained with reference solution (a);
- $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;
- $m_2$  = mass of ephedrine hydrochloride CRS used to prepare reference solution (a), in grams;
- $p$  = percentage content of ephedrine hydrochloride in ephedrine hydrochloride CRS.

Ph Eur

**Eucalyptus Leaf**

(Ph. Eur. monograph 1320)

Ph Eur

**DEFINITION**

Whole or cut, dried leaves of older branches of *Eucalyptus globulus* Labill.

**Essential oil content:**

- for the whole drug, minimum 20 mL/kg (anhydrous drug);
- for the cut drug, minimum 15 mL/kg (anhydrous drug).

**CHARACTERS**

Aromatic odour of cineole.

**IDENTIFICATION**

**A.** The leaves, which are mainly greyish-green and relatively thick, are elongated, elliptical and slightly sickle-shaped and usually up to 25 cm in length and up to 5 cm in width. The petiole is twisted, strongly wrinkled and is 2-3 cm, rarely 5 cm, in length. The coriaceous, stiff leaves are entire and glabrous and have a yellowish-green midrib. Lateral veins anastomose near the margin to a continuous line. The margin is even and somewhat thickened. On both surfaces there are minute, irregularly distributed, warty, dark brown spots. Small oil glands may be seen in transmitted light.

**B.** Microscopic examination (2.8.23). The powder is greyish-green. Examine under a microscope using chloral hydrate solution R. The powder shows the following diagnostic characters (Figure 1320.-1): fragments of glabrous lamina (surface view [A, L], transverse section [F, H]), with small, thick-walled epidermal cells bearing a thick cuticle [Fa, Ha],

numerous anomocytic stomata (2.8.3) greater than 80  $\mu$ m in diameter [Aa, La] with occasional groups of brown cork cells, 300  $\mu$ m in diameter and brownish-black in their centre, and underlying palisade parenchyma [Ab, Fb]; fragments of bilateral mesophyll (side view [G]), with 2-3 layers of palisade parenchyma [Ga] on each side and in the centre several layers of spongy mesophyll [Gb] with elongated cells having the same orientation as the palisade cells and containing prisms [B, Gd] and cluster crystals of calcium oxalate [Gc, K]; large schizogenous oil glands, whole [E] or usually broken, accompanied by palisade parenchyma [Ea]; fragments of vessels [J] and thick-walled and slightly channelled fibres [C] accompanied by crystal sheaths [Ca, Ja]; crystal sheaths containing prisms of calcium oxalate [D].

Figure 1320.-1. – Illustration for identification test B of powdered herbal drug of eucalyptus leaf

**C. Thin-layer chromatography (2.2.27).**

**Test solution** Shake 0.5 g of the freshly powdered herbal drug (355) (2.9.12) with 5 mL of toluene R for 2-3 min and filter over about 2 g of anhydrous sodium sulfate R.

**Reference solution** Dissolve 50  $\mu$ L of cineole R in toluene R and dilute to 5 mL with the same solvent.

**Plate** TLC silica gel plate R.

**Mobile phase** ethyl acetate R, toluene R (10:90 V/V).

**Application** 10  $\mu$ L as bands.

**Development** Over a path of 15 cm.

**Drying** In air.

**Detection** Treat with anisaldehyde solution R and heat at 100-105  $^{\circ}$ C for 10-15 min; examine in daylight.

**Results** The chromatogram obtained with the reference solution shows in the middle a zone due to cineole. The chromatogram obtained with the test solution shows a principal zone similar in position and colour to the zone due to cineole in the chromatogram obtained with the reference

solution, it also shows an intense violet zone (hydrocarbons) near the solvent front and there may also be other fainter zones.

#### TESTS

##### Foreign matter (2.8.2)

Maximum 3 per cent of dark and brown leaves, maximum 5 per cent of stems and maximum 2 per cent of other foreign matter. Cordate or ovate sessile leaves of young branches, with numerous glands on both sides, visible as points in transmitted light, are not present. Carry out the determination using 30 g of the herbal drug to be examined.

##### Water (2.2.13)

Maximum 100 mL/kg, determined on 20.0 g of the powdered herbal drug (355) (2.9.12).

##### Total ash (2.4.16)

Maximum 6.0 per cent.

#### ASSAY

##### Essential oil (2.8.12)

Use 10.0 g of the herbal drug, cut immediately before determination, a 500 mL round-bottomed flask, 200 mL of water R and 100 mL of glycerol R as the distillation liquid and 0.5 mL of xylene R in the graduated tube. Distil at a rate of 2-3 mL/min for 2 h.

Ph Eur

## Eucalyptus Oil

(Ph. Eur. monograph 0390)

Ph Eur

#### DEFINITION

Essential oil obtained by steam distillation and rectification from the fresh leaves or the fresh terminal branchlets of various species of *Eucalyptus* rich in 1,8-cineole. The species mainly used are *Eucalyptus globulus* Labill., *Eucalyptus polybractea* R.T.Baker and *Eucalyptus smithii* R.T.Baker.

#### CHARACTERS

##### Appearance

Colourless or pale yellow liquid.

Odour: reminiscent of 1,8-cineole.

#### IDENTIFICATION

First identification: B.

Second identification: A.

A. Thin-layer chromatography (2.2.27).

**Test solution** Dissolve 0.1 g of the essential oil to be examined in toluene R and dilute to 10 mL with the same solvent.

**Reference solution** Dissolve 20 µL of  $\alpha$ -terpineol R and 50 µL of cineole R in toluene R and dilute to 5 mL with the same solvent.

**Plate** TLC silica gel plate R (5-40 µm) [or TLC silica gel plate R (2-10 µm)].

**Mobile phase** ethyl acetate R, toluene R (10:90 V/V).

**Application** 10 µL [or 2 µL] as bands of 10 mm [or 6 mm].

**Development** Over a path of 15 cm [or 6 cm].

**Drying** In air.

**Detection** Spray with anisaldehyde solution R and heat at 100-105 °C for 5-10 min; examine in daylight.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution, near the solvent front and at the level of  $\alpha$ -terpineol.

Top of the plate	
1,8-Cineole: a violet-brown zone	An intense violet-brown zone (1,8-cineole)
$\alpha$ -Terpineol: a violet-brown zone	
Reference solution	Test solution

B. Examine the chromatograms obtained in the test for chromatographic profile.

**Results** The characteristic peaks due to  $\alpha$ -pinene,  $\beta$ -pinene,  $\alpha$ -phellandrene, limonene and 1,8-cineole in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with reference solution (a). Sabinene and camphor may be present in the chromatogram obtained with the test solution.

#### TESTS

##### Relative density (2.2.5)

0.906 to 0.927.

##### Refractive index (2.2.6)

1.458 to 1.470.

##### Optical rotation (2.2.7)

0° to +10°.

##### Solubility in alcohol (2.8.10)

- eucalyptus oil containing 70-79 per cent of 1,8-cineole is soluble in 10 volumes of ethanol (70 per cent V/V) R;
- eucalyptus oil containing minimum 80 per cent of 1,8-cineole is soluble in 5 volumes of ethanol (70 per cent V/V) R.

#### Aldehydes

To 10 mL in a ground-glass-stoppered tube 25 mm in diameter and 150 mm long, add 5 mL of toluene R and 4 mL of alcoholic hydroxylamine solution R. Shake vigorously and titrate immediately with 0.5 M potassium hydroxide in alcohol (60 per cent V/V) until the red colour changes to yellow. Continue the titration with shaking; the end-point is reached when the pure yellow colour of the indicator is permanent in the lower layer after shaking vigorously for 2 min and allowing separation to take place. The reaction is complete in about 15 min. Repeat the titration using a further 10 mL of the substance to be examined and, as a reference solution for the end-point, the titrated liquid from the 1<sup>st</sup> determination to which has been added 0.5 mL of 0.5 M potassium hydroxide in alcohol (60 per cent V/V). Not more than 2.0 mL of 0.5 M potassium hydroxide in alcohol (60 per cent V/V) is required in the 2<sup>nd</sup> titration.

#### Chromatographic profile

Gas chromatography (2.2.28): use the normalisation procedure.

**Test solution** Dissolve 200 µL of the essential oil to be examined in heptane R and dilute to 10.0 mL with the same solvent.

**Reference solution (a)** Dissolve 10 µL of  $\alpha$ -pinene R, 5 µL of  $\beta$ -pinene R, 5 µL of sabinene R, 5 µL of  $\alpha$ -phellandrene R, 10 µL of limonene R, 50 µL of cineole R and 5 mg of

camphor R in heptane R and dilute to 10 mL with the same solvent.

Reference solution (b) Dissolve 5  $\mu$ L of limonene R in heptane R and dilute to 50.0 mL with the same solvent. Dilute 0.5 mL of the solution to 5.0 mL with heptane R.

Column:

- material: fused silica;
- size:  $l = 60$  m,  $\varnothing =$  about 0.25 mm;
- stationary phase: macrogol 20 000 R (film thickness 0.25  $\mu$ m).

Carrier gas helium for chromatography R.

Flow rate 1.5 mL/min.

Split ratio 1:50.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 5	60
	5 - 33	60 $\rightarrow$ 200
	33 - 38	200
Injection port		220
Detector		220

Detection Flame ionisation.

Injection 1  $\mu$ L.

Elution order Order indicated in the composition of reference solution (a). Record the retention times of these substances.

System suitability Reference solution (a):

- resolution: minimum 1.5 between the peaks due to limonene and cineole.

Identification of components Using the retention times determined from the chromatogram obtained with reference solution (a), locate the components of reference solution (a) in the chromatogram obtained with the test solution.

Determine the percentage content of each of these components. The percentages are within the following ranges:

- $\alpha$ -pinene: 0.05 per cent to 10.0 per cent;
- $\beta$ -pinene: 0.05 per cent to 1.5 per cent;
- sabinene: maximum 0.3 per cent;
- $\alpha$ -phellandrene: 0.05 per cent to 1.5 per cent;
- limonene: 0.05 per cent to 15.0 per cent;
- 1,8-cineole: minimum 70.0 per cent;
- camphor: maximum 0.1 per cent;
- disregard limit: the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

#### STORAGE

At a temperature not exceeding 25 °C.

## Eucommia Bark

(Ph. Eur. monograph 2412)

Ph Eur

#### DEFINITION

Whole or fragmented, scraped, dried bark of the stem of *Eucommia ulmoides* Oliv.

#### Content

Minimum 0.10 per cent of pinoresinol diglucoside ( $C_{32}H_{42}O_{16}$ ;  $M_r$  683) (dried drug).

#### IDENTIFICATION

A. Pieces are flat, curved or channelled, varying in size, about 3-7 mm thick. The outer surface is pale brown or greenish-brown, markedly wrinkled or fissured, sometimes with intentional scarring in a rhombus shape; some barks show lenticels. The inner surface is dark reddish-brown or dark purplish-brown, smooth to the touch. The texture is fragile, easily broken, with the edges of the fracture connected by fine, dense, silvery and elastic rubber threads.

B. Microscopic examination (2.8.23). The powder is brownish. Examine under a microscope using chloral hydrate solution R. The powder shows the following diagnostic characters (Figure 2412.-1): many ribbon-shaped latex fragments with a granular surface, twisted or folded back on themselves [B]; numerous sclereids up to 180  $\mu$ m long and 20-80  $\mu$ m in diameter, isolated [F] or mostly in groups [C], with very thick and markedly channelled walls, some sclereids having masses of latex in their lumen [Ca]; fibres with very narrow lumens, usually in groups associated with sclereids [D]; fragments of cork (transverse section [A]) consisting of layers of cells with slightly and regularly thickened walls [Aa] and layers of hard cork with rectangular cells whose walls are irregularly thickened with fine pits on 3 sides and thin on the upper side [Ab]; fragments of cork consisting of polygonal cells with slightly thickened walls (surface view [G]) and fragments of hard cork consisting of polygonal cells 15-40  $\mu$ m in diameter (surface view [E]); numerous isolated hard cork cells ([K], surface view [Ka], transverse section [Kb]); ovoid parenchyma cells [J]; rare fragments of phloem parenchyma (transverse section [H]) consisting of medullary rays [Ha], phloem parenchyma [Hb] and laticiferous vessels [Hc].

Figure 2412.-1. – Illustration for identification test B of powdered herbal drug of eucommia bark

C. To 1.0 g of the powdered herbal drug (355) (2.9.12) add 10 mL of *methylene chloride R* and allow to stand for 2 h. Filter and evaporate the filtrate to dryness. Take up the residue with 1.0 mL of *anhydrous ethanol R*; an elastic film is formed.

D. Thin-layer chromatography (2.2.27).

**Test solution** To 1 g of the powdered herbal drug (355) (2.9.12) add 10 mL of *methylene chloride R*. Sonicate for 10 min. Discard the liquid phase and repeat the extraction with another 10 mL of *methylene chloride R*. Discard the liquid phase again. Dry the residue in air. Add 7 mL of *methanol R*. Sonicate in a centrifuge tube at 60 °C for 20 min. Centrifuge; use the supernatant.

**Reference solution** Dissolve 2 mg of 5,7-dihydroxy-4-methylcoumarin *R* and 20 mg of  $\beta$ -sitosterol *R* in 10 mL of *methanol R*.

**Plate** TLC silica gel plate *R* (5-40  $\mu$ m) [or TLC silica gel plate *R* (2-10  $\mu$ m)].

**Mobile phase** *anhydrous formic acid R*, *ethyl acetate R*, *toluene R* (1:35:65 V/V/V).

**Application** 20  $\mu$ L [or 10  $\mu$ L] as bands of 10 mm [or 8 mm].

**Development** Over a path of 10 cm [or 6 cm].

**Drying** In air.

**Detection** Treat with *anisaldehyde solution R* and heat at 100-105 °C for 5 min; examine in daylight.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

## TESTS

### Loss on drying (2.2.32)

Maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C.

### Total ash (2.4.16)

Maximum 10.0 per cent.

## ASSAY

Liquid chromatography (2.2.29).

**Test solution** Treat 2.00 g of the freshly powdered herbal drug (355) (2.9.12) with 75 mL of *methylene chloride R* in a continuous extraction apparatus (Soxhlet type) for 1 h. Cool. Discard the organic solution and replace with 75 mL of *methanol R*. Extract for 6 h in the same apparatus. Filter and evaporate the filtrate to dryness. Take up the residue with

10.0 mL of a mixture of *methanol R* and *water R* (30:70 V/V). Centrifuge. Filter through a membrane filter (nominal pore size 0.45  $\mu$ m).

**Reference solution (a)** Treat 2.00 g of *eucommia bark HRS* with 75 mL of *methylene chloride R* in a continuous extraction apparatus (Soxhlet type) for 1 h. Cool. Discard the organic solution and replace with 75 mL of *methanol R*. Extract for 6 h in the same apparatus. Filter and evaporate the filtrate to dryness. Take up the residue with 10.0 mL of a mixture of *methanol R* and *water R* (30:70 V/V). Centrifuge. Filter through a membrane filter (nominal pore size 0.45  $\mu$ m).

**Reference solution (b)** Dissolve 20.0 mg of *caffeine CRS* in mobile phase A and dilute to 20.0 mL with mobile phase A. Dilute 1.0 mL of the solution to 25.0 mL with mobile phase A.

**Column:**

— size:  $l = 0.25$  m,  $\varnothing = 4.0$  mm;

— stationary phase: end-capped octadecylsilyl silica gel for chromatography *R*.

**Mobile phase:**

— mobile phase A: 1.0 g/L solution of *phosphoric acid R*;

— mobile phase B: *acetonitrile R*;

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 35	87 → 75	13 → 25
35 - 40	75 → 0	25 → 100

**Flow rate** 1.0 mL/min.

**Detection** Spectrophotometer at 278 nm.

**Injection** 20  $\mu$ L.

**Identification of peaks** Use the chromatogram supplied with *eucommia bark HRS* and the chromatogram obtained with reference solution (a) to identify the peak due to pinosresinol diglucoside and peak 2 (unknown).

**Retention time** Caffeine = about 8 min; pinosresinol diglucoside = about 10 min; peak 2 = about 11 min.

**System suitability** Reference solution (a):

— resolution: minimum 2.0 between the peak due to pinosresinol diglucoside and peak 2.

Calculate the percentage content of pinosresinol diglucoside using the following expression:

$$\frac{A_1 \times m_2 \times 5.6 \times p}{A_2 \times m_1 \times 50}$$

- $A_1$  = area of the peak due to pinosresinol diglucoside in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to caffeine in the chromatogram obtained with reference solution (b);
- $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;
- $m_2$  = mass of *caffeine CRS* used to prepare reference solution (b), in grams;
- $p$  = percentage content of caffeine in *caffeine CRS*;
- 5.6 = correction factor for caffeine with respect to pinosresinol diglucoside.

Ph Eur

## Evodia Fruit

(Ph. Eur. monograph 2718)

Ph Eur

### DEFINITION

Dried, whole unopened fruit of *Tetradium ruticarpum* (A. Juss.) T.G.Hartley (syn. *Evodia ruticarpa* (A.Juss.) Hook.f. & Thomson) collected just before ripening.

### Content

Minimum 0.15 per cent for the sum of evodiamine and rutecarpine, expressed as evodiamine (C<sub>19</sub>H<sub>17</sub>N<sub>3</sub>O; M<sub>r</sub> 303.4) (dried drug).

### IDENTIFICATION

A. The whole fruit is pentagonal to spheroidal, flattened at the apex, about 2-5 mm in diameter. It consists of 5 follicles more or less fused together, with a dark greenish-brown or brown external surface, rough, with numerous protuberances due to the presence of oil cavities; the flattened upper part is more or less regularly stellate whereas the conical lower surface bears the hairy remnants of the sepals and peduncle. The texture is tough. A transverse section of the fruit shows 5 loculi, each containing a tiny yellowish seed.

B. Microscopic examination (2.8.23). The powder is brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2718.-1): fragments of epicarp (surface view [A, B]) with cells whose walls are usually rigid and covered in a finely grained cuticle [Aa, Ba], bearing unicellular [Ac] or multicellular [Ab] covering trichomes (with fine internal separations between the cells) with spiny outer walls, occasionally remaining only as circular scars [Ae], and glandular trichomes with a multicellular stalk (2-6 cells) with slightly thickened walls and a globular, ovoid, multicellular head [Ad]; anomocytic stomata (2.8.3) [Bb] and acicular crystals in dark brown bundles [Bc] are present; isolated covering trichomes, often fragmented, with a sharp [C, L] or sometimes rounded [E] tip; numerous isolated glandular trichomes [H]; fragments of the outer part of the pericarp (transverse section [F]), consisting of the epicarp [Fa] with small cells, the mesocarp [Fc] and fragments of schizolysigenous oil glands [Fb]; fragments from the inner part of the mesocarp (surface view [G], transverse section [K]) consisting of small vascular bundles with spiral vessels [Kc] and parenchyma containing very numerous cluster crystals of calcium oxalate [Ga, Kb], sometimes associated with the endocarp composed of fine elongated cells [Gb, Ka]; fragments of parenchyma from the base of the fruit [D] containing prisms of calcium oxalate [Db] and a few sclereids [Da]; sclereids, isolated or in small groups [J].

C. Thin-layer chromatography (2.2.27).

**Test solution** To 1 g of the powdered herbal drug (355) (2.9.12) add 10 mL of *ethanol (96 per cent) R*, sonicate for 10 min, centrifuge and use the supernatant.

**Reference solution** Dissolve 1 mg of *evodiamine R* and 1 mg of *rutecarpine R* in 1 mL of *ethanol (96 per cent) R*.

**Plate** TLC silica gel plate R (2-10 µm).

**Mobile phase** *ethanol (96 per cent) R*, *triethylamine R*, *ethyl acetate R*, *cyclohexane R* (1:1:5:19 V/V/V/V).

**Application** 5 µL as bands of 8 mm.

**Development** Over a path of 6 cm.

**Drying** In air.

**Detection A** Examine in ultraviolet light at 254 nm.

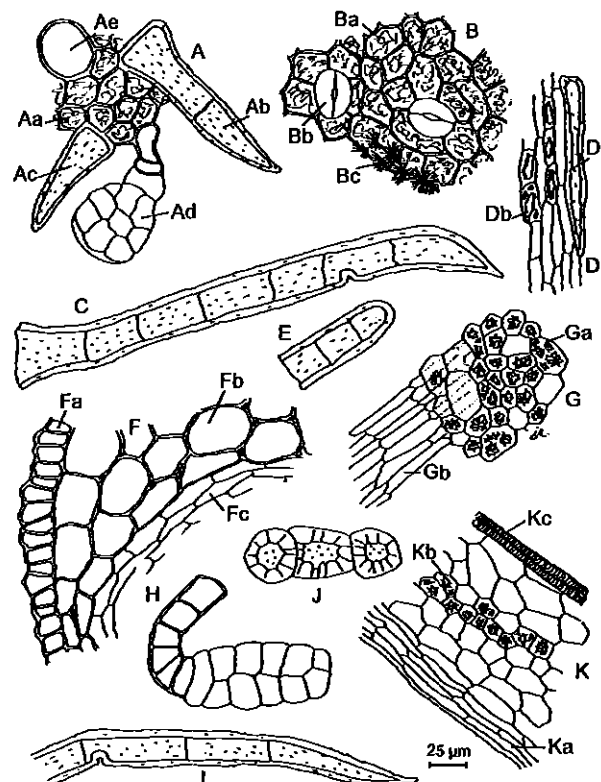

Figure 2718.-1. – Illustration for identification test B of powdered herbal drug of evodia fruit

**Results A** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint quenching zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Rutecarpine: a quenching zone	A quenching zone (rutecarpine)
Evodiamine: a quenching zone	A quenching zone (evodiamine)
	A quenching zone
Reference solution	Test solution

**Detection B** Treat with a mixture of 10 volumes of *sulfuric acid R* and 90 volumes of *ethanol (96 per cent) R*, heat at 100 °C for 3 min and examine in daylight.

**Results B** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

**TESTS****Loss on drying (2.2.32)**

Maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

**Total ash (2.4.16)**

Maximum 9.0 per cent.

**Ash insoluble in hydrochloric acid (2.8.1)**

Maximum 1.0 per cent.

**ASSAY****Liquid chromatography (2.2.29).**

**Test solution** To 0.200 g of the powdered herbal drug (355) (2.9.12) add 10.0 mL of ethanol (50 per cent V/V) R and allow to macerate for 1 h. Sonicate for 30 min, centrifuge for 5 min and transfer the supernatant to a 50.0 mL volumetric flask. Add 10.0 mL of ethanol (50 per cent V/V) R to the residue and sonicate for 30 min. Centrifuge for 5 min and transfer the supernatant to the same volumetric flask. Repeat this operation once more. Dilute the 3 fractions of supernatant in the volumetric flask to 50.0 mL with ethanol (50 per cent V/V) R and filter through a membrane filter (nominal pore size 0.45 µm).

**Reference solution (a)** Dissolve 5.0 mg of evodiamine CRS in anhydrous ethanol R and dilute to 100.0 mL with the same solvent.

**Reference solution (b)** Dilute 10.0 mL of reference solution (a) to 100.0 mL with anhydrous ethanol R.

**Reference solution (c)** Dissolve 2.5 mg of rutecarpine R in 50.0 mL of reference solution (a) and dilute to 100.0 mL with anhydrous ethanol R.

**Column:**

- size:  $l = 0.25$  m,  $\varnothing = 4.6$  mm;
- stationary phase: end-capped octadecylsilyl silica gel for chromatography R (5 µm).

**Mobile phase:**

- mobile phase A: water for chromatography R;
- mobile phase B: acetonitrile R1;

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 15	45	55
15 - 17	45 → 10	55 → 90
17 - 30	10	90
30 - 32	10 → 45	90 → 55
32 - 45	45	55

**Flow rate** 1.0 mL/min.

**Detection** Spectrophotometer at 225 nm.

**Injection** 10 µL.

**Retention time** Evodiamine = about 8 min;  
rutecarpine = about 10 min.

**System suitability** Reference solution (c):

— resolution: minimum 5.0 between the peaks due to evodiamine and rutecarpine.

Calculate the percentage content of evodiamine and rutecarpine, expressed as evodiamine, using the following expression:

$$\frac{[A_1 + (A_3 \times 4)] \times m_2 \times p}{A_2 \times m_1 \times 20}$$

- $A_1$  = area of the peak due to evodiamine in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to evodiamine in the chromatogram obtained with reference solution (b);
- $A_3$  = area of the peak due to rutecarpine in the chromatogram obtained with the test solution;
- $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;
- $m_2$  = mass of evodiamine CRS used to prepare reference solution (a), in grams;
- $p$  = percentage content of evodiamine in evodiamine CRS.

Ph Eur

**Bitter Fennel**

(Ph. Eur. monograph 0824)

Ph Eur

**DEFINITION**

Dry cremocarps and mericarps of *Foeniculum vulgare* Müll. ssp. *vulgare* var. *vulgare*.

**Content**

- essential oil: minimum 40 mL/kg (anhydrous drug);
- anethole: minimum 60.0 per cent in the essential oil;
- fenchone: minimum 15.0 per cent in the essential oil.

**CHARACTERS**

Bitter fennel is greenish-brown, brown or green.

**IDENTIFICATION**

A. The fruit of bitter fennel is a cremocarp, of almost cylindrical shape with a rounded base and a narrower summit crowned with a large stylopod. It is generally 3-12 mm long and 3-4 mm wide. The mericarps, usually free, are glabrous. Each bears 5 prominent, slightly crenated ridges. When cut transversely, 4 vittae on the dorsal surface and 2 on the commissural surface may be seen with a lens.

B. Microscopic examination (2.8.23). The powder is greyish-brown or greyish-yellow. Examine under a microscope using chloral hydrate solution R. The powder shows the following diagnostic characters (Figure 0824.-1): yellow fragments of wide secretory canals, often made up of yellowish-brown-walled polygonal secretory cells [D, H]; reticulate

parenchyma of the mesocarp [B]; numerous fibre bundles [G] from the ridges [Ga], often accompanied by narrow spiral vessels [Gb]; very numerous endosperm fragments [F] containing aleurone grains [Fb] and very small cluster crystals of calcium oxalate [Fa]; some fibre bundles from the carphophore [E]; fragments of the endocarp (surface view [A, K]) consisting of thin-walled, transversely elongated cells, 2-9  $\mu\text{m}$  wide, having a parquetry arrangement, sometimes accompanied by the inner layer of the mesocarp [Aa]; fragments of the epicarp with stomata accompanied by oil droplets [C]; very numerous oil droplets [J].

Figure 0824.-1. – Illustration for identification test B of powdered herbal drug of bitter fennel

#### C. Thin-layer chromatography (2.2.27).

**Test solution** Shake 0.3 g of the freshly powdered herbal drug (1400) (2.9.12) with 5.0 mL of *methylene chloride R* for 15 min. Filter and carefully evaporate the filtrate to dryness on a water-bath at 60 °C. Dissolve the residue in 0.5 mL of *toluene R*.

**Reference solution** Dissolve 50  $\mu\text{L}$  of *anethole R* and 10  $\mu\text{L}$  of *fenchone R* in 5.0 mL of *hexane R*.

**Plate** TLC silica gel GF<sub>254</sub> plate R.

**Mobile phase** *hexane R*, *toluene R* (20:80 V/V).

**Application** 10  $\mu\text{L}$  as bands of 20 mm by 3 mm.

**Development** Over a path of 10 cm.

**Drying** In air.

**Detection A** Examine in ultraviolet light at 254 nm.

**Results A** The chromatograms show in the central part a quenching zone due to anethole.

**Detection B** Treat with *sulfuric acid R* and heat at 140 °C for 5-10 min until a yellow zone due to fenchone appears in the lower third of the chromatograms.

**Results B** Anethole appears as a violet band in the central part; the chromatogram obtained with the test solution also shows a reddish-brown zone in its upper third (terpenes).

#### TESTS

##### Estragole

**Gas chromatography (2.2.28):** use the normalisation procedure.

**Test solution** Dilute the mixture of essential oil and *xylene R* obtained in the determination of essential oil to 5.0 mL with *xylene R*, by rinsing the apparatus.

**Reference solution** Dissolve 5 mg of *estragole R* in 0.5 mL of *xylene R*.

**Column:**

— size:  $l = 30\text{-}60\text{ m}$ ,  $\varnothing = 0.3\text{ mm}$ ;

— stationary phase: *macrogol 20 000 R*.

**Carrier gas** *nitrogen for chromatography R*.

**Flow rate** 0.40 mL/min.

**Split ratio** 1:200.

**Temperature:**

	Time (min)	Temperature (°C)
Column	0 - 4	60
	4 - 26	60 → 170
	26 - 41	170
Injection port		220
Detector		270

**Detection** Flame ionisation.

**Injection** 1  $\mu\text{L}$ .

**Limit:**

— *estragole*: maximum 5.0 per cent in the essential oil obtained in the assay.

#### Foreign matter (2.8.2)

Maximum 1.5 per cent of peduncles and maximum 1.5 per cent of other foreign matter.

#### Water (2.2.13)

Maximum 100 mL/kg, determined on 20.0 g of the powdered herbal drug (710) (2.9.12).

#### Total ash (2.4.16)

Maximum 10.0 per cent.

#### ASSAY

##### Essential oil (2.8.12)

Use 5.0 g of the herbal drug reduced to a powder (1400) (2.9.12) immediately before the assay, a 500 mL round-bottomed flask, 200 mL of *water R* as the distillation liquid, and 0.50 mL of *xylene R* in the graduated tube. Distil at a rate of 2-3 mL/min for 2 h.

##### Anethole and fenchone

Gas chromatography (2.2.28) as described in the test for estragole with the following modifications.

**Reference solution** Dissolve 5 mg of *fenchone R* and 5 mg of *anethole R* in 0.5 mL of *xylene R*.

**Elution order** The order indicated in the composition of the reference solution; record the retention times of these substances.

#### STORAGE

Protected from moisture.

## Bitter-Fennel Fruit Oil

(Ph. Eur. monograph 1826)

Ph Eur

### DEFINITION

Essential oil obtained by steam distillation from the ripe fruits of *Foeniculum vulgare* Miller, ssp. *vulgare* var. *vulgare*.

### Content

- fenchone: 12.0 per cent to 25.0 per cent,
- *trans*-anethole: 55.0 per cent to 75.0 per cent.

### CHARACTERS

#### Appearance

Clear, colourless or pale yellow liquid.

Characteristic odour.

### IDENTIFICATION

First identification: B.

Second identification: A.

A. Thin-layer chromatography (2.2.27).

**Test solution** Dissolve 0.1 mL of the essential oil to be examined in 5 mL of *toluene R*.

**Reference solution** Dissolve 10 µL of *fenchone R* and 80 µL of *anethole R* in 5 mL of *toluene R*.

**Plate** TLC silica gel plate R.

**Mobile phase** *ethyl acetate R*, *toluene R* (5:95 V/V).

**Application** 10 µL as bands.

**Development** Over a path of 15 cm.

**Drying** In air.

**Detection** Spray with a freshly prepared 200 g/L solution of *phosphomolybdic acid R* in *ethanol (96 per cent) R* and heat at 150 °C for 15 min; examine in daylight.

**Results** See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Anethole: a dark blue to dark violet zone	A dark blue to dark violet zone (anethole)
Fenchone: a blue or bluish-grey zone	A blue or bluish-grey zone (fenchone)
Reference solution	Test solution

B. Examine the chromatograms obtained in the test for chromatographic profile.

**Results** The characteristic peaks in the chromatogram obtained with the test solution are similar in retention time to

Figure 1826.-1. – Chromatogram for the test for chromatographic profile of bitter-fennel fruit oil

those in the chromatogram obtained with the reference solution.

#### TESTS

**Relative density (2.2.5)**  
0.961 to 0.975.

**Refractive index (2.2.6)**  
1.528 to 1.539.

**Optical rotation (2.2.7)**  
+ 10.0° to + 24.0°.

#### Chromatographic profile

**Gas chromatography (2.2.28):** use the normalisation procedure.

**Test solution** Dissolve 0.20 mL of the essential oil to be examined in *heptane R* and dilute to 10.0 mL with the same solvent.

**Reference solution** Dissolve 20 µL of  $\alpha$ -pinene R, 20 µL of limonene R, 50 µL of fenchone R, 20 µL of estragole R, 100 µL of anethole R and 20 µL of anisaldehyde R in *heptane R* and dilute to 10.0 mL with the same solvent.

#### Column:

- material: fused silica,
- size:  $l = 60$  m,  $\varnothing = 0.25$  mm,
- stationary phase: *macrogol 20 000 R* (film thickness 0.25 µm).

**Carrier gas** helium for chromatography R.

**Flow rate** 1 mL/min.

**Split ratio** 1:200.

**Temperature:**

	Time (min)	Temperature (°C)
Column	0 – 4	60
	4 – 26	60 → 170
	26 – 41	170
Injection port		220
Detector		270

**Detection** Flame ionisation.

**Injection** 1.0 µL.

**Elution order** Order indicated in the composition of the reference solution. Record the retention times of these substances.

**System suitability** Reference solution:

- resolution: minimum 5.0 between the peaks due to estragole and *trans*-anethole.

Using the retention times determined from the chromatogram obtained with the reference solution, locate the components of the reference solution on the chromatogram obtained with the test solution and locate *cis*-anethole using Figure 1826.-1. (Disregard the peak due to heptane).

Determine the percentage content of each of these components. The percentages are within the following ranges:

- $\alpha$ -pinene: 1.0 per cent to 10.0 per cent,
- limonene: 0.9 per cent to 5.0 per cent,
- fenchone: 12.0 per cent to 25.0 per cent,
- estragole: maximum 6.0 per cent,
- *cis*-anethole: maximum 0.5 per cent,
- *trans*-anethole: 55.0 per cent to 75.0 per cent,
- anisaldehyde: maximum 2.0 per cent.

The ratio of  $\alpha$ -pinene content to limonene content is greater than 1.0.

#### STORAGE

At a temperature not exceeding 25 °C.

Ph Eur

## Bitter-Fennel Herb Oil

(Ph. Eur. monograph 2380)

Ph Eur

#### DEFINITION

Essential oil obtained by steam distillation of the aerial parts of *Foeniculum vulgare* Mill. ssp. *vulgare*, var. *vulgare* collected during fruiting.

#### CHARACTERS

##### Appearance

Clear, pale or intense yellow liquid.

Anise-like odour.

#### IDENTIFICATION

**First identification: B.**

**Second identification: A.**

A. Thin-layer chromatography (2.2.27).

**Test solution** Dissolve 0.1 mL of the oil to be examined in 5 mL of *toluene R*.

**Reference solution** Dissolve 10 µL of *fenchone R* and 40 µL of *anethole R* in 5 mL of *toluene R*.

**Plate** TLC silica gel plate R (5–40 µm) [or TLC silica gel plate R (2–10 µm)].

**Mobile phase** *ethyl acetate R*, *toluene R* (5:95 V/V).

**Application** 10 µL [or 3 µL] as bands of 10 mm [or 8 mm].

**Development** Over a path of 8 cm [or 6 cm].

**Drying** In air.

**Detection** Spray with a freshly prepared 200 g/L solution of *phosphomolybdic acid R* in *ethanol (96 per cent) R* and heat at 150 °C for 15 min; examine in daylight.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Anethole: a dark blue or dark violet zone	A dark blue or dark violet zone (anethole)
Fenchone: a blue or bluish-grey zone	A sometimes faint blue or bluish-grey zone (fenchone)
Reference solution	Test solution

B. Examine the chromatograms obtained in the test for chromatographic profile.

**Results:**

- *Spanish type*: the characteristic peaks due to  $\alpha$ -pinene,  $\beta$ -pinene,  $\beta$ -myrcene,  $\alpha$ -phellandrene, limonene, fenchone, estragole and *trans*-anethole in the chromatogram obtained with the test solution are

Figure 2380.-1. – Chromatogram for the test for chromatographic profile of Spanish-type bitter-fennel herb oil

Figure 2380.-2. – Chromatogram for the test for chromatographic profile of Tasmanian-type bitter-fennel herb oil

similar in retention time to those in the chromatogram obtained with reference solution (a);

- *Tasmanian type*: the characteristic peaks due to  $\alpha$ -pinene,  $\alpha$ -phellandrene, limonene, fenchone, estragole and *trans*-anethole in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with reference solution (a).

#### TESTS

##### Relative density (2.2.5)

- *Spanish type*: 0.877 to 0.921;
- *Tasmanian type*: 0.940 to 0.973.

##### Refractive index (2.2.6)

- *Spanish type*: 1.487 to 1.501;
- *Tasmanian type*: 1.512 to 1.538.

##### Optical rotation (2.2.7)

- *Spanish type*: + 42° to + 68°;
- *Tasmanian type*: + 11° to + 35°.

##### Solubility in alcohol (2.8.10)

- *Spanish type*: 1 volume is soluble in 2 volumes and more of ethanol (90 per cent V/V) R;
- *Tasmanian type*: 1 volume is soluble in 10 volumes and more of ethanol (85 per cent V/V) R.

##### Chromatographic profile

Gas chromatography (2.2.28): use the normalisation procedure.

*Test solution* Dissolve 0.20 mL of the oil to be examined in acetone R and dilute to 10.0 mL with the same solvent.

*Reference solution (a)* Dissolve 20  $\mu$ L of  $\alpha$ -pinene R, 10  $\mu$ L of  $\beta$ -pinene R, 20  $\mu$ L of  $\beta$ -myrcene R, 20  $\mu$ L of  $\alpha$ -phellandrene R, 20  $\mu$ L of limonene R, 40  $\mu$ L of fenchone R, 10  $\mu$ L of estragole R, 40  $\mu$ L of anethole R, 10  $\mu$ L of anisaldehyde R and 10  $\mu$ L of anise ketone R in acetone R and dilute to 10.0 mL with the same solvent.

*Reference solution (b)* Dissolve 5  $\mu$ L of anethole R in 25.0 mL of acetone R. Dilute 0.5 mL of this solution to 20.0 mL with acetone R.

##### Column:

- *material*: fused silica;
- *size*:  $l = 60$  m,  $\varnothing = 0.25$  mm;
- *stationary phase*: macrogol 20 000 R (film thickness 0.25  $\mu$ m).

*Carrier gas* helium for chromatography R.

*Flow rate* 1 mL/min.

*Split ratio* 1:50.

*Temperature*:

	Time (min)	Temperature (°C)
Column	0 - 35 35 - 42	70 → 210 210
Injection port		250
Detector		270

*Detection* Flame ionisation.

*Injection* 1  $\mu$ L.

*Elution order* Order indicated in the composition of the reference solution; record the retention times of these substances.

*System suitability* Reference solution (a):

- *resolution*: minimum 1.5 between the peaks due to  $\beta$ -myrcene and  $\alpha$ -phellandrene.

Using the chromatogram obtained with the reference solution, locate the relevant components for the type of the essential oil to be examined in the chromatogram obtained with the test solution, and locate *cis*-anethole using Figures 2380.-1 and 2380.-2.

Determine the percentage content of each of these components.

For Spanish-type bitter-fennel herb oil, the percentages are within the following ranges:

- $\alpha$ -pinene: 2.0 to 8.0 per cent;
- $\beta$ -pinene: 1.0 to 4.0 per cent;
- $\beta$ -myrcene: 1.0 to 12.0 per cent;
- $\alpha$ -phellandrene: 1.0 to 25.0 per cent;
- limonene: 8.0 to 30.0 per cent;
- fenchone: 7.0 to 16.0 per cent;
- estragole: 2.0 to 7.0 per cent;
- *cis*-anethole: maximum 0.5 per cent;
- *trans*-anethole: 15.0 to 40.0 per cent;
- anisaldehyde: maximum 1.0 per cent;
- anise ketone: maximum 0.05 per cent;
- *disregard limit*: the area of the principal peak in the chromatogram obtained with reference solution (b) (0.025 per cent).

For Tasmanian-type bitter-fennel herb oil, the percentages are within the following ranges:

- $\alpha$ -pinene: 2.0 to 11.0 per cent;
- $\alpha$ -phellandrene: 1.0 to 8.5 per cent;
- limonene: 1.0 to 6.0 per cent;
- fenchone: 10.0 to 25.0 per cent;
- estragole: 1.5 to 6.0 per cent;
- *cis*-anethole: maximum 0.5 per cent;
- *trans*-anethole: 45.0 to 78.0 per cent;
- anisaldehyde: maximum 1.0 per cent;
- anise ketone: maximum 0.05 per cent;
- *disregard limit*: the area of the principal peak in the chromatogram obtained with reference solution (b) (0.025 per cent).

#### STORAGE

At a temperature not exceeding 25 °C.

#### LABELLING

The label states that the content is Spanish-type or Tasmanian-type.

Ph Eur

## Sweet Fennel

(Ph. Eur. monograph 0825)

Ph Eur

#### DEFINITION

Dry cremocarps and mericarps of *Foeniculum vulgare* Mill. subsp. *vulgare* var. *dulce* (Mill.) Batt. & Trab.

#### Content

- *essential oil*: minimum 20 mL/kg (anhydrous drug);
- *anethole*: minimum 80.0 per cent in the essential oil.

#### CHARACTERS

Sweet fennel is pale green or pale yellowish-brown.

#### IDENTIFICATION

A. The fruit of sweet fennel is a cremocarp of almost cylindrical shape with a rounded base and a narrowed summit crowned with a large stylopod. It is generally

3-12 mm long and 3-4 mm wide. The mericarps, usually free, are glabrous. Each bears 5 prominent, slightly crenated ridges. When cut transversely, 4 vittae on the dorsal surface and 2 on the commissural surface may be seen with a lens.

**B. Microscopic examination (2.8.23).** The powder is greyish-brown or greyish-yellow. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 0825.-1.): yellow fragments of wide secretory canals, often made up of yellowish-brown-walled polygonal secretory cells [D, H]; reticulate parenchyma of the mesocarp [B]; numerous fibre bundles [G] from the ridges [Ga], often accompanied by narrow spiral vessels [Gb]; very numerous endosperm fragments [F] containing aleurone grains [Fb] and very small calcium oxalate cluster crystals [Fa]; some fibre bundles from the carphophore [E]; fragments of the endocarp (surface view [K, A]) consisting of thin-walled, transversely elongated cells 2-9  $\mu\text{m}$  wide, having a parquetry arrangement, sometimes accompanied by the inner layer of the mesocarp [Aa]; fragments of the epicarp with stomata accompanied by oil droplets [C]; very numerous oil droplets [J].

Figure 0825.-1. – Illustration for identification test B of powdered herbal drug of sweet fennel

**C. Thin-layer chromatography (2.2.27).**

**Test solution** Shake 0.3 g of the freshly powdered herbal drug (1400) (2.9.12) with 5.0 mL of *methylene chloride R* for 15 min. Filter and carefully evaporate the filtrate to dryness on a water-bath at 60 °C. Dissolve the residue in 0.5 mL of *toluene R*.

**Reference solution** Dissolve 60  $\mu\text{L}$  of *anethole R* in 5.0 mL of *hexane R*.

**Plate** TLC silica gel GF<sub>254</sub> plate R.

**Mobile phase** *hexane R*, *toluene R* (20:80 V/V).

**Application** 10  $\mu\text{L}$  as bands of 20 mm by 3 mm.

**Development** Over a path of 10 cm.

**Drying** In air.

**Detection A** Examine in ultraviolet light at 254 nm.

**Results A** The chromatograms show in the central part a quenching zone due to anethole.

**Detection B** Spray with *sulfuric acid R* and heat at 140 °C for 5 min; examine in daylight.

**Results B** The chromatograms show in the central part a violet band due to anethole; the chromatogram obtained with the test solution also shows a reddish-brown zone in the upper third (terpenes).

#### TESTS

##### Estragole and fenchone

Gas chromatography (2.2.28): use the normalisation procedure.

**Test solution** Dilute the mixture of essential oil and *xylene R* obtained in the assay of essential oil to 5.0 mL with *xylene R*, by rinsing the apparatus.

**Reference solution** Dissolve 5 mg of *estragole R* and 5 mg of *fenchone R* in 0.5 mL of *xylene R*.

**Column:**

— size:  $l = 30\text{-}60\text{ m}$ ,  $\varnothing = 0.3\text{ mm}$ ;

— stationary phase: *macrogol 20 000 R*.

**Carrier gas** *nitrogen for chromatography R*.

**Flow rate** 0.40 mL/min.

**Split ratio** 1:200.

	Time (min)	Temperature (°C)
Column	0 - 4	60
	4 - 26	60 → 170
	26 - 41	170
Injection port		220
Detector		270

**Detection** Flame ionisation.

**Injection** 1  $\mu\text{L}$ .

**Limits:**

— *estragole*: maximum 10.0 per cent in the essential oil;

— *fenchone*: maximum 7.5 per cent in the essential oil.

##### Foreign matter (2.8.2)

Maximum 1.5 per cent of peduncles and maximum 1.5 per cent of other foreign matter.

##### Water (2.2.13)

Maximum 80 mL/kg, determined on 20.0 g of the powdered herbal drug (710) (2.9.12).

##### Total ash (2.4.16)

Maximum 10.0 per cent.

#### ASSAY

##### Essential oil (2.8.12)

Use 10.0 g of the herbal drug reduced to a powder (1400) (2.9.12) immediately before the assay, a 500 mL round-bottomed flask, 200 mL of *water R* as the distillation liquid, and 0.50 mL of *xylene R* in the graduated tube. Distil at a rate of 2-3 mL/min for 2 h.

##### Anethole

Gas chromatography (2.2.28) as described in the test for estragole and fenchone with the following modification.

**Reference solution** Dissolve 5 mg of *anethole R* in 0.5 mL of *xylene R*.

#### STORAGE

Protected from moisture.

Ph Eur

## Fenugreek

(Ph. Eur. monograph 1323)

Ph Eur

### DEFINITION

Dried, ripe seeds of *Trigonella foenum-graecum* L.

### IDENTIFICATION

A. The seed is hard, flattened, brown or reddish-brown and more or less rhomboidal with rounded edges. It is 3-5 mm long, 2-3 mm wide and 1.5-2 mm thick. The widest surfaces are marked by a groove that divides the seed into 2 unequal parts. The smaller part contains the radicle; the larger part contains the cotyledons.

B. Microscopic examination (2.8.23). The powder is yellowish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 1323.-1): fragments of the testa (transverse section [B]) with lageniform epidermal cells [Bb] covered by a thick cuticle [Ba], a hypodermis consisting of large cells, narrower at the upper end and constricted in the middle, with bar-like thickenings of the radial walls [Bc] and parenchyma with flattened cells [Bd]; fragments of the epidermis in surface view, yellowish-brown, consisting of small polygonal cells, either with thick, channelled walls and a narrow lumen (view from above [G]) or with smooth walls and a larger lumen (view from below [C]); fragments of the hypodermis in surface view, with cells having either a circular outline and thickened walls, closely beaded (view from above [H]), or having a polyhedral outline whose bar-like thickenings extend from the lower to the upper walls (view from below [A]); parenchyma of the testa consisting of loosely arranged cells leaving numerous spaces [E]; fragments of endosperm with cells that are rounded [F] or elongated [D] depending on the orientation, associated with mucilage [Fa] and sometimes with small spiral or annular vessels [J].

Figure 1323.-1. – Illustration for identification test B of powdered herbal drug of fenugreek

C. Thin-layer chromatography (2.2.27).

*Test solution* Place 1.0 g of the powdered herbal drug (710) (2.9.12) in a 25 mL conical flask and add 5.0 mL of *methanol R*. Heat in a water-bath at 65 °C for 5 min. Cool and filter.

*Reference solution* Dissolve 3.0 mg of *trigonelline hydrochloride R* in 1.0 mL of *methanol R*.

*Plate* TLC silica gel *F<sub>254</sub>* plate *R*.

*Mobile phase* *water R*, *methanol R* (30:70 *V/V*).

*Application* 20 µL of the test solution and 10 µL of the reference solution, as bands.

*Development* Over a path of 10 cm.

*Drying* In air.

*Detection A* Examine in ultraviolet light at 254 nm.

*Results A* The chromatogram obtained with the test solution shows in its lower half a quenching zone similar in position and fluorescence to the zone in the chromatogram obtained with the reference solution.

*Detection B* Spray with *potassium iodobismuthate solution R2*.

*Results B* The chromatogram obtained with the test solution shows an intense orange-red zone similar in position and colour to the zone in the chromatogram obtained with the reference solution. It also shows in its upper half, a broad light brownish-yellow zone (triglycerides).

### TESTS

*Loss on drying* (2.2.32)

Maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug by drying in an oven at 105 °C for 2 h.

*Total ash* (2.4.16)

Maximum 5.0 per cent.

*Swelling index* (2.8.4)

Minimum 6, determined on the powdered herbal drug (710) (2.9.12).

Ph Eur

## Feverfew

(Ph. Eur. monograph 1516)

Ph Eur

### DEFINITION

Dried, whole or fragmented aerial parts of *Tanacetum parthenium* (L.) Sch. Bip.

### Content

Minimum 0.20 per cent of parthenolide ( $C_{15}H_{20}O_3$ ;  $M_r$  248.3) (dried drug).

### CHARACTERS

Camphoraceous odour.

### IDENTIFICATION

A. The leafy, more or less branched stem has a diameter of up to 5 mm; it is almost quadrangular, channelled longitudinally and slightly pubescent. The leaves are ovate, 2-5 cm long, sometimes up to 10 cm, yellowish-green, petiolate and alternate. They are pinnate or bipinnate, deeply divided into 5-9 segments, each with a coarsely crenate margin and an obtuse apex. Both surfaces are somewhat pubescent and the midrib is prominent on the lower surface. When present, the flowering heads are 12-22 mm in diameter with long pedicels; they are clustered into broad corymbs consisting of 5-30 flower-heads. The hemispherical involucre is 6-8 mm wide and consists of many overlapping bracts, which are rather narrow, obtuse and scarious and have membranous margins. The central flowers are yellow, hermaphrodite, tube-shaped with 5 teeth and have 5 stamens

inserted in the corolla; the filaments of the stamens are separate from each other but the anthers are fused into a tube through which passes the style, bearing 2 stigmatic branches. The peripheral flowers are female and have a white, three-toothed ligule, 2-7 mm long. The fruit is an achene, 1.2-1.5 mm long, brown when ripe, with 5-10 white longitudinal ribs. It is glandular and bears a short, crenate, membranous crown.

**B. Microscopic examination (2.8.23).** The powder is yellowish-green. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 1516.-1): numerous isolated, large, multicellular, uniseriate covering trichomes [J] consisting of a rhomboidal basal cell, 3-5 smaller, thick-walled rectangular cells, and a very long, flat, slender terminal cell, often curved at a right angle to the axis of the basal cell; isolated glandular trichomes [C, F] with a short, biserial, 2- to 4-celled stalk and a biserial head of 4-6 cells around which the cuticle forms a bladder-like covering; fragments of the epidermis of the leaves [A] consisting of cells with sinuous anticlinal walls, with a striated cuticle [Aa], anomocytic stomata (2.8.3) [Ab], covering trichomes [Ac] or their basal part [Ad] and glandular trichomes; numerous fragments of the stems (longitudinal section [H, L]) showing pitted or reticulate vessels [Ha] accompanied by cells of the pith with pitted walls [Hb] and groups of fibres [La]. If flowers are present, the powder also shows: fragments of the outer epidermis of the bracts of the involucre (surface view [M]), consisting, on the margin, of thin-walled cells [Ma] and occasional covering trichomes [Mb], and a central region composed of elongated sclereids with strongly thickened and channelled walls [Mc]; fragments of the inner epidermis of the corolla [K] consisting of polygonal cells, papillose, with finely striated walls; fragments of the outer epidermis of the corolla (surface view [B]) consisting of sinuous cells, covered by a striated cuticle, bearing numerous glandular trichomes [Ba]; fragments of the ovary [E] with parenchymatous cells containing small crystals of calcium oxalate [Ea] occurring as cluster crystals or occasionally as prisms [Eb], accompanied by small spiral vessels [Ec]; spherical pollen grains about 25 µm in diameter, with 3 pores and a spiny exine [D, G].

**C. Thin-layer chromatography (2.2.27).**

**Test solution** To 1 g of the powdered herbal drug (355) (2.9.12) add 20 mL of *methanol R*. Heat in a water-bath at 60 °C for 15 min. Allow to cool and filter. Evaporate to dryness under reduced pressure and dissolve the residue in 2 mL of *methanol R*.

**Reference solution** Dissolve 5 mg of *parthenolide R* in *methanol R* and dilute to 5 mL with the same solvent.

**Plate** TLC silica gel plate R.

**Mobile phase** *acetone R*, *toluene R* (15:85 V/V).

**Application** 20 µL, as bands.

**Development** Over a path of 10 cm.

**Drying** In air.

**Detection** Spray with a 5 g/L solution of *vanillin R* in a mixture of 20 volumes of *anhydrous ethanol R* and 80 volumes of *sulfuric acid R*; examine in daylight after 5 min.

**Results** The chromatogram obtained with the test solution shows in its central part a blue principal zone that is similar in position, colour and size to the principal zone in the chromatogram obtained with the reference solution, and somewhat below the principal zone a 2<sup>nd</sup> blue zone may be present; 1 or 2 blue zones are also present in its lower third; other violet zones may be present.

Figure 1516.-1. – Illustration for identification test B of powdered herbal drug of feverfew

#### TESTS

##### Foreign matter (2.8.2)

Maximum 10.0 per cent of stem with a diameter greater than 5 mm and maximum 2.0 per cent of other foreign matter.

##### Loss on drying (2.2.32)

Maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

##### Total ash (2.4.16)

Maximum 12.0 per cent.

#### ASSAY

##### Liquid chromatography (2.2.29).

**Test solution** Completely reduce about 50 g of the herbal drug to be examined to a powder (355) (2.9.12). After homogenisation, introduce 1.00 g of the powdered herbal drug into a flask and add 40 mL of *methanol R*. Heat in a water-bath at 60 °C for 10 min. Allow to cool and filter. Rinse the filter with 15 mL of *methanol R*. Take up the residue with 40 mL of *methanol R*. Repeat the operation. Collect the filtrates and rinsings and evaporate to dryness under reduced pressure. Take up the residue with *methanol R* and dilute to 20.0 mL with the same solvent. Dilute 10.0 mL of this solution to 50.0 mL with the mobile phase. Filter through a membrane filter (nominal pore size 0.45 µm).

**Reference solution** Dissolve 5.0 mg of *parthenolide GRS* in *methanol R* and dilute to 10.0 mL with the same solvent. Dilute 2.0 mL of the solution to 50.0 mL with the mobile phase.

##### Column:

— size:  $l = 0.25$  m,  $\varnothing = 4.6$  mm;

— stationary phase: octadecylsilyl silica gel for chromatography R (5 µm).

Mobile phase acetonitrile for chromatography R, water for chromatography R (40:60 V/V).

Flow rate 1 mL/min.

Detection Spectrophotometer at 220 nm.

Injection 20 µL.

Retention time Parthenolide = about 11.5 min.

Calculate the percentage content of parthenolide using the following expression:

$$\frac{A_1 \times m_2 \times p \times 0.4}{A_2 \times m_1}$$

- $A_1$  = area of the peak due to parthenolide in the chromatogram obtained with the test solution;  
 $A_2$  = area of the peak due to parthenolide in the chromatogram obtained with the reference solution;  
 $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;  
 $m_2$  = mass of parthenolide CRS used to prepare the reference solution, in grams;  
 $p$  = assigned percentage content of parthenolide in parthenolide CRS.

Ph Eur

## Fig

### DEFINITION

The sun-dried succulent fruit of *Ficus carica* L.

### CHARACTERISTICS

Odour, pleasantly fruity; taste, sweet.

**Macroscopical** Fruit compound: soft, fleshy, brown or yellowish brown, sometimes covered with a saccharine efflorescence; at the summit a small opening surrounded by scales and at the base a short, stalk-like prolongation; fruit up to about 5 cm in length and breadth, consisting of a hollow receptacle bearing on the inner surface numerous drupelets, each containing a stone about 1.5 to 2.0 mm long; seed containing endosperm and a curved embryo.

**Microscopical** Receptacle: epidermal cells polyhedral, stomata raised, trichomes unicellular, thick walled, of varying length up to about 300 µm; hypodermis composed of rounded polyhedral cells, some containing small rosette crystals of calcium oxalate; parenchyma made up of large, irregular cells, forming the greater part of the receptacle, containing large rosette crystals of calcium oxalate and interspersed with numerous latex tubes, about 30 to 50 µm wide, and slender vascular bundles. Pericarp: epicarp consisting of radially elongated cells with mucilaginous outer walls; mesocarp of delicate, often disorganised cells; endocarp of radially elongated sclereids with pitted walls. Endosperm and embryo: small cells containing aleurone grains and fixed oil; starch absent.

### Water-soluble extractive

Not less than 60.0% when determined by the following method. To 25 g, minced, add 500 mL of water, boil under a reflux condenser for 1 hour, cool and filter. To 20 mL of the filtrate add 20 g of washed and ignited sand, evaporate to dryness in a tared, flat bottomed shallow dish and dry the residue to constant weight at 100°. Calculate the water-soluble extractive by subtracting the weight of sand from the weight of the residue obtained.

### STORAGE

Figs should be stored in a dry place.

## Fleeceflower Root

(Ph. Eur. monograph 2433)

Ph Eur

### DEFINITION

Whole or fragmented dried tuberous root of *Fallopia multiflora* (Thunb.) Haraldson (syn. *Polygonum multiflorum* Thunb.).

### Content

Minimum 1.0 per cent of 2,3,5,4'-tetrahydroxystilbene-2-O-β-D-glucoside (C<sub>20</sub>H<sub>22</sub>O<sub>9</sub>; M<sub>r</sub> 406.4) (dried drug).

### IDENTIFICATION

A. The whole drug consists of an irregular, fusiform, tuberous, root 6-15 cm long and 4-12 cm in diameter; the fragmented drug consists of slices or irregular pieces.

The external surface of the root is reddish-brown with irregular wrinkles, resembling transversely elongated lenticels, and with fine rootlet scars. The texture is dense, compact and granular. The fracture is pale yellowish-brown or reddish-brown. The drug is powdery when it is fractured. In the cortex there are 4-11 bundles giving rise to a cloud-like appearance. The central xylem is large, sometimes distinguishable as a central lignified part.

B. Microscopic examination (2.8.23). The powder is yellowish-brown. Examine under a microscope using chloral hydrate solution R. The powder shows the following diagnostic characters: cluster crystals of calcium oxalate 10-80 µm, sometimes up to 160 µm, in diameter, with obtuse angles; rare, relatively large, isolated tetragonal prism crystals; fragments of parenchyma consisting of thin-walled, sub-rounded or rectangular cells, sometimes containing brown, yellowish-brown or reddish-brown inclusions; rare fragments of cork consisting of several layers of regular cells filled with brown contents; fragments of pitted vessels 15-180 µm in diameter; few groups of xylem fibres; scattered brown masses, varying in shape, size and colour. Examine under a microscope using a 50 per cent V/V solution of glycerol R. The powder shows simple or 2-9 compound starch granules, the simple granules are sub-rounded, 4-50 µm in diameter, with a V-shaped, stellate or Y-shaped hilum, the large granules show clearly visible layers.

C. Thin-layer chromatography (2.2.27).

**Test solution** To 0.500 g of the powdered herbal drug (355) (2.9.12) add 5 mL of methanol R. Heat in a water-bath at 60 °C for 15 min and filter.

**Reference solution** Dissolve 1 mg of emodin R and 1 mg of resveratrol R in 2 mL of methanol R.

**Plate** TLC silica gel F<sub>254</sub> plate R (5-40 µm) [or TLC silica gel F<sub>254</sub> plate R (2-10 µm)].

**Mobile phase** glacial acetic acid R, anhydrous ethanol R, toluene R (1:4:16 V/V/V).

**Application** 20 µL [or 5 µL] as bands of 10 mm [or 8 mm].

**Development** Over a path of 10 cm [or 6 cm].

**Drying** In air.

**Detection** Examine in ultraviolet light at 365 nm.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Emodin: a yellow fluorescent zone	A yellow fluorescent zone A yellow fluorescent zone (emodin)
Resveratrol: a light blue fluorescent zone	A light blue fluorescent zone
Reference solution	Test solution

**TESTS****Loss on drying (2.2.32)**

Maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

**Total ash (2.4.16)**

Maximum 5.0 per cent.

**Ash insoluble in hydrochloric acid (2.8.1)**

Maximum 2.0 per cent.

**ASSAY**

Liquid chromatography (2.2.29).

**Test solution** Weigh 0.250 g of the powdered herbal drug (355) (2.9.12) in a 100 mL glass vial with a screw cap. Add 50.0 mL of a 50 per cent *V/V* solution of *methanol R*, close and extract for 1 h using ultrasound. Filter the solution through a membrane filter (nominal pore size 0.45 µm).

**Reference solution (a)** Dissolve 10.0 mg of *resveratrol CRS* in *methanol R* and dilute to 20.0 mL with the same solvent. Dilute 1.0 mL of the solution to 10.0 mL with *methanol-R*.

**Reference solution (b)** Weigh 0.250 g of *fleeceflower root HRS* in a 100 mL glass vial with a screw cap. Add 50.0 mL of a 50 per cent *V/V* solution of *methanol R*, close and extract for 1 h using ultrasound. Filter the solution through a membrane filter (nominal pore size 0.45 µm).

**Column:**

- size:  $l = 0.125$  m,  $\varnothing = 4.6$  mm;
- stationary phase: octadecylsilyl silica gel for chromatography *R* (5 µm);
- temperature: 30 °C.

**Mobile phase:**

- mobile phase A: 0.1 per cent *V/V* solution of *anhydrous formic acid R*;
- mobile phase B: *acetonitrile R*;

Time (min)	Mobile phase A (per cent <i>V/V</i> )	Mobile phase B (per cent <i>V/V</i> )
0 - 15	90 → 70	10 → 30
15 - 16	70 → 20	30 → 80
16 - 21	20	80

**Flow rate** 1.0 mL/min.

**Detection** Spectrophotometer at 320 nm.

**Injection** 10 µL.

**Identification of peaks** Use the chromatogram supplied with *fleeceflower root HRS* and the chromatogram obtained with reference solution (b) to identify the peak due to 2,3,5,4'-tetrahydroxystilbene-2-*O*-β-D-glucoside and peak 2 (unknown).

**Retention time** 2,3,5,4'-tetrahydroxystilbene-2-*O*-β-D-glucoside = about 12 min; peak 2 = about 13 min; resveratrol = about 17 min.

**System suitability** Reference solution (b):

— **resolution:** minimum 2.0 between the peak due to 2,3,5,4'-tetrahydroxystilbene-2-*O*-β-D-glucoside and peak 2.

Calculate the percentage content of 2,3,5,4'-tetrahydroxystilbene-2-*O*-β-D-glucoside using the following expression:

$$\frac{A_1 \times m_2 \times p}{A_2 \times m_1 \times 4 \times 0.5}$$

- $A_1$  = area of the peak due to 2,3,5,4'-tetrahydroxystilbene-2-*O*-β-D-glucoside in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to resveratrol in the chromatogram obtained with reference solution (a);
- $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;
- $m_2$  = mass of *resveratrol CRS* used to prepare reference solution (a), in grams;
- $p$  = percentage content of resveratrol in *resveratrol CRS*.
- 0.5 = correction factor for resveratrol with respect to 2,3,5,4'-tetrahydroxystilbene-2-*O*-β-D-glucoside.

Ph Eur

**Forsythia Fruit**

(Ph. Eur. monograph 2720)

Ph Eur

**DEFINITION**

Dried ripe or steamed and dried unripe fruit of *Forsythia suspensa* (Thunb.) Vahl.

**Content**

Minimum 0.15 per cent of forsythoside A (C<sub>29</sub>H<sub>36</sub>O<sub>15</sub>; *M<sub>r</sub>* 625) (dried drug).

**IDENTIFICATION**

**A.** Loculicidal woody capsule which opens apically into 2 brittle, boat-shaped valves; the capsule is slightly compressed, ovoid to elongated-ellipsoid. Valves are 1.2-2.5 cm long and 0.5-1.2 cm in diameter. The valve apex is acute and the rounded base bears the peduncle scar or the peduncle, which may be as long as the fruit. The outer surface of each valve bears numerous verrucose, pale brown lenticels, irregular longitudinal wrinkles and a deep median, longitudinal furrow. The inner surface of the valve is mostly pale yellowish-brown, smooth, slightly lustrous and is divided in 2 by a longitudinal septum. Each capsule contains numerous seeds (around 11-20 in smaller fruits, up to 30 in larger fruits) which are elongated, 0.5-0.9 cm long, flattened, slightly curved and noticeably winged on one side along their entire length.

The unripe capsule is closed, yellowish-, brownish- or blackish-green or dark brown. Seeds are greenish-yellow or pale brownish-yellow.

The ripe light brown or orange-brown fruit capsule may be present as 2, free, fully dehisced valves or partially open, the valves connected at the base and the apices recurved. Seeds are rare, light- or dark brown. The inner surface of the valve may bear the remains of the apical placenta, with or without seeds.

**B.** Microscopic examination (2.8.23). The powder is typically greenish-brown (unripe fruits) or orange-brown (ripe fruits). Examine under a microscope using *chloral hydrate solution R*.

The powder shows the following diagnostic characters (Figure 2720.-1): fragments of the pericarp (surface view [A], transverse section [F]) showing a layer of more or less polygonal epicarp cells (surface view [Ab]) with slightly thickened walls [Ab, Fb] covered by a thick, fissured cuticle [Aa, Fa], the cuticle is 9-26  $\mu\text{m}$  thick; fragments of the outer layers of the mesocarp consisting of cells with irregularly thickened walls, some with small rounded outgrowths (surface view [J], transverse section [Fc]); sclerenchymatous fibres in numerous bundles [D], isolated [G] or in groups [C] as well as sclereids of various shapes and sizes, isolated [H] or in groups [B], from the inner layers of the mesocarp, sclerenchymatous fibres sometimes in a parquetry arrangement. Xylem vessels are narrow, 6-15  $\mu\text{m}$  in diameter. If seeds are present, the powder also shows fragments of the outer testa (surface view [K]), consisting of large cells, often containing oil droplets; fragments of the testa (transverse section [L]), consisting of the outer testa with large cells [La] and several layers of more or less flattened cells of the inner testa [Lb], some of which contain small prisms of calcium oxalate [Lc]; small fragments of the endosperm [E]; isolated oil droplets are also present [Ld].

Figure 2720.-1. – Illustration for identification test B of powdered herbal drug of forsythia fruit

**C. High-performance thin-layer chromatography (2.8.25).**

**Test solution** To 1.0 g of the powdered herbal drug (355) (2.9.12) add 10.0 mL of *methanol R*. Sonicate for 10 min, centrifuge and use the supernatant.

**Reference solution (a)** Dissolve 5.0 mg of *ursolic acid R* and 50.0 mg of *forsythoside A R* in *methanol R* and dilute to 5.0 mL with the same solvent.

**Reference solution (b)** Dilute 2.5 mL of reference solution (a) to 10.0 mL with *methanol R*.

**Reference solution (c)** Dissolve 30 mg of *arbutin R* and 50 mg of *forsythoside A R* in *methanol R* and dilute to 5 mL with the same solvent.

**Intensity marker** Ursolic acid.

**Plate** TLC silica gel  $F_{254}$  plate R (2-10  $\mu\text{m}$ ).

**Mobile phase** *anhydrous formic acid R*, *water R*, *toluene R*, *acetone R*, *ethyl acetate R* (6:6:40:50:60 V/V/V/V/V).

**Application** 2  $\mu\text{L}$  as bands of 8 mm.

**Development** 70 mm from the lower edge of the plate.

**Drying** In a current of cold air for 5 min.

**Detection** Treat with *anisaldehyde solution R2* and heat at 100 °C for 3 min; examine in daylight.

**System suitability** Reference solution (c):

- the chromatogram shows in the lower third 2 distinct zones; the upper zone (arbutin) and the lower zone (forsythoside A) show a brownish colour.

**Results** See below the sequence of zones present in the chromatograms obtained with reference solution (a) and the test solution. Furthermore, in the chromatogram obtained with the test solution, other faint zones may be present.

Top of the plate	
Ursolic acid: a reddish-violet zone	2 violet zones, faint to intense A reddish-violet zone, faint to equivalent
	A greyish-reddish-violet zone, faint
Forsythoside A: a brownish zone	A reddish-brown zone, faint to equivalent A brownish or brownish-yellow zone, faint to equivalent A brownish-yellow zone, faint to equivalent
Reference solution (a)	Test solution

**TESTS**

**Foreign matter (2.8.2)**

Maximum 5.0 per cent.

**Loss on drying (2.2.32)**

Maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

**Total ash (2.4.16)**

Maximum 4.0 per cent.

**ASSAY**

**Liquid chromatography (2.2.29).**

**Test solution** Place 0.500 g of the powdered herbal drug (355) (2.9.12) in a 250 mL round-bottomed flask, add 100.0 mL of *methanol R* and weigh. Heat under a reflux condenser at 70 °C for 30 min, cool and weigh again. Compensate for the loss of solvent with *methanol R*. Filter

1.5 mL of the solution through a membrane filter (nominal pore size 0.45 µm).

**Reference solution (a)** Dissolve 6.0 mg of *forsythoside A CRS* in *methanol R* and dilute to 200.0 mL with the same solvent.

**Reference solution (b)** Dissolve 1.5 mg of *rutoside trihydrate R* in 50 mL of reference solution (a).

**Column:**

— size:  $l = 0.25\text{ m}$ ,  $\varnothing = 4.0\text{ mm}$ ;

— stationary phase: end-capped octadecylsilyl silica gel for chromatography R1 (5 µm);

— temperature: 20 °C.

**Mobile phase:**

— mobile phase A: *anhydrous formic acid R*, *water for chromatography R* (0.1:99.9 V/V);

— mobile phase B: *anhydrous formic acid R*, *acetonitrile R* (0.1:99.9 V/V);

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 – 20	83 → 77.5	17 → 22.5
20 – 25	77.5 → 10	22.5 → 90
25 – 28	10	90

**Flow rate** 0.6 mL/min.

**Detection** Spectrophotometer at 325 nm.

**Injection** 10 µL.

**Identification of peaks** Use the chromatogram obtained with reference solution (a) to identify the peak due to *forsythoside A*; use the chromatogram obtained with reference solution (b) to identify the peak due to *rutoside*.

**Retention time** *Forsythoside A* = about 16 min; *rutoside* = about 17 min.

**System suitability** Reference solution (b):

— resolution: minimum 1.5 between the peaks due to *forsythoside A* and *rutoside*.

Calculate the percentage content of *forsythoside A* using the following expression:

$$\frac{A_1 \times m_2 \times p}{A_2 \times m_1}$$

- $A_1$  = area of the peak due to *forsythoside A* in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to *forsythoside A* in the chromatogram obtained with reference solution (a);
- $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;
- $m_2$  = mass of *forsythoside A CRS* used to prepare reference solution (a), in grams;
- $p$  = percentage content of *forsythoside A* in *forsythoside A CRS*.

Ph Eur

## Frangula Bark

(Ph. Eur. monograph 0025)

### Preparation

#### Standardised Frangula Bark Dry Extract

When Powdered Frangula Bark is prescribed or demanded, material complying with the requirements below, with the exception of Identification test A and the test for Foreign matter, shall be dispensed or supplied.

Ph Eur

### DEFINITION

Dried, whole or fragmented bark of the stems and branches of *Rhamnus frangula* L. (*Frangula alnus* Miller).

### Content

Minimum 7.0 per cent of glucofrangulins, expressed as glucofrangulin A ( $C_{27}H_{30}O_{14}$ ;  $M_r$  578.5) (dried drug).

### IDENTIFICATION

**A.** The bark occurs in curved, almost flat or rolled fragments or in single or double quilled pieces usually 0.5–2 mm thick and variable in length and width. The greyish-brown or dark brown outer surface is wrinkled longitudinally and covered with numerous greyish, transversely elongated lenticels; when the outer layers are removed, a dark red layer is exposed. The orange-brown or reddish-brown inner surface is smooth and bears fine longitudinal striations; it becomes red when treated with alkali. The fracture is short, fibrous in the inner part.

**B.** Microscopic examination (2.8.23). The powder is yellowish or reddish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 0025.-1): numerous phloem fibres (tangential section [D], longitudinal section [K]), partially lignified, in groups [Da, Ka] with crystal sheaths containing calcium oxalate prisms [Db, Kb], sometimes including medullary rays [Dc]; reddish-brown fragments of cork [H]; fragments of phloem parenchyma, in longitudinal section [G] containing calcium oxalate cluster crystals [A, E] or in tangential section [C] including medullary rays [Ca] and cells containing calcium oxalate cluster crystals [Cb]; a few fragments of collenchyma [F]; isolated calcium oxalate cluster crystals [B] and prisms [J].

Figure 0025.-1. – Illustration for identification test B of powdered herbal drug of *frangula* bark

**C.** Examine the chromatogram obtained in test A for other species of *Rhamnus*; anthrones in ultraviolet light at 365 nm.

**Results** The chromatogram obtained with the test solution shows 2 orange-brown zones (glucofrangulins) in the lower third and 2-4 red zones (frangulins, not always clearly separated, and above them frangula-emodin) in the upper third.

D. To about 50 mg of the powdered herbal drug (180) (2.9.12) add 25 mL of dilute hydrochloric acid R and heat the mixture on a water-bath for 15 min. Allow to cool, shake with 20 mL of ether R and discard the aqueous layer. Shake the ether layer with 10 mL of dilute ammonia R1. The aqueous layer becomes reddish-violet.

#### TESTS

**Other species of *Rhamnus*; anthrones**

Thin-layer chromatography (2.2.27).

**Test solution** To 0.5 g of the powdered herbal drug (180) (2.9.12) add 5 mL of ethanol (70 per cent V/V) R and heat to boiling. Cool and centrifuge. Decant the supernatant immediately and use within 30 min.

**Reference solution** Dissolve 20 mg of barbaloin R in ethanol (70 per cent V/V) R and dilute to 10 mL with the same solvent.

**Plates** TLC silica gel plate R (2 plates).

**Mobile phase** water R, methanol R, ethyl acetate R (13:17:100 V/V/V).

**A. Application:** 10 µL as bands.

**Development** Over a path of 10 cm.

**Drying** In air for 5 min.

**Detection** Spray with a 50 g/L solution of potassium hydroxide R in ethanol (50 per cent V/V) R, and heat at 100-105 °C for 15 min; examine in ultraviolet light at 365 nm.

**Results** The chromatogram obtained with the reference solution shows a brownish-yellow zone due to barbaloin in the central part; the chromatogram obtained with the test solution shows no zones of intense yellow fluorescence and no zone of orange or reddish fluorescence similar in position to the zone due to barbaloin in the chromatogram obtained with the reference solution.

**B. Application:** 10 µL of the test solution as a band.

**Development** Over a path of 10 cm.

**Drying** In air for maximum 5 min.

**Detection** Spray immediately with a 5 g/L solution of nitrotetrazolium blue R in methanol R; examine immediately.

**Results** No violet or greyish-blue zones appear.

**Foreign matter** (2.8.2)

Maximum 1 per cent.

**Loss on drying** (2.2.32)

Maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

**Total ash** (2.4.16)

Maximum 6.0 per cent.

#### ASSAY

Carry out the assay protected from bright light.

In a tared, round-bottomed flask with a ground-glass neck, weigh 0.250 g of the powdered herbal drug (180) (2.9.12). Add 25.0 mL of a 70 per cent V/V solution of methanol R; mix and weigh. Heat in a water-bath under a reflux condenser for 15 min. Allow to cool, weigh and adjust to the original mass with a 70 per cent V/V solution of methanol R. Filter and transfer 5.0 mL of the filtrate to a separating

funnel. Add 50 mL of water R and 0.1 mL of hydrochloric acid R. Shake with 5 quantities, each of 20 mL, of light petroleum R. Allow the layers to separate and transfer the aqueous layer to a 100 mL volumetric flask. Combine the light petroleum layers and wash with 2 quantities, each of 15 mL, of water R. Use this water for washing the separating funnel and add it to the aqueous solution in the volumetric flask. Add 5 mL of a 50 g/L solution of sodium carbonate R and dilute to 100.0 mL with water R. Discard the light petroleum layer. Transfer 40.0 mL of the aqueous solution to a 200 mL round-bottomed flask with a ground-glass neck. Add 20 mL of a 200 g/L solution of ferric chloride R and heat under a reflux condenser for 20 min in a water-bath with the water level above that of the liquid in the flask. Add 2 mL of hydrochloric acid R and continue heating for 20 min, shaking frequently, until the precipitate is dissolved. Allow to cool, transfer the mixture to a separating funnel and shake with 3 quantities, each of 25 mL, of ether R, previously used to rinse the flask. Combine the ether extracts and wash with 2 quantities, each of 15 mL, of water R. Transfer the ether layer to a volumetric flask and dilute to 100.0 mL with ether R. Evaporate 20.0 mL carefully to dryness and dissolve the residue in 10.0 mL of a 5 g/L solution of magnesium acetate R in methanol R. Measure the absorbance (2.2.25) at 515 nm using methanol R as the compensation liquid. Calculate the percentage content of glucofrangulins, expressed as glucofrangulin A, using the following expression:

$$\frac{A \times 3.06}{m}$$

i.e. taking the specific absorbance of glucofrangulin A to be 204.

*A* = absorbance at 515 nm;  
*m* = mass of the substance to be examined, in grams.

Ph Eur

## Standardised Frangula Bark Dry Extract

(Ph. Eur. monograph 1214)

Ph Eur

#### DEFINITION

Standardised dry extract obtained from *Frangula bark* (0025).

#### Content

15.0 per cent to 30.0 per cent of glucofrangulins, expressed as glucofrangulin A (C<sub>27</sub>H<sub>30</sub>O<sub>14</sub>; *M*<sub>r</sub> 578.5) (dried extract). The measured content does not deviate from that stated on the label by more than ± 10 per cent.

#### PRODUCTION

The extract is produced from the herbal drug by a suitable procedure using ethanol (50-90 per cent V/V).

#### CHARACTERS

##### Appearance

Yellowish-brown, fine powder.

#### IDENTIFICATION

A. Thin-layer chromatography (2.2.27).

**Test solution** To 0.05 g of the extract to be examined add 5 mL of ethanol (70 per cent V/V) R and heat to boiling. Cool

and centrifuge. Decant the supernatant immediately and use within 30 min.

**Reference solution** Dissolve 20 mg of *barbaloin R* in *ethanol (70 per cent V/V) R* and dilute to 10 mL with the same solvent.

**Plate** TLC silica gel plate *R*.

**Mobile phase** *water R, methanol R, ethyl acetate R (13:17:100 V/V/V)*.

**Application** 10 µL as bands.

**Development** Over a path of 10 cm.

**Drying** In air for 5 min.

**Detection** Treat with a 50 g/L solution of *potassium hydroxide R* in *ethanol (50 per cent V/V) R* and heat at 100–105 °C for 15 min; examine immediately after heating.

**Results** The chromatogram obtained with the reference solution shows in the middle third a reddish-brown zone due to *barbaloin*. The chromatogram obtained with the test solution shows 2 orange-brown zones (*glucofrangulins*) in the lower third and 2–4 red zones (*frangulins*, not always clearly separated, and above them *frangula-emodin*) in the upper third.

B. To about 25 mg add 25 mL of *dilute hydrochloric acid R* and heat the mixture on a water-bath for 15 min. Allow to cool, shake with 20 mL of *ether R* and discard the aqueous layer. Shake the ether layer with 10 mL of *dilute ammonia R1*. The aqueous layer becomes reddish-violet.

#### TESTS

**Loss on drying (2.8.17)**

Maximum 5.0 per cent.

#### ASSAY

Carry out the assay protected from bright light.

Into a tared round-bottomed flask with a ground-glass neck, weigh 0.100 g. Add 25.0 mL of a 70 per cent *V/V* solution of *methanol R*, mix and weigh again. Heat the flask in a water-bath under a reflux condenser at 70 °C for 15 min. Allow to cool, weigh and adjust to the original mass with a 70 per cent *V/V* solution of *methanol R*. Filter and transfer 5.0 mL of the filtrate to a separating funnel. Add 50 mL of *water R* and 0.1 mL of *hydrochloric acid R*. Shake with 5 quantities, each of 20 mL, of *light petroleum R1*. Allow the layers to separate and transfer the aqueous layer to a 100 mL volumetric flask. Combine the light petroleum layers and wash with 2 quantities, each of 15 mL, of *water R*. Use this water for washing the separating funnel and add it to the aqueous solution in the volumetric flask. Add 5 mL of a 50 g/L solution of *sodium carbonate R* and dilute to 100.0 mL with *water R*. Discard the light petroleum layer. Transfer 40.0 mL of the aqueous solution to a 200 mL round-bottomed flask with a ground-glass neck. Add 20 mL of a 200 g/L solution of *ferric chloride R* and heat under a reflux condenser for 20 min in a water-bath with the water level above that of the liquid in the flask. Add 2 mL of *hydrochloric acid R* and continue heating for 20 min, shaking frequently, until the precipitate is dissolved. Allow to cool, transfer the mixture to a separating funnel and shake with 3 quantities, each of 25 mL, of *ether R*, previously used to rinse the flask. Combine the ether extracts and wash with 2 quantities, each of 15 mL, of *water R*. Transfer the ether layer to a volumetric flask and dilute to 100.0 mL with *ether R*. Evaporate 20.0 mL carefully to dryness and dissolve the residue in 10.0 mL of a 5 g/L solution of *magnesium acetate R* in *methanol R*. Measure the absorbance (2.2.25) at 515 nm using *methanol R* as the compensation liquid.

Calculate the percentage content of *glucofrangulins*, expressed as *glucofrangulin A*, using the following expression:

$$\frac{A \times 3.06}{m}$$

i.e. taking the specific absorbance of *glucofrangulin A* to be 204, calculated on the basis of the specific absorbance of *barbaloin*.

*A* = absorbance at 515 nm;  
*m* = mass of the extract to be examined, in grams.

#### LABELLING

The label states the content of *glucofrangulins*.

Ph Eur

## Indian Frankincense

(Ph. Eur. monograph 2310)

Ph Eur

#### DEFINITION

Air-dried gum-resin exudate, obtained by incision in the stem or branches of *Boswellia serrata* Roxb. ex Colebr.

#### Content

- *11-keto-β-boswellic acid* (C<sub>30</sub>H<sub>46</sub>O<sub>4</sub>; M<sub>r</sub> 470.7): minimum 1.0 per cent (dried drug);
- *acetyl-11-keto-β-boswellic acid* (C<sub>32</sub>H<sub>48</sub>O<sub>5</sub>; M<sub>r</sub> 512.7): minimum 1.0 per cent (dried drug).

#### IDENTIFICATION

A. Indian frankincense consists of translucent, roundish or irregularly shaped, variable size pieces of up to 3 cm. They are yellowish or reddish-brown. Their surface is covered with grey dust. The fracture is dull or slightly glossy.

B. Thin-layer chromatography (2.2.27).

**Test solution** To 1.0 g of the powdered herbal drug (355) (2.9.12) add 90 mL of *methanol R* and sonicate for 10 min. Shake the mixture vigorously 3 or 4 times during this procedure. Dilute to 100 mL with *methanol R*. Centrifuge and use the clear supernatant solution.

**Reference solution** Dissolve 2 mg of *11-keto-β-boswellic acid R* and 2 mg of *acetyl-11-keto-β-boswellic acid R* in 20 mL of *methanol R*.

**Plate** TLC silica gel *F<sub>254</sub>* plate *R* (5–40 µm) [or TLC silica gel *F<sub>254</sub>* plate *R* (2–10 µm)].

**Mobile phase** *anhydrous formic acid R, heptane R, ethyl acetate R, toluene R (3:10:20:80 V/V/V/V)*.

**Application** 10 µL [or 3 µL] as bands.

**Development** Over a path of 8 cm [or 6 cm].

**Drying** In air.

**Detection** Examine in ultraviolet light at 254 nm.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. The zones due to *11-keto-β-boswellic acid* and *acetyl-11-keto-β-boswellic acid* in the test solution are of approximately equivalent intensity. Furthermore, other weak quenching zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Acetyl-11-keto-β-boswellic acid: a quenching zone	A quenching zone (acetyl-11-keto-β-boswellic acid)
11-Keto-β-boswellic acid: a quenching zone	A quenching zone (11-keto-β-boswellic acid)
Reference solution	Test solution

**TESTS****Loss on drying (2.2.32)**

Maximum 8.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 3 h.

**Total ash (2.4.16)**

Maximum 10.0 per cent.

**ASSAY****Liquid chromatography (2.2.29).**

**Test solution** To 1.0 g of the powdered herbal drug (355) (2.9.12) add 90 mL of *methanol R* and sonicate for 10 min. Shake the mixture vigorously 3 or 4 times during this procedure. Dilute to 100.0 mL with *methanol R*. Centrifuge for 5 min. Dilute 1.0 mL of the clear solution to 10.0 mL with a mixture of 16 volumes of mobile phase A and 84 volumes of mobile phase B.

**Reference solution** Dissolve 1.0 mg of *11-keto-β-boswellic acid R* and 1.0 mg of *acetyl-11-keto-β-boswellic acid R* in 20.0 mL of *methanol R*. Dilute 1.0 mL of this solution to 10.0 mL with a mixture of 16 volumes of mobile phase A and 84 volumes of mobile phase B.

**Column:**

- size:  $l = 0.25$  m,  $\varnothing = 4.6$  mm;
- stationary phase: octadecylsilyl silica gel for chromatography *R* (5 μm).

**Mobile phase:**

- mobile phase A: phosphoric acid *R*, water *R* (0.1:99.9 V/V);
- mobile phase B: phosphoric acid *R*, acetonitrile *R* (0.1:99.9 V/V);

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 12.5	16 → 6	84 → 94
12.5 - 13.5	6 → 0	94 → 100
13.5 - 28	0	100

**Flow rate** 1.0 mL/min.

**Detection** Spectrophotometer at 250 nm.

**Injection** 20 μL.

**Retention time** 11-keto-β-boswellic acid = about 8 min; acetyl-11-keto-β-boswellic acid = about 12 min.

**System suitability** Reference solution:

- resolution: minimum 6.0 between the peaks due to 11-keto-β-boswellic acid and acetyl-11-keto-β-boswellic acid.

Calculate the percentage content of 11-keto-β-boswellic acid using the following expression:

$$\frac{A_1 \times m_1 \times 5 \times p_1}{A_2 \times m}$$

$A_1$  = area of the peak due to 11-keto-β-boswellic acid in the chromatogram obtained with the test solution;

$A_2$  = area of the peak due to 11-keto-β-boswellic acid in the chromatogram obtained with the reference solution;  
 $m$  = mass of the substance to be examined, in grams;  
 $m_1$  = mass of 11-keto-β-boswellic acid *R* in the reference solution, in grams;  
 $p_1$  = percentage content of 11-keto-β-boswellic acid in 11-keto-β-boswellic acid *R*.

Calculate the percentage content of acetyl-11-keto-β-boswellic acid using the following expression:

$$\frac{A_3 \times m_2 \times 5 \times p_2}{A_4 \times m}$$

$A_3$  = area of the peak due to acetyl-11-keto-β-boswellic acid in the chromatogram obtained with the test solution;  
 $A_4$  = area of the peak due to acetyl-11-keto-β-boswellic acid in the chromatogram obtained with the reference solution;  
 $m$  = mass of the substance to be examined, in grams;  
 $m_2$  = mass of acetyl-11-keto-β-boswellic acid *R* in the reference solution, in grams;  
 $p_2$  = percentage content of acetyl-11-keto-β-boswellic acid in acetyl-11-keto-β-boswellic acid *R*.

Ph Eur

**Fraxinus Chinensis Bark****Fraxinus Rhynchophylla Bark**

(Ph. Eur. monograph 2452)

Ph Eur

**DEFINITION**

Whole or fragmented, dried branch or trunk bark of *Fraxinus chinensis* subsp. *rhynchophylla* (Hance) A.E. Murray (syn. *Fraxinus rhynchophylla* Hance), collected in spring or autumn.

**Content**

Minimum 1.0 per cent for the sum of esculetin ( $C_9H_6O_4$ ;  $M_r$  178.1) and esculin ( $C_{15}H_{16}O_9$ ;  $M_r$  340.3) (dried drug).

**IDENTIFICATION**

A. The branch bark occurs as flexible, curved or channelled, rolled or folded pieces up to 60 cm long and 3 mm thick; the outer surface is whitish-grey to dark brownish-grey, sometimes in patches, and is smooth or slightly rough, dotted with whitish-grey, rounded lenticels; the inner surface is smooth, soft to the touch, yellowish-white or brown. The fracture is fibrous.

The trunk bark occurs as compact, rigid, flat-shaped pieces, up to 6 mm thick; the outer surface is brownish-grey, with fine longitudinal furrows and many reddish-brown lenticels, rounded or slightly split transversally; the inner surface is smooth, orange-brown. The fracture is fibrous.

B. Microscopic examination (2.8.23). The powder is brownish. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2452.-1): large sclereids up to 300 μm in diameter, single [J] or in groups [E], with a very narrow lumen and channelled walls with concentric striations; fragments of brownish cork consisting of polygonal cells with slightly thickened and pitted walls (surface view [A]) and of superimposed layers of cells with slightly thickened and channelled walls (transverse section [D]), sometimes associated with one or more layers of collenchyma [Da]; long fibres, usually fragmented, with very thick walls and a greatly reduced lumen, slightly channelled, isolated [B, G] or in groups [C, F, H], sometimes accompanied by sclereids [Ca, Ha] or medullary rays with rectangular cells containing tiny

acicular crystals of calcium oxalate [Fa]; groups of parenchymatous cells [K], some containing tiny crystals of calcium oxalate [Ka].

Figure 2452.-1. – Illustration for identification B of powdered herbal drug of *fraxinus chinensis* bark

C. To 0.1 g of the powdered herbal drug (355) (2.9.12) add 10 mL of *water R* previously heated to 60 °C. Allow to stand for 2 min and filter. Examined in ultraviolet light at 365 nm, the solution shows an intense blue fluorescence that fades considerably after the addition of 2 mL of *hydrochloric acid R*.  
D. Thin-layer chromatography (2.2.27).

**Test solution** To 0.25 g of the powdered herbal drug (355) (2.9.12) add 5 mL of *methanol R*. Heat in a water-bath at 60 °C for 1 min. Centrifuge and use the supernatant; filter, if necessary.

**Reference solution** Dissolve 1 mg of *esculetin R* and 1 mg of *esculin R* in 2 mL of *methanol R*.

**Plate** TLC silica gel F<sub>254</sub> plate R (5-40 μm) [or TLC silica gel F<sub>254</sub> plate R (2-10 μm)].

**Mobile phase** *anhydrous formic acid R*, *water R*, *ethyl acetate R* (10:10:80 V/V/V).

**Application** 10 μL as bands of 15 mm [or 8 mm].

**Development** Over a path of 10 cm [or 6 cm].

**Drying** In air.

**Detection** Treat with a solution containing 10 g/L of *diphenylboric acid aminoethyl ester R* and 50 g/L of *macrogol 400 R* in *methanol R*; examine in ultraviolet light at 365 nm.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other fluorescent zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Esculetin: a greenish-yellow fluorescent zone	A greenish-yellow fluorescent zone (esculetin)
	A green fluorescent zone may be present
	A blue fluorescent zone may be present
Esculin: an intense blue fluorescent zone	An intense blue fluorescent zone (esculin)
	A whitish-blue fluorescent zone
Reference solution	Test solution

### TESTS

#### Loss on drying (2.2.32)

Maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C.

#### Total ash (2.4.16)

Maximum 5.0 per cent.

#### Ash insoluble in hydrochloric acid (2.8.1)

Maximum 2.0 per cent.

### ASSAY

#### Liquid chromatography (2.2.29).

**Test solution** To 0.500 g of the powdered herbal drug (355) (2.9.12) add 50.0 mL of *methanol R* and weigh. Heat on a water-bath under a reflux condenser for 1 h. Cool and weigh again. Compensate for the loss of solvent with *methanol R* and mix. Filter through a membrane filter (nominal pore size 0.45 μm).

**Reference solution (a)** Dissolve 10.0 mg of *esculin CRS* in the mobile phase and dilute to 50.0 mL with the mobile phase.

**Reference solution (b)** Dissolve 10.0 mg of *esculetin CRS* in 10 mL of *acetonitrile R* and dilute to 50.0 mL with the mobile phase.

**Reference solution (c)** Mix 3.0 mL of reference solution (b) and 5.0 mL of reference solution (a) and dilute to 10.0 mL with the mobile phase.

#### Column:

— size:  $l = 0.15$  m,  $\varnothing = 4.0$  mm;

— stationary phase: end-capped octadecylsilyl silica gel for chromatography R (5 μm).

**Mobile phase** *acetonitrile R*, 0.1 per cent V/V solution of *phosphoric acid R* (12:88 V/V).

**Flow rate** 0.75 mL/min.

**Detection** Spectrophotometer at 334 nm.

**Injection** 10 μL.

**Run time** 1.5 times the retention time of esculetin.

**Retention time** Esculin = about 4.5 min; esculetin = about 8.5 min.

**Identification of peaks** Use the chromatogram obtained with reference solution (a) to identify the peak due to esculin and the chromatogram obtained with reference solution (b) to identify the peak due to esculetin.

**System suitability** Reference solution (c):

— resolution: minimum 5.0 between the peaks due to esculin and esculetin.

Calculate the percentage content of the sum of esculetin and esculetin using the following expression:

$$\frac{A_1 \times m_2 \times p_1 \times 0.5}{A_2 \times m_1} + \frac{A_3 \times m_3 \times p_2 \times 0.3}{A_4 \times m_1}$$

- $A_1$  = area of the peak due to esculetin in the chromatogram obtained with the test solution;  
 $A_2$  = area of the peak due to esculetin in the chromatogram obtained with reference solution (c);  
 $A_3$  = area of the peak due to esculetin in the chromatogram obtained with the test solution;  
 $A_4$  = area of the peak due to esculetin in the chromatogram obtained with reference solution (c);  
 $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;  
 $m_2$  = mass of *esculetin CRS* used to prepare reference solution (a), in grams;  
 $m_3$  = mass of *esculetin CRS* used to prepare reference solution (b), in grams;  
 $p_1$  = percentage content of esculetin in *esculetin CRS*;  
 $p_2$  = percentage content of esculetin in *esculetin CRS*.

Ph Eur

## Fumitory

(Ph. Eur. monograph 1869)

Ph Eur

### DEFINITION

Whole or fragmented, dried aerial parts of *Fumaria officinalis* L. harvested in full bloom.

### Content

Minimum 0.40 per cent of total alkaloids, expressed as protopine (C<sub>20</sub>H<sub>19</sub>NO<sub>5</sub>; M<sub>r</sub> 353.4) (dried drug).

### IDENTIFICATION

**A.** The hollow, angular stem is light green or greenish-brown. The leaves are alternate, bipinnatisect with 2 or 3 leaf segments, the ultimate lobes lanceolate or obovate; they are greenish-blue and glabrous on both surfaces. The flowers are small and occur in loose racemes; each has a short pedicel and is subtended by a leafy bract; they are pink or purplish-red, dark purple or brown at the apex; the calyx is short, composed of 2 petaloid sepals and the corolla is tubular with 4 petals, the upper petal slightly spurred; there are 6 stamens united by their filaments into 2 groups of 3. The greenish-brown, indehiscent fruits are globular or keel-shaped, truncated or slightly emarginate at the apex, and each contains a small brown seed.

**B.** Microscopic examination (2.8.23). The powder is green. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 1869.-1): fragments of the leaf lamina (surface view [D]) with the upper epidermis composed of irregularly polygonal cells [Da], some of which contain microcrystals of calcium oxalate [Db], and underlying palisade parenchyma [Dc]; marginal cells at the apex of the lamina elongated to form blunt papillae [Dd], and with the lower epidermis [A] composed of cells having wavier walls [Aa] and underlying spongy parenchyma [Ac]; anomocytic stomata (2.8.3) [Ab, De] on both surfaces; groups [G] of lignified fibres [Ga] and spiral [Gb], reticulate or bordered-pitted [B] vessels from the stem; fragments of the epidermis of the petals [F] composed of polygonal cells with sinuous or wavy anticlinal walls and no papillae; spherical pollen grains [E], about 30 µm in diameter, with a pitted exine and 6 large pores; fragments of

the fruit with polygonal cells with a thick, warty cuticle, from the epicarp [H], and sinuous sclereids with thick and channelled walls, from the endocarp [C].

Figure 1869.-1. – Illustration for identification test B of powdered herbal drug of fumitory

**C.** Thin-layer chromatography (2.2.27).

**Test solution** To 2 g of the powdered herbal drug (355) (2.9.12) add 15 mL of *dilute sulfuric acid R1* and stir for 15 min. Filter. Dilute the filtrate to 20 mL with *dilute sulfuric acid R1*. Add 1 mL of *concentrated ammonia R* and 10 mL of *ethyl acetate R*. Stir and centrifuge. Collect the upper organic layer. Repeat the extraction in the same manner. Collect the organic layers and dry over *anhydrous sodium sulfate R*. Evaporate to dryness under reduced pressure. Take up the residue with 0.5 mL of *methanol R*.

**Reference solution** Dissolve 5 mg of *protopine hydrochloride R* and 5 mg of *quinine R* in 10 mL of *methanol R*.

**Plate** TLC silica gel plate R.

**Mobile phase** *concentrated ammonia R*, *ethanol (96 per cent) R*, *acetone R*, *toluene R* (2:6:40:52 V/V/V/V).

**Application** 30 µL as bands.

**Development** Over a path of 15 cm.

**Drying** In air.

**Detection A** Examine in ultraviolet light at 365 nm.

**Results A** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other blue fluorescent zones are present in the chromatogram obtained with the test solution.

Top of the plate	
Quinine: a blue fluorescent zone	4 blue fluorescent zones  A greenish-blue fluorescent zone
Reference solution	Test solution

**Detection B** Treat with a mixture of *potassium iodobismuthate solution R2*, *acetic acid R* and *water R* (1:2:10 V/V/V) until orange zones appear against a yellow background.

**Results B** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other less intense orange zones are present in the chromatogram obtained with the test solution.

Top of the plate	
Protopine: an orange zone	An orange zone (protopine) 2 orange zones
Quinine: an orange zone	A faint orange zone
Reference solution	Test solution

## TESTS

### Cadmium (2.4.27)

Maximum 1.5 ppm.

### Loss on drying (2.2.32)

Maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

### Total ash (2.4.16)

Maximum 15.0 per cent.

## ASSAY

To 5.000 g of the powdered herbal drug (355) (2.9.12) add 5 mL of *dilute ammonia R1* and 50 mL of *ethyl acetate R*. Shake for 15 min. Filter. Repeat the procedure in the same manner and combine the filtrates. Evaporate the filtrates to dryness under reduced pressure. Dissolve the residue by sonication for 10 min in 50 mL of *dilute sulfuric acid R1*. Filter. Dilute the filtrate to 100 mL with *dilute sulfuric acid R1*. Adjust to pH 9-10 with *concentrated ammonia R* and then add 50 mL of *ethyl acetate R*. Shake gently. Collect the upper organic layer, after centrifugation if necessary. Repeat the procedure in the same manner. Combine the organic layers and dry over *anhydrous sodium sulfate R*. Evaporate to dryness under reduced pressure. Take up the residue with 100 mL of *anhydrous acetic acid R*. Titrate with 0.02 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 mL of 0.02 M *perchloric acid* is equivalent to 7.068 mg of protopine.

Calculate the percentage content of total alkaloids, expressed as protopine, using the following expression:

$$\frac{n \times 706.8}{m}$$

*n* = volume of 0.02 M *perchloric acid* used, in millilitres;  
*m* = mass of the herbal drug to be examined, in milligrams.

Ph Eur

## Ganoderma

(Ph. Eur. monograph 3001)

Ph Eur

## DEFINITION

Whole or fragmented sporophore (reproductive body) of *Ganoderma lucidum* (Curtis) P.Karst., cultivated or wild, dried in the shade or in an oven at 40-50 °C.

## Content

Minimum 0.3 per cent of total triterpene acids, expressed as ganoderic acid A (C<sub>30</sub>H<sub>44</sub>O<sub>7</sub>; M<sub>r</sub> 516.7) (dried drug).

## IDENTIFICATION

**A. Whole drug.** The sporophore consists of a stipe (stalk) and a cap (pileus), with a woody appearance. At maturity, it is covered in a hard, glossy, violet-brown to reddish-brown varnish, except for the under surface of the cap. The stipe, about 7-15 cm high and 1-5 cm in diameter, is cylindrical, uneven and somewhat bent. The cap is usually eccentric, reniform or subrounded, 10-18 cm in diameter and 1-2 cm thick. The upper surface is hard and glossy and shows concentric furrows and radial striations. The margin is either fine and slightly curved inwards, or thick, obtuse, protuberant, matt and whitish. The under surface is whitish to brownish and shows small, round, orange-brown pores less than 0.2 mm in diameter. Cultivated ganoderma often has a larger cap (10-22 cm in diameter and 1.5-4 cm thick), with a less glossy outer surface and is often covered by abundant spores appearing as a yellowish-brown powder.

**Fragmented drug** Slices of the cap. The outer surface is reddish-brown to blackish-brown; the fracture, spongy, shows several brown to pale brown zones. A darker brown zone, consisting of numerous parallel tubes 0.5-2 mm long, is visible near the under surface.

**B. Microscopic examination (2.8.23).** The powder is brown, blackish-brown or yellowish-brown. Examine under a microscope using *lactic reagent R*. The powder shows the following diagnostic characters (Figure 3001.-1): thin-walled, colourless or pale brown hyphae [A], 2.5-6.5 µm in diameter, curved, twisted or branched, isolated or in groups; orange-brown spores (8-12 µm long and 5-8 µm wide), oval, truncated, with a germinal pore at the apex [B]; the outer walls of the spores are colourless and the inner walls show protuberances; the orange-yellow contents are granular and sometimes show droplets.

**C. High-performance thin-layer chromatography (2.8.25).**

**Test solution** To 0.5 g of the powdered herbal drug (4000) (2.9.12) add 5.0 mL of *ethanol (70 per cent V/V) R*. Sonicate for 15 min, centrifuge and use the supernatant.

Figure 3001.-1. – Illustration for identification test B of powdered herbal drug of ganoderma

**Reference solution (a)** Dissolve 2.5 mg of oleanolic acid R and 5.0 mg of ganoderic acid A R in ethanol (70 per cent V/V) R and dilute to 10.0 mL with the same solvent.

**Reference solution (b)** Dilute 2.5 mL of reference solution (a) to 10.0 mL with ethanol (70 per cent V/V) R.

**Reference solution (c)** Dissolve 2.5 mg of oleanolic acid R and 5 mg of diosgenin R in ethanol (70 per cent V/V) R and dilute to 10 mL with the same solvent.

**Intensity marker** Oleanolic acid.

**Plate** TLC silica gel F<sub>254</sub> plate R (2-10 µm).

**Mobile phase** anhydrous formic acid R, ethyl formate R, toluene R (2:50:50 V/V/V).

**Application** 10 µL as bands of 8 mm.

**Development** 70 mm from the lower edge of the plate.

**Drying** In a current of cold air for 5 min.

**Detection** Treat with a 10 per cent V/V solution of sulfuric acid R in ethanol (96 per cent) R; heat at 105 °C for 5 min and examine in ultraviolet light at 366 nm.

**System suitability** Reference solution (c):

- the chromatogram shows 2 distinct zones in the middle third, which may, however, be touching; the upper zone (oleanolic acid) is reddish-brown and the lower zone (diosgenin) shows a bright blue fluorescence.

**Results** See below the sequence of zones present in the chromatograms obtained with reference solution (a) and the test solution. Furthermore, other faint zones of various colours may be present in the chromatogram obtained with the test solution.

Top of the plate	
	A pale yellow zone
	An intense dark red zone
Oleanolic acid: an intense reddish-brown zone	An intense reddish-brown zone overlapping with a yellow zone
	1-3 yellow zones of variable intensity
	A faint to intense yellow zone
Ganoderic acid A: a greenish-blue fluorescent zone	A very faint to faint greenish-blue fluorescent zone (ganoderic acid A)
	A very faint or intense yellow zone
Reference solution (a)	Test solution

## TESTS

### Loss on drying (2.2.32)

Maximum 17.0 per cent, determined on 1.000 g of the powdered herbal drug (4000) (2.9.12) by drying in an oven at 105 °C for 4 h.

### Total ash (2.4.16)

Maximum 2.0 per cent.

## ASSAY

### Liquid chromatography (2.2.29).

**Stock solution** To 2.0 g of the powdered herbal drug (4000) (2.9.12) add 75 mL of ethanol (96 per cent) R and heat on a water-bath under a reflux condenser for 45 min. Allow to cool and filter. Evaporate the filtrate to dryness under reduced pressure. Dissolve the residue in ethanol (96 per cent) R and dilute to 25.0 mL with the same solvent. Filter through a membrane filter (nominal pore size 0.45 µm).

**Test solution** To 2.0 mL of the stock solution add 18 mL of water R and mix thoroughly. Apply the solution to a 4 mL solid phase extraction column, containing 0.200 g of octadecylsilyl silica gel for chromatography R, previously conditioned with 5 mL of methanol R and then with 3 mL of water R ensuring that the column does not dry out. Wash the column with 3 mL of water R and discard the washings. Elute the column with 2 mL of methanol R, collect the eluate and mix thoroughly. Filter through a membrane filter (nominal pore size 0.22 µm).

**Reference solution (a)** Dissolve 5.0 mg of ganoderic acid A CRS in methanol R and dilute to 5.0 mL with the same solvent. Dilute 1.0 mL of the solution to 10.0 mL with methanol R.

**Reference solution (b)** To 0.200 g of ganoderma dry extract for system suitability HRS add 25 mL of ethanol (96 per cent) R. Sonicate for 10 min and centrifuge. To 2 mL of the supernatant add 18 mL of water R and mix thoroughly.

Apply the solution to a 4 mL solid phase extraction column, containing 0.200 g of *octadecylsilyl silica gel for chromatography R*, previously conditioned with 5 mL of *methanol R* and then with 3 mL of *water R* ensuring that the column does not dry out. Wash the column with 3 mL of *water R* and discard the washings. Elute the column with 2 mL of *methanol R*, collect the eluate and mix thoroughly. Filter through a membrane filter (nominal pore size 0.22 µm).

**Column:**

- size:  $l = 0.15$  m,  $\varnothing = 2.1$  mm;
- stationary phase: *end-capped octadecylsilyl silica gel for chromatography compatible with 100 per cent aqueous mobile phases R* (1.8 µm);
- temperature: 25 °C.

**Mobile phase:**

- mobile phase A: 0.075 per cent *V/V* solution of *phosphoric acid R*;
- mobile phase B: *acetonitrile R*;

Time (min)	Mobile phase A (per cent <i>V/V</i> )	Mobile phase B (per cent <i>V/V</i> )
0 - 3	80 → 73.5	20 → 26.5
3 - 35	73.5	26.5
35 - 53	73.5 → 61.5	26.5 → 38.5

**Flow rate** 0.4 mL/min.

**Detection** Spectrophotometer at 257 nm.

**Injection** 5 µL.

**Identification of peaks** Use the chromatogram supplied with *ganoderma dry extract for system suitability HRS* and the chromatogram obtained with reference solution (b) to identify the peaks due to triterpenes 1, 2, 3, 4, 5, 6 (ganoderic acid A), 7, 8, 9 and 10; use the chromatogram obtained with reference solution (a) to identify the peak due to ganoderic acid A.

**Relative retention** With reference to ganoderic acid A (retention time = about 34.4 min): triterpene 1 = about 0.36; triterpene 2 = about 0.41; triterpene 3 = about 0.56; triterpene 4 = about 0.60; triterpene 5 = about 0.66; triterpene 7 = about 1.05; triterpene 8 = about 1.25; triterpene 9 = about 1.33; triterpene 10 = about 1.54.

**System suitability** Reference solution (b):

- *peak-to-valley ratio*: minimum 10.0, where  $H_p$  = height above the baseline of the peak due to ganoderic acid A and  $H_o$  = height above the baseline of the lowest point of the curve separating this peak from the peak due to triterpene 7.

Calculate the percentage content of total triterpene acids, expressed as ganoderic acid A, using the following expression:

$$\frac{A_1 \times m_2 \times p}{A_2 \times m_1 \times 2}$$

- $A_1$  = sum of the areas of the peaks due to triterpenes 1, 2, 3, 4, 5, 7, 8, 9, 10 and to ganoderic acid A in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to ganoderic acid A in the chromatogram obtained with reference solution (a);
- $m_1$  = mass of the herbal drug to be examined used to prepare the stock solution, in grams;
- $m_2$  = mass of *ganoderic acid A CRS* used to prepare reference solution (a), in grams;
- $p$  = percentage content of ganoderic acid A in *ganoderic acid A CRS*.

Ph Eur

**Garlic Powder**

(Ph. Eur. monograph 1216)

Ph Eur

**DEFINITION**

Bulb of *Allium sativum L.*, with the outer corneous layer removed, cut, freeze-dried or dried at a temperature not exceeding 65 °C and powdered.

**Content**

Minimum 0.45 per cent of allicin ( $C_6H_{10}OS_2$ ;  $M_r$  162.3) (dried drug).

**CHARACTERS****Appearance**

Light yellowish powder.

**IDENTIFICATION**

**A.** Microscopic examination (2.8.23). Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 1216.-1): numerous fragments of parenchyma (surface view [A], transverse section [B]) and groups of spiral or annular vessels, sometimes with a large diameter [C, D], accompanied by thin-walled parenchymatous cells.

Figure 1216.-1. – Illustration for identification test A of garlic powder

**B.** Thin-layer chromatography (2.2.27).

**Test solution** To 1.0 g of garlic powder add 5.0 mL of *methanol R*, shake for 60 s and filter.

**Reference solution** Dissolve 5 mg of *alanine R* in 10 mL of *water R* and dilute to 20 mL with *methanol R*.

**Plate** TLC silica gel plate R.

**Mobile phase** *glacial acetic acid R*, *propanol R*, *water R*, *anhydrous ethanol R* (20:20:20:40 *V/V/V/V*).

**Application** 20 µL of the test solution and 10 µL of the reference solution, as bands.

**Development** Over a path of 10 cm.

**Drying** In air.

**Detection** Spray with a 2 g/L solution of *ninhydrin R* in a mixture of 5 volumes of *glacial acetic acid R* and 95 volumes of *butanol R* and heat at 105-110 °C for 5-10 min; examine in daylight.

**Results** The chromatogram obtained with the reference solution shows a violet zone (alanine) in the middle third. The chromatogram obtained with the test solution shows a violet or brownish-red zone similar in position to that in the chromatogram obtained with the reference solution and corresponding to alliin; above and below this zone are other, generally fainter, violet zones.

#### TESTS

##### Starch

Examine the powdered herbal drug under a microscope using *water R*. Add *iodine solution R1*. No blue colour develops.

##### Loss on drying (2.2.32)

Maximum 7.0 per cent, determined on 1.000 g of the powdered herbal drug by drying in an oven at 105 °C.

##### Total ash (2.4.16)

Maximum 5.0 per cent.

#### ASSAY

Liquid chromatography (2.2.29). Carry out the assay as quickly as possible.

**Internal standard solution** Dissolve 20.0 mg of *butyl parahydroxybenzoate CRS* in 100.0 mL of a mixture of equal volumes of *methanol R* and *water R*.

**Test solution** To 0.800 g of garlic powder add 20.0 mL of *water R* and homogenise the mixture in an ultrasonic bath at 4 °C for 5 min. Allow to stand at room temperature for 30 min, then centrifuge for 30 min. Dilute 10.0 mL of the supernatant to 25.0 mL with a mixture of 40 volumes of a 1 per cent *V/V* solution of *anhydrous formic acid R* and 60 volumes of *methanol R* (stock solution). Shake and centrifuge for 5 min. Place 0.50 mL of the internal standard solution in a volumetric flask and dilute to 10.0 mL with the stock solution.

##### Precolumn:

- size:  $l = 20$  mm,  $\varnothing = 4$  mm;
- stationary phase: silanised octadecylsilyl silica gel for chromatography *R* (5  $\mu$ m).

##### Column:

- size:  $l = 0.25$  m,  $\varnothing = 4$  mm;
- stationary phase: silanised octadecylsilyl silica gel for chromatography *R* (5  $\mu$ m).

**Mobile phase** Mix 40 volumes of a 1 per cent *V/V* solution of *anhydrous formic acid R* and 60 volumes of *methanol R*.

**Flow rate** 0.8 mL/min.

**Detection** Spectrophotometer at 254 nm.

**Injection** 1  $\mu$ L of the internal standard solution and 10  $\mu$ L of the test solution.

Calculate the percentage content of alliin using the following expression:

$$\frac{S_1 \times m_2 \times 22.75}{S_2 \times m_1}$$

- $S_1$  = area of the peak due to alliin (principal peak) in the chromatogram obtained with the test solution;
- $S_2$  = area of the peak due to butyl parahydroxybenzoate in the chromatogram obtained with the test solution;
- $m_1$  = mass of the herbal drug to be examined, in grams;
- $m_2$  = mass of butyl parahydroxybenzoate in 100.0 mL of the internal standard solution, in grams. 1 mg of butylparahydroxybenzoate corresponds to 8.65 mg of alliin.

## Gastrodia Elata Rhizome

(*Gastrodia Rhizome*, Ph. Eur. monograph 2721)

Ph Eur

#### DEFINITION

Steamed, fragmented and dried tuber of *Gastrodia elata* Blume.

#### Content

Minimum 0.20 per cent of gastrodin ( $C_{13}H_{18}O_7$ ;  $M_r$  286.3) (dried drug).

#### IDENTIFICATION

A. Whole or fragmented slices up to 3 cm in diameter and 0.1-0.2 cm thick, uniformly yellow or brownish-yellow, translucent and vitreous. The texture is corneous. The fracture is hard.

B. Microscopic examination (2.8.23). The powder is reddish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2721.-1): fragments of internal parenchyma consisting of large spheroidal cells, up to 350  $\mu$ m in diameter, with slightly thickened and pitted walls [E]; numerous fragments of parenchyma with shrivelled and often ripped cells caused by the treatment of the herbal drug [B]; rare fragments of dermal tissue [A, C] with cells that are polyhedral (surface view [A]) and elongated (transverse section [Ca]) accompanied by a few layers of parenchyma cells of the same shape [Cb]; rare fragments of parenchyma containing idioblasts with raphides of calcium oxalate, the needles of which are 50-70  $\mu$ m long [D]; fragments of annular or scalariform vessels up to 35  $\mu$ m in diameter [F]. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder mainly shows colourless or pale yellow, gelatinised masses, that turn uniformly violet or brownish-violet upon addition of *iodine solution R1*.

C. Thin-layer chromatography (2.2.27).

**Test solution** To 1.0 g of the powdered herbal drug (355) (2.9.12) add 5.0 mL of *methanol R*. Sonicate for 10 min. Centrifuge and use the supernatant.

**Reference solution** Dissolve 1.5 mg of *gastrodin R* and 1.5 mg of  $\beta$ -sitosterol *R* in *methanol R* and dilute to 5.0 mL with the same solvent.

**Plate** TLC silica gel plate *R* (2-10  $\mu$ m).

**Mobile phase** *water R*, *ethyl acetate R*, *methanol R*, *methylene chloride R* (2:20:20:58 *V/V/V/V*).

**Application** 15  $\mu$ L as bands of 8 mm.

**Development** Over a path of 6 cm.

**Drying** In air.

**Detection** Treat with a 10 per cent *V/V* solution of *sulfuric acid R* in *methanol R*, heat at 120 °C for 3 min and examine in daylight.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Figure 2721.-1. – Illustration for identification test B of powdered herbal drug of *gastrodia* rhizome

Top of the plate	
$\beta$ -Sitosterol: a reddish-violet zone	A faint reddish-violet zone A prominent brown zone
	A faint reddish-violet zone
Gastrodin: a brown zone	A brown zone (gastrodin) A prominent dark brown zone
Reference solution	Test solution

## TESTS

### Loss on drying (2.2.32)

Maximum 12.0 per cent, determined on 2.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

### Total ash (2.4.16)

Maximum 4.0 per cent.

## ASSAY

Liquid chromatography (2.2.29).

*Solvent mixture* acetoniirile R, water R (3:97 V/V).

*Test solution* To 2.000 g of the powdered herbal drug (355) (2.9.12) in a round-bottomed flask add 30 mL of *ethanol* (50 per cent V/V) R. Heat under a reflux condenser in a water-bath at 90 °C for 3 h. Allow to cool. Filter through a paper filter and rinse the round-bottomed flask and the filter

with *ethanol* (50 per cent V/V) R. Combine the filtrate and the rinsings and dilute to 50.0 mL with *ethanol* (50 per cent V/V) R. Evaporate 10.0 mL of the solution to dryness. Dissolve the residue in the solvent mixture and dilute to 25.0 mL with the solvent mixture. Filter through a membrane filter (nominal pore size 0.45 μm).

*Reference solution (a)* Dissolve 5.0 mg of *gastrodin* CRS in the solvent mixture and dilute to 10.0 mL with the solvent mixture.

*Reference solution (b)* Dilute 1.0 mL of reference solution (a) to 10.0 mL with the solvent mixture.

*Reference solution (c)* Dissolve 1 mg of *arbutin* R in 2 mL of reference solution (a) and dilute to 20 mL with the solvent mixture.

### Column:

— size:  $l = 0.15$  m,  $\varnothing = 4.6$  mm;

— stationary phase: end-capped octadecylsilyl silica gel for chromatography R (3 μm).

### Mobile phase:

— mobile phase A: phosphoric acid R, water for chromatography R (0.1:99.9 V/V);

— mobile phase B: acetoniirile R1;

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 18	97	3
18 - 22	97 → 0	3 → 100

*Flow rate* 0.5 mL/min.

*Detection* Spectrophotometer at 220 nm.

*Injection* 10 μL of the test solution and reference solutions (b) and (c).

*Retention time* Arbutin = about 9 min; gastrodin = about 14 min.

*System suitability* Reference solution (c):

— resolution: minimum 3.0 between the peaks due to arbutin and gastrodin.

Calculate the percentage content of gastrodin using the following expression:

$$\frac{A_1 \times m_2 \times p \times 1.25}{A_2 \times m_1}$$

- $A_1$  = area of the peak due to gastrodin in the chromatogram obtained with the test solution;  
 $A_2$  = area of the peak due to gastrodin in the chromatogram obtained with reference solution (b);  
 $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;  
 $m_2$  = mass of *gastrodin* CRS used to prepare reference solution (a), in grams;  
 $p$  = percentage content of gastrodin in *gastrodin* CRS.

Ph Eur

## Gentian

(*Gentian* Root, Ph. Eur. monograph 0392)

When Powdered Gentian is prescribed or demanded, material complying with the requirements below with the exception of Identification test A shall be dispensed or supplied.

### Preparations

Compound Gentian Infusion

Gentian Tincture

Ph Eur

**DEFINITION**

Dried, fragmented underground organs of *Gentiana lutea* L.

**CHARACTERS**

Strong and persistent bitter taste.

**IDENTIFICATION**

**A.** Gentian root occurs as single or branched subcylindrical pieces of various lengths (typically 5-15 cm) and usually 5-40 mm in diameter. The surface is yellowish-brown or greyish-brown, and the colour of a transverse section is yellowish or reddish-yellow, but not reddish-brown. The root is longitudinally wrinkled and bears occasional rootlet scars. The branches of the rhizome frequently bear a terminal bud and are always encircled by closely arranged leaf scars. The rhizome and root are brittle when dry and break with a short fracture but they absorb moisture readily to become flexible. The smoothed, transversely cut surface shows a bark, occupying about one-quarter of the radius, separated by the well-marked cambium from an indistinctly radiate and mainly parenchymatous xylem.

**B.** Microscopic examination (2.8.23). The powder is light brown or yellowish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 0392.-1): fragments of cork with polyhedral, thin-walled, yellowish-brown cells (surface view [E]); fragments of dermal tissue (transverse section [C]) consisting of thin-walled, yellowish-brown cork cells [Ca] and thick-walled collenchymatous cells (phelloderm) [Cb]; fragments of parenchyma (longitudinal section [B], transverse section [D]) with moderately thick-walled cells containing droplets of oil [Ba, Da], small prisms [Bb, Db] and minute needles of calcium oxalate [Bc, Dc]; isolated fragments of lignified vessels with spiral [H] or reticulate [G] thickening and up to 80 µm in diameter; fragments of xylem (longitudinal section [A], transverse section [F]) consisting of vessels [Aa, Fa] and of moderately thick-walled parenchymatous cells containing droplets of oil [Ab, Fb].

**C.** Thin-layer chromatography (2.2.27).

**Test solution** To 1.0 g of the powdered herbal drug (355) (2.9.12) add 25 mL of *methanol R*, shake for 15 min and filter. Evaporate the filtrate to dryness under reduced pressure, at a temperature not exceeding 50 °C. Take up the residue with small quantities of *methanol R* so as to obtain 5 mL of a solution, which may contain a sediment.

**Reference solution** Dissolve 5 mg of *hyperoside R* and 5 mg of *phenazone R* in 10 mL of *methanol R*.

**Plate** TLC silica gel F<sub>254</sub> plate R.

**Mobile phase** *water R*, *anhydrous formic acid R*, *ethyl formate R* (4:8:88 V/V/V).

**Application** 20 µL as bands.

**Development** In an unsaturated tank, over a path of 8 cm.

**Drying** In air.

**Detection A** Examine in ultraviolet light at 254 nm.

**Results A** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.

Figure 0392.-1. – Illustration for identification test B of powdered herbal drug of gentian root

Top of the plate	
Phenazone: a quenching zone	A prominent quenching zone
	A weak quenching zone (amarogentin)
Hyperoside: a quenching zone	A prominent quenching zone (gentiopicroside)
Reference solution	Test solution

**Detection B** Treat with a 100 g/L solution of *potassium hydroxide R* in *methanol R* and then with a freshly prepared 2 g/L solution of *fast blue B salt R* in a mixture of 50 volumes of *anhydrous ethanol R* and 50 volumes of *water R*; examine in daylight.

**Results B** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
	A prominent dark violet zone
	A violet-red zone (amarogentin)
Hyperoside: a brownish-red zone	A weak light brown zone (gentiopicroside)
Reference solution	Test solution

**TESTS****Other species of *Gentiana***

Examine the chromatograms obtained in identification test C, detection B.

**Results** The chromatogram obtained with the test solution does not show violet zones immediately above the zone due to amarogentin.

**Total ash (2.4.16)**

Maximum 6.0 per cent.

**Bitterness value (2.8.15)**

Minimum 10 000.

**Water-soluble extractive**

Minimum 33 per cent.

To 5.0 g of the powdered herbal drug (710) (2.9.12) add 200 mL of boiling water R. Allow to stand for 10 min, shaking occasionally. Allow to cool, dilute to 200.0 mL with water R and filter. Evaporate 20.0 mL of the filtrate to dryness on a water-bath. Dry the residue in an oven at 100-105 °C. The residue weighs a minimum of 0.165 g.

Ph Eur

**Compound Gentian Infusion****DEFINITION**

Concentrated Compound Gentian Infusion 100 ml  
Water Sufficient to produce 1000 ml

The infusion complies with the requirements stated under Infusions.

**CONCENTRATED COMPOUND GENTIAN INFUSION****DEFINITION**

Gentian, cut small and bruised	125 g
Dried Bitter-orange Peel, cut small	125 g
Dried Lemon Peel, cut small	125 g
Ethanol (25 per cent)	1200 ml

**Extemporaneous preparation**

The following directions apply.

Macerate the Gentian, the Dried Bitter-orange Peel and the Dried Lemon Peel in a covered vessel for 48 hours with 1000 ml of the Ethanol (25 per cent); express the liquid. To the pressed marc add 200 ml of the Ethanol (25 per cent), macerate for 24 hours, press and add the liquid to the product of the first pressing. Allow to stand for not less than 14 days; filter.

**TESTS****Ethanol content**

20 to 24% v/v, Appendix VIII F.

**Total solids**

Not less than 9.5% w/v, Appendix XI A.

**Gentian Tincture**

(Ph. Eur. monograph 1870)

Ph Eur

**DEFINITION**

Tincture produced from *Gentian root* (0392).

**PRODUCTION**

The tincture is produced from 1 part of the comminuted drug and 5 parts of ethanol (70 per cent V/V) by a suitable procedure.

**CHARACTERS****Appearance**

Yellowish-brown or reddish-brown liquid.

It has a strong bitter taste.

**IDENTIFICATION**

Thin-layer chromatography (2.2.27).

**Test solution** The tincture to be examined.

**Reference solution** Dissolve 5 mg of phenazone R and 5 mg of hyperoside R in 10 mL of methanol R.

**Plate** TLC silica gel F<sub>254</sub> plate R.

**Mobile phase** water R, anhydrous formic acid R, ethyl formate R (4:8:88 V/V/V).

**Application** 20 µL, as bands.

**Development** Over a path of 8 cm, in an unsaturated tank.

**Drying** In air.

**Detection A** Examine in ultraviolet light at 254 nm.

**Results A** See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Phenazone: a quenching zone	A prominent quenching zone
	A weak quenching zone (amarogentin)
Hyperoside: a quenching zone	A prominent quenching zone (gentiopicroside)
Reference solution	Test solution

**Detection B** Spray with a 10 per cent V/V solution of potassium hydroxide R in methanol R and then with a freshly prepared 2 g/L solution of fast blue B salt R in a mixture of ethanol R and water R (50:50 V/V). Examine in daylight.

**Results B** See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
	A prominent dark violet zone A violet-red zone (amarogentin)
Hyperoside: a brownish-red zone	A weak light brown zone (gentiopicroside)
Reference solution	Test solution

**TESTS****Ethanol content (2.9.10)**62 per cent *V/V* to 67 per cent *V/V*.**Bitterness value (2.8.15)**

Minimum 1000.

**Dry residue (2.8.16)**

Minimum 5.0 per cent, determined on 3.00 g.

*Ph Eur***Acid Gentian Mixture**

Acid Gentian Oral Solution

**DEFINITION**

Acid Gentian Mixture is an *oral solution* containing 10% *v/v* of Concentrated Compound Gentian Infusion and 5% *v/v* of Dilute Hydrochloric Acid in a suitable vehicle.

*The mixture complies with the requirements stated under Oral Liquids and with the following requirements.*

**Content of hydrochloric acid, HCl**0.48 to 0.56% *w/v*.**ASSAY**

To 10 mL add 10 mL of *water*, adjust the pH to between 5.0 and 6.0 with 2M *sodium hydroxide* and dilute to 25 mL with *water*. Add 75 mL of *acetate buffer pH 5.0* and titrate with 0.1M *silver nitrate VS* determining the end point potentiometrically using a silver indicator electrode and a glass reference electrode and stirring throughout the titration. Each mL of 0.1M *silver nitrate VS* is equivalent to 3.646 mg of HCl.

**Alkaline Gentian Mixture**

Alkaline Gentian Oral Solution

**DEFINITION**

Alkaline Gentian Mixture is an *oral solution* containing 10% *v/v* of Concentrated Compound Gentian Infusion and 5% *w/v* of Sodium Bicarbonate in a suitable vehicle.

*The mixture complies with the requirements stated under Oral Liquids and with the following requirements.*

**Content of sodium bicarbonate, NaHCO<sub>3</sub>**4.75 to 5.25% *w/v*.**ASSAY**

To 10 mL of the mixture add 100 mL of *water* and 25 mL of 0.5M *hydrochloric acid VS*, boil for 10 minutes and titrate the excess of hydrochloric acid with 0.5M *sodium hydroxide VS* using 0.5 mL of *methyl red solution* as indicator. Each mL of 0.5M *hydrochloric acid VS* is equivalent to 42.00 mg of NaHCO<sub>3</sub>.

**Ginger***(Ph. Eur. monograph 1522)***Preparation**

Strong Ginger Tincture

Ginger may be known in commerce as unbleached ginger.

When Powdered Ginger is prescribed or demanded, material complying with the appropriate requirements below shall be dispensed or supplied.

*Ph Eur***DEFINITION**

Dried, whole or cut rhizome of *Zingiber officinale* Roscoe, with the cork removed, either completely or from the wide, flat surfaces only.

**Content**

Minimum 15 mL/kg of essential oil (anhydrous drug).

**CHARACTERS**

Characteristic aromatic odour.

Spicy and burning taste.

**IDENTIFICATION**

A. The rhizome is laterally compressed, bearing short, flattened, obovate oblique branches on the upper side, each sometimes having a depressed scar at the apex; the whole rhizomes are about 5-10 cm long, 1.5-3 cm or 4 cm wide and 1-1.5 cm thick, sometimes split longitudinally.

The scraped rhizome with a light-brown external surface shows longitudinal striations and occasional loose fibres; the outer surface of the unscraped rhizome varies from pale to dark brown and is more or less covered with cork that shows conspicuous, narrow, longitudinal and transverse ridges; the cork readily exfoliates from the lateral surfaces but persists between the branches. The fracture is short and starchy with projecting fibres. The smoothed transversely cut surface exhibits a narrow cortex separated by an endodermis from a much wider stele; it shows numerous, scattered, fibrovascular bundles and abundant scattered oleoresin cells with yellow contents. The unscraped rhizome shows, in addition, an outer layer of dark brown cork.

B. Microscopic examination (2.8.23). The powder is pale yellow or brownish. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 1522.-1): groups of large, thin-walled, septate fibres, with one wall frequently dentate [C, D, G]; fragments [K] containing vessels with reticulate thickening [Ka] often accompanied by narrow, thin-walled cells containing brown pigment [Kb] and amyloiferous parenchyma [Kc]; abundant reticulate vessels, fairly large, isolated [H, L]; abundant thin-walled parenchyma of the ground tissue [J, M], some cells containing brown oleoresin [Ja]; fragments of brown cork, usually seen in surface view [F] but sometimes in transverse section [E]. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows abundant starch granules, simple, flattened, oblong or oval or irregular, up to about 50 µm long and 25 µm wide, with a small point hilum situated at the narrower end; sometimes, granules show faint, transverse striations, and may be free [A], agglomerated [B] or included in parenchymatous cells (Kc).

Figure 1522.-1. – Illustration for identification test B of powdered herbal drug of ginger

**C. Thin-layer chromatography (2.2.27).**

**Test solution** To 1.0 g of the powdered herbal drug (710) (2.9.12) add 5 mL of *methanol R*. Shake for 15 min and filter.

**Reference solution** Dissolve 10 μL of *citral R* and 10 mg of *resorcinol R* in 10 mL of *methanol R*. Prepare the solution immediately before use.

**Plate** TLC silica gel plate *R*.

**Mobile phase** *hexane R*, *ether R* (40:60 *V/V*).

**Application** 20 μL as bands.

**Development** In an unsaturated tank, over a path of 15 cm.

**Drying** In air.

**Detection** Spray with a 10 g/L solution of *vanillin R* in *sulfuric acid R* and examine in daylight while heating at 100-105 °C for 10 min.

**Results** The chromatogram obtained with the reference solution shows in the lower half an intense red zone (*resorcinol*) and in the upper half 2 violet zones (*citral*); the chromatogram obtained with the test solution shows below the zone due to *resorcinol* in the chromatogram obtained with the reference solution 2 intense violet zones (*gingerols*) and in the middle, between the zones due to *resorcinol* and *citral* in the chromatogram obtained with the reference solution, 2 other less intense violet zones (*shogaols*); other zones may be present.

**TESTS**

**Water (2.2.13)**

Maximum 100 mL/kg, determined by distillation on 20.0 g of the powdered herbal drug (710) (2.9.12).

**Total ash (2.4.16)**

Maximum 6.0 per cent.

**ASSAY**

**Essential oil (2.8.12)**

Use 20.0 g of the freshly, coarsely powdered herbal drug, a 1000 mL round-bottomed flask, 10 drops of *liquid paraffin R* or other antifoam, 500 mL of *water R* as distillation liquid and 0.5 mL of *xylene R* in the graduated tube. Distil at a rate of 2-3 mL/min for 4 h.

*Ph Eur*

**Strong Ginger Tincture**

Ginger Essence

**DEFINITION**

Ginger, in moderately coarse powder  
Ethanol (90 per cent)

500 g  
Sufficient to produce  
1000 ml

**Extemporaneous preparation**

The following directions apply.

Prepare by *percolation*, Appendix XI F.

The tincture complies with the requirements for Tinctures stated under *Extracts* and with the following requirements.

**TESTS**

**Ethanol content**

80 to 88% *v/v*, Appendix VIII F, Method III.

**Dry residue**

2.0 to 3.0% *w/v*.

**Relative density**

0.832 to 0.846, Appendix V G.

**Weak Ginger Tincture**

**DEFINITION**

Strong Ginger Tincture  
Ethanol (90 per cent)

200 ml  
Sufficient to produce 1000 ml

The tincture complies with the requirements for Tinctures stated under *Extracts* and with the following requirements.

**TESTS**

**Ethanol content**

86 to 90% *v/v*, Appendix VIII F, Method III.

**Dry residue**

Not less than 0.4% *w/v*. Use 10 ml.

**Relative density**

0.825 to 0.835, Appendix V G.

**Ginkgo Leaf**

(*Ph. Eur. monograph 1828*)

**Preparation**

Ginkgo Leaf Dry Extract, Refined and Quantified

*Ph Eur*

**DEFINITION**

Whole or fragmented, dried leaf of *Ginkgo biloba L.*

**Content**

Not less than 0.5 per cent of flavonoids, expressed as flavone glycosides ( $M_r$  757) (dried drug).

**IDENTIFICATION**

A. The leaf is greyish or yellowish-green or yellowish-brown. The upper surface is slightly darker than the lower surface. The petioles are about 4-9 cm long. The lamina is about 4-10 cm wide, fan-shaped, usually bilobate or sometimes undivided. Both surfaces are smooth, and the venation dichotomous, the veins appearing to radiate from the base; they are equally prominent on both surfaces. The distal margin is incised, irregularly and to different degrees, and irregularly lobate or emarginate. The lateral margins are entire and taper towards the base.

B. Microscopic examination (2.8.23). The powder is greyish or yellowish-green or yellowish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 1828.-1): irregularly-shaped fragments of the lamina [A, B, D, E], with the upper epidermis (surface view [D]), transverse section [E]) consisting of elongated cells with irregularly sinuous walls [Da], often accompanied by palisade parenchyma [Db], and the lower epidermis (surface view [A], transverse section [B]), consisting of small cells, with a finely striated cuticle and each cell shortly papillose [Aa], and stomata [Ab] about 60 µm, wide, deeply sunken with 6-8 subsidiary cells; fragments of vascular tissue from the petiole and veins [C] with xylem [Ca] and parenchyma, some cells containing abundant cluster crystals of calcium oxalate of various sizes [Cb].

Figure 1828.-1. – Illustration for identification test B of powdered herbal drug of ginkgo leaf

**C. Thin-layer chromatography (2.2.27).**

**Test solution** To 2.0 g of the powdered herbal drug (710) (2.9.12) add 10 mL of *methanol R*. Heat in a water-bath at 65 °C for 10 min. Shake frequently. Allow to cool to room temperature and filter.

**Reference solution** Dissolve 1.0 mg of *chlorogenic acid R* and 3.0 mg of *rutoside trihydrate R* in 20 mL of *methanol R*.

**Plate** TLC silica gel plate R.

**Mobile phase** *anhydrous formic acid R*, *glacial acetic acid R*, *water R*, *ethyl acetate R* (7.5:7.5:17.5:67.5 V/V/V/V).

**Application** 20 µL as bands.

**Development** Over a path of 17 cm.

**Drying** At 100-105 °C.

**Detection** Spray the warm plate with a 10 g/L solution of *diphenylboric acid aminoethyl ester R* in *methanol R*, then with the same volume of a 50 g/L solution of *macrogol 400 R* in *methanol R*; allow to dry in air for about 30 min and examine in ultraviolet light at 365 nm.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other weak fluorescent zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Chlorogenic acid: a light blue fluorescent zone	A yellowish-brown fluorescent zone
	A green fluorescent zone
	2 yellowish-brown fluorescent zones
	An intense light blue fluorescent zone sometimes overlapped by a greenish-brown fluorescent zone
	A green fluorescent zone
Rutoside: a yellowish-brown fluorescent zone	2 yellowish-brown fluorescent zones
	A green fluorescent zone
	A yellowish-brown fluorescent zone
Reference solution	Test solution

**TESTS****Foreign matter (2.8.2)**

Maximum 5 per cent of stems and 2 per cent of other foreign matter.

**Loss on drying (2.2.32)**

Maximum 11.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

**Total ash (2.4.16)**

Maximum 11.0 per cent.

**ASSAY****Flavonoids****Liquid chromatography (2.2.29).**

**Test solution** Heat 2.500 g of the powdered herbal drug (710) (2.9.12) in 50 mL of a 60 per cent V/V solution of *acetone R* under a reflux condenser for 30 min. Filter and collect the filtrate. Extract the drug residue a 2<sup>nd</sup> time in the same manner, using 40 mL of a 60 per cent V/V solution of *acetone R* and filter. Collect the filtrates and dilute to 100.0 mL with a 60 per cent V/V solution of *acetone R*. Evaporate 50.0 mL of the solution to eliminate the acetone and transfer to a 50.0 mL vial, rinsing with 30 mL of *methanol R*. Add 4.4 mL of *hydrochloric acid R1*, dilute to 50.0 mL with *water R* and centrifuge. Place 10 mL of the supernatant in a 10 mL brown-glass vial. Close with a rubber seal and an aluminium cap and heat on a water-bath for 25 min. Allow to cool to room temperature.

**Reference solution** Dissolve 10.0 mg of *quercetin dihydrate R* in 20 mL of *methanol R*. Add 15.0 mL of *dilute hydrochloric acid R* and 5 mL of *water R* and dilute to 50.0 mL with *methanol R*.

**Column:**

- size:  $l = 0.125$  m,  $\varnothing = 4$  mm;
- stationary phase: octadecylsilyl silica gel for chromatography R (5  $\mu$ m);
- temperature: 25 °C.

**Mobile phase:**

- mobile phase A: 0.3 g/L solution of *phosphoric acid R* adjusted to pH 2.0;
- mobile phase B: *methanol R*;

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 1	60	40
1 - 20	60 → 45	40 → 55
20 - 21	45 → 0	55 → 100
21 - 25	0	100

**Flow rate** 1.0 mL/min.

**Detection** Spectrophotometer at 370 nm.

**Injection** 10  $\mu$ L.

**Relative retention** With reference to quercetin (retention time = about 12.5 min): kaempferol = about 1.4; isorhamnetin = about 1.5.

**System suitability:**

- resolution: minimum 1.5 between the peaks due to kaempferol and isorhamnetin.

Do not take into account peaks eluting before the quercetin peak or after the isorhamnetin peak in the chromatogram obtained with the test solution.

Calculate the percentage content of flavonoids, expressed as flavone glycosides, using the following expression:

$$2 \times \frac{F_1 \times m_1 \times 2.514 \times p}{F_2 \times m_2}$$

- $F_1$  = sum of the areas of all the considered peaks in the chromatogram obtained with the test solution;
- $F_2$  = area of the peak due to quercetin in the chromatogram obtained with the reference solution;
- $m_1$  = mass of quercetin used to prepare the reference solution, in grams;
- $m_2$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;
- $p$  = percentage content of anhydrous quercetin in *quercetin dihydrate R*.

Ph Eur

## Refined and Quantified Ginkgo Dry Extract

(Ph. Eur. monograph 1827)

Ph Eur

### DEFINITION

Refined and quantified dry extract produced from *Ginkgo leaf* (1828).

### Content

- flavonoids, expressed as flavone glycosides ( $M_r$  756.7): 22.0 per cent to 27.0 per cent (dried extract);
- bilobalide: 2.6 per cent to 3.2 per cent (dried extract);

— ginkgolides A, B and C: 2.8 per cent to 3.4 per cent (dried extract);

— ginkgolic acids: maximum 5 ppm (dried extract).

### PRODUCTION

The extract is produced from the herbal drug by an appropriate procedure using organic solvents and their mixtures with water, physical separation steps as well as other suitable processes.

### CHARACTERS

#### Appearance

Bright yellow-brown, powder or friable mass.

### IDENTIFICATION

Thin-layer chromatography (2.2.27).

**Test solution** Dissolve 20.0 mg of the extract to be examined in 10 mL of a mixture of 2 volumes of *water R* and 8 volumes of *methanol R*.

**Reference solution** Dissolve 1.0 mg of *chlorogenic acid R* and 3.0 mg of *rutoside trihydrate R* in 20 mL of *methanol R*.

**Plate** TLC silica gel plate R (5-40  $\mu$ m) or [TLC silica gel plate R (2-10  $\mu$ m)].

**Mobile phase** anhydrous formic acid R, glacial acetic acid R, water R, ethyl acetate R (7.5:7.5:17.5:67.5 V/V/V/V).

**Application** 20  $\mu$ L [or 5  $\mu$ L], as bands.

**Development** Over a path of 17 cm [or 6 cm].

**Drying** At 100-105 °C.

**Detection** Spray the plate whilst still hot with a 10 g/L solution of *diphenylboric acid aminoethyl ester R* in *methanol R*, then spray with a 50 g/L solution of *macrogol 400 R* in *methanol R*; allow to dry in air for about 30 min and examine in ultraviolet light at 365 nm.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other, weaker fluorescent zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
	A blue fluorescent zone
	Several faint coloured zones
	A brown fluorescent zone
	A green fluorescent zone
	An intense light blue fluorescent zone sometimes overlapped by a greenish-brown fluorescent zone
Chlorogenic acid: a light blue fluorescent zone	One or two green fluorescent zones
Rutoside: a yellowish-brown fluorescent zone	One or two yellowish-brown fluorescent zones
	Several green and yellowish-brown fluorescent zones
Reference solution	Test solution

Figure 1827.-1. – Chromatogram for the assay of flavonoids in refined and quantified ginkgo dry extract

#### ASSAY

##### Flavonoids

##### Liquid chromatography (2.2.29).

**Test solution** Dissolve 0.200 g of the extract to be examined in 20 mL of methanol R. Add 15.0 mL of dilute hydrochloric acid R and 5 mL of water R and dilute to 50.0 mL with methanol R. Transfer 10.0 mL of this solution into a 10 mL brown-glass vial. Close the vial with a tight rubber membrane stopper and secure with an aluminium crimped cap. Heat on a water-bath for 25 min. Allow to cool to 20 °C.

**Reference solution** Dissolve 10.0 mg of quercetin dihydrate CRS in 20 mL of methanol R. Add 15.0 mL of dilute hydrochloric acid R and 5 mL of water R and dilute to 50.0 mL with methanol R.

##### Column:

- size:  $l = 0.125$  m,  $\varnothing = 4$  mm;
- stationary phase: octadecylsilyl silica gel for chromatography R (5  $\mu$ m);
- temperature: 25 °C.

##### Mobile phase:

- mobile phase A: 0.3 g/L solution of phosphoric acid R adjusted to pH 2.0;
- mobile phase B: methanol R;

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 1	60	40
1 - 20	60 → 45	40 → 55
20 - 21	45 → 0	55 → 100
21 - 25	0	100

**Flow rate** 1.0 mL/min.

**Detector** Spectrophotometer at 370 nm.

**Injection** 10  $\mu$ L.

**Relative retention** With reference to quercetin (retention time = about 12.5 min): kaempferol = about 1.4; isorhamnetin = about 1.5.

**System suitability** Test solution:

— resolution: minimum 1.5 between the peaks due to kaempferol and isorhamnetin.

Determine the sum of the areas including all the peaks from the peak due to quercetin to the peak due to isorhamnetin in the chromatogram obtained with the test solution (see Figure 1827.-1).

Calculate the percentage content of flavonoids, expressed as flavone glycosides, using the following expression:

$$\frac{F_1 \times m_1 \times 2.514 \times p}{F_2 \times m_2}$$

- $F_1$  = sum of the areas of all the peaks from the peak due to quercetin to the peak due to isorhamnetin in the chromatogram obtained with the test solution;
- $F_2$  = area of the peak due to quercetin in the chromatogram obtained with the reference solution;
- $m_1$  = mass of quercetin dihydrate CRS in the reference solution, in grams;
- $m_2$  = mass of the extract to be examined used to prepare the test solution, in grams;
- $p$  = percentage content of anhydrous quercetin in quercetin dihydrate CRS.

### Terpene lactones

#### Liquid chromatography (2.2.29).

**Test solution** Place 0.120 g of the extract to be examined in a 25 mL beaker and dissolve it in 10 mL of phosphate buffer solution pH 5.8 R by stirring. Transfer the solution into a chromatography column, about 0.15 m long and about 30 mm in internal diameter, containing 15 g of kieselguhr for chromatography R. Wash the beaker with 2 quantities, each of 5 mL, of phosphate buffer solution pH 5.8 R and transfer the washings to the chromatography column. Allow to stand for 15 min. Elute with 100 mL of ethyl acetate R. Evaporate the eluate to dryness at a pressure not exceeding 4 kPa in a water-bath at 50 °C. The residue of solvent is eliminated by an air-current. Take up the residue in 2.5 mL of the mobile phase.

**Reference solution (a)** Dissolve 30.0 mg of benzyl alcohol CRS in the mobile phase and dilute to 100.0 mL with the mobile phase.

**Reference solution (b)** Place 0.120 g of the ginkgo dry extract for peak identification CRS in a 25 mL beaker and dissolve it in 10 mL of phosphate buffer solution pH 5.8 R by stirring, then proceed as described for the test solution.

#### Column:

- size:  $l = 0.25$  m,  $\varnothing = 4$  mm;
- stationary phase: octylsilyl silica gel for chromatography R (5  $\mu$ m);
- temperature: 25 °C.

**Mobile phase** tetrahydrofuran R, methanol R, water R (10:20:75 V/V/V).

**Flow rate** 1.0 mL/min.

**Detection** Refractometer maintained at 35 °C.

**Injection** 100  $\mu$ L.

**Identification of peaks** Use the chromatogram supplied with ginkgo dry extract for peak identification CRS and the chromatogram obtained with the reference solution (b) to identify the peaks due to bilobalide and ginkgolides A, B and C.

#### System suitability:

- the chromatogram obtained with reference solution (b) is similar to the chromatogram supplied with ginkgo dry extract for peak identification CRS.

Calculate the percentage content of bilobalide, using the following expression:

$$\frac{F_1 \times m_1 \times p \times 0.025 \times 1.20}{F_5 \times m_2}$$

Calculate the percentage content of ginkgolide A, using the following expression:

$$\frac{F_2 \times m_1 \times p \times 0.025 \times 1.22}{F_5 \times m_2}$$

Calculate the percentage content of ginkgolide B, using the following expression:

$$\frac{F_3 \times m_1 \times p \times 0.025 \times 1.19}{F_5 \times m_2}$$

Calculate the percentage content of ginkgolide C, using the following expression:

$$\frac{F_4 \times m_1 \times p \times 0.025 \times 1.27}{F_5 \times m_2}$$

- $F_1$  = area of the peak due to bilobalide in the chromatogram obtained with the test solution;
- $F_2$  = area of the peak due to ginkgolide A in the chromatogram obtained with the test solution;
- $F_3$  = area of the peak due to ginkgolide B in the chromatogram obtained with the test solution;
- $F_4$  = area of the peak due to ginkgolide C in the chromatogram obtained with the test solution;
- $F_5$  = area of the peak due to benzyl alcohol in the chromatogram obtained with reference solution (a);
- $m_1$  = mass of benzyl alcohol CRS in reference solution (a), in grams;
- $m_2$  = mass of the extract to be examined used to prepare the test solution, in grams;
- $p$  = percentage content of benzyl alcohol in benzyl alcohol CRS.

Calculate the percentage content of the sum of ginkgolides A, B and C, using the following expression:

$$G_A + G_B + G_C$$

- $G_A$  = percentage content of ginkgolide A;
- $G_B$  = percentage content of ginkgolide B;
- $G_C$  = percentage content of ginkgolide C.

### Ginkgolic acids

#### Liquid chromatography (2.2.29).

**Test solution** Dissolve 0.500 g of the powdered extract to be examined in 8 mL of methanol R, sonicating if necessary, and dilute to 10.0 mL with the same solvent. Centrifuge if necessary.

**Reference solution** Dissolve 10.0 mg of ginkgolic acids CRS in 8 mL of methanol R, sonicating if necessary, and dilute to 10.0 mL with the same solvent. Dilute 2.0 mL of this solution to 10.0 mL with methanol R.

#### Column:

- size:  $l = 0.25$  m,  $\varnothing = 4.6$  mm;
- stationary phase: octylsilyl silica gel for chromatography R (5  $\mu$ m);
- temperature: 35 °C.

#### Mobile phase:

- mobile phase A: dilute 0.1 mL of trifluoroacetic acid R to 1000 mL with water R;
- mobile phase B: dilute 0.1 mL of trifluoroacetic acid R to 1000 mL with acetonitrile R;

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 30	25 → 10	75 → 90
30 - 35	10	90
35 - 36	10 → 25	90 → 75
36 - 45	25	75

**Flow rate** 1.0 mL/min.

**Detection** Spectrophotometer at 210 nm.

**Injection** 50  $\mu$ L.

**Identification of components** Use the chromatogram supplied with ginkgolic acids CRS and the chromatogram obtained with the test solution to identify the peaks due to ginkgolic acids C13, C15 and C17.

**System suitability** Reference solution:

- **resolution:** minimum 2.0 between the peaks due to ginkgolic acids C13 and C15;
- **symmetry factor:** 0.8 to 2.0 for the peaks due to ginkgolic acids C13, C15 and C17.

Calculate the content in parts per million of ginkgolic acids expressed as ginkgolic acid C17, using the following expression:

$$\frac{A_1 \times m_2 \times p \times 2000}{A_2 \times m_1}$$

- $A_1$  = sum of the areas of the peaks due to the ginkgolic acids C13, C15 and C17 in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to ginkgolic acid C17 in the chromatogram obtained with the reference solution;
- $m_1$  = mass of the extract to be examined used to prepare the test solution, in grams;
- $m_2$  = mass of ginkgolic acids CRS used to prepare the reference solution, in grams;
- $p$  = percentage content of ginkgolic acid C17 in ginkgolic acids CRS.

Ph Eur

## Ginseng

(Ph. Eur. monograph 1523)

Ph Eur

### DEFINITION

Whole or cut dried root, designated white ginseng; treated with steam and then dried, designated red ginseng, of *Panax ginseng* C.A.Mey.

### Content

Minimum 0.40 per cent for the sum of ginsenosides Rg1 ( $C_{42}H_{72}O_{14} \cdot 2H_2O$ ;  $M_r$  837) and Rb1 ( $C_{54}H_{92}O_{23} \cdot 3H_2O$ ;  $M_r$  1163) (dried drug).

### IDENTIFICATION

**A.** The principal root is fusiform or cylindrical, sometimes branched, up to about 20 cm long and 2.5 cm in diameter, and may be curved or markedly re-curved. The surface is pale yellow to cream in white ginseng, brownish-red in red ginseng and shows longitudinal ridges. Stem scars may be seen at the crown. The fracture is short. The transversely cut surface shows a wide outer zone with scattered orange-red resin canals and a finely radiate inner region. The rootlets, numerous in the lower part of white ginseng, are normally absent in red ginseng.

**B.** Microscopic examination (2.8.23). The powder is pale yellow. Examine under a microscope using chloral hydrate solution R. The powder shows the following diagnostic characters (Figure 1523.-1): abundant fragments of parenchymatous cells [A, E] with thin [Ea] or slightly thickened [Aa] walls, some of which contain cluster crystals of calcium oxalate [Ab]; fragments of large secretory canals [Eb] containing yellowish-brown resin in granular masses [Ec]; non-lignified tracheids and partially lignified vessels with spiral or reticulate thickening, isolated [J]; fragments of xylem (longitudinal section [C], transverse section [F]) consisting of vessels [Ca, Fa] and thin-walled parenchymatous cells [Cb, Fb]; isolated cluster crystals of calcium oxalate [D, G]; fragments of cork (surface view [B], transverse section [H]) often associated with phelloderm having slightly thickened cells [Ha] and with the outer layers

of the cortical parenchyma [Hb]. Examine under a microscope using a 50 per cent V/V solution of glycerol R. The starch granules [K] are very abundant, simple or compound, and range from 1-10 µm in diameter. In red ginseng, the starch granules are deformed and often destroyed by treating with steam, or may be absent.

Figure 1523.-1. – Illustration for identification test B of powdered herbal drug of ginseng

### C. Thin-layer chromatography (2.2.27).

**Test solution** Boil 1.0 g of the powdered herbal drug (355) (2.9.12) under a reflux condenser with 10 mL of a 70 per cent V/V solution of methanol R for 15 min. Filter after cooling and dilute to 10.0 mL with methanol R.

**Reference solution** Dissolve 5.0 mg of aescin R and 5.0 mg of arbutin R in 1 mL of methanol R.

**Plate** TLC silica gel plate R (5-40 µm) [or TLC silica gel plate R (2-10 µm)].

**Mobile phase** ethyl acetate R, water R, butanol R (25:50:100 V/V/V); allow the mixture to separate for 10 min and use the upper layer.

**Application** 20 µL [or 4 µL] as bands.

**Development** Over 10 cm [or 5 cm] in an unsaturated tank.

**Drying** In air.

**Detection** Treat with anisaldehyde solution R and heat at 105-110 °C for 5-10 min; examine in daylight.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution.

Figure 1523.-2. – Chromatogram for the assay of ginseng: test solution

Top of the plate	
Arbutin: a brown zone	A violet zone (ginsenosides Rg1 + Rg2) A faint violet zone (ginsenoside Rf) A violet zone (ginsenoside Rc) A violet zone (ginsenoside Rd) A faint violet zone
Aescin: a grey zone	A violet zone (ginsenoside Rc)
Reference solution	A violet zone (ginsenosides Rb1 + Rb2) Test solution

bottomed flask. After adding a few grains of pumice, boil on a water-bath under a reflux condenser for 1 h. After cooling, centrifuge and collect the supernatant. Treat the residue as described above. Mix the collected liquids and evaporate to dryness under reduced pressure at a temperature not exceeding 60 °C. Take up the residue with 20.0 mL of a mixture of 20 volumes of *acetonitrile R* and 80 volumes of *water R*. Dilute 2.0 mL of the solution to 10.0 mL with a mixture of 20 volumes of *acetonitrile R* and 80 volumes of *water R*. Filter through a suitable membrane filter (nominal pore size 0.45 µm) before injection.

**Reference solution** Dissolve 3.0 mg of *ginsenoside Rg1 CRS*, 3.0 mg of *ginsenoside Re R*, 3.0 mg of *ginsenoside Rf R* and 3.0 mg of *ginsenoside Rb1 CRS* in *methanol R* and dilute to 10.0 mL with the same solvent.

**Column:**

- size:  $l = 0.125$  m,  $\varnothing = 4.6$  mm;
- stationary phase: *octadecylsilyl silica gel for chromatography R* (5 µm);
- temperature: 35 °C.

**Mobile phase:**

- mobile phase A: *water for chromatography R* adjusted to pH 2 with *phosphoric acid R*;
- mobile phase B: *acetonitrile R1*;

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 8	80	20
8 - 40	80 → 60	20 → 40
40 - 45	60 → 40	40 → 60
45 - 47	40 → 0	60 → 100
47 - 52	0	100

**TESTS**

***Panax quinquefolium***

Examine the chromatograms obtained in the assay. The chromatogram obtained with the test solution shows a peak due to ginsenoside Rf (see Figure 1523.-2). In the case of a substitution by *Panax quinquefolium*, no peak due to ginsenoside Rf is present.

**Loss on drying (2.2.32)**

Maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C.

**Total ash (2.4.16)**

Maximum 7.0 per cent.

**Ash insoluble in hydrochloric acid (2.8.1)**

Maximum 1.0 per cent.

**ASSAY**

Liquid chromatography (2.2.29).

**Test solution** Reduce about 50 g to a powder (355) (2.9.12). Place 1.00 g of the powdered herbal drug and 70 mL of a 50 per cent V/V solution of *methanol R* in a 250 mL round-

**Flow rate** 1.0 mL/min.

**Detection** Spectrophotometer at 203 nm.

**Equilibration** 20 min.

**Injection** 20 µL.

**Elution order** Order indicated in the composition of the reference solution; record the retention times of these substances.

**System suitability** Reference solution:

— **resolution:** minimum 1.0 between the peaks due to ginsenoside Rg1 and ginsenoside Re.

Locate the peaks due to ginsenoside Rb1 and ginsenoside Rg1 in the chromatogram obtained with the test solution.

Calculate the percentage content of ginsenosides Rb1 and Rg1 using the following expression:

$$\frac{A_1 \times m_2 \times p_1}{A_3 \times m_1 \times 100} + \frac{A_2 \times m_3 \times p_2}{A_4 \times m_1 \times 100}$$

- $A_1$  = area of the peak due to ginsenoside Rb1 in the chromatogram obtained with the test solution;  
 $A_2$  = area of the peak due to ginsenoside Rg1 in the chromatogram obtained with the test solution;  
 $A_3$  = area of the peak due to ginsenoside Rb1 in the chromatogram obtained with the reference solution;  
 $A_4$  = area of the peak due to ginsenoside Rg1 in the chromatogram obtained with the reference solution;  
 $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;  
 $m_2$  = mass of *ginsenoside Rb1 CRS* used to prepare the reference solution, in milligrams;  
 $m_3$  = mass of *ginsenoside Rg1 CRS* used to prepare the reference solution, in milligrams;  
 $p_1$  = percentage content of ginsenoside Rb1 in *ginsenoside Rb1 CRS*;  
 $p_2$  = percentage content of ginsenoside Rg1 in *ginsenoside Rg1 CRS*.

Ph Eur

## Ginseng Dry Extract

(Ph. Eur. monograph 2356)

Ph Eur

**DEFINITION**

Dry extract produced from *Ginseng* (1523).

**Content**

Minimum 4.0 per cent of the sum of ginsenosides Rb1, Rb2, Rc, Rd, Re, Rf, Rg1 and Rg2, expressed as ginsenoside Rb1 ( $C_{34}H_{52}O_{23}$ ;  $M_r$  1109) (dried extract).

**PRODUCTION**

The extract is produced from the herbal drug by a suitable procedure using a hydroalcoholic solvent equivalent in strength to ethanol (35-90 per cent *V/V*).

**CHARACTERS****Appearance**

Light brownish-yellow, hygroscopic powder or brittle mass.

**IDENTIFICATION**

Thin-layer chromatography (2.2.27).

**Test solution** Dissolve 0.15 g of the extract to be examined in 10 mL of a 70 per cent *V/V* solution of *methanol R*.

**Reference solution** Dissolve 0.15 g of *ginseng dry extract HRS* in 10 mL of a 70 per cent *V/V* solution of *methanol R*.

**Plate** TLC silica gel plate R (5-40  $\mu\text{m}$ ) [or TLC silica gel plate R (2-10  $\mu\text{m}$ )].

**Mobile phase** ethyl acetate R, water R, butanol R (25:50:100 *V/V/V*); allow the phases to separate for 10 min and use the upper layer.

**Application** 20  $\mu\text{L}$  [or 4  $\mu\text{L}$ ] as bands of 10 mm [or 8 mm].

**Development** Over a path of 10 cm [or 5 cm] in an unsaturated tank.

**Drying** In air.

**Detection** Treat with *anisaldehyde solution R* and heat at 105-110 °C for 5-10 min; examine in daylight.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatograms obtained with the test solution and the reference solution.

Top of the plate	
A violet zone (ginsenosides Rg1 + Rg2)	A violet zone (ginsenosides Rg1 + Rg2)
A faint violet zone (ginsenoside Rf)	A faint violet zone (ginsenoside Rf)
A violet zone (ginsenoside Re)	A violet zone (ginsenoside Re)
A violet zone (ginsenoside Rd)	A violet zone (ginsenoside Rd)
A faint violet zone	A faint violet zone
A violet zone (ginsenoside Rc)	A violet zone (ginsenoside Rc)
A faint violet zone	A faint violet zone
A violet zone (ginsenosides Rb1 + Rb2)	A violet zone (ginsenosides Rb1 + Rb2)
Several unresolved violet and greenish zones	Several unresolved violet and greenish zones
Reference solution	Test solution

**TESTS**

**Loss on drying** (2.8.17)

Maximum 7.0 per cent.

**ASSAY**

Liquid chromatography (2.2.29).

**Buffer solution** Dissolve 3.5 g of *disodium hydrogen phosphate dihydrate R* and 7.2 g of *potassium dihydrogen phosphate R* in water R and dilute to 1000 mL with the same solvent.

**Test solution** Dissolve 0.100 g of the extract to be examined in the buffer solution and dilute to 10.0 mL with the buffer solution. Prepare a ready-to-use sample-preparation cartridge containing 0.50 g of octadecylsilyl silica gel (45  $\mu\text{m}$ ), using 5 mL of *methanol R* followed by 20 mL of *water R*. Apply 5.0 mL of the solution to be analysed to the top of the cartridge. Wash the cartridge with 20 mL of *water R* followed by 15 mL of a 30 per cent *V/V* solution of *methanol R*. Discard the eluates after confirming that no ginsenosides are present, otherwise repeat the preparation of the solution with another brand of cartridge where no ginsenosides are eluted with a 30 per cent *V/V* solution of *methanol R*. Elute the cartridge with 20 mL of *methanol R*; collect the eluate. Under reduced pressure, evaporate the eluate to dryness. Dissolve the residue in 2.0 mL of *methanol R*. Filter through a suitable membrane filter (nominal pore size 0.45  $\mu\text{m}$ ).

**Reference solution (a)** Dissolve 0.100 g of *ginseng dry extract HRS* in the buffer solution and dilute to 10.0 mL with the buffer solution. Prepare a ready-to-use sample-preparation cartridge containing 0.50 g of octadecylsilyl silica gel (45  $\mu\text{m}$ ), using 5 mL of *methanol R* followed by 20 mL of *water R*. Apply 5.0 mL of the solution to be analysed to the top of the cartridge. Wash the cartridge with 20 mL of

water R followed by 15 mL of a 30 per cent V/V solution of methanol R. Discard the eluates after confirming that no ginsenosides are present, otherwise repeat the preparation of the solution with another brand of cartridge where no ginsenosides are eluted with a 30 per cent V/V solution of methanol R. Elute the cartridge with 20 mL of methanol R; collect the eluate. Under reduced pressure, evaporate the eluate to dryness. Dissolve the residue in 2.0 mL of methanol R. Filter through a suitable membrane filter (nominal pore size 0.45 µm).

**Reference solution (b)** Dissolve 3.0 mg of ginsenoside Rb1 CRS in methanol R and dilute to 5.0 mL with the same solvent.

**Reference solution (c)** Dissolve 3.0 mg of ginsenoside Rg2 R in methanol R and dilute to 5.0 mL with the same solvent.

**Reference solution (d)** Dilute 1.0 mL of reference solution (b) to 2.0 mL with reference solution (c).

**Column:**

- size:  $l = 0.125$  m,  $\varnothing = 4.6$  mm;
- stationary phase: octadecylsilyl silica gel for chromatography R (5 µm);
- temperature: 35 °C.

**Mobile phase:**

- mobile phase A: water R adjusted to pH 2 with phosphoric acid R;
- mobile phase B: acetonitrile R1;

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 8	80	20
8 - 40	80 → 60	20 → 40
40 - 45	60 → 40	40 → 60
45 - 47	40 → 0	60 → 100

**Flow rate** 1.0 mL/min.

**Detection** Spectrophotometer at 203 nm.

**Injection** 20 µL.

**Elution order** Ginsenoside Rg1, ginsenoside Re, ginsenoside Rf, ginsenoside Rb1, ginsenoside Rg2, ginsenoside Rc, ginsenoside Rb2, ginsenoside Rd; depending on the operating conditions and the state of the column, ginsenoside Rb1 may elute before or after ginsenoside Rg2.

**Identification of peaks** Use the chromatogram supplied with ginseng dry extract HRS and the chromatogram obtained with reference solution (a) to identify the peaks due to ginsenosides Rg1, Re, Rf, Rc, Rb2 and Rd; use the chromatogram obtained with reference solution (b) to identify the peak due to ginsenoside Rb1; use the chromatogram obtained with reference solution (c) to identify the peak due to ginsenoside Rg2.

**Relative retention:** With reference to ginsenoside Rb1 (retention time = about 33 min): ginsenoside Rg1 = about 0.53; ginsenoside Re = about 0.54; ginsenoside Rf = about 0.88; ginsenoside Rg2 = about 0.98; ginsenoside Rc = about 1.04; ginsenoside Rb2 = about 1.08; ginsenoside Rd = about 1.17.

**System suitability** Reference solution (d):

- resolution: minimum 1.5 between the peaks due to ginsenosides Rg2 and Rb1.

Calculate the percentage content of the sum of ginsenosides Rb1, Rb2, Rc, Rd, Re, Rf, Rg1 and Rg2, expressed as ginsenoside Rb1, using the following expression:

$$\frac{A_1 \times m_2 \times p \times 0.8}{A_2 \times m_1}$$

- $A_1$  = sum of the areas of the peaks due to ginsenosides Rb1, Rb2, Rc, Rd, Re, Rf, Rg1 and Rg2 in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to ginsenoside Rb1 in the chromatogram obtained with reference solution (b);
- $m_1$  = mass of the extract to be examined used to prepare the test solution, in grams;
- $m_2$  = mass of ginsenoside Rb1 CRS used to prepare reference solution (b), in grams;
- $p$  = percentage content of ginsenoside Rb1 in ginsenoside Rb1 CRS.

Ph Eur

## Glehnia Littoralis Root

### DEFINITION

Glehnia Littoralis Root is the dried and peeled root of *Glehnia littoralis* F. Schmidt ex Miq.

It is collected in summer and autumn, removed from rootlets and dried.

### IDENTIFICATION

**A.** The root is slender-cylindrical, 9 cm to 30 cm in length and 2 mm to 15 mm in diameter. The outer surface is pale buffish-white to buff, somewhat rough with occasional fragments of brown cork; fine longitudinal wrinkles and grooves and brownish yellow punctiform scars of rootlets. The top is slender, sometimes marked with the yellowish brown rhizome base; the greater part of the root is thick, narrowing towards the distal end. The root is often cut transversely to give discs 6 mm to 15 mm in diameter and 1 mm thick, or short cylinders 3 mm to 9 mm in diameter and 10 mm to 20 mm long, or short sticks 2 mm in diameter and 15 mm to 60 mm long. The cut surface (a transverse section of the root) shows concentric rings of buff and golden brown, especially on the larger diameter roots, which also sometimes have a small circular cavity in the centre.

**B.** Reduce to a powder, Appendix XVII A. The powder is pale buff to buff. Examine under a microscope using chloral hydrate solution. The powder shows the following characters: abundant parenchyma of several types including large rounded rectangular, oval or bottle shaped thin walled cells often arranged in rows or groups; smaller sub-rectangular or irregular cells with slightly thickened walls and elongated rectangular thin walled cells; fragments of xylem vessels and tracheids with reticulate or scalariform thickening, singly or in groups; bundles of narrow, thin walled fibres; secretory canals with brownish-yellow contents. Examine under a microscope using water. Many of the parenchyma cells show uniformly granular contents and abundant fragments of a similar granular material occur throughout the slide.

**C.** Carry out the method for high-performance thin-layer chromatography, Appendix XI W, using the following solutions.

- (1) Mix with the aid of ultrasound 1.0 g of the powdered herbal drug (425) with 5 mL of methanol, centrifuge and use the supernatant liquid.
- (2) 0.0125% w/v of ursolic acid and 0.0125% w/v of beta-amyrin in methanol.
- (3) Dilute 1 volume of solution (2) to 4 volumes with methanol.
- (4) 0.025% w/v of thymol and 0.125% v/v of linalool in methanol.

(5) 0.05% w/v of *bergapten* in *methanol*.

#### CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *high-performance silica gel F<sub>254</sub>* (Merck silica gel 60 F<sub>254</sub> HPTLC plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 18 µL of solution (1) and 2 µL of solutions (2) to (5), as 8 mm bands.

(d) Develop the plate to 7 cm.

(e) After removal of the plate, dry in a current of air and examine under *ultraviolet light (366 nm)*.

(f) Dip the plate in freshly-prepared *anisaldehyde solution*, heat at 100° for 5 minutes and examine under white light.

#### MOBILE PHASE

1 volume of *ethyl acetate* and 2 volumes of *cyclohexane*.

#### SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (4) shows two clearly separated bands under white light.

#### CONFIRMATION

The chromatogram obtained with solution (1) under 366 nm, should show no bands above the band for *bergapten* in the chromatogram obtained with solution (5). Bands above *bergapten* indicate the presence of *Adenophora* root.

The chromatogram obtained with solution (1) when observed in white light shows the presence of all bands described for solution (1) as shown in the table. In the chromatogram obtained with solution (1) no orange band should be seen above the orange band for *thymol* seen in solution (4) and would indicate the presence of *Adenophora* root.

Top of the plate		
An intense purple band		
A faint purple-brown band		
A faint to equivalent greenish-brown band	A purple band (beta-amyrin)	A diffuse orange band (thymol)
A very faint to equivalent purple-brown band		A diffuse brown band (linalool)
A blue band		
A very faint to equivalent greenish-brown band	A blue band (ursolic acid)	
An intense to equivalent purple band		
Solution (1)	Solution (2) and (3)	Solution (4)

#### TESTS

##### Foreign matter

Not more than 2%, Appendix XI D.

##### Loss on drying

When dried for 2 hours at 105°, loses not more than 11.0% of its weight, Appendix IX D. Use 1 g.

##### Total ash

Not more than 5.0%, Appendix XI J.

#### Acid-insoluble ash

Not more than 0.5%, Appendix XI K.

#### ANNEX

*This section is non-mandatory.*

#### DNA reference sequence

A DNA reference sequence for the identity of *Glehnia Littoralis* Root is published in *Supplementary Chapter VII D*.

## Goldenrod

(Ph. Eur. monograph 1892)

Ph Eur

#### DEFINITION

Whole or cut, dried, flowering aerial parts of *Solidago gigantea* Aiton or *Solidago canadensis* L., their varieties or hybrids and/or mixtures of these.

#### Content

Minimum 2.5 per cent of flavonoids, expressed as hyperoside (C<sub>21</sub>H<sub>20</sub>O<sub>12</sub>; M<sub>r</sub> 464.4) (dried drug).

#### IDENTIFICATION

A. The stems are greenish-yellow or greenish-brown, partly tinted reddish, roundish, more or less conspicuously grooved, glabrous and smooth in the lower part, slightly or densely pubescent in the upper part. They are solid with a whitish pith.

The leaves are green, sessile, lanceolate, with a serrate margin, 8-12 cm long and about 1-3 cm wide, the upper surface is green and more or less glabrous, the lower surface is greyish-green and pubescent, especially on the veins. The inflorescence consists of a number of unilateral, curved racemes which together form a pyramidal panicle at the end of the stems.

Each capitulum has an involucre composed of linear-lanceolate, imbricated yellowish-green bracts, surrounding a single row of yellow ligulate florets about the same length as the involucre; yellow, radially arranged tubular florets, as long as, or longer, than the ligulate florets; a brownish inferior ovary surmounted by a white pappus of silky hairs.

B. Microscopic examination (2.8.23). The powder is green or greyish-green. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 1892.-1): pappus bristles, usually broken, consisting of multiseriate trichomes composed of elongated cells with the tips free from the surface and forming pointed projections over the entire length [J]; fragments of the mesophyll [F] with vascular bundles [Fa], oil glands [Fb] and palisade parenchyma [Fc]; fragments of the leaf epidermises [E, H] with sinuous or wavy-walled cells accompanied by palisade parenchyma [Ea] (upper epidermis), with whip-like, multicellular covering trichomes [Eb] and anomocytic stomata (mainly on the lower epidermis) (2.8.3) [Ha]; multicellular uniseriate covering trichomes from the stems and the margins of the leaves with up to 5 or 6 thick-walled cells [C]; in *Solidago canadensis* L., covering trichomes with a terminal cell that may be bent at a right angle [G]; fragments of the style [A] with short papillae [Aa] and long, slender papillae with wrinkled walls [Ab]; pollen grains with 3 germinal pores and a spiny exine [B]; a few rare fragments of the ovary with twin covering trichomes [D].

Figure 1892.-1. – Illustration for identification test B of powdered herbal drug of goldenrod

**C. Thin-layer chromatography (2.2.27).**

**Test solution** To 0.75 g of the powdered herbal drug (355) (2.9.12) add 5 mL of *methanol R* and boil in a water-bath under a reflux condenser for 10 min. Cool and filter.

**Reference solution** Dissolve 1.0 mg of *chlorogenic acid R*, 2.5 mg of *quercitrin R* and 2.5 mg of *rutoside trihydrate R* in 10 mL of *methanol R*.

**Plate** TLC silica gel plate *R*.

**Mobile phase** *anhydrous formic acid R*, *water R*, *methyl ethyl ketone R*, *ethyl acetate R* (6:6:18:30 V/V/V/V).

**Application** 20 μL of the test solution and 10 μL of the reference solution, as bands.

**Development** Over a path of 10 cm.

**Drying** At 100-105 °C.

**Detection** Treat with a 10 g/L solution of *diphenylboric acid aminoethyl ester R* in *methanol R* and then with a 50 g/L solution of *macrogol 400 R* in *methanol R*. Allow to stand for 30 min. Examine in ultraviolet light at 365 nm.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Quercitrin: a yellowish-brown fluorescent zone	A bluish-green fluorescent zone A faint to intense yellowish-brown fluorescent zone (quercitrin)
Chlorogenic acid: a light blue fluorescent zone	A more or less intense yellowish-brown zone A light blue fluorescent zone (chlorogenic acid) and/or a yellow fluorescent zone
Rutoside: an orange fluorescent zone	A faint to intense yellowish-brown fluorescent zone (rutoside)
Reference solution	Test solution

**TESTS**

**Foreign matter (2.8.2)**

Maximum 5 per cent of brownish parts and maximum 2 per cent of other foreign matter.

**Loss on drying (2.2.32)**

Maximum 10 per cent, determined on 0.500 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

**Total ash (2.4.16)**

Maximum 7.0 per cent.

**Ash insoluble in hydrochloric acid (2.8.1)**

Maximum 1.0 per cent.

**ASSAY**

**Stock solution** In a 100 mL round-bottomed flask, introduce 0.200 g of the powdered herbal drug (250) (2.9.12), add 1 mL of a 5 g/L solution of *hexamethylenetetramine R*, 20 mL of *acetone R* and 2 mL of *hydrochloric acid R1*. Boil the mixture under a reflux condenser for 30 min. Filter the liquid through a small plug of absorbent cotton into a 100 mL flask. Add the absorbent cotton to the residue in the round-bottomed flask, extract with 2 quantities, each of 20 mL of *acetone R*, each time boiling under a reflux condenser for 10 min. Allow to cool. Filter the combined acetone extracts through a filter paper into a volumetric flask. Rinse the flask and the filter paper and dilute to 100.0 mL with *acetone R*. Introduce 20.0 mL of the solution into a separating funnel, add 20 mL of *water R* and shake the mixture with 1 quantity of 15 mL and then with 3 quantities, each of 10 mL, of *ethyl acetate R*. Combine the ethyl acetate extracts in a separating funnel, wash twice with 50 mL of *water R* and filter the extracts over 10 g of *anhydrous sodium sulfate R* into a volumetric flask. Dilute to 50.0 mL with *ethyl acetate R*, rinsing the separating funnel and the sodium sulfate.

**Test solution** To 10.0 mL of the stock solution add 1.0 mL of *aluminium chloride reagent R* and dilute to 25.0 mL with a 5 per cent V/V solution of *glacial acetic acid R* in *methanol R*.

**Compensation solution** Dilute 10.0 mL of the stock solution to 25.0 mL with a 5 per cent V/V solution of *glacial acetic acid R* in *methanol R*.

Measure the absorbance of the test solution (2.2.25) at 425 nm after 30 min by comparison with the compensation solution.

Calculate the percentage content of flavonoids, expressed as hyperoside, using the following expression:

$$\frac{A \times 1.25}{m}$$

i.e. taking the value of the specific absorbance of hyperoside to be 500.

*A* = absorbance measured at 425 nm;  
*m* = mass of the herbal drug to be examined, in grams.

Ph Eur

## European Goldenrod

(Ph. Eur. monograph 1893)

Ph Eur

### DEFINITION

Whole or fragmented, dried, flowering aerial parts of *Solidago virgaurea* L.

### Content

Minimum 0.5 per cent and maximum 1.5 per cent of flavonoids, expressed as hyperoside ( $C_{21}H_{20}O_{12}$ ;  $M_r$  464.4) (dried drug).

### IDENTIFICATION

A. The stem is cylindrical, striated, the lower part often reddish-violet, sometimes entirely glabrous or pubescent with short, bent, apically directed hairs. The basal leaves are obovate or oblanceolate, with a serrate margin, and taper at the base into a long, winged petiole; the cauline leaves are alternate, smaller than the basal leaves and more elliptical in outline, with an entire or slightly toothed margin; they are sessile or with only a short petiole. Both surfaces of the leaves are glabrous or only slightly pubescent with a prominent reticulate venation on the lower surface. The capitula form a tightly packed panicle. At the base of the pedicels there are 2 small, linear bracts with scarious margins. The involucre consists of 2-4 rows of loosely arranged, imbricate bracts, each bract greenish-yellow with a smooth and shiny inner surface, the outer surface hairy or glabrous, with a scarious margin. Each capitulum contains 6-12 widely separated female ray florets, about twice as long as the bracts, and about 10-30 hermaphrodite, tubular florets. All florets are yellow. The brown, inferior ovary tapers towards the base and has a ribbed surface, covered with scattered hairs; it is surmounted by a whitish pappus composed of smooth or rough, bristly hairs.

B. Microscopic examination (2.8.23). The powder is light green. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figures 1893.-1 and 1893.-2): fragments of the upper epidermis of the leaf (surface view [B, H, M]), covered by a distinctly striated cuticle, composed of polygonal cells with straight, beaded, thickened walls [Ba, Ma], uniseriate, multicellular covering trichomes [Ha] or rounded, thick-walled, covering trichome scars with a pitted lumen [Mb], and a few anomocytic stomata (2.8.3) [Bb] sometimes accompanied by underlying palisade parenchyma [Bc]; fragments of the lower epidermis of the leaf (surface view [A, K, N]) covered by a slightly striated cuticle composed of cells with sinuous walls in the area of the lamina [Aa] or with more rigid walls near the veins [N], numerous anomocytic stomata (2.8.3) [Ab], occasional glandular trichomes with a unicellular stalk and a unicellular head [Ka, Na], covering trichomes some of which are pennant-like [Ac, F], uniseriate,

multicellular, with 1-3 thin-walled basal cells [Fa], a flagella-like distal cell [Fb], and an enlarged, more or less rounded cell [Fc] between them, others are uniseriate, multicellular (up to about 10 cells), with thick, finely wrinkled walls and a rigid conical distal cell (side view [E]); rare fragments from the ovary [G] bearing paired, covering trichomes with a distinctly pitted central wall and a bifid apex (surface view [Ga], side view [Gb]); vascular tissue from the stems [L] composed of vessels [La] and groups of fibres [Lb]; fragments of the epidermis of the petals with a striated cuticle, through which run fine spiral vessels [S], and bearing biseriate glandular trichomes (side view [P]); spherical pollen grains, with 3 germinal pores and a spiny exine [J]; abundant pappus hairs and their fragments [C, D], multiseriate with the marginal cells overlapping outwards; fragments of parenchyma [Q], some showing cells containing small, isolated cluster crystals of calcium oxalate [Qa]; fragments of bracts [R] with a finely striated cuticle, polygonal cells [Ra], bearing pennant-like covering trichomes [Rb] and whose margin bears uniseriate, multicellular covering trichomes [Rc].

Figure 1893.-1. – Illustration for identification test B of powdered herbal drug of European goldenrod

C. Thin-layer chromatography (2.2.27) as described in the test for *Solidago gigantea* Aiton and *Solidago canadensis* L.  
**Results** See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other fluorescent zones may be present in the chromatogram obtained with the test solution.

Reference solution	Test solution

## TESTS

### Foreign matter (2.8.2)

Maximum 5 per cent of brown coloured matter and maximum 5 per cent of other foreign matter.

### *Solidago gigantea* Aiton and *Solidago canadensis* L Thin-layer chromatography (2.2.27).

**Test solution** To 0.75 g of the powdered herbal drug (355) (2.9.12) add 5 mL of *methanol R* and heat on a water-bath under a reflux condenser for 10 min. Cool and filter.

**Reference solution** Dissolve 1.0 mg of *chlorogenic acid R*, 2.5 mg of *quercitrin R* and 2.5 mg of *rutoside trihydrate R* in 10 mL of *methanol R*.

**Plate** TLC silica gel plate *R*.

**Mobile phase** *anhydrous formic acid R*, *water R*, *methyl ethyl ketone R*, *ethyl acetate R* (6:6:18:30 V/V/V/V).

**Application** 20 µL as bands.

**Development** Over a path of 10 cm.

**Drying** In air.

**Detection** Treat the plate with a 10 g/L solution of *diphenylboric acid aminoethyl ester R* in *methanol R* and then with a 50 g/L solution of *macrogol 400 R* in *methanol R*. Examine in ultraviolet light at 365 nm after 30 min.

**Results** The chromatogram obtained with the test solution shows no strong orange fluorescent zone similar in position to the zone of quercitrin in the chromatogram obtained with the reference solution.

### Loss on drying (2.2.32)

Maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

### Total ash (2.4.16)

Maximum 8.0 per cent.

## ASSAY

**Stock solution** In a 100 mL round-bottomed flask, place 0.200 g of the powdered herbal drug (355) (2.9.12), add 1 mL of a 5 g/L solution of *hexamethylenetetramine R*, 20 mL of *acetone R* and 2 mL of *hydrochloric acid R1*. Boil the mixture in a water-bath under a reflux condenser for 30 min. Filter the liquid through a small plug of absorbent cotton into a 100 mL flask. Add the absorbent cotton to the residue in the round-bottomed flask and extract with 2 quantities, each of 20 mL, of *acetone R*, each time boiling under a reflux condenser for 10 min. Allow to cool. Filter the combined acetone extracts through filter paper, dilute to 100.0 mL with *acetone R*, rinsing the volumetric flask and the filter paper with acetone. Introduce 20.0 mL of the solution into a suitable separating funnel, add 20 mL of *water R* and shake the mixture with 1 quantity of 15 mL and then with 3 quantities, each of 10 mL, of *ethyl acetate R*. Combine the ethyl acetate extracts in a separating funnel, wash twice with 50 mL of *water R* and filter the extracts over 10 g of *anhydrous sodium sulfate R* into a volumetric flask. Dilute to 50.0 mL with *ethyl acetate R*, rinsing the separating funnel and the sodium sulfate.

**Test solution** To 10.0 mL of the stock solution add 1.0 mL of *aluminium chloride reagent R* and dilute to 25.0 mL with a 5 per cent V/V solution of *glacial acetic acid R* in *methanol R*.

**Compensation liquid** Dilute 10.0 mL of the stock solution to 25.0 mL with a 5 per cent V/V solution of *glacial acetic acid R* in *methanol R*.

After 30 min, measure the absorbance (2.2.25) of the test solution at 425 nm by comparison with the compensation liquid.

Calculate the percentage content of flavonoids, expressed as hyperoside, using the following expression:

$$\frac{A \times 1.25}{m} \quad ;$$

i.e. taking the specific absorbance of hyperoside to be 500.

*A* = measured absorbance at 425 nm;  
*m* = mass of the herbal drug to be examined, in grams.

Ph Eur

## Goldenseal Root

(Goldenseal Rhizome, Ph. Eur. monograph 1831)

Ph Eur

### DEFINITION

Whole or cut, dried rhizome and root of *Hydrastis canadensis* L.

### Content

- *hydrastine* ( $C_{21}H_{21}NO_6$ ;  $M_r$  383.4): minimum 2.5 per cent (dried drug);
- *berberine* ( $C_{20}H_{18}NO_4$ ;  $M_r$  336.4): minimum 3.0 per cent (dried drug).

### IDENTIFICATION

A. The rhizome is tortuous and knotty, about 5 cm long and 5-10 mm thick. The surface is yellowish or brownish-grey, irregularly wrinkled, and bears the remains of numerous slender, wiry roots; stem bases and scale leaves occur on the upper surface. The fracture is short and resinous.

The transversely cut surface is yellowish-brown and shows a fairly wide bark, a ring of 12-20 widely separated xylem bundles and a large, central pith.

B. Microscopic examination (2.8.23). Reduce to a powder (180) (2.9.12). The powder is greenish-yellow. Examine under a microscope using *chloral hydrate solution R*.

The powder shows the following diagnostic characters (Figure 1831.-1): abundant thin-walled fragments of parenchyma [A, G, K]; occasional fragments of yellowish-brown cork from the rhizome and roots (surface view [J], transverse section [F]); groups of small vessels with conspicuous perforations in the oblique end walls [L] and with simple or bordered, slit-shaped pits [B, D, E]; infrequent groups of thin-walled, pitted fibres [H], usually found associated with the vessels; numerous ovoid or spherical, orange-brown granular masses. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows abundant starch granules [C], mostly simple but sometimes compound with up to 4 components; the granules are small, spherical or ovoid, up to about 10  $\mu$ m in diameter, occasionally with a small, rounded or slit-shaped hilum.

C. Thin-layer chromatography (2.2.27).

**Test solution** To 250 mg of the powdered herbal drug (180) (2.9.12) add 4 mL of a mixture of 20 volumes of *water R* and 80 volumes of *methanol R*. Sonicate for 10 min and filter. Wash the residue with 2 quantities, each of 2 mL, of *methanol R*. Combine the solutions and dilute to 20 mL with *methanol R*.

**Reference solution** Immediately before use, dissolve 5 mg of *hydrastine hydrochloride R* and 5 mg of *berberine chloride R* in 20 mL of *methanol R*.

**Plate** TLC silica gel plate *R* (5-40  $\mu$ m) [or TLC silica gel plate *R* (2-10  $\mu$ m)].

**Mobile phase** *anhydrous formic acid R*, *water R*, *ethyl acetate R* (10:10:80 *V/V/V*).

**Application** 20  $\mu$ L [or 2  $\mu$ L] as bands.

**Development** Over a path of 15 cm [or 6 cm].

**Drying** In air.

**Detection** Examine in ultraviolet light at 365 nm.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other fluorescent zones may be present in the chromatogram obtained with the test solution.

Figure 1831.-1. – Illustration for identification test B of powdered herbal drug of goldenseal rhizome

Hydrastine: a deep blue fluorescent zone	A deep blue fluorescent zone (hydrastine)
	A bright light blue fluorescent zone (hydrastinine)
	A deep blue fluorescent zone
Reference solution	Test solution

### TESTS

**Loss on drying** (2.2.32)

Maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (180) (2.9.12) by drying in an oven at 105 °C for 2 h.

**Total ash** (2.4.16)

Maximum 8.0 per cent.

**Ash insoluble in hydrochloric acid** (2.8.1)

Maximum 4.0 per cent.

### ASSAY

Liquid chromatography (2.2.29).

**Test solution** To 1.000 g of the powdered herbal drug (355) (2.9.12) in a 100 mL round-bottomed flask, add 50 mL of a 1 per cent *V/V* solution of *concentrated ammonia R* in *ethanol (96 per cent) R* and boil the mixture under a reflux condenser for 30 min. Allow to cool to room temperature and filter the liquid through a plug of absorbent cotton into a flask. Add the plug of absorbent cotton to the residue in the

round-bottomed flask and repeat the extraction with a further 2 quantities, each of 30 mL, of a 1 per cent *V/V* solution of concentrated ammonia R in ethanol (96 per cent) R, each time boiling under a reflux condenser for 10 min and filtering through a plug of absorbent cotton in the same flask as previously. Filter the combined filtrates through a filter paper into a 250 mL round-bottomed flask, and rinse the flask and the filter with 20 mL of a 1 per cent *V/V* solution of concentrated ammonia R in ethanol (96 per cent) R. Evaporate the filtrate to dryness *in vacuo* in a water-bath at 55 °C. Dissolve the residue in 50.0 mL of the mobile phase. Dilute 10.0 mL of this solution to 50.0 mL with the mobile phase.

**Reference solution** Immediately before use, dissolve 10.0 mg of hydrastine hydrochloride CRS and 10.0 mg of berberine chloride CRS in methanol R and dilute to 100.0 mL with the same solvent.

**Column:**

- size:  $l = 0.125$  m,  $\varnothing = 4$  mm;
- stationary phase: end-capped octadecylsilyl silica gel for chromatography R (5  $\mu$ m).

**Mobile phase** Dissolve 9.93 g of potassium dihydrogen phosphate R in 730 mL of water R, add 270 mL of acetonitrile R and mix.

**Flow rate** 1.2 mL/min.

**Detection** Spectrophotometer at 235 nm.

**Injection** 10  $\mu$ L.

**System suitability** Reference solution:

- **elution order:** order indicated in the composition of the reference solution; record the retention times of these substances;
- **resolution:** minimum 1.5 between the peaks due to hydrastine and berberine.

Using the retention times determined from the chromatogram obtained with the reference solution, locate in the chromatogram obtained with the test solution the components of the reference solution.

Calculate the percentage content of each alkaloid (hydrastine and berberine) using the following expression:

$$\frac{A_1 \times m_2 \times p}{A_2 \times m_1} \times 2.5$$

- $A_1$  = area of the peak due to hydrastine or berberine in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to hydrastine or berberine in the chromatogram obtained with the reference solution;
- $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;
- $m_2$  = mass of hydrastine hydrochloride CRS or berberine chloride CRS used to prepare the reference solution, in grams;
- $p$  = percentage content of hydrastine in hydrastine hydrochloride CRS or berberine in berberine chloride CRS.

Ph Eur

## Green Tea

(Ph. Eur. monograph 2668)

Ph Eur

**DEFINITION**

Young, unfermented leaf of *Camellia sinensis* (L.) Kuntze rapidly stabilised by short time heating and then dried.

**Content**

- **caffeine** ( $C_8H_{10}N_4O_2$ ;  $M_r$  194.2): minimum 1.5 per cent (dried drug);
- **total catechins, expressed as (-)-epigallocatechin-3-O-gallate** ( $C_{22}H_{18}O_{11}$ ;  $M_r$  458.4): minimum 8.0 per cent (dried drug).

**CHARACTERS**

Greyish-green leaf with petiole removed, rolled and often folded or twisted, whole or cut before being rolled.

**IDENTIFICATION**

A. Examine after allowing the leaf to unroll for a few minutes in warm water. The leaf is oval, elongated and acuminate. Starting at a quarter of the distance from the base, the margins are serrate with peculiarly shaped teeth bearing a small blackish point curved in a claw shape. The secondary veins branch from the midrib, curving near the margins of the lamina so that they anastomose in an arc. Flexuous, conical, covering trichomes are abundant on the lower surface of the leaves.

B. Microscopic examination (2.8.23). The powder is greenish-grey. Examine under a microscope using chloral hydrate solution R. The powder shows the following diagnostic characters (Figure 2668.-1): numerous fragments of unicellular, flexuous, thick-walled covering trichomes [E]; fragments of abaxial epidermis (surface view [A]) consisting of cells with slightly wavy walls [Aa], numerous anomocytic stomata (2.8.3) surrounded by 3 or 4 narrow subsidiary cells [Ab] and long, flexuous, thick-walled, unicellular covering trichomes, pointed at the apex [Ac]; fragments of adaxial epidermis (surface view [F]) consisting of cells with rigid, slightly thickened walls [Fa], accompanied by cells of the underlying palisade parenchyma [Fb] and sometimes by the end of a sclereid [Fc]; numerous isolated sclereids, often very ramified, with thick-walls and distinct channels [C]; fragments of lamina (transverse section [B]), showing the adaxial epidermis covered by a smooth cuticle [Ba], palisade parenchyma usually arranged in 2 layers [Bb], spongy parenchyma [Bc] including cells containing cluster crystals of calcium oxalate [Bd], and the abaxial epidermis [Be] with stomata; fragments of spiral vessels (longitudinal section [D]) accompanied by spongy parenchyma [Db] with some cells containing cluster crystals of calcium oxalate [Da]; vessels [G] accompanied by lignified fibres [Ga] from the principal veins.

C. Thin-layer chromatography (2.2.27).

**Test solution** To 0.1 g of the powdered herbal drug (355) (2.9.12) add 10 mL of a mixture of water R and ethanol (96 per cent) R (20:80 *V/V*). Sonicate for 10 min and filter.

**Reference solution** Dissolve 2 mg of (-)-epicatechin R and 5 mg of (-)-epigallocatechin-3-O-gallate R in methanol R and dilute to 10 mL with the same solvent.

**Plate** TLC silica gel F<sub>254</sub> plate R (5-40  $\mu$ m) [or TLC silica gel F<sub>254</sub> plate R (2-10  $\mu$ m)].

**Mobile phase** anhydrous formic acid R, acetone R, toluene R (10:45:45 *V/V/V*).

Figure 2668.-1. – Illustration for identification test B of powdered herbal drug of green tea

**Application** 30  $\mu$ L [or 5  $\mu$ L] as bands of 15 mm [or 8 mm].

**Development** Over a path of 10 cm [or 6 cm].

**Drying** In air.

**Detection** Treat with a freshly prepared 5 g/L solution of fast blue B salt R. Examine in daylight.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
(-)-Epicatechin: a reddish-brown zone	A reddish-brown zone ((-)-epicatechin) 1 or 2 reddish-brown zone(s)
(-)-Epigallocatechin-3-O-gallate: a reddish-brown zone	A reddish-brown zone ((-)-epigallocatechin-3-O-gallate)
Reference solution	Test solution

### TESTS

#### Loss on drying (2.2.32)

Maximum 8.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

#### Total ash (2.4.16)

Maximum 9.0 per cent.

### ASSAY

Liquid chromatography (2.2.29).

**Stabilising solution** Dissolve 250 mg of (ethylenedinitrilo)tetraacetic acid R and 250 mg of ascorbic acid R in 500 mL of water R, add 100 mL of acetonitrile R and dilute to 1000 mL with water R.

**Extraction solution** Place a sealed container filled with a mixture of water R and methanol R (30:70 V/V) in a water-bath at 70 °C for at least 30 min in order to reach the temperature.

**Test solution** Introduce 0.200 g of the powdered herbal drug (355) (2.9.12) into a test tube, place in a water-bath at 70 °C and add 5 mL of the extraction solution (pre-warmed to 70 °C). Stopper the tube and carefully mix using a vortex mixer. Continue heating the test tube in the water-bath for 10 min, mixing on the vortex mixer after 5 min and 10 min. Remove the test tube from the water-bath, allow to cool and centrifuge at 2350 g for 10 min. Decant the supernatant liquid into a 10 mL volumetric flask. Repeat the extraction procedure again with 5 mL of extraction solution, combine the extracts in the same volumetric flask and dilute to 10.0 mL with a cold mixture of water R and methanol R (30:70 V/V). Dilute 1.0 mL of this solution to 20.0 mL with the stabilising solution. Filter through a membrane filter (nominal pore size 0.45  $\mu$ m).

**Reference solution (a)** Dissolve 20.0 mg of (-)-epigallocatechin-3-O-gallate CRS and 20.0 mg of caffeine CRS in water R and dilute to 25.0 mL with the same solvent. Dilute 2.0 mL of the solution to 50.0 mL with the stabilising solution. Filter through a membrane filter (nominal pore size 0.45  $\mu$ m).

**Reference solution (b)** Dissolve 0.100 g of green tea dry extract HRS in 5 mL of water R using sonication, add 1.0 mL of acetonitrile R and dilute to 10.0 mL with water R. Dilute 2.0 mL of the solution to 50.0 mL with the stabilising solution. Filter through a membrane filter (nominal pore size 0.45  $\mu$ m).

#### Column:

- size:  $l = 0.15$  m,  $\varnothing = 4.6$  mm;
- stationary phase: end-capped octadecylsilyl silica gel for chromatography R (3  $\mu$ m).

#### Mobile phase:

- mobile phase A: 0.05 per cent V/V solution of anhydrous formic acid R;

**Flow rate** 1 mL/min.

**Detection** Spectrophotometer at 210 nm.

**Injection** 10  $\mu$ L.

**Identification of peaks** Use the chromatogram supplied with green tea dry extract HRS and the chromatogram obtained with reference solution (b) to identify the peaks due to (+)-gallocatechin, (-)-epigallocatechin, (+)-catechin, (-)-

epigallocatechin-3-O-gallate, (-)-epicatechin, (-)-gallocatechin-3-O-gallate and (-)-epicatechin-3-O-gallate.

**System suitability** Reference solution (b):

— **resolution:** minimum 1.5 between the peaks due to (-)-epigallocatechin-3-O-gallate and (-)-epicatechin.

Calculate the percentage content of total catechins, expressed as (-)-epigallocatechin-3-O-gallate, using the following expression:

$$\frac{A_1 \times m_2 \times 0.32 \times p}{A_2 \times m_1}$$

- $A_1$  = sum of the area of the peaks due to catechins [(+)-gallocatechin, (-)-epigallocatechin, (+)-catechin, (-)-epigallocatechin-3-O-gallate, (-)-epicatechin, (-)-gallocatechin-3-O-gallate and (-)-epicatechin-3-O-gallate] in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to (-)-epigallocatechin-3-O-gallate in the chromatogram obtained with reference solution (a);
- $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;
- $m_2$  = mass of (-)-epigallocatechin-3-O-gallate CRS used to prepare reference solution (a), in grams;
- $p$  = percentage content of (-)-epigallocatechin-3-O-gallate in (-)-epigallocatechin-3-O-gallate CRS.

Calculate the percentage content of caffeine using the following expression:

$$\frac{A_1 \times m_2 \times 0.32 \times p}{A_2 \times m_1}$$

- $A_1$  = area of the peak due to caffeine in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to caffeine in the chromatogram obtained with reference solution (a);
- $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;
- $m_2$  = mass of caffeine CRS used to prepare reference solution (a), in grams;
- $p$  = percentage content of caffeine in caffeine CRS.

## STORAGE

Protected from moisture.

Ph Eur

## Guarana

(Ph. Eur. monograph 2669)

Ph Eur

### DEFINITION

Dried seed of *Paullinia cupana* Kunth (syn. *Paullinia sorbilis* Mart.).

### Content

Minimum 3.5 per cent of caffeine ( $C_8H_{10}N_4O_2$ ;  $M_r$  194.2) (dried drug).

### IDENTIFICATION

A. The seed is more or less spherical, about 12 mm in diameter, shiny, glabrous, dark brown with a large, light-coloured spot corresponding to the hilum.

B. Microscopic examination (2.8.23). Reduce to a powder without sieving. The powder is brownish and oily. Examine under a microscope using chloral hydrate solution R.

The powder shows the following diagnostic characters (Figure 2669.-1): polyhedral endosperm cells with thick cellulose walls; fragments of episperm cells with lobed and regularly thickened walls (surface view [D]) and forming a

palisade layer (transverse section [B, E]); numerous fragments of cotyledons with rounded to ovoid cells, with spaces between them [H] and filled with starch; more or less polyhedral sclereids with channelled walls, free [F] or in groups [A]; rare spiral vessels [G]; fragments of the embryo with thin-walled elongated cells (surface view [C]). Examine under a microscope using a 50 per cent V/V solution of glycerol R. The powder shows numerous rounded or oval starch granules [J], up to 30 µm long and 18 µm wide, simple or sometimes 2-3 compound, either free or included in the cells of the cotyledons.

Figure 2669.-1. – Illustration for identification test B of powdered herbal drug of guarana

C. Thin-layer chromatography (2.2.27).

**Test solution** To 1 g of the powdered herbal drug (355) (2.9.12) add 10 mL of methanol R, sonicate for 10 min, then centrifuge for 10 min and use the supernatant.

**Reference solution** Dissolve 2.0 mg of caffeine R and 1.0 mg of catechin R in 2 mL of methanol R.

**Plate** TLC silica gel F<sub>254</sub> plate R (2-10 µm).

**Mobile phase** anhydrous formic acid R, toluene R, acetone R (10:45:45 V/V/V).

**Application** 4 µL as bands of 8 mm.

**Development** In an unsaturated tank over a path of 6 cm.

**Drying** In a current of air at room temperature.

**Detection A** Examine in ultraviolet light at 254 nm.

**Results A** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint quenching zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Caffeine: an intense quenching zone	An intense quenching zone (caffeine)
Reference solution	Test solution

**Detection B** Heat at 100 °C for 2 min, then treat the still-hot plate with *fast blue B salt solution R* and examine in daylight.

**Results B** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Catechin: a reddish-brown zone	An intense reddish-brown zone (catechin) 2 red or brown zones of varying intensity  1 or 2 reddish-brown zones A reddish-brown zone
Reference solution	Test solution

## TESTS

### Loss on drying (2.2.32)

Maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C.

### Total ash (2.4.16)

Maximum 4.0 per cent.

## ASSAY

Liquid chromatography (2.2.29).

**Solution A** Dissolve 30.0 mg of *caffeine CRS* in the mobile phase and dilute to 100.0 mL with the mobile phase.

**Test solution** Introduce 0.500 g of the powdered herbal drug (355) (2.9.12) into a 100 mL round-bottomed flask and add 40 mL of *methanol R*. Heat in a water-bath at 70 °C under a reflux condenser for 30 min. Allow to cool and filter through a plug of absorbent cotton into a 100 mL volumetric flask. Transfer the absorbent cotton with the drug residue into the round-bottomed flask. Add 40 mL of *methanol R*, proceed as before and filter into the same volumetric flask. Rinse the round-bottomed flask and the filter with *methanol R*, add the rinsings to the volumetric flask and dilute to 100.0 mL with *methanol R*. Shake to homogenise the solution. Transfer 10.0 mL of this solution into a volumetric flask, add 30 mL of *water R* and dilute to 50.0 mL with the mobile phase. Filter through a membrane filter (nominal pore size 0.45 µm).

**Reference solution (a)** Dilute 5.0 mL of solution A to 50.0 mL with the mobile phase.

**Reference solution (b)** Dissolve 15.0 mg of (-)-*epicatechin R* in the mobile phase and dilute to 25.0 mL with the mobile phase. To 10.0 mL of the solution add 5 mL of solution A and dilute to 50.0 mL with the mobile phase.

### Column:

— size:  $l = 0.25$  m,  $\varnothing = 4.6$  mm;

— stationary phase: end-capped octadecylsilyl silica gel for chromatography R (5 µm).

**Mobile phase** *methanol R*, *water for chromatography R* (25:75 V/V).

**Flow rate** 1 mL/min.

**Detection** Spectrophotometer at 272 nm.

**Injection** 10 µL.

**Run time** 3 times the retention time of caffeine.

**Retention time** Caffeine = about 11 min.

**System suitability** Reference solution (b):

— resolution: minimum 2.0 between the peaks due to caffeine and (-)-epicatechin.

Calculate the percentage content of caffeine using the following expression:

$$\frac{A_1 \times m_2 \times p}{A_2 \times m_1 \times 2}$$

- $A_1$  = area of the peak due to caffeine in the chromatogram obtained with the test solution;  
 $A_2$  = area of the peak due to caffeine in the chromatogram obtained with reference solution (a);  
 $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;  
 $m_2$  = mass of *caffeine CRS* used to prepare solution A, in grams;  
 $p$  = percentage content of caffeine in *caffeine CRS*.

Ph Eur

## Hamamelis Bark

(Ph. Eur. monograph 2532)

Ph Eur

### DEFINITION

Cut, dried bark from the trunk and branches of *Hamamelis virginiana* L.

### Content

Minimum 5.0 per cent of tannins, expressed as pyrogallol ( $C_6H_6O_3$ ;  $M_r$  126.1) (dried drug).

### IDENTIFICATION

- A. Pieces of different lengths, channelled, sometimes quilled or in strips, up to 2 cm long and 3 mm thick. The outer surface is ochre-brown or reddish-brown and has a thin, whitish or greyish-brown cork with numerous lenticels. The inner surface is yellowish-brown or reddish-brown and is longitudinally striated. The fracture is splintery and fibrous.
- B. Microscopic examination (2.8.23). The powder is brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2532.-1): very abundant sclereids of 2 types: one type (more abundant) rounded, oval or subrectangular, isolated [C] but more often in groups [A], with heavily thickened and striated walls and numerous and branched channels, sometimes accompanied by cells containing prisms of calcium oxalate [Aa]; the other type much more regular in size and shape, polygonal, with walls only moderately thickened and with simple channels, occurring in dense

groups with no intercellular spaces [E], sometimes accompanied by cells containing prisms of calcium oxalate [Ea]; abundant groups of fibres [G], usually surrounded by a sheath of prisms of calcium oxalate [Gb]; fibres, very thick-walled and lignified, with an indistinct lumen [Ga]; thin-walled, parenchymatous cells of the phloem [D], sometimes filled with dark brown contents [Db]; uniseriate medullary rays, composed of cells with slightly thickened walls, somewhat rectangular (longitudinal section [Gc]) and rounded (tangential section [Da]); fragments of cork [H] consisting of thin-walled cells, polyhedral (surface view [B, Ha]), sometimes accompanied by an underlying layer of sclereids with slightly thickened and channelled walls [Hb]; abundant isolated prisms of calcium oxalate [F].

Figure 2532-1. – Illustration for identification test B of powdered herbal drug of hamamelis bark

C. Examine the chromatogram obtained in the test for *Corylus avellana* L. bark and twigs and *Hamamelis virginiana* L. twigs.

**Results** See below the sequence of zones present in the chromatogram obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the upper third of the chromatogram obtained with the test solution.

Top of the plate	
Gallic acid: a blue fluorescent zone	
Hamamelittannin: a blue fluorescent zone	An intense blue fluorescent zone (hamamelittannin) A blue fluorescent zone 2 or 3 blue fluorescent zones
Reference solution	Test solution

**TESTS**

*Corylus avellana* L. bark and twigs and *Hamamelis virginiana* L. twigs

Thin-layer chromatography (2.2.27).

**Test solution** To 1.0 g of the powdered herbal drug (355) (2.9.12) add 10.0 mL of methanol R, shake for 15 min and filter.

**Reference solution** Dissolve 5.0 mg of gallic acid R and 8.0 mg of hamamelittannin R in 5.0 mL of ethanol (60 per cent V/V) R.

**Plate** TLC silica gel F<sub>254</sub> plate R (5-40 µm) [or TLC silica gel F<sub>254</sub> plate R (2-10 µm)].

**Mobile phase** anhydrous formic acid R, water R, ethyl formate R (10:10:80 V/V/V).

**Application** 6 µL [or 2 µL] as bands of 10 mm [or 8 mm].

**Development** Over a path of 10 cm [or 6 cm].

**Drying** In air.

**Detection** Heat at 100 °C for 3 min; treat the plate whilst still hot with a 5 g/L solution of diphenylboric acid aminoethyl ester R in ethyl acetate R, allow to dry in air and examine in ultraviolet light at 365 nm.

**Results** The chromatogram obtained with the test solution shows no yellow or orange zones.

**Foreign matter (2.8.2)**

Maximum 3 per cent of branches and twigs and maximum 2 per cent of other foreign matter.

**Loss on drying (2.2.32)**

Maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

**Total ash (2.4.16)**

Maximum 6.0 per cent.

**ASSAY**

**Tannins (2.8.14)**

Carry out the determination with the following modifications.

**Preparation of the test solution** Introduce 0.150 g of the powdered herbal drug (355) (2.9.12) into a 250 mL round-bottomed flask, add 150 mL of water R and heat on a water-bath for 30 min. Cool under running water and transfer quantitatively to a 250 mL volumetric flask. Rinse the round-bottomed flask and collect the washings in the volumetric flask, dilute to 250.0 mL with water R and shake. Centrifuge 25 mL at 1000 g for 10 min.

**Total polyphenols** Use the supernatant instead of the filtrate described in the general method.

**Polyphenols not adsorbed by hide powder** Use the supernatant instead of the filtrate described in the general method.

Ph Eur

**Hamamelis Leaf**

(Ph. Eur. monograph 0909)

Ph Eur

**DEFINITION**

Whole or cut, dried leaf of *Hamamelis virginiana* L.

**Content**

Minimum 3 per cent of tannins, expressed as pyrogallol (C<sub>6</sub>H<sub>6</sub>O<sub>3</sub>; M<sub>r</sub> 126.1) (dried drug).

**IDENTIFICATION**

A. The leaf is green or greenish-brown, often broken, crumpled and compressed into more or less compact masses.

The lamina is broadly ovate or obovate; the base is oblique and asymmetric and the apex is acute or, rarely, obtuse. The margins of the lamina are roughly crenate or dentate. The venation is pinnate and prominent on the abaxial surface. Usually, 4-6 pairs of secondary veins are attached to the main vein, emerging at an acute angle and curving gently to the marginal points where there are fine veins often at right angles to the secondary veins.

**B. Microscopic examination (2.8.23).** The powder is brownish-green. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 0909.-1): fragments of adaxial epidermis with wavy anticlinal walls (surface view [C, J]), often accompanied by small, cylindrical cells of the palisade parenchyma (surface view [Ja]), or elongated (transverse section [F]); fragments of abaxial epidermis with stomata mainly paracytic (2.8.3) (surface view [B]), which may be accompanied by irregular-shaped cells of spongy mesophyll [K, L]; star-shaped covering trichomes, either entire or broken [A, D, M], composed of 4-12 unicellular branches that are united by their bases, elongated, conical and curved, usually up to 250  $\mu\text{m}$  long, thick-walled and with a clearly visible lumen whose contents are often brown; fibres are lignified and thick-walled, isolated or in groups, and accompanied by a sheath of prismatic calcium oxalate crystals [N, P]; sclereids, frequently enlarged at 1 or both ends, 150-180  $\mu\text{m}$  long, whole or fragmented [H]; fragments of annular or spiral vessels [E]; isolated prisms of calcium oxalate [G].

Figure 0909.-1. – Illustration for identification test B of powdered herbal drug of hamamelis leaf

C. Thin-layer chromatography (2.2.27).

**Test solution** To 1.0 g of the powdered herbal drug (355) (2.9.12) add 10 mL of *ethanol (60 per cent V/V) R*, shake for 15 min and filter.

**Reference solution (a)** Dissolve 30 mg of *tannic acid R* in 5 mL of *ethanol (60 per cent V/V) R*.

**Reference solution (b)** Dissolve 5 mg of *gallic acid R* in 5 mL of *ethanol (60 per cent V/V) R*.

**Plate** TLC silica gel G plate R.

**Mobile phase** *anhydrous formic acid R*, *water R*, *ethyl formate R* (10:10:80 V/V/V).

**Application** 10  $\mu\text{L}$ , as bands.

**Development** Over a path of 10 cm.

**Drying** At 100-105  $^{\circ}\text{C}$  for 10 min, then allow to cool.

**Detection** Spray with *ferric chloride solution R2* until bluish-grey zones (phenolic compounds) appear.

**Results** The chromatogram obtained with the test solution shows in its lower third a principal zone similar in position to the principal zone in the chromatogram obtained with reference solution (a) and, in its upper part, a narrow zone similar in position to the principal zone in the chromatogram obtained with reference solution (b); the chromatogram obtained with the test solution shows, in addition, several slightly coloured zones in the central part.

#### TESTS

**Foreign matter (2.8.2)**

Maximum 7 per cent of stems and maximum 2 per cent of other foreign matter, determined on 50 g.

**Loss on drying (2.2.32)**

Maximum 10.0 per cent, determined on 2.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105  $^{\circ}\text{C}$  for 4 h.

**Total ash (2.4.16)**

Maximum 7.0 per cent.

**Ash insoluble in hydrochloric acid (2.8.1)**

Maximum 2.0 per cent.

#### ASSAY

**Tannins (2.8.14)**

Use 0.750 g of the powdered herbal drug (180) (2.9.12).

Ph Eur

## Hawthorn Berries

(Ph. Eur. monograph 1220)

Ph Eur

#### DEFINITION

Dried false fruits of *Crataegus monogyna* Jacq. or *C. laevigata* (Poir.) DC. (syn. *C. oxyacantha* L.) or their hybrids or a mixture of these false fruits.

#### Content

Minimum 0.06 per cent of procyanidins, expressed as cyanidin chloride ( $\text{C}_{15}\text{H}_{11}\text{ClO}_6$ ;  $M_r$  322.7) (dried drug).

#### IDENTIFICATION

A. The false fruit of *C. monogyna* is obovate or globular, generally 6-10 mm long and 4-8 mm wide, reddish-brown or dark red. The surface is pitted or, more rarely, reticulated. The upper end of the fruit is crowned by the remains of 5 reflexed sepals surrounding a small, sunken disc with a shallow, raised rim. The remains of the style occur in the centre of the disc with tufts of stiff, colourless hairs at the

base. At the lower end of the fruit is a short length of pedicel or, more frequently, a small, pale, circular scar where the pedicel was attached. The receptacle is fleshy and encloses a yellowish-brown, ovoid fruit with a hard, thick wall containing a single, elongated, pale brown, smooth and shiny seed.

The false fruit of *C. laevigata* is up to 13 mm long. It contains 2-3 stony fruits, ventrally flattened, with short hairs at the top. The centre of the disc of the false fruit frequently bears the remains of the 2 styles.

**B. Microscopic examination (2.8.23).** The powder is greyish-red. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 1220.-1): covering trichomes [F] from inside the disc that are long, unicellular, frequently bent, tapering to a point, with heavily thickened and lignified walls; fragments of the red outer layer of the receptacle (surface view [G]); fragments of the inner layers of the receptacle [A], some cells containing cluster crystals [Aa] or prisms [Ab] of calcium oxalate; occasional fragments [J, K] including groups of sclereids [Ka] and vascular bundles [Ja, Kb] associated with rows of cells containing prisms of calcium oxalate [Jb, Kc]; fragments of the pericarp [B] consisting of parenchyma including some cells containing cluster crystals of calcium oxalate [Ba] and groups of sclereids of various sizes with numerous pits [Bb]; thick-walled sclereids [E, H], channelled [E], some with conspicuously branched channels [H]; a few fragments of the testa [C] having an outer layer composed of hexagonal, mucilaginous cells [Ca] beneath which is a yellowish-brown pigment layer containing numerous prisms of calcium oxalate [Cb]; parenchyma of the endosperm and cotyledons consisting of cells containing aleurone grains and globules of fixed oil [D].

Figure 1220.-1. – Illustration for identification test B of powdered herbal drug of hawthorn berries

**C. High-performance thin-layer chromatography (2.8.25).**

**Test solution** To 0.5 g of the powdered herbal drug (355) (2.9.12) add 5.0 mL of *methanol R*. Sonicate for 15 min, filter or centrifuge and use the filtrate or supernatant.

**Reference solution (a)** Dissolve 2.5 mg of *hyperoside R* and 3.5 mg of *rutoside trihydrate R* in *methanol R* and dilute to 10.0 mL with the same solvent.

**Reference solution (b)** Dilute 2.5 mL of reference solution (a) to 10.0 mL with *methanol R*.

**Reference solution (c)** Dissolve 2.5 mg of *hyperoside R* and 3 mg of *chlorogenic acid R* in *methanol R* and dilute to 10 mL with the same solvent.

**Intensity marker** Hyperoside.

**Plate** TLC silica gel  $F_{254}$  plate R (2-10 µm).

**Mobile phase** *anhydrous formic acid R*, *water R*, *ethyl acetate R* (10:10:80 V/V/V).

**Application** 4 µL as bands of 8 mm.

**Development** 70 mm from the lower edge of the plate.

**Drying** In a current of air at room temperature for 5 min.

**Detection** Heat at 100-105 °C for 5 min; spray the warm plate with a 10 g/L solution of *diphenylboric acid aminoethyl ester R* in *methanol R*, then with a 50 g/L solution of *macrogol 400 R* in *methanol R* or, alternatively, dip the warm plate in a 5 g/L solution of *diphenylboric acid aminoethyl ester R* in *ethyl acetate R*, then in a 50 g/L solution of *macrogol 400 R* in *methylene chloride R*; allow to dry in air for about 1 min and examine in ultraviolet light at 366 nm.

**System suitability** Reference solution (c):

- the chromatogram shows in the middle third 2 distinct zones, which may be touching; the lower zone (chlorogenic acid) shows a light blue fluorescence and the upper zone (hyperoside) shows a yellow or orange fluorescence.

**Results** See below the sequence of fluorescent zones present in the chromatograms obtained with reference solution (a) and the test solution. Furthermore, in the chromatogram obtained with the test solution, other faint blue, greenish and orange or yellow fluorescent zones may be present.

Top of the plate	
	1-2 blue zones, very faint to faint
Hyperoside: a yellow or orange zone	A yellow or orange zone, very faint to faint A yellow or orange zone, faint to equivalent (hyperoside) A light blue zone, faint (chlorogenic acid)
Rutoside: a yellow or orange zone	A yellow or orange zone, very faint (rutoside)
Reference solution (a)	Test solution

## TESTS

### Foreign matter (2.8.2)

Maximum 5 per cent of deteriorated false fruit and maximum 2 per cent of other foreign matter. It does not contain false fruits of other *Crataegus* species (*C. nigra* Waldst. et Kit., *C. pentagyna* Waldst. et Kit. ex Willd.

and *C. azarolus* L.), which are characterised by the presence of more than 3 hard stones.

#### Loss on drying (2.2.32)

Maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

#### Total ash (2.4.16)

Maximum 5.0 per cent.

#### ASSAY

To 2.50 g of the powdered herbal drug (355) (2.9.12) add 30 mL of *ethanol (70 per cent V/V) R*. Heat under a reflux condenser for 30 min and filter. Wash the residue with 10.0 mL of *ethanol (70 per cent V/V) R*. Add to the filtrate 15.0 mL of *hydrochloric acid R1* and 10.0 mL of *water R*. Heat under a reflux condenser for 80 min. Allow to cool, filter and wash the residue with *ethanol (70 per cent V/V) R* until the filtrate is colourless. Dilute the filtrate to 250.0 mL with *ethanol (70 per cent V/V) R*. Evaporate 50.0 mL of this solution in a round-bottomed flask to about 3 mL and transfer to a separating funnel. Rinse the round-bottomed flask sequentially with 10 mL and 5 mL of *water R* and transfer to the separating funnel. Shake the combined solution with 3 quantities, each of 15 mL, of *butanol R*. Combine the organic layers and dilute to 100.0 mL with *butanol R*.

Measure the absorbance (2.2.25) of the solution at 555 nm. Calculate the percentage content of procyanidins, expressed as cyanidin chloride, using the following expression:

$$\frac{A \times 500}{1200 \times m}$$

i.e. taking the specific absorbance of cyanidin chloride to be 1200.

*A* = absorbance at 555 nm;  
*m* = mass of the substance to be examined, in grams.

Ph Eur

## Hawthorn Leaf and Flower

(Ph. Eur. monograph 1432)

#### Preparations

Hawthorn Leaf and Flower Dry Extract

Hawthorn Leaf and Flower Liquid Extract

Ph Eur

#### DEFINITION

Whole or fragmented, dried flower-bearing branches of *Crataegus monogyna* Jacq. (Lindm.), *C. laevigata* (Poir.) DC. or their hybrids or, more rarely, *C. pentagyna* Waldst. et Kit. ex Willd. or *C. azarolus* L. These species may be mixed.

#### Content

Minimum 0.2 per cent of total vitexin-2''-O-rhamnoside derivatives, expressed as vitexin-2''-O-rhamnoside (C<sub>27</sub>H<sub>30</sub>O<sub>14</sub>; M<sub>r</sub> 578.5) (dried drug).

#### IDENTIFICATION

A. The stems are dark brown, woody, 1-2.5 mm in diameter, bearing alternate, petiolate leaves with small, often deciduous stipules and corymbs of numerous small white flowers.

The leaves are more or less deeply lobed with slightly serrate or almost entire margins; those of *C. azarolus* are the narrowest of all species, pinnatisect, with 3, 5 or 7 acute to cuspidate, long, narrow lobes and almost entire margins; those of *C. laevigata* are broad, pinnately lobed or pinnatifid with 3, 5 or 7 obtuse to acute lobes and finely crenate-serrate margins; those of *C. monogyna* are pinnatisect with 3, 5 or 7 acute lobes and entire or irregularly serrate margins; those of *C. pentagyna* are pinnatisect with 3, 5, 7 or 9 acute or obtuse lobes and irregularly serrate margins; the adaxial surface is dark green or brownish-green, the abaxial surface is lighter greyish-green and shows a prominent, dense, reticulate venation. The leaves of *C. laevigata*, *C. monogyna* and *C. azarolus* are more or less glabrous or with few trichomes, those of *C. pentagyna* are mostly densely pubescent. The flowers have a brownish-green tubular calyx composed of 5 free, reflexed sepals, a corolla composed of 5 free, yellowish-white or brownish, rounded or broadly ovate and shortly unguiculate petals and numerous stamens. The hypanthium and calyx of *C. azarolus*, *C. laevigata* and *C. monogyna* are glabrous or with few trichomes; those of *C. pentagyna* are mostly densely pubescent. The ovary is fused to the calyx and consists of 1-5 carpels, each with a long style and containing a single ovule; in *C. monogyna* there is 1 carpel, in *C. laevigata* 2 or 3, in *C. azarolus* 2, 3, or sometimes only 1, in *C. pentagyna* 5 or, rarely, 3 or 4.

B. Microscopic examination (2.8.23). The powder is yellowish-green to brownish-green. Examine under a microscope using *chloral hydrate solution R*. Irrespective of the species, the powder shows the following diagnostic characters (Figures 1432.-1 and 1432.-2): unicellular covering trichomes, usually with a thick wall and wide lumen, almost straight or slightly curved, isolated or attached to the epidermis of the leaves by a rosette of cells [A]; fragments of petals showing rounded or polygonal epidermal cells, strongly papillose, covered by a cuticle which clearly shows wavy striations (surface view [M]); fragments of the epidermis of the leaves showing anomocytic stomata (2.8.3) surrounded by 4-7 subsidiary cells [Da, La, Pa, Qa, Ta]; fragments of the endothecium of the anthers [G]; fragments of stems [B, J] containing bordered-pitted vessels [Ba] and groups of lignified fibres with narrow lumens [Ja] associated with calcium oxalate prism sheaths [Jb], sclereids [Bb, Jc] and sometimes cells of the pith with thick, pitted walls [Bc]; unicellular covering trichomes from the sepals, with sinuous walls, up to 400 µm long [H]; fragments of the leaf mesophyll [F] showing parenchymatous cells usually measuring 10-20 µm and containing calcium oxalate cluster crystals [Fa], and veins with fibres attached [Fb] surrounded by a calcium oxalate prism sheath [Fc]; isolated cluster crystals and prisms [E, S, U]; numerous tricolporate pollen grains, spherical to elliptical or triangular, up to 45 µm in diameter [N].

The species can be distinguished by their leaf epidermis as follows:

*C. laevigata* The lower epidermis [D] is covered by a smooth cuticle and comprises polygonal cells or cells with sinuous anticlinal walls; stomata [Db]; frequently, scars of covering trichomes [De] surrounded by a rosette of cells with thickened walls [Dd]; along the veins, elongated cells [Dc]. The upper epidermis [C] comprises polygonal cells covered by a smooth cuticle and is accompanied by palisade parenchyma [Ca].

*C. monogyna* The lower epidermis [L] is covered by a striated cuticle and comprises polygonal cells or cells with sinuous anticlinal walls; stomata [Lb]; frequently, scars of

covering trichomes surrounded by a rosette of cells with thickened walls; along the veins, elongated cells. The upper epidermis [K] comprises polygonal cells covered by a striated cuticle and is accompanied by palisade parenchyma [Ka].

*C. azarolus* The lower epidermis (view of the cuticle [O], view of epidermal cells [Q]) is covered by a thick and deeply wrinkled cuticle [Oa] and comprises polygonal cells [Qb], stomata [Qc] and unicellular covering trichomes. The upper epidermis [T] comprises polygonal cells covered by a striated cuticle, and stomata; it is accompanied by palisade parenchyma [Tb], with some cells containing a cluster crystal or a prism crystal of calcium oxalate.

*C. pentagyna* The lower epidermis [P] is covered by a smooth cuticle and comprises cells with sinuous anticlinal walls, stomata [Pb] and rolled unicellular covering trichomes [Pc]. The upper epidermis [R] comprises polygonal cells covered by a fine striated cuticle, with slightly sinuous unicellular covering trichomes [Ra]; it is accompanied by palisade parenchyma [Rb], with some cells containing a cluster crystal of calcium oxalate.

Figure 1432.-2. – Illustration for identification test B of powdered herbal drug of hawthorn leaf and flower

**Reference solution (c)** Dissolve 2.5 mg of *hyperoside R* and 3 mg of *chlorogenic acid R* in *methanol R* and dilute to 10 mL with the same solvent.

**Intensity markers** Reference solutions (a) and (b):

- *hyperoside* for yellow, orange or red fluorescent zones;
- *vitexin-2''-O-rhamnoside* for green, greenish-blue or blue fluorescent zones.

**Plate** TLC silica gel F<sub>254</sub> plate R (2-10 µm).

**Mobile phase** *anhydrous formic acid R*, *water R*, *methyl ethyl ketone R*, *ethyl acetate R* (10:10:30:50 V/V/V/V).

**Application** 4 µL as bands of 8 mm.

**Development** 70 mm from the lower edge of the plate.

**Drying** In a current of air at room temperature for 5 min.

**Detection** Heat at 100-105 °C for 5 min; spray the warm plate with a 10 g/L solution of *diphenylboric acid aminoethyl ester R* in *methanol R*, then with a 50 g/L solution of *macrogol 400 R* in *methanol R* or, alternatively, dip the warm plate in a 5 g/L solution of *diphenylboric acid aminoethyl ester R* in *ethyl acetate R*, then in a 50 g/L solution of *macrogol 400 R* in *methylene chloride R*; allow to dry in air for about 1 min and examine in ultraviolet light at 366 nm.

**System suitability** Reference solution (c):

- the chromatogram shows in the middle third 2 distinct zones, which may be touching; the lower zone (*chlorogenic acid*) shows a light blue fluorescence and the upper zone (*hyperoside*) shows a yellow or orange fluorescence.

**Results** See below the sequence of fluorescent zones present in the chromatograms obtained with reference solution (a) and the test solution. Furthermore, in the chromatogram obtained with the test solution, other very faint to faint blue, greenish-blue, brownish, yellow or orange fluorescent zones may be present.

Figure 1432.-1. – Illustration for identification test B of powdered herbal drug of hawthorn leaf and flower

### C. High-performance thin-layer chromatography (2.8.25).

**Test solution** To 0.5 g of the powdered herbal drug (355) (2.9.12) add 5.0 mL of *methanol R*. Sonicate for 15 min, then filter or centrifuge the solution and use the filtrate or supernatant.

**Reference solution (a)** Dissolve 2.5 mg of *hyperoside R* and 4.0 mg of *vitexin-2''-O-rhamnoside R* in *methanol R* and dilute to 10.0 mL with the same solvent.

**Reference solution (b)** Dilute 2.5 mL of reference solution (a) to 10.0 mL with *methanol R*.

Top of the plate		
	1 or 2 red zones, very faint to equivalent	1 or 2 red zones, very faint to equivalent
	1 or 2 light blue zones, very faint to equivalent	1 or 2 light blue zones, very faint to equivalent
	A light blue zone, very faint to equivalent	A light blue zone, very faint to equivalent
	A yellow or orange zone, very faint to equivalent	A yellow or orange zone, faint to intense
Hyperoside: a yellow or orange zone	A yellow or orange zone, faint to intense	A yellow or orange zone, very faint to intense
	A light blue zone, very faint to intense (chlorogenic acid)	A light blue zone, faint to intense (chlorogenic acid)
		A yellow zone, faint to equivalent
Vitexin-2''-O-rhamnoside: a green or greenish-blue zone	A green or greenish-blue zone, faint to equivalent (vitexin-2''-O-rhamnoside)	A green or greenish-blue zone, very faint to faint (vitexin-2''-O-rhamnoside)
	A yellow or orange zone, very faint to faint	A yellow or orange zone, faint to equivalent
Reference solution (a)	Test solution ( <i>C. monogyna</i> , <i>C. laevigata</i> , <i>C. asarohus</i> )	Test solution ( <i>C. pentagyna</i> and mixtures with other allowed species)

### TESTS

#### Foreign matter (2.8.2)

Maximum 8 per cent of lignified branches with a diameter greater than 2.5 mm and maximum 2 per cent of other foreign matter.

#### Loss on drying (2.2.32)

Maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

#### Total ash (2.4.16)

Maximum 10.0 per cent.

### ASSAY

#### Liquid chromatography (2.2.29)

**Test solution** To about 0.35 g of the powdered herbal drug (710) (2.9.12) add 10 mL of a 50 per cent V/V solution of methanol R and 10 mL of a 2 g/L solution of sodium hydroxide R. Sonicate for 20 min at about 25-35 °C. Allow to cool and neutralise with 50 µL of anhydrous formic acid R. Dilute to 25.0 mL with a 50 per cent V/V solution of methanol R. Filter through a membrane filter (nominal pore size 0.2 µm).

**Reference solution (a)** Dissolve 2.0 mg of vitexin-2''-O-rhamnoside CRS in a 50 per cent V/V solution of methanol R and dilute to 10.0 mL with the same solution.

**Reference solution (b)** To about 0.1 g of hawthorn leaf and flower dry extract HRS add 10 mL of a 50 per cent V/V solution of methanol R and 10 mL of a 2 g/L solution of sodium hydroxide R. Sonicate for 20 min at about 25-35 °C. Allow to cool and neutralise with 50 µL of anhydrous formic acid R. Dilute to 25 mL with a 50 per cent V/V solution of methanol R. Filter through a membrane filter (nominal pore size 0.2 µm).

#### Column:

- size:  $l = 0.125$  m,  $\varnothing = 4.0$  mm;
- stationary phase: end-capped octadecylsilyl silica gel for chromatography R (3 µm);
- temperature: 40 °C.

#### Mobile phase:

- mobile phase A: mix 1.0 g of phosphoric acid R, 2.6 g of acetonitrile R, 3.3 g of methanol R and 82.1 g of tetrahydrofuran R and dilute to 1000.0 g with water for chromatography R;
- mobile phase B: methanol R;

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 20	100	0
20 - 22	100 → 10	0 → 90
22 - 26	10	90

Flow rate 1.0 mL/min.

Detection Spectrophotometer at 340 nm.

Injection 10 µL.

**Identification of peaks** Use the chromatogram obtained with reference solution (a) to identify the peak due to vitexin-2''-O-rhamnoside; use the chromatogram supplied with hawthorn leaf and flower dry extract HRS and the chromatogram obtained with reference solution (b) to identify peak 2 (unknown).

**System suitability** Reference solution (b):

- peak-to-valley ratio: minimum 1.5, where  $H_p$  = height above the baseline of peak 2 (eluted immediately after vitexin-2''-O-rhamnoside) and  $H_v$  = height above the baseline of the lowest point of the curve separating this peak from the peak due to vitexin-2''-O-rhamnoside.

Calculate the percentage content of total vitexin-2''-O-rhamnoside derivatives, expressed as vitexin-2''-O-rhamnoside resulting from alkaline hydrolysis, using the following expression:

$$\frac{A_1 \times m_2 \times p \times 2.5}{A_2 \times m_1}$$

- $A_1$  = area of the peak due to vitexin-2''-O-rhamnoside in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to vitexin-2''-O-rhamnoside in the chromatogram obtained with reference solution (a);
- $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;
- $m_2$  = mass of vitexin-2''-O-rhamnoside CRS used to prepare reference solution (a), in grams;
- $p$  = percentage content of vitexin-2''-O-rhamnoside in vitexin-2''-O-rhamnoside CRS.

Ph Eur

## Hawthorn Leaf and Flower Dry Extract

(Ph. Eur. monograph 1865)

Ph Eur

### DEFINITION

Dry extract produced from *Hawthorn leaf and flower* (1432).

### Content

- *aqueous extracts*: minimum 1.0 per cent of total vitexin-2''-O-rhamnoside derivatives, expressed as vitexin-2''-O-rhamnoside (C<sub>27</sub>H<sub>30</sub>O<sub>14</sub>; M<sub>r</sub> 578.5) (dried extract);
- *hydroalcoholic extracts*: minimum 2.0 per cent of total vitexin-2''-O-rhamnoside derivatives, expressed as vitexin-2''-O-rhamnoside (C<sub>27</sub>H<sub>30</sub>O<sub>14</sub>; M<sub>r</sub> 578.5) (dried extract).

### PRODUCTION

The extract is produced from the herbal drug by a suitable procedure using either water or a hydroalcoholic solvent at least equivalent in strength to ethanol (45 per cent V/V).

### CHARACTERS

#### Appearance

Light brown or greenish-brown powder.

#### IDENTIFICATION

High-performance thin-layer chromatography (2.8.25).

**Test solution** Suspend 0.2 g of the extract to be examined in 20.0 mL of *methanol R*. Sonicate for 5 min, then filter or centrifuge. Use the filtrate or supernatant.

**Reference solution (a)** Dissolve 2.5 mg of *hyperoside R* and 4.0 mg of *vitexin-2''-O-rhamnoside R* in *methanol R* and dilute to 10.0 mL with the same solvent.

**Reference solution (b)** Dilute 2.5 mL of reference solution (a) to 10.0 mL with *methanol R*.

**Reference solution (c)** Dissolve 2.5 mg of *hyperoside R* and 3 mg of *chlorogenic acid R* in *methanol R* and dilute to 10 mL with the same solvent.

**Intensity markers** Reference solutions (a) and (b):

- *hyperoside* for yellow, orange or red fluorescent zones,
- *vitexin-2''-O-rhamnoside* for green, greenish-blue or blue fluorescent zones.

**Plate** TLC silica gel F<sub>254</sub> plate R (2-10 µm).

**Mobile phase** *anhydrous formic acid R*, *water R*, *methyl ethyl ketone R*, *ethyl acetate R* (10:10:30:50 V/V/V/V).

**Application** 4 µL as bands of 8 mm.

**Development** 70 mm from the lower edge of the plate.

**Drying** In a current of air at room temperature for 5 min.

**Detection** Heat at 100-105 °C for 5 min; spray the warm plate with a 10 g/L solution of *diphenylboric acid aminoethyl ester R* in *methanol R*, then with a 50 g/L solution of *macrogol 400 R* in *methanol R* or, alternatively, dip the warm plate in a 5 g/L solution of *diphenylboric acid aminoethyl ester R* in *ethyl acetate R*, then in a 50 g/L solution of *macrogol 400 R* in *methylene chloride R*; allow to dry in air for about 1 min and examine in ultraviolet light at 366 nm.

**System suitability** Reference solution (c):

- the chromatogram shows in the middle third 2 distinct zones, which may be touching; the lower zone (*chlorogenic acid*) shows a light blue fluorescence and the upper zone (*hyperoside*) shows a yellow or orange fluorescence.

**Results (aqueous extracts)** See below the sequence of fluorescent zones present in the chromatograms obtained with reference solution (a) and the test solution.

Furthermore, in the chromatogram obtained with the test solution, other very faint or faint blue or brownish fluorescent zones may be present.

Top of the plate	
	A blue zone, very faint to faint
	A green or greenish-blue zone, very faint to faint

- $p$  = percentage content of *vitexin-2''-O-rhamnoside* in *vitexin-2''-O-rhamnoside CRS*.

Ph Eur

## Hawthorn Leaf and Flower Liquid Extract

Quantified Hawthorn Leaf and Flower Liquid Extract

(Ph. Eur. monograph 1864)

Ph Eur

## DEFINITION

Liquid extract produced from *Hawthorn leaf and flower* (1432).

## Content

Minimum 0.4 per cent of total *vitexin-2''-O-rhamnoside* derivatives, expressed as *vitexin-2''-O-rhamnoside* ( $C_{27}H_{30}O_{14}$ ;  $M_r$  578.5).

## PRODUCTION

The extract is produced from the herbal drug by a suitable procedure using ethanol (30-70 per cent *V/V*).

## IDENTIFICATION

High-performance thin-layer chromatography (2.8.25).

**Test solution** Dilute 2.0 g of the extract to be examined in 10.0 mL of *methanol R* then filter or centrifuge. Use the filtrate or supernatant.

**Reference solution (a)** Dissolve 2.5 mg of *hyperoside R* and 4.0 mg of *vitexin-2''-O-rhamnoside R* in *methanol R* and dilute to 10.0 mL with the same solvent.

**Reference solution (b)** Dilute 2.5 mL of reference solution (a) to 10.0 mL with *methanol R*.

**Reference solution (c)** Dissolve 2.5 mg of *hyperoside R* and 3 mg of *chlorogenic acid R* in *methanol R* and dilute to 10 mL with the same solvent.

**Intensity markers** Reference solutions (a) and (b):

- *hyperoside* for yellow, orange or red fluorescent zones,
- *vitexin-2''-O-rhamnoside* for green, greenish-blue or blue fluorescent zones.

**Plate** TLC silica gel  $F_{254}$  plate R (2-10 µm).

**Mobile phase** *anhydrous formic acid R*, *water R*, *methyl ethyl ketone R*, *ethyl acetate R* (10:10:30:50 *V/V/V/V*).

**Application** 4 µL as bands of 8 mm.

**Development** 70 mm from the lower edge of the plate.

**Drying** In a current of air at room temperature for 5 min.

**Detection** Heat at 100-105 °C for 5 min; spray the warm plate with a 10 g/L solution of *diphenylboric acid aminoethyl ester R* in *methanol R*, then with a 50 g/L solution of *macrogol 400 R* in *methanol R* or, alternatively, dip the warm plate in a 5 g/L solution of *diphenylboric acid aminoethyl ester R* in *ethyl acetate R*, then in a 50 g/L solution of *macrogol 400 R* in

*methylene chloride R*; allow to dry in air for about 1 min and examine in ultraviolet light at 366 nm.

**System suitability** Reference solution (c):

- the chromatogram shows in the middle third 2 distinct zones, which may be touching; the lower zone (chlorogenic acid) shows a light blue fluorescence and the upper zone (hyperoside) shows a yellow or orange fluorescence.

**Results** See below the sequence of fluorescent zones present in the chromatograms obtained with reference solution (a) and the test solution. Furthermore, in the chromatogram obtained with the test solution, other very faint or faint blue or red fluorescent zones may be present.

Top of the plate	
	1 or 2 blue zones, very faint to faint
	A green or greenish-blue zone, faint
	A yellow or orange zone
Hyperoside: a yellow or orange zone	A yellow or orange zone, intense
	A blue zone
	A green or greenish-blue zone (vitexin-2''-O-rhamnoside)
Vitexin-2''-O-rhamnoside: a green or greenish-blue zone	An orange zone, very faint to faint
Reference solution (a)	Test solution

## TESTS

### Ethanol (2.9.10)

95 per cent to 105 per cent of the content stated on the label.

## ASSAY

Liquid chromatography (2.2.29).

**Test solution** To about 1.0 g of the extract to be examined add 10 mL of a 50 per cent *V/V* solution of *methanol R* and 10 mL of a 2 g/L solution of *sodium hydroxide R*. Sonicate for 20 min at about 25-35 °C. Allow to cool and neutralise with 50 µL of *anhydrous formic acid R*. Dilute to 25.0 mL with a 50 per cent *V/V* solution of *methanol R*. Filter through a membrane filter (nominal pore size 0.2 µm).

**Reference solution (a)** Dissolve 2.0 mg of *vitexin-2''-O-rhamnoside CRS* in a 50 per cent *V/V* solution of *methanol R* and dilute to 10.0 mL with the same solution.

**Reference solution (b)** To about 0.1 g of *hawthorn leaf and flower dry extract HRS* add 10 mL of a 50 per cent *V/V* solution of *methanol R* and 10 mL of a 2 g/L solution of *sodium hydroxide R*. Sonicate for 20 min at about 25-35 °C. Allow to cool and neutralise with 50 µL of *anhydrous formic acid R*. Dilute to 25 mL with a 50 per cent *V/V* solution of *methanol R*. Filter through a membrane filter (nominal pore size 0.2 µm).

**Column:**

- size:  $l = 0.125$  m,  $\varnothing = 4.0$  mm;
- stationary phase: end-capped octadecylsilyl silica gel for chromatography *R* (3 µm);
- temperature: 40 °C.

**Mobile phase:**

- mobile phase A: mix 1.0 g of *phosphoric acid R*, 2.6 g of *acetonitrile R*, 3.3 g of *methanol R* and 82.1 g of *tetrahydrofuran R* and dilute to 1000.0 g with *water for chromatography R*;
- mobile phase B: *methanol R*;

Time (min)	Mobile phase A (per cent <i>V/V</i> )	Mobile phase B (per cent <i>V/V</i> )
0 - 20	100	0
20 - 22	100 → 10	0 → 90
22 - 26	10	90

**Flow rate** 1.0 mL/min.

**Detection** Spectrophotometer at 340 nm.

**Injection** 10 µL.

**Identification of peaks** Use the chromatogram obtained with reference solution (a) to identify the peak due to *vitexin-2''-O-rhamnoside*; use the chromatogram supplied with *hawthorn leaf and flower dry extract HRS* and the chromatogram obtained with reference solution (b) to identify peak 2 (unknown).

**System suitability** Reference solution (b):

- peak-to-valley ratio: minimum 1.5, where  $H_p$  = height above the baseline of peak 2 (eluted immediately after *vitexin-2''-O-rhamnoside*) and  $H_v$  = height above the baseline of the lowest point of the curve separating this peak from the peak due to *vitexin-2''-O-rhamnoside*.

Calculate the percentage content of total *vitexin-2''-O-rhamnoside* derivatives, expressed as *vitexin-2''-O-rhamnoside* resulting from alkaline hydrolysis, using the following expression:

$$\frac{A_1 \times m_2 \times p \times 2.5}{A_2 \times m_1}$$

- $A_1$  = area of the peak due to *vitexin-2''-O-rhamnoside* in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to *vitexin-2''-O-rhamnoside* in the chromatogram obtained with reference solution (a);
- $m_1$  = mass of the extract to be examined used to prepare the test solution, in grams;
- $m_2$  = mass of *vitexin-2''-O-rhamnoside CRS* used to prepare reference solution (a), in grams;
- $p$  = percentage content of *vitexin-2''-O-rhamnoside* in *vitexin-2''-O-rhamnoside CRS*.

Ph Eur

## Hop Strobile

(Ph. Eur. monograph 1222)

Ph Eur

### DEFINITION

Dried, generally whole, female inflorescence of *Humulus lupulus* L.

### CHARACTERS

Characteristic, aromatic odour.

### IDENTIFICATION

A. Hop strobiles are generally isolated and 2-5 cm long, petiolate, ovoid, made up of many oval, greenish-yellow,

sessile, membranous, overlapping bracts. The external bracts are flattened and symmetrical. The internal bracts are longer and asymmetrical at the base because of a fold generally encircling an induviate fruit (achene). The ovary or rarely the fruit, the base of the bracts and especially the induvial fold, are covered with small orange-yellow glands.

**B. Microscopic examination (2.8.23).** The powder is greenish-yellow. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 1222.-1): fragments of bracts and bracteoles covered by polygonal, irregular or wavy-walled epidermal cells [D, L, M]; unicellular, conical, straight or curved covering trichomes with thin, smooth walls, fragmented [E, G] or attached to an epidermis [A]; rare anomocytic stomata (2.8.3) [K]; glandular trichomes, usually free, with bicellular biseriate stalks and heads consisting of 8 small cells [H, N], rarely attached to an epidermis [La]; fragments of mesophyll containing small calcium oxalate cluster crystals [J]; many characteristic orange-yellow glandular trichomes with short, bicellular biseriate stalks, bearing a part widening into a cup, 150-250 µm in diameter, made up of a hemispherical layer of secretory cells with a cuticle that has been detached and distended by the accumulation of oleoresinous secretions (surface view [B], side view [C]); fragments of elongated sclerenchymatous cells of the testa with thick walls showing striations and numerous pits [F].

Figure 1222.-1. – Illustration for identification test B of powdered herbal drug of hop strobile

**C. Thin-layer chromatography (2.2.27).**

**Test solution** To 1.0 g of the freshly powdered herbal drug (355) (2.9.12) add 10 mL of a mixture of 3 volumes of *water R* and 7 volumes of *methanol R*; shake for 15 min and filter.

**Reference solution** Dissolve 1.0 mg of Sudan orange R, 2.0 mg of *curcumin R* and 2.0 mg of *dimethylaminobenzaldehyde R* in 20 mL of *methanol R*.

**Plate** TLC silica gel F<sub>254</sub> plate R.

**Mobile phase** *anhydrous acetic acid R*, *ethyl acetate R*, *cyclohexane R* (2:38:60 V/V/V).

**Application** 20 µL as bands.

**Development** Over a path of 15 cm.

**Drying** In air.

**Detection A** Examine in ultraviolet light at 254 nm.

**Results A** The chromatogram obtained with the reference solution shows 3 quenching zones; in the lower quarter is the faint zone due to curcumin, somewhat below the middle is the zone due to dimethylaminobenzaldehyde, and above, the zone due to Sudan orange. The chromatogram obtained with the test solution shows a number of quenching zones similar in position to the zones in the chromatogram obtained with the reference solution: at about the level of the zone due to curcumin is a faint zone due to xanthohumol, near the level of the zone due to dimethylaminobenzaldehyde are zones due to humulones, and near the level of the zone due to Sudan orange are zones due to lupulones.

**Detection B** Examine in ultraviolet light at 365 nm.

**Results B** In the chromatogram obtained with the test solution the zones due to lupulones show blue fluorescence, the zones due to humulones show brown fluorescence and the zone due to xanthohumol shows dark brown fluorescence.

**Detection C** Spray with *dilute phosphomolybdotungstic reagent R*; expose to ammonia vapour and examine in daylight.

**Results C** In the chromatogram obtained with the test solution the zones due to humulones and to lupulones are bluish-grey and the zone due to xanthohumol is greenish-grey; in the chromatogram obtained with the reference solution the zones are bluish-grey or brownish-grey.

**TESTS**

**Matter extractable by ethanol (70 per cent V/V)**  
Minimum 25.0 per cent.

To 10.0 g of the powdered herbal drug (355) (2.9.12) add 300 mL of *ethanol (70 per cent V/V) R* and heat for 10 min on a water-bath under a reflux condenser. Allow to cool, filter, and discard the first 10 mL of the filtrate. Evaporate 30.0 mL of the filtrate to dryness on a water-bath and dry in an oven at 100-105 °C for 2 h. The residue weighs a minimum of 0.250 g.

**Loss on drying (2.2.32)**

Maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

**Total ash (2.4.16)**

Maximum 12.0 per cent.

Ph Eur

## White Horehound

(Ph. Eur. monograph 1835)

Ph Eur

### DEFINITION

Whole or fragmented dried flowering aerial parts of *Marrubium vulgare* L.

### Content

Minimum 0.7 per cent of marrubiin ( $C_{20}H_{28}O_4$ ;  $M_r$  332.4) (dried drug).

### IDENTIFICATION

A. The stems are up to 50 cm long, quadrangular, up to 7 mm wide, young stems are densely covered with whitish downy hairs, older stems are greenish-grey and less hairy. The lower leaves are broadly ovate to almost orbicular, upper leaves less broadly ovate, both petiolate; lamina 1.5-4 cm long, 1-3.5 cm wide, apex sub-acute, base tapering or somewhat cordate, margin dentate to crenate, petiole up to 3 cm long; venation pinnate, prominent on the lower surface, distinctly depressed on the upper surface. Both leaf surfaces are densely covered with fine, white, woolly hairs, older leaves having fewer hairs on the dark greyish-green upper surface. The flowers are small, sessile in dense axillary clusters. The calyx is 5 mm long, persistent, with 5 long and 5 short, alternating, hooked, recurved fringing spines; throat of calyx with an internal ring of long silky hairs; corolla 7 mm long, dull white, 4-lobed, upper lobe 2-lipped, lower-lobe 3-lipped; 4 short stamens; style with bifid stigma.

B. Microscopic examination (2.8.23). The powder is greyish-green. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 1835.-1): numerous covering trichomes of different types, isolated or associated with fragments of the epidermis of the leaves: a) covering trichomes in tufts [B, H] with 3-20 rigid branches of various sizes with smooth, regularly thickened walls, sometimes sessile [B], sometimes arising from a multicellular stalk [H], some branches are unicellular [Ba, Ha], others are multicellular (2-6 cells), 100-200  $\mu$ m long, thick-walled and swollen at the junctions [Bb, Hb]; b) unicellular covering trichomes; c) multicellular covering trichomes similar to the branches of the trichomes in tufts; glandular trichomes of different types: a) glandular trichomes with a unicellular stalk and a unicellular head [D], bicellular [Hc] or quadricellular head (surface view [Gb]); b) glandular trichomes with a multicellular stalk and a unicellular head [A]; c) glandular trichomes of lamieaceous type with a unicellular stalk and an 8-celled head covered with a cuticle (surface view [Gd]); fragments of the epidermis of the leaves [G] consisting of polygonal cells with slightly sinuous walls [Ga], stomata of the diacytic type (2.8.3) [Gc], covering trichomes and glandular trichomes; covering trichomes from the inner surface of the calyx, twisted or coiled, up to 1000  $\mu$ m long, bi- or tricellular, thickened at the cell junctions, with a flexuous, very elongated distal cell [C]; fragments of palisade parenchyma (surface view [Bc]) containing small needle-shaped crystals of calcium oxalate; fragments of vascular tissue from the stems and veins [F]; fragments of petals with papillose cells [J]; spherical pollen grains, about 25  $\mu$ m in diameter with a smooth exine [E].

C. Thin-layer chromatography (2.2.27).

Figure 1835.-1. – Illustration for identification test B of powdered herbal drug of white horehound

**Test solution (a)** To 1.0 g of the powdered herbal drug (710) (2.9.12) add 2 mL of *dilute hydrochloric acid R* and 8 mL of *methanol R*. Heat under a reflux condenser for 30 min, cool and filter.

**Test solution (b)** To 1.0 g of the powdered herbal drug (710) (2.9.12) add 10 mL of *methanol R*. Heat under a reflux condenser for 30 min, cool and filter.

**Reference solution** Dissolve 10 mg of *cholesterol R* and 10 mg of *guaiazulene R* in 10 mL of *methanol R*.

**Plate** TLC silica gel plate R (5-40  $\mu$ m) [or TLC silica gel plate R (2-10  $\mu$ m)].

**Mobile phase** *methanol R*, *toluene R* (5:95 V/V).

**Application** 20  $\mu$ L [or 5  $\mu$ L] of test solutions (a) and (b) and 10  $\mu$ L [or 2  $\mu$ L] of the reference solution, as bands.

**Development** Over a path of 10 cm [or 6 cm].

**Drying** In air.

**Detection** Treat with a 5 g/L solution of *vanillin R* in a mixture of 20 volumes of *ethanol (96 per cent) R* and 80 volumes of *sulfuric acid R* and examine in daylight immediately after heating at 130 °C for 5-10 min.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and test solutions (a) and (b). Further zones in the chromatograms obtained with test solutions (a) and (b) may be present. The zone due to marrubiin in the chromatogram obtained with test solution (a) is more intense than that in the chromatogram obtained with test solution (b). During extraction with hydrochloric acid and methanol, conversion of pre-marrubiin to marrubiin takes place which leads to an increase in intensity of the zone.

	A bluish-violet zone	A bluish-violet zone
Reference solution	Test solution (a)	Test solution (b)

**TESTS****Loss on drying (2.2.32)**

Maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (710) (2.9.12) by drying in an oven at 105 °C for 2 h.

**Total ash (2.4.16)**

Maximum 15.0 per cent.

**Ash insoluble in hydrochloric acid (2.8.1)**

Maximum 3.0 per cent.

**ASSAY**

Liquid chromatography (2.2.29).

**Test solution** Reduce 50 g of the herbal drug to a powder (250) (2.9.12) and homogenise. To 1.00 g of the powdered herbal drug in a 50 mL round-bottomed flask add 15 mL of a mixture of 2 volumes of dilute hydrochloric acid R and 8 volumes of methanol R. Heat in a water bath at 80 °C under a reflux condenser for 30 min. Allow to cool to room temperature and filter through a plug of adsorbent cotton into a 25 mL volumetric flask. Dilute to 25.0 mL with methanol R by rinsing the round-bottomed flask and the filter.

**Reference solution** Dissolve 2.0 mg of marrubiin CRS in methanol R and dilute to 10.0 mL with the same solvent.

**Column:**

— size:  $l = 0.25$  m,  $\varnothing = 4$  mm;

— stationary phase: end-capped octadecylsilyl silica gel for chromatography R (5  $\mu$ m).

**Mobile phase:**

— mobile phase A: acetonitrile R1;

— mobile phase B: dilute 0.5 mL of phosphoric acid R to 1000 mL with water for chromatography R;

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 15	40 → 90	60 → 10
15 - 20	90 → 40	10 → 60
20 - 25	40	60

**Flow rate** 1.5 mL/min.

**Detection** Spectrophotometer at 217 nm.

**Injection** 20  $\mu$ L.

Locate the peak due to marrubiin by comparison with the chromatogram obtained with the reference solution.

Calculate the percentage content of marrubiin from the following expression:

$$\frac{A_1 \times m_2 \times p \times 2.5}{A_2 \times m_1}$$

- $A_1$  = area of the peak due to marrubiin in the chromatogram obtained with the test solution;  
 $A_2$  = area of the peak due to marrubiin in the chromatogram obtained with the reference solution;  
 $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in milligrams;  
 $m_2$  = mass of marrubiin CRS used to prepare the reference solution, in milligrams;  
 $p$  = percentage content of marrubiin in marrubiin CRS.

Ph Eur

**Horse-chestnut Fruit**

(Horse-chestnut, Ph. Eur. monograph 1830)

**Preparation**

Standardised Horse-chestnut Dry Extract

Ph Eur

**DEFINITION**

Whole or fragmented, dried, ripe seeds of *Aesculus hippocastanum* L.

**Content**

Minimum 1.5 per cent of triterpene glycosides, expressed as protoaescigenin ( $C_{30}H_{50}O_6$ ;  $M_r$  506.7) (dried drug).

**IDENTIFICATION**

A. The whole, spherical or oval, slightly flattened seed is 2-4 cm in diameter. It has a shiny, dark-brown testa with a broad, round, matt, light-brown spot (hilum); particularly on larger seeds, a short, narrow v-shaped ridge marks the position of the radicle, with the point terminating close to the hilum.

The fragmented seed occurs as more or less polyhedral pieces, about 1-2 cm in diameter, or as slices. The surfaces corresponding to the cotyledons are matt, light brown, with a clean fracture. Those corresponding to the testa are shiny, dark brown, except at the hilum, where they are matt, light brown. The testa is weakly bound to the cotyledons and is often detached.

B. Microscopic examination (2.8.23). The powder is yellowish-brown. Examine under a microscope using chloral hydrate solution R. The powder shows the following diagnostic characters (Figure 1830.-1): numerous different-sized droplets of fatty oil that are either free [D] or inside the thin-walled colourless cells of the cotyledons [E, G]; yellowish-brown fragments of the outer testa consisting of sclerenchymatous cells with thick walls (surface view [C], transverse section [A]); fragments from the inner testa consisting of thick-walled, colourless parenchymatous cells varying in shape [B, H, J] with poorly visible pits and occasional annular or spiral vessels [F]. Examine under a microscope using a 50 per cent V/V solution of glycerol R. Starch [K] is present in 3 forms: pyriform or reniform simple granules, often with verruciform excrescences, about 15-25  $\mu$ m in size, sometimes up to 30  $\mu$ m; roundish simple granules 5-10  $\mu$ m in diameter; and a few granules that form rows consisting of 2-4 simple granules that are up to about 35  $\mu$ m in length and occasionally up to about 45  $\mu$ m; most of the granules have either a stellate (2 or more rays) or more rarely a punctiform hilum.

C. Thin-layer chromatography (2.2.27).

**Test solution** To 1.0 g of the powdered herbal drug (355) (2.9.12) add 10 mL of ethanol (70 per cent V/V) R and heat under a reflux condenser for 15 min. Cool and filter.

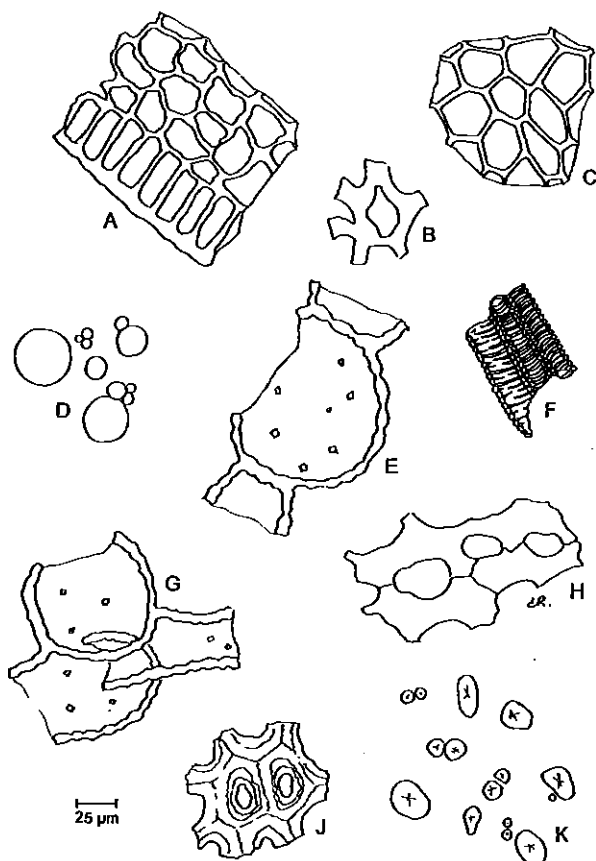

Figure 1830.-1. – Illustration for identification test B of powdered herbal drug of horse-chestnut

**Reference solution** Dissolve 5 mg of aescin for LC assay HRS and 5 mg of sucrose R in 1.0 mL of ethanol (70 per cent V/V) R.

**Plate** TLC silica gel F<sub>254</sub> plate R (5–40 µm) [or TLC silica gel F<sub>254</sub> plate R (2–10 µm)].

**Mobile phase** acetic acid R, ethyl acetate R, water R, propanol R (1.5:30:30:40 V/V/V/V).

**Application** 10 µL [or 3 µL] as bands of 10 mm [or 6 mm].

**Development** Over a path of 12 cm [or 6 cm].

**Drying** In air.

**Detection** Treat with anisaldehyde solution R, heat at 100–105 °C for 10 min and examine in daylight.

**Results** See below the sequence of zones present in the chromatogram obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.

#### TESTS

##### Loss on drying (2.2.32)

Maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

##### Total ash (2.4.16)

Maximum 4.0 per cent.

#### ASSAY

##### Liquid chromatography (2.2.29).

**Solvent mixture** acetonitrile R1, 0.05 per cent V/V solution of trifluoroacetic acid R (40:60 V/V).

**Internal marker solution** Dissolve 25.0 mg of methyl salicylate R and 75.0 mg of ibuprofen R in the solvent mixture and dilute to 50.0 mL with the solvent mixture. Dilute 5.0 mL of the solution to 25.0 mL with the solvent mixture.

**Test solution** To 2.00 g of the powdered herbal drug (355) (2.9.12) add 10.0 mL of the internal marker solution and 10.0 mL of the solvent mixture and sonicate for 10 min. Centrifuge and filter 2.0 mL of the supernatant through a membrane filter (0.45 µm). Use the filtrate as the test solution.

**Reference solution (a)** Dissolve 50.0 mg of aescin for LC assay HRS in the internal marker solution and dilute to 10.0 mL with the internal marker solution. Sonicate for 10 min and filter through a membrane filter (0.45 µm).

**Reference solution (b)** Dilute 1.0 mL of the internal marker solution to 50.0 mL with the solvent mixture. Dilute 1.0 mL of this solution to 10.0 mL with the solvent mixture.

##### Column:

— size:  $l = 0.25$  m,  $\varnothing = 4.6$  mm;

— stationary phase: end-capped octadecylsilyl silica gel for chromatography R (5 µm) with a pore size of 30 nm;

— temperature: 25 °C.

##### Mobile phase:

— mobile phase A: 0.05 per cent V/V solution of trifluoroacetic acid R;

— mobile phase B: acetonitrile R1;

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 15	70	30
15 - 25	70 → 65	30 → 35
25 - 35	65	35
35 - 65	65 → 50	35 → 50
65 - 70	50 → 10	50 → 90

**Flow rate** 1.0 mL/min.

**Detection** Spectrophotometer at 210 nm.

**Injection** 20 µL.

**Identification of peaks** Use the chromatogram supplied with *aescin* for LC assay HRS and the chromatogram obtained with reference solution (a) to identify peaks A and B due to *aescin*.

**System suitability:**

- the chromatogram obtained with reference solution (a) is similar to the chromatogram supplied with *aescin* for LC assay HRS regarding the peaks between those due to methyl salicylate and ibuprofen;
- **retention time:** methyl salicylate = 11.5 min to 15.5 min; ibuprofen = 34.0 min to 46.0 min;
- **resolution:** minimum 2.0 between peaks A and B due to *aescin* in the chromatogram obtained with reference solution (a);
- **signal-to-noise ratio:** minimum 10 for the peak due to methyl salicylate in the chromatogram obtained with reference solution (b).

**Integration:**

- **test solution:** integrate the peaks eluting between the peak due to methyl salicylate and the peak due to ibuprofen; integrate the area of the individual peaks or integrate groups of peaks in case of incomplete separation of the individual peaks;
- **reference solution (a):** for quantification, integrate as 1 integral, valley-to-valley, starting from the 1<sup>st</sup> peak after the peak due to methyl salicylate and ending with the last peak before the peak due to ibuprofen; if a peak is poorly separated from the peaks due to methyl salicylate or ibuprofen, integrate it separately; use the sum of the peak areas for the calculation.

Calculate the percentage content of triterpene glycosides, expressed as protoaescigenin, using the following expression:

$$\frac{A_1 \times m_2 \times p \times 2}{A_2 \times m_1}$$

- $A_1$  = total area (integrated as described above) of the peaks eluting between the peaks due to methyl salicylate and ibuprofen in the chromatogram obtained with the test solution;
- $A_2$  = total area (integrated as described above) of the peaks eluting between the peaks due to methyl salicylate and ibuprofen in the chromatogram obtained with reference solution (a);
- $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;
- $m_2$  = mass of *aescin* for LC assay HRS used to prepare reference solution (a), in grams;
- $p$  = percentage content of *aescin*, expressed as protoaescigenin, in *aescin* for LC assay HRS.

## STORAGE

In an airtight container.

Ph Eur

## Standardised Horse-chestnut Dry Extract

(Ph. Eur. monograph 1829)

Ph Eur

## DEFINITION

Standardised dry extract produced from *Horse-chestnut* (1830).

## Content

6.5 per cent to 10.0 per cent of total triterpene glycosides, expressed as protoaescigenin (C<sub>30</sub>H<sub>50</sub>O<sub>6</sub>; M<sub>r</sub> 506.7) (dried extract).

## PRODUCTION

The extract is produced from the herbal drug by a suitable procedure using a hydroalcoholic solvent equivalent in strength to ethanol (40-80 per cent V/V).

## CHARACTERS

### Appearance

Yellowish or yellowish-brown, hygroscopic powder or agglomerate.

### IDENTIFICATION

Thin-layer chromatography (2.2.27).

**Test solution** To 0.25 g of the extract to be examined add 10 mL of ethanol (70 per cent V/V) R, shake for 2 min and filter.

**Reference solution** Dissolve 5 mg of *aescin* for LC assay HRS and 5 mg of *sucrose* R in 1.0 mL of ethanol (70 per cent V/V) R.

**Plate** TLC silica gel F<sub>254</sub> plate R (5-40 µm) [or TLC silica gel F<sub>254</sub> plate R (2-10 µm)].

**Mobile phase** acetic acid R, ethyl acetate R, water R, propanol R (1.5:30:30:40 V/V/V/V).

**Application** 10 µL [or 3 µL] as bands of 10 mm [or 6 mm].

**Development** Over a path of 12 cm [or 6 cm].

**Drying** In air.

**Detection** Treat with *anisaldehyde* solution R, heat at 100-105 °C for 10 min and examine in daylight.

**Results** See below the sequence of zones present in the chromatogram obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
	1 or 2 yellowish-violet zones
Aescin: an intense violet-blue zone	An intense violet-blue zone ( <i>aescin</i> )

- $m_1$  = mass of the extract to be examined used to prepare the test solution, in grams;
- $m_2$  = mass of aescin for LC assay HRS used to prepare reference solution (a), in grams;
- $p$  = percentage content of aescin, expressed as protoaescigenin, in aescin for LC assay HRS.

Ph Eur

## Horsetail

(*Equisetum* Stem, Ph. Eur. monograph 1825)

Ph Eur

### DEFINITION

Whole or cut, dried sterile aerial parts of *Equisetum arvense* L.

### Content

Minimum 0.3 per cent of total flavonoids, expressed as isoquercitroside ( $C_{21}H_{20}O_{12}$ ;  $M_r$  464.4) (dried drug).

### IDENTIFICATION

A. It consists of fragments of grooved main stems, branches with longitudinal sharp ridges and leaves in whorls, united at the base into a sheath, light green or greenish-grey.

The fragments are rough to the touch, brittle and crunchy when crushed. The main stems are about 1-4.5 mm in diameter, hollow, jointed at the nodes, which occur at intervals of about 1.5-4.5 cm; distinct vertical grooves are present on the internodes, ranging in number from 4 to 14 or more. The central hollow is less than 50 per cent but more than 25 per cent of the diameter of the main stem. Verticils of widely spaced and erect branches, usually simple, each about 1 mm thick with 3-5 longitudinal, sharp ridges, occur at the nodes; at the end of each ridge is a protruding, distinct collenchymatic bundle under the epidermis. The branches are not hollow. The leaves are small, linear, verticillate at each node, concrescent at the base; they form a toothed sheath around the stem with the number of teeth corresponding to the number of grooves on the stem. Each tooth, often brown, is lanceolate-triangular. The lowest internode of each branch is longer than the sheath of the stem to which it belongs.

B. Microscopic examination (2.8.23). The powder is greenish-grey. Examine under a microscope using chloral hydrate solution R. The powder shows the following diagnostic characters (Figure 1825.-1): fragments of the epidermis (surface view [B, C]) composed of rectangular cells with wavy walls and paracytic stomata (2.8.3) in 2-4 rows, the 2 subsidiary cells are in the same plane as the epidermis, cover the guard cells and show radial ridges; small silica pilulae are scattered on the surface of the subsidiary cells and appear more frequent at the margin forming a distinct ring surrounding the subsidiary cells [C]; 2-celled papillae on the ridges, less distinct on the main stem [A] but large and rectangular on the branches, oriented longitudinally [F]; in surface view, the epidermis of the main stems consists of elongated cells [G], the epidermis of the secondary branches shows the 2-celled papillae which resemble pairs of small cells separated by a larger cell [D]; fragments of large-celled parenchyma [H] and groups of long un lignified fibres with narrow lumens; small vessels with spiral or annular thickening [E].

C. Examine the chromatograms obtained in the test for *Equisetum palustre*.

Figure 1825.-1. – Illustration for identification test B of powdered herbal drug of equisetum stem

**Results** See below the sequence of zones present in the chromatograms obtained with reference solution (b) and the test solution. Furthermore, other weak fluorescent zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Caffeic acid: a greenish-blue fluorescent zone	2 red fluorescent zones
	2 greenish-blue fluorescent zones
Hyperoside: an orange fluorescent zone	An orange fluorescent zone
	2 greenish-blue fluorescent zones
Rutoside: an orange fluorescent zone	
Reference solution (b)	Test solution

## TESTS

**Foreign matter (2.8.2)**  
Maximum 5 per cent.

### *Equisetum palustre*

Thin-layer chromatography (2.2.27).

**Test solution** To 1.0 g of the powdered herbal drug (355) (2.9.12) add 10 mL of *methanol R*. Heat in a water-bath at 60 °C for 10 min with occasional shaking. Allow to cool. Filter.

**Reference solution (a)** To 100.0 mg of *Equisetum palustre HRS* add 10 mL of *methanol R*. Heat in a water-bath at 60 °C for 10 min with occasional shaking. Allow to cool. Filter.

**Reference solution (b)** Dissolve 1.0 mg of *caffeic acid R*, 2.5 mg of *hyperoside R* and 2.5 mg of *rutoside trihydrate R* in 20 mL of *methanol R*.

**Plate** TLC silica gel plate R (2-10 µm).

**Mobile phase** anhydrous formic acid R, glacial acetic acid R, water R, ethyl acetate R (7.5:7.5:18:67 V/V/V/V).

**Application** 5 µL as bands of 8 mm.

**Development** Over a path of 6 cm.

**Drying** In a current of cold air for 5 min.

**Detection** Heat at 100 °C for 3 min and treat the still-warm plate with a 10 g/L solution of *diphenylboric acid aminoethyl ester R* in *methanol R*, then treat with a 50 g/L solution of *macrogol 400 R* in *methanol R*; allow to dry in a current of cold air and examine after 10 min in ultraviolet light at 365 nm.

**System suitability** The chromatogram obtained with reference solution (a) shows 2 greenish fluorescent zones just above the line of application.

**Results** In the chromatogram obtained with the test solution, any greenish fluorescent zones just above the line of application are not more intense than the corresponding zones (characteristic of *E. palustre* L.) in the chromatogram obtained with reference solution (a).

### Loss on drying (2.2.32)

Maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

### Ash insoluble in hydrochloric acid (2.8.1)

Minimum 3.0 per cent and maximum 15.0 per cent.

### Total ash (2.4.16)

Minimum 12.0 per cent and maximum 27.0 per cent.

## ASSAY

**Stock solution** In a 100 mL round-bottomed flask, introduce 0.800 g of the powdered herbal drug (355) (2.9.12) and add 1 mL of a 5 g/L solution of *hexamethylenetetramine R*, 20 mL of *acetone R* and 2 mL of *hydrochloric acid R1*. Boil the mixture under a reflux condenser for 30 min. Filter the liquid through a plug of absorbent cotton into a flask. Add the absorbent cotton to the residue in the round-bottomed flask and extract with 2 quantities, each of 20 mL, of *acetone R*, each time boiling under a reflux condenser for 10 min. Allow to cool and filter each extract through a plug of absorbent cotton into the flask. After cooling, filter the combined acetone extracts through a filter paper into a volumetric flask and dilute to 100.0 mL with *acetone R* by rinsing the flask and the filter paper. Introduce 20.0 mL of the solution into a separating funnel, add 20 mL of *water R* and shake the mixture with 1 quantity of 15 mL and then 3 quantities, each of 10 mL, of *ethyl acetate R*. Combine the ethyl acetate extracts in a separating funnel, wash with 2 quantities, each of 50 mL, of *water R*, and filter the extracts over 10 g of *anhydrous sodium sulfate R* into a volumetric flask. Dilute to 50.0 mL with *ethyl acetate R*.

**Test solution** To 10.0 mL of the stock solution add 1 mL of *aluminium chloride reagent R* and dilute to 25.0 mL with a 5 per cent V/V solution of *glacial acetic acid R* in *methanol R*.

**Compensation solution** Dilute 10.0 mL of the stock solution to 25.0 mL with a 5 per cent V/V solution of glacial acetic acid R in methanol R.

Measure the absorbance (2.2.25) of the test solution after 30 min, by comparison with the compensation solution at 425 nm. Calculate the percentage content of flavonoids, expressed as isoquercitroside, using the following expression:

$$\frac{A \times 1.25}{m}$$

i.e. taking the specific absorbance of isoquercitroside to be 500.

*A* = absorbance at 425 nm;  
*m* = mass of the substance to be examined, in grams.

Ph Eur

## Houttuynia Herb

(Ph. Eur. Monograph 2722)

Ph Eur

### DEFINITION

Whole or fragmented, dried, flowering aerial parts of *Houttuynia cordata* Thunb.

### Content

Minimum 0.10 per cent of quercitrin (C<sub>21</sub>H<sub>20</sub>O<sub>11</sub>; M<sub>r</sub> 448.4) (dried drug).

### IDENTIFICATION

**A. Whole drug.** It comprises stems, abundant leaves and flowering spikes. Stems are compressed-cylindrical, externally yellowish-brown, with several deep longitudinal furrows and distinctly jointed nodes. The leaves (if still attached to stems) are alternate, with petioles shorter than the leaf blade and enclosed by a downy membranous sheath (stipule) about 1/4 to 1/2 the length of the petiole; leaf blades are rolled or crumpled and densely gland-dotted; when intact and expanded, the leaf blades are broadly ovate (3-10 cm long, 3-5 cm wide) with a cordate base and a narrowly pointed tip and entire margins; the upper surface is dark yellowish-green or dark brown, the lower surface greyish-green or greyish-brown. The flowers are densely packed in yellowish-brown cylindrical heads (about 1 cm long, 0.3 cm in diameter), occasionally with 4 (rarely 6 or 8) shrivelled brown bracts (about 1 cm long), persistent at the base. Individual flowers are very small (about 1 mm in diameter), always petal-less, comprising of 3 stamens and 3 carpels, each with a recurved style and a semi-inferior ovary. A few fruiting spikes may be present. Individual fruits are very small (about 2-3 mm long, 1 mm in diameter), dry, subglobose capsules with persistent styles, and are apically dehiscent. Once dehisced, fruits resemble tiny goblets with a 3-toothed lip.

**Fragmented drug** It consists of fragments (up to about 4 cm long, 2.5-5 mm in diameter) of stems, leaves and the spike, similar to those described above.

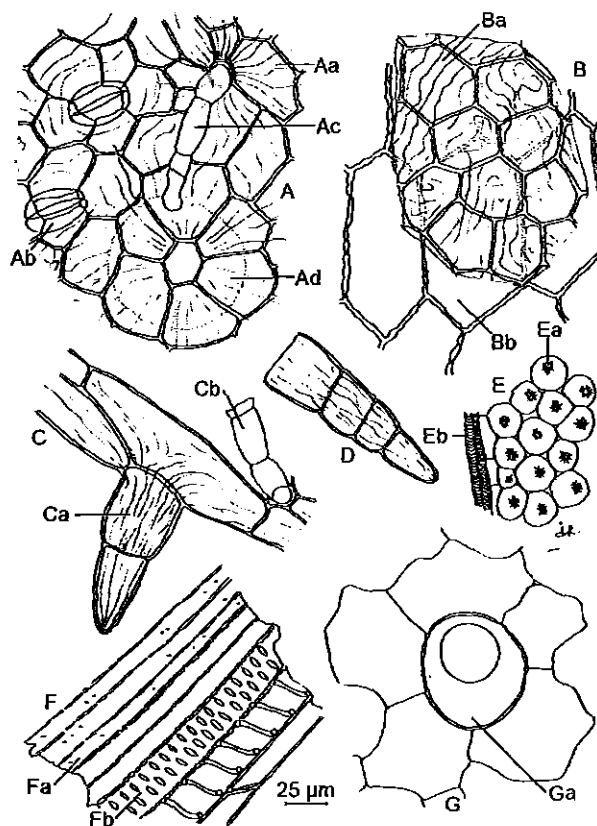

Figure 2722.-1. – Illustration for identification test B of powdered herbal drug of *houttuynia* herb

**B. Microscopic examination (2.8.23).** The powder is dark brownish-green. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2722.-1): fragments of the upper epidermis of the leaf (surface view [B]), covered by a strongly striated cuticle, composed of polygonal cells [Ba] usually associated with a hypodermis consisting of a layer of large polygonal cells with irregularly thickened walls [Bb]; fragments of the lower epidermis of the leaf (surface view [A]), covered by a striated cuticle, with polygonal cells [Aa], anomocytic stomata [Ab] (2.8.3) and uniseriate glandular trichomes, with a multicellular stalk and a unicellular head, whole (rare) [Ac] or broken (frequent) [Cb]; epidermal cells located above the oil cells are arranged in a rosette and the cuticle shows radial striations [Ad]; fragments of palisade parenchyma (surface view [E]) with each cell containing a small cluster crystal of calcium oxalate [Ea], sometimes associated with spiral vessels of the veins [Eb]; fragments of the epidermis of the veins with elongated cells [C], uniseriate and multicellular covering trichomes, with rounded ends and strongly striated walls [Ca], and glandular trichomes; scattered covering trichomes of the veins [D]; fragments of parenchyma [G] consisting of oil cells with orange-yellow contents [Ga]; fragments of vascular tissue from the stems [F] with large vessels [Fb] and pitted fibres [Fa].

**C. High performance thin-layer chromatography (2.8.25).**  
**Test solution** To 0.5 g of the powdered herbal drug (355) (2.9.12) add 5 mL of *methanol R* and sonicate for 10 min. Centrifuge and use the supernatant. If necessary, filter through a membrane filter (nominal pore size 0.45 µm).

**Reference solution (a)** Dissolve 2.0 mg of *hyperoside R* and 5.0 mg of *quercitrin R* in *methanol R* and dilute to 20.0 mL with the same solvent.

**Reference solution (b)** Dilute 2.5 mL of reference solution (a) to 10.0 mL with *methanol R*.

**Reference solution (c)** Dissolve 1 mg of *chlorogenic acid R* and 2 mg of *hyperoside R* in *methanol R* and dilute to 20.0 mL with the same solvent.

**Intensity marker** Quercitrin.

**Plate** TLC silica gel  $F_{254}$  plate R (2–10  $\mu\text{m}$ ).

**Mobile phase** *acetic acid R*, *anhydrous formic acid R*, *water R*, *ethyl acetate R* (11:11:27:100 V/V/V/V).

**Application** 5  $\mu\text{L}$  as bands of 8 mm.

**Development** Over a path of 6 cm.

**Drying** In air.

**Detection** Heat at 100 °C for 5 min. Spray the warm plate with a 10 g/L solution of *diphenylboric acid aminoethyl ester R* in *methanol R*, then with a 50 g/L solution of *macrogol 400 R* in *methanol R* or, alternatively, dip the warm plate in a 5 g/L solution of *diphenylboric acid aminoethyl ester R* in *ethyl acetate R*, then in a 50 g/L solution of *macrogol 400 R* in *methylene chloride R*. Allow the plate to dry in air for about 1 min and examine in ultraviolet light at 366 nm.

**System suitability** Reference solution (c):

- the chromatogram shows 2 distinct zones in the middle third; the lower zone (chlorogenic acid) shows a light blue fluorescence and the upper zone (hyperoside) shows a yellow fluorescence.

**Results** See below the sequence of zones present in the chromatograms obtained with reference solution (a) and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Top of the plate		
	Quercitrin: a yellow zone	2 red zones A yellow zone (quercitrin)
		A faint yellow zone
Hyperoside: a yellow zone	Hyperoside: a yellow zone	A yellow zone (hyperoside)
		A blue zone
Chlorogenic acid: a bluish zone		A blue zone
		A faint yellow zone
Reference solution (c)	Reference solution (a)	Test solution

## TESTS

### Loss on drying (2.2.32)

Maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

### Total ash (2.4.16)

Maximum 15.0 per cent.

### Ash insoluble in hydrochloric acid (2.8.1)

Maximum 3.0 per cent.

## ASSAY

Liquid chromatography (2.2.29).

**Test solution** To 1.000 g of the powdered herbal drug (355) (2.9.12) add 50.0 mL of a mixture of equal volumes of *methanol R* and *water R*. Weigh and sonicate for 1 h. Allow to cool and weigh again. Compensate for the loss of solvent with a mixture of equal volumes of *methanol R* and *water R*. Filter through a membrane filter (nominal pore size 0.45  $\mu\text{m}$ ).

**Reference solution (a)** Dissolve 5.0 mg of *quercitrin CRS* in *methanol R* and dilute to 10.0 mL with the same solvent. Dilute 1.0 mL of the solution to 10.0 mL with *methanol R*.

**Reference solution (b)** Dissolve 2.5 mg of *isoquercitrin R* in reference solution (a) and dilute to 5.0 mL with reference solution (a). Dilute 1.0 mL of this solution to 10.0 mL with *methanol R*.

**Column:**

- size:  $l = 0.25 \text{ m}$ ,  $\varnothing = 4.0 \text{ mm}$ ;
- stationary phase: end-capped octadecylsilyl silica gel for chromatography R (5  $\mu\text{m}$ ).

**Mobile phase:**

- mobile phase A: *water for chromatography R*;
- mobile phase B: *acetonitrile R*;

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 10	80 → 70	20 → 30
10 - 10.1	70 → 5	30 → 95
10.1 - 20	5	95

**Flow rate** 1.0 mL/min.

**Detection** Spectrophotometer at 258 nm.

**Injection** 20  $\mu\text{L}$ .

**Retention time** Isoquercitrin = about 6.5 min; quercitrin = about 8 min.

**System suitability** Reference solution (b):

- resolution: minimum 5 between the peaks due to isoquercitrin and quercitrin.

Calculate the percentage content of quercitrin using the following expression:

$$\frac{A_1 \times m_2 \times p}{A_2 \times m_1 \times 2}$$

- $A_1$  = area of the peak due to quercitrin in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to quercitrin in the chromatogram obtained with reference solution (a);
- $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;
- $m_2$  = mass of *quercitrin CRS* used to prepare reference solution (a), in grams;
- $p$  = percentage content of quercitrin in *quercitrin CRS*.

Ph Eur

## Iceland Moss

(Ph. Eur. monograph 1439)

Ph Eur

### DEFINITION

Whole or cut, dried thallus of *Cetraria islandica* (L.) Acharius s.l.

### IDENTIFICATION

A. The thallus, up to 15 cm long, is irregularly dichotomous and consists of glabrous, groove-shaped or almost flat, stiff, brittle bands, 0.3-1.5 cm wide and about 0.5 mm thick, sometimes serrated with the margin appearing ciliated (pycnidia). The upper surface is greenish or greenish-brown, the lower surface is greyish-white or light brownish and shows whitish, depressed spots (so-called respiratory cavities). On the apices of the terminal lobes, very rarely, there are brown, discoid apothecia.

B. Microscopic examination (2.8.23). The powder is greyish-brown. Examine under a microscope, using *chloral hydrate solution R*. The powder shows the following diagnostic characters: numerous fragments of the pseudoparenchyma consisting of narrow-lumened, thick-walled hyphae from the marginal layer and wide-lumened hyphae from the adjacent layer consisting of loosely entwined hyphae, in which, in the medullary zone, greenish or brownish algae cells up to 15 µm in diameter, are embedded; occasionally marginal fragments of the thallus with tube-like or cylindrical spermogonia, up to about 160 µm wide and up to about 400 µm long.

C. To 1.0 g of the powdered herbal drug (355) (2.9.12) add 10 mL of *water R* and boil for 2-3 min. The greyish-brown solution forms a gel after cooling which gives a blue colour with *iodine solution R1*.

D. Thin-layer chromatography (2.2.27).

**Test solution** To 1.0 g of the powdered herbal drug (355) (2.9.12) add 5 mL of *acetone R* and heat in a water-bath under a reflux condenser for 2-3 min. Cool and filter.

**Reference solution** Dissolve 5 mg of *anethole R* and 5 mg of *caffeic acid R* in 2 mL of *acetone R*.

**Plate** TLC silica gel plate R (5-40 µm) [or TLC silica gel plate R (2-10 µm)].

**Mobile phase** *acetone R*, *methanol R*, *anhydrous formic acid R*, *toluene R* (5:5:10:80 V/V/V/V).

**Application** 20 µL [or 4 µL] of the test solution and 10 µL [or 2 µL] of the reference solution, as bands.

**Development** Over a path of 10 cm [or 6 cm].

**Drying** In air.

**Detection** Spray with *anisaldehyde solution R*. Heat at 100-105 °C for 5-10 min and examine in daylight.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Anethole: a blue or bluish-violet zone	A greyish-blue zone
	2 weak greyish-blue zones
	A weak greyish-brown or grey zone
Caffeic acid: a greyish-blue zone	A greyish-violet zone
Reference solution	Test solution

### TESTS

**Foreign matter** (2.8.2)

Maximum 5 per cent.

**Lead** (2.4.27)

Maximum 10.0 ppm.

**Loss on drying** (2.2.32)

Maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

**Total ash** (2.4.16)

Maximum 3.0 per cent.

**Swelling index** (2.8.4)

Minimum 4.5, determined on the powdered herbal drug (355) (2.9.12).

Ph Eur

## Indian Sandalwood Oil

### DEFINITION

Indian Sandalwood Oil is the non-rectified or rectified essential oil of the heartwood of *Santalum album* L. trees, not younger than 12 years of age.

The essential oil complies with the requirements stated under *Essential Oils* and with the following requirements.

### PRODUCTION

Non-rectified Indian Sandalwood Oil is produced by steam distillation. Rectified Indian Sandalwood Oil is obtained by sequential steam and vacuum distillation.

### CHARACTERISTICS

A clear to yellow-coloured liquid with a characteristic sweet woody odour.

### IDENTIFICATION

A. Carry out the method for *high-performance thin-layer chromatography*, Appendix XI W, using the following solutions.

(1) Dilute the preparation being examined with sufficient *toluene* to produce a solution containing 0.7% v/v of Indian Sandalwood Oil.

(2) 0.1% v/v of *linalool* and 0.1% v/v of *linalyl acetate* in *toluene*.

(3) Dilute 1 volume of solution (2) to 4 volumes with *toluene* and use *linalyl acetate* as the intensity marker.

(4) 0.025% v/v of *isoeugenol* and 0.05% v/v of *isoeugenyl acetate* in *toluene*.

#### CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *high performance silica gel 254* (Merck silica gel 60 F<sub>254</sub> plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 2 µL of each solution, as 8-mm bands.

(d) Develop the plate to 7 cm.

(e) After removal of the plate, dry in a current of air.

(f) Dip the plate in freshly prepared *anisaldehyde solution*, heat at 100° for 3 minutes and examine under white light.

#### MOBILE PHASE

5 volumes of *ethyl acetate* and 95 volumes of *toluene*.

#### SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (4) shows two clearly separated zones under white light.

#### CONFIRMATION

The chromatogram obtained with solution (1) shows a faint purple zone at the top of the plate. There is a pink zone in the middle of the plate. There are two faint purple-brown zones in the bottom third of the plate, below which is an intense purple-brown zone. Other faint zones may be present.

Top of the plate		
		A faint purple zone
—	A purple-brown zone (linalyl acetate)	A pink zone
A faint purple-brown zone (isoeugenyl acetate)		
A faint purple-brown zone (isoeugenol)		
—		A faint purple-brown zone
		A faint purple-brown zone
	A purple-brown zone (linalool)	An intense purple-brown zone
Solution (4) SST	Solution (2) and (3) Intensity marker	Solution (1) Test solution

B. In the test for Chromatographic profile the characteristic peaks in the chromatogram obtained with solution (1) are similar in retention times to those in the chromatogram obtained with solution (2).

#### TESTS

##### *Santalum spicatum* Oil

In the test for Chromatographic profile, the amount of (*E,E*)-farnesol present is not greater than 1.0%.

The presence of (*E,E*)-farnesol at levels of greater than 1.0% may suggest the presence of the oil of *Santalum spicatum* (oil of *Santalum spicatum* typically has an (*E,E*)-farnesol content of around 10% to 12%).

#### Relative density

0.968 to 0.983, Appendix V G.

#### Refractive index

1.503 to 1.509, Appendix V E.

#### Optical rotation

- 21° to -12°, Appendix V F.

#### Solubility in ethanol

One volume of the neat oil is soluble, sometimes with opalescence, in 5 volumes of *ethanol (70%)*, Appendix X M.

#### Ester value

Not more than 10, Appendix X C.

#### Chromatographic profile

Carry out the method for *gas chromatography*, Appendix III B using the following solutions. Use the normalisation procedure.

(1) Dissolve a quantity of the substance to be examined with sufficient *dichloromethane* to produce a solution containing approximately 0.5% w/v of Indian Sandalwood Oil.

(2) 0.5% w/v of *indian sandalwood oil BPCRS* in *dichloromethane*.

(3) 0.005% w/v of (*E,E*)-farnesol in *dichloromethane*.

(4) 0.00025% of (*E,E*)-farnesol in *dichloromethane*.

#### CHROMATOGRAPHIC CONDITIONS

(a) Use a fused silica column (30 m × 0.25 mm) bonded with a film (0.25 µm) of *polydimethylsiloxane* (RTX-1 is suitable).

(b) Use *hydrogen for chromatography* as the carrier gas at 2.7 mL per minute.

(c) Use the gradient conditions described below.

(d) Use an inlet temperature of 250°.

(e) Use a flame ionisation detector at a temperature of 250°.

(f) Inject 1.0 µL of each solution.

(g) Use a split ratio of 1:50.

(h) Collect the data up to 90 minutes. The re-equilibration time may be adjusted depending on equipment.

Time (Minutes)	Temperature	Comment
0-10	70°	isocratic
10-85	70°→220°	linear gradient
85-90	220°	isocratic
90-120	220°→70°	linear gradient

When recorded under the prescribed conditions, the relative retentions with reference to (*E,E*)-farnesol (retention time about 48.8 minutes) are: sesquiterpene olefins, between 0.11 and 0.74; (*Z*)- $\alpha$ -santalol, about 0.94; (*Z*)-exo- $\alpha$ -bergamotol, about 0.96; (*Z*)-epi- $\beta$ -santalol, about 0.97; (*Z*)- $\beta$ -santalol, about 0.99 and (*Z*)-lanceol, about 1.04.

#### SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2):

the *resolution* between the peaks due to (*Z*)- $\alpha$ -santalol and (*Z*)-exo- $\alpha$ -bergamotol is at least 3.0;

the *column efficiency* calculated using the peak due to (*Z*)- $\alpha$ -santalol is at least 44,000.

## DETERMINATION OF CONTENT

Use the chromatogram obtained with solution (2) to identify the peaks in the chromatogram obtained with solution (1). Use the chromatogram obtained with solution (3) to identify any peak due to (*E,E*)-farnesol in the chromatogram obtained with solution (1), as (*E,E*)-farnesol may co-elute with another peak. Locate all sesquiterpene olefins between the solvent peak and 34 minutes.

## LIMITS

For non-rectified Indian Sandalwood Oil:

- Total sesquiterpene olefins not more than 7.0%,
- (*Z*)- $\alpha$ -santalol, 41.0% to 55.0%,
- (*Z*)- $\beta$ -santalol, 16.0% to 24.0%
- (*Z*)-lanceol, not more than 5.0%
- (*E,E*)-farnesol, not more than 1.0%.

For rectified Indian Sandalwood Oil:

- Total sesquiterpene olefins not more than 3.5%,
- (*Z*)- $\alpha$ -santalol, 41.0% to 55.0%,
- (*Z*)- $\beta$ -santalol, 16.0% to 24.0%
- (*Z*)-lanceol, not more than 5.0%
- (*E,E*)-farnesol, not more than 1.0%.

Disregard peaks with a percentage area less than 0.05%.

## LABELLING

The labelling states whether the oil is rectified or non-rectified.

## Indigo Plant Leaf

(Ph. Eur. monograph 2727)

Ph Eur

## DEFINITION

Whole or fragmented, dried leaf of *Persicaria tinctoria* (Aiton) Spach (syn. *Polygonum tinctorium* Aiton) collected in summer and autumn.

## Content

Minimum 0.55 per cent of indigo ( $C_{16}H_{10}N_2O_2$ ; *M*, 262.3) (dried drug).

## IDENTIFICATION

A. The leaf is usually fragmented into small crumpled pieces. The whole leaf is elliptical, about 3-8 cm long and 2-5 cm wide, bluish-green or dark bluish-green, with an obtuse or slightly acute apex and attenuate base, and with entire margins, which are slightly ciliated. The adaxial surface is glabrous and the abaxial surface is slightly pubescent along the veins. The veins, slightly prominent on the abaxial surface, are yellow or pale brown. The petiole is short, about 5-10 mm long, flattened, occasionally with membranous ochrea with long ciliate extensions.

B. Microscopic examination (2.8.23). The powder is dark bluish-green. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2727.-1): fragments of epidermis covered by a fine striated cuticle (surface view [C, E, F]) consisting of polygonal cells with straight [Ea, Fa] or slightly sinuous [Ca] anticlinal walls, glandular trichomes with a bi- or multicellular stalk and a 2- to 8-celled head [Fc], or their scars [Cb], paracytic stomata (2.8.3), rare on the adaxial surface [Fd] and frequent on the abaxial surface [Ce]; fragments of mesophyll [A] consisting of palisade parenchyma (surface view [Fb]) and spongy parenchyma (surface view [Ab]) with granular bluish or bluish-black

pigmented contents including some idioblastic cells containing calcium oxalate cluster crystals [Aa] or calcium oxalate spherocrystals [Ac] of various sizes (10-80  $\mu$ m); cluster crystals [B] or spherocrystals, whole [H] or fragmented [D], isolated; multicellular, multiseriate covering trichomes, 500  $\mu$ m long or more, sometimes whole [Eb] or, most often, occurring as isolated fragments [G], with cells with lignified walls; fragments of the vascular bundles of the petioles or veins [J] with spiral or annular vessels [Ja] accompanied by fibres [Jb].

Figure 2727.-1. – Illustration for identification test B of powdered herbal drug of indigo plant leaf

C. Thin-layer chromatography (2.2.27).

*Solution A* 20 g/L solution of *chloral hydrate R* in *methylene chloride R*.

*Test solution* To 0.1 g of the powdered herbal drug (355) (2.9.12) add 45 mL of solution A and sonicate at 30 °C for 30 min. Allow to cool, centrifuge, dilute the supernatant to 50.0 mL with solution A and mix thoroughly. Filter through a membrane filter (nominal pore size 0.45  $\mu$ m).

*Reference solution* To 1 mg of *indigo R* and 1 mg of *indirubin R* add 9.5 mL of solution A and sonicate at 30 °C for 30 min. Allow to cool, dilute to 10.0 mL with solution A and mix thoroughly. Filter through a membrane filter (nominal pore size 0.45  $\mu$ m).

*Plate* TLC silica gel *F<sub>254</sub> plate R* (2-10  $\mu$ m).

*Mobile phase* *acetone R*, *methylene chloride R* (5:95 *V/V*).

*Application* 15  $\mu$ L as bands of 8 mm.

*Development* Immediately, over a path of 6 cm.

*Drying* Immediately, in air.

*Detection* Examine immediately in daylight.

*Results* See below the sequence of zones present in the chromatograms obtained with the reference solution and the

test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

### TESTS

#### Loss on drying (2.2.32)

Maximum 7.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

#### Total ash (2.4.16)

Maximum 15.0 per cent.

#### Ash insoluble in hydrochloric acid (2.8.1)

Maximum 7.0 per cent.

### ASSAY

Liquid chromatography (2.2.29).

**Solution A** 20 g/L solution of chloral hydrate R in methylene chloride R.

**Test solution** To 50.0 mg of the powdered herbal drug (355) (2.9.12) add 45 mL of solution A and sonicate at 30 °C for 30 min. Allow to cool, centrifuge, dilute the supernatant to 50.0 mL with solution A and mix thoroughly. Filter through a membrane filter (nominal pore size 0.45 µm).

**Reference solution** To 5.0 mg of indigo CRS and 5.0 mg of indirubin R add 950 mL of solution A and sonicate at 30 °C for 30 min. Allow to cool, dilute to 1000.0 mL with solution A and mix thoroughly. Filter through a membrane filter (nominal pore size 0.45 µm).

#### Column:

— size:  $l = 0.25$  m,  $\varnothing = 4.0$  mm;

— stationary phase: end-capped octadecylsilyl silica gel for chromatography R (5 µm).

**Mobile phase** 70 per cent V/V solution of methanol R.

**Flow rate** 1.0 mL/min.

**Detection** Spectrophotometer at 290 nm.

**Injection** 5 µL.

**Run time** 2.5 times the retention time of indigo.

**Relative retention** With reference to indigo (retention time = about 10 min): indirubin = about 1.7.

**System suitability** Reference solution:

— resolution: minimum 4.0 between the peaks due to indigo and indirubin.

Calculate the percentage content of indigo using the following expression:

$$\frac{A_1 \times m_2 \times p \times 0.05}{A_2 \times m_1}$$

$A_1$  = area of the peak due to indigo in the chromatogram obtained with the test solution;

$A_2$  = area of the peak due to indigo in the chromatogram obtained with the reference solution;

$m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;

$m_2$  = mass of indigo CRS used to prepare the reference solution, in grams;

$p$  = percentage content of indigo in indigo CRS.

## Ipecacuanha

(Ipecacuanha Root, Ph. Eur. monograph 0094)

### Preparations

Prepared Ipecacuanha

Ipecacuanha Liquid Extract

Standardised Ipecacuanha Liquid Extract

Standardised Ipecacuanha Tincture

Ph Eur

### DEFINITION

Fragmented and dried underground organs of *Carapichea ipecacuanha* (Brot.) L. Andersson (syn. *Cephaelis ipecacuanha* (Brot.) A. Rich.; *Cephaelis acuminata* H. Karst.) from Mato Grosso or Costa Rica. The principal alkaloids are emetine and cephaeline.

### Content

Minimum 2.0 per cent of total alkaloids, expressed as emetine ( $C_{29}H_{40}N_2O_4$ ;  $M_r$  480.6) (dried drug).

### IDENTIFICATION

**A. Mato Grosso ipecacuanha:** the root occurs as somewhat tortuous pieces, dark reddish-brown or very dark brown, seldom more than 15 cm long or 6 mm thick, closely annulated externally, having rounded ridges completely encircling the root; the fracture is short in the bark and splintery in the wood. The transversely cut surface shows a wide greyish bark and a small uniformly dense wood. The rhizome occurs as short lengths usually attached to roots, cylindrical, up to 2 mm in diameter, finely wrinkled longitudinally and with pith occupying approximately one-sixth of the whole diameter.

**Costa Rica ipecacuanha** The root in general resembles the root of Mato Grosso ipecacuanha, but differs in the following particulars: it is often up to 9 mm thick; the external surface is greyish-brown or reddish-brown with transverse ridges at intervals of usually 1-3 mm, the ridges being about 0.5-1 mm wide, extending about half-way round the circumference and fading at the extremities into the general surface level.

**B. Microscopic examination (2.8.23).** The powder is light grey or yellowish-brown. Examine under a microscope using chloral hydrate solution R. The powder shows the following diagnostic characters (Figure 0094.-1): fragments of parenchyma [G] with ovoid cells [Ga]; raphides of calcium oxalate up to 80 µm in length either in bundles [Bc] or scattered throughout the powder [Gb]; fragments [E] of tracheids and vessels usually 10-20 µm in diameter, with bordered pits [Eb] accompanied by ligneous parenchyma with longitudinally elongated rectangular cells [Ea]; larger vessels and sclereids from the rhizome [D]; fragments of dermal tissue (transverse section [B]) with reddish-brown cork [Ba] and phelloderm [Bb], with some cells containing raphides of calcium oxalate [Bc]; large parenchymatous cells with slightly thickened and pitted walls, from the pith of the rhizome [C]; a few fragments of fibres with moderately thickened and slightly pitted walls from the xylem, isolated

[H] or associated with vessels [F]. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows simple [Aa] or 2- to 10-compound [Ab] starch granules contained in parenchymatous cells [A], the simple granules being up to 15  $\mu\text{m}$  in diameter in Costa Rica ipecacuanha and up to 22  $\mu\text{m}$  in diameter in Mato Grosso ipecacuanha.

Figure 0094.-1. – Illustration for identification test B of powdered herbal drug of ipecacuanha root

#### C. Thin-layer chromatography (2.2.27).

**Test solution** To 0.1 g of the powdered herbal drug (180) (2.9.12) in a test-tube add 0.05 mL of *concentrated ammonia R* and 5 mL of *ether R* and stir the mixture vigorously with a glass rod. Allow to stand for 30 min and filter.

**Reference solution** Dissolve 2.5 mg of *emetine hydrochloride CRS* and 3 mg of *cephaeline hydrochloride CRS* in *methanol R* and dilute to 20 mL with the same solvent.

**Plate** TLC silica gel  $F_{254}$  plate *R* (5–40  $\mu\text{m}$ ) [or TLC silica gel  $F_{254}$  plate *R* (2–10  $\mu\text{m}$ )].

**Mobile phase** *concentrated ammonia R*, *methanol R*, *ethyl acetate R*, *toluene R* (2:15:18:65 *V/V/V/V*).

**Application** 10  $\mu\text{L}$  [or 5  $\mu\text{L}$ ] as bands of 10 mm [or 8 mm].

**Development** Over a path of 10 cm [or 6 cm].

**Drying** In air.

**Detection A** Examine in ultraviolet light at 365 nm.

**Results A** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint fluorescent zones may be present in the chromatogram obtained with the test solution.

Top of the plate		
Emetine: a blue fluorescent zone	A blue fluorescent zone (emetine)	A blue fluorescent zone (emetine)
Cephaeline: a blue fluorescent zone	A blue fluorescent zone (cephaeline)	A faint blue fluorescent zone (cephaeline)
Reference solution	Test solution (Costa Rica ipecacuanha)	Test solution (Mato Grosso ipecacuanha)

**Detection B** Treat with a 5 g/L solution of *iodine R* in *ethanol (96 per cent) R*, heat at 60 °C for 10 min and examine in ultraviolet light at 365 nm.

**System suitability** Reference solution:

- the blue fluorescent zone due to cephaeline and the yellow fluorescent zone due to emetine are clearly separated.

**Results B** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint fluorescent zones may be present in the chromatogram obtained with the test solution.

#### TESTS

##### Loss on drying (2.2.32)

Maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (180) (2.9.12) by drying in an oven at 105 °C.

##### Total ash (2.4.16)

Maximum 5.0 per cent.

##### Ash insoluble in hydrochloric acid (2.8.1)

Maximum 3.0 per cent.

#### ASSAY

Place 7.5 g of the powdered herbal drug (180) (2.9.12) in a dry flask, add 100 mL of *ether R* and shake for 5 min. Add 5 mL of *dilute ammonia R1*, shake for 1 h, add 5 mL of *water R* and shake vigorously. Decant the ether layer into a flask through a plug of cotton. Wash the residue in the flask with 2 quantities, each of 25 mL, of *ether R*, decanting each portion through the same plug of cotton. Combine the ether solutions and eliminate the ether by distillation. Dissolve the residue in 2 mL of *ethanol (90 per cent V/V) R*, evaporate to dryness and heat at 100 °C for 5 min. Dissolve the residue in 5 mL of previously neutralised *ethanol (90 per cent V/V) R*, warming on a water-bath. Add 15.0 mL of 0.1 M *hydrochloric acid* and titrate the excess acid with 0.1 M *sodium hydroxide* using 0.5 mL of *methyl red mixed solution R* as indicator.

1 mL of 0.1 M *hydrochloric acid* is equivalent to 24.03 mg of total alkaloids, expressed as emetine.

**STORAGE**

In an airtight container.

**Prepared Ipecacuanha**

**TESTS****Loss on drying (2.2.32)**

Maximum 5.0 per cent, determined on 1.000 g of the herbal drug by drying in an oven at 105 °C.

**Total ash (2.4.16)**

Maximum 5.0 per cent.

**Ash insoluble in hydrochloric acid (2.8.1)**

Maximum 3.0 per cent.

**ASSAY**

Place 7.5 g of the herbal drug in a dry flask, add 100 mL of ether R and shake for 5 min. Add 5 mL of dilute ammonia R1, shake for 1 h, add 5 mL of water R and shake vigorously. Decant the ether layer into a flask through a plug of cotton. Wash the residue in the flask with 2 quantities, each of 25 mL, of ether R, decanting each portion through the same plug of cotton. Combine the ether solutions and eliminate the ether by distillation. Dissolve the residue in 2 mL of ethanol (90 per cent V/V) R, evaporate to dryness and heat at 100 °C for 5 min. Dissolve the residue in 5 mL of previously neutralised ethanol (90 per cent V/V) R, warming on a water-bath. Add 15.0 mL of 0.1 M hydrochloric acid and titrate the excess acid with 0.1 M sodium hydroxide using 0.5 mL of methyl red mixed solution R as indicator.

1 mL of 0.1 M hydrochloric acid is equivalent to 24.03 mg of total alkaloids, expressed as emetine.

**STORAGE**

In an airtight container.

Ph Eur

below. To the remainder of the liquid add sufficient Ethanol (80%) to produce an Ipecacuanha Liquid Extract containing 2% w/v of total alkaloids calculated as emetine. Allow to stand for not less than 24 hours; filter.

The extract complies with the requirements stated under Extracts and with the following requirements.

**TESTS****Ethanol content**

63 to 69% v/v, Appendix VIII F, Method III.

**Relative density**

0.910 to 0.960, Appendix V G.

**Dry residue**

The requirement for Dry residue does not apply to Ipecacuanha Liquid Extract.

**ASSAY**

To 5 mL in a separating funnel add 20 mL of water, 5 mL of 1M sulfuric acid and 10 mL of chloroform and shake well. Transfer the chloroform extract to a second separating funnel containing a mixture of 4 mL of ethanol (96%) and 20 mL of 0.05M sulfuric acid, shake, allow to separate and discard the chloroform layer. Continue the extraction of the liquid in the first separating funnel with two further 10 mL quantities of chloroform, transferring the chloroform solution each time to the second separating funnel and washing as before. Transfer the acidic liquid from the second separating funnel to the first separating funnel, make distinctly alkaline with 5M ammonia and shake with successive quantities of chloroform until complete extraction of the alkaloids is effected, Appendix XI G, washing each chloroform solution with the same 10 mL of water contained in a third separating funnel. Remove the chloroform, add to the residue 2 mL of ethanol (96%), evaporate to dryness and dry for 5 minutes at 80° in a current of air. Dissolve the residue in 2 mL of ethanol (96%), previously neutralised to methyl red solution, add 10 mL of 0.05M sulfuric acid VS and titrate with 0.1M sodium hydroxide VS using methyl red mixed solution as indicator. Each mL of 0.05M sulfuric acid VS is equivalent to 24.03 mg of total alkaloids, calculated as emetine, C<sub>29</sub>H<sub>40</sub>N<sub>2</sub>O<sub>4</sub>.

**Ipecacuanha Liquid Extract****DEFINITION**

Ipecacuanha Liquid Extract is prepared from Ipecacuanha by a method stated under the general monograph for Extracts. It contains not less than 1.90% and not more than 2.10% of total alkaloids, calculated as emetine, C<sub>29</sub>H<sub>40</sub>N<sub>2</sub>O<sub>4</sub>.

**EXTEMPORANEOUS PREPARATION**

Prepare by extracting Ipecacuanha with Ethanol (80 per cent) according to the following formula and directions.

Ipecacuanha in fine powder  
Ethanol (80 per cent)

1000 g  
A sufficient quantity

Exhaust the Ipecacuanha by percolation, Appendix XI F, with Ethanol (80 per cent), reserving the first 750 mL of the percolate. Remove the ethanol from the remainder of the percolate by evaporation under reduced pressure at a temperature not exceeding 60° and dissolve the residual extract in the reserved portion. Determine the proportion of alkaloids in the liquid thus obtained by the Assay described

**Standardised Ipecacuanha Liquid Extract**

(Ph. Eur. monograph 1875)

Ph Eur

**DEFINITION**

Standardised liquid extract produced from Ipecacuanha root (0094).

**Content**

1.80 per cent to 2.20 per cent of total alkaloids, expressed as emetine (C<sub>29</sub>H<sub>40</sub>N<sub>2</sub>O<sub>4</sub>; M<sub>r</sub> 480.6).

**PRODUCTION**

The extract is produced from the herbal drug by a suitable procedure using ethanol (60-80 per cent V/V).

**CHARACTERS****Appearance**

Dark brown liquid.

**IDENTIFICATION**

Thin-layer chromatography (2.2.27).

Test solution Dilute 5.0 mL of the extract to be examined to 50 mL with ethanol (70 per cent V/V) R. To 2.0 mL of this

solution add 2 mL of *water R* and 0.1 mL of *concentrated ammonia R*. Add 10 mL of *ether R* and shake. Separate the upper layer, dry it over about 2 g of *anhydrous sodium sulfate R* and filter.

**Reference solution** Dissolve 2.5 mg of *emetine hydrochloride CRS* and 3 mg of *cephaeline hydrochloride CRS* in *methanol R* and dilute to 10 mL with the same solvent.

**Plate** TLC silica gel  $F_{254}$  plate *R* (5-40  $\mu\text{m}$ ) [or TLC silica gel  $F_{254}$  plate *R* (2-10  $\mu\text{m}$ )].

**Mobile phase** *concentrated ammonia R*, *methanol R*, *ethyl acetate R*, *toluene R* (2:15:18:65 *V/V/V/V*).

**Application** 10  $\mu\text{L}$  [or 5  $\mu\text{L}$ ] as bands of 10 mm [or 8 mm].

**Development** Over a path of 10 cm [or 6 cm].

**Drying** In air.

**Detection A** Examine in ultraviolet light at 365 nm.

**Results A** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint fluorescent zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Emetine: a blue fluorescent zone	A blue fluorescent zone (emetine)
Cephaeline: a blue fluorescent zone	A blue or faint blue fluorescent zone (cephaeline)

## TESTS

### Ethanol (2.9.10)

95 per cent to 105 per cent of the quantity stated on the label.

### ASSAY

Dilute 1.00 g of the extract to be examined to 10 mL with *ethanol (70 per cent V/V) R* and transfer to a chromatography column about 0.2 m long and about 15 mm in internal diameter, containing 8 g of *basic aluminium oxide R*. After

infiltration into the aluminium oxide layer, rinse the internal wall of the column with 3 quantities, each of 2 mL, of *ethanol (70 per cent V/V) R*. Elute in portions, with 40 mL of *ethanol (70 per cent V/V) R*. Avoid disturbance or drying of the surface of the aluminium oxide layer. Collect the whole of the eluate. Evaporate the eluate on a water-bath to about 10 mL. Allow to cool. Add 10.0 mL of 0.02 M *hydrochloric acid* and 20 mL of *carbon dioxide-free water R*. Titrate the excess acid with 0.02 M *sodium hydroxide* using 0.15 mL of *methyl red mixed solution R* as indicator.

Perform a blank assay replacing the extract to be examined with 10.0 mL of *ethanol* of the strength stated on the label.

1 mL of 0.02 M *hydrochloric acid* is equivalent to 4.807 mg of total alkaloids, expressed as *emetine*.

Ph Eur

## Standardised Ipecacuanha Tincture

(Ph. Eur. monograph 1530)

Ph Eur

### DEFINITION

Tincture produced from *Ipecacuanha root (0094)*.

### Content

0.18 per cent *m/m* to 0.22 per cent *m/m* of total alkaloids, expressed as *emetine* ( $\text{C}_{29}\text{H}_{40}\text{N}_2\text{O}_4$ ;  $M_r$  480.6).

### PRODUCTION

The tincture is produced from the herbal drug by a suitable procedure using *ethanol (70 per cent V/V)*.

### CHARACTERS

#### Appearance

Yellowish-brown liquid.

### IDENTIFICATION

Thin-layer chromatography (2.2.27).

**Test solution** To 2.0 mL of the tincture to be examined add 2 mL of *water R* and 0.1 mL of *concentrated ammonia R*. Add 10 mL of *ether R* and shake. Separate the ether layer, dry it over about 2 g of *anhydrous sodium sulfate R* and filter.

**Reference solution** Dissolve 2.5 mg of *emetine hydrochloride CRS* and 3 mg of *cephaeline hydrochloride CRS* in *methanol R* and dilute to 10 mL with the same solvent.

**Plate** TLC silica gel  $F_{254}$  plate *R* (5-40  $\mu\text{m}$ ) [or TLC silica gel  $F_{254}$  plate *R* (2-10  $\mu\text{m}$ )].

**Mobile phase** *concentrated ammonia R*, *methanol R*, *ethyl acetate R*, *toluene R* (2:15:18:65 *V/V/V/V*).

**Application** 10  $\mu\text{L}$  [or 5  $\mu\text{L}$ ] as bands of 10 mm [or 8 mm].

**Development** Over a path of 10 cm [or 6 cm].

**Drying** In air.

**Detection A** Examine in ultraviolet light at 365 nm.

**Results A** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint fluorescent zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Emetine: a blue fluorescent zone	A blue fluorescent zone (emetine)
Cephaeline: a blue fluorescent zone	A blue or faint blue fluorescent zone (cephaeline)
Reference solution	Test solution

**Detection B** Treat with a 5 g/L solution of *iodine R* in *ethanol (96 per cent) R*, heat at 60 °C for 10 min and examine in ultraviolet light at 365 nm.

**System suitability** Reference solution:

— the blue fluorescent zone due to cephaeline and the yellow fluorescent zone due to emetine are clearly separated.

**Results B** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint fluorescent zones may be present in the chromatogram obtained with the test solution.

Top of the plate

Cephaeline: a blue fluorescent zone	A blue fluorescent zone (cephaeline)
Reference solution	Test solution

## TESTS

### Ethanol (2.9.10)

95 per cent to 105 per cent of the quantity stated on the label.

### ASSAY

Transfer 10.00 g of the tincture to be examined to a chromatography column about 0.2 m long and about 15 mm in internal diameter, containing 8 g of *basic aluminium oxide R*. After infiltration into the aluminium oxide layer, rinse the internal wall of the column with 3 quantities, each of 2 mL, of *ethanol (70 per cent V/V) R*. Elute in portions, with 40 mL of *ethanol (70 per cent V/V) R*. Avoid disturbance or drying of the surface of the aluminium oxide layer. Collect the whole of the eluate. Evaporate the eluate on a water-bath to about 10 mL. Allow to cool. Add 10.0 mL of 0.02 M *hydrochloric acid* and 20 mL of *carbon dioxide-free water R*. Titrate the excess acid with 0.02 M *sodium hydroxide* using 0.15 mL of *methyl red mixed solution R* as indicator.

Perform a blank assay replacing the tincture to be examined with 10.0 mL of *ethanol* of the strength stated on the label.

1 mL of 0.02 M *hydrochloric acid* is equivalent to 4.807 mg of total alkaloids, expressed as *emetine*.

Ph Eur

## Paediatric Ipecacuanha Emetic Mixture

Paediatric Ipecacuanha Emetic; Paediatric Ipecacuanha Emetic Oral Solution

### DEFINITION

Paediatric Ipecacuanha Emetic Mixture is an *oral solution*.

Ipecacuanha Liquid Extract	70 mL
Hydrochloric Acid	2.5 mL
Glycerol	100 mL
Syrup	Sufficient to produce 1000 mL

The mixture complies with the requirements stated under *Oral Liquids* and with the following requirements.

### Content of total alkaloids

0.12 to 0.16% w/v, calculated as *emetine*, C<sub>29</sub>H<sub>40</sub>N<sub>2</sub>O<sub>4</sub>.

### IDENTIFICATION

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

- Mix 5 mL with 10 mL of 1M *sulfuric acid*, shake with two 10 mL quantities of *chloroform* and discard the *chloroform*. Add sufficient 5M *ammonia* to make the aqueous solution distinctly alkaline to *litmus paper*, extract with four 10 mL quantities of *chloroform*, evaporate the combined extracts to dryness, cool the residue and dissolve it in 0.5 mL of *ethanol (96%)*.
- 0.1% w/v of *cephaeline hydrochloride EPCRS* in *ethanol (96%)*.
- 0.1% w/v of *emetine hydrochloride EPCRS* in *ethanol (96%)*.

### CHROMATOGRAPHIC CONDITIONS

- Use as the coating *silica gel G*.
- Use the mobile phase as described below.
- Apply 2 µL of each solution.
- Develop the plate to 15 cm.
- After removal of the plate, dry it at 105° to 110° for 30 minutes, allow to cool and spray with *dilute potassium iodobismuthate solution*.

### MOBILE PHASE

10 volumes of *diethylamine* and 90 volumes of *chloroform*.

### CONFIRMATION

The principal spots in the chromatogram obtained with solution (1) correspond in colour and position to the spots in the chromatograms obtained with solutions (2) and (3). Disregard any *secondary spots*.

### ASSAY

To 25 mL in a separating funnel add 20 mL of *water* and 5 mL of 1M *sulfuric acid*, shake with three 10 mL quantities of *chloroform* and wash each *chloroform* extract with a mixture of 20 mL of 0.05M *sulfuric acid* and 4 mL of *ethanol (96%)* contained in a second separating funnel. Transfer the acid-ethanol mixture from the second separating funnel to the first, make the combined liquids distinctly alkaline to *litmus paper* with 5M *ammonia* and extract with successive quantities of *chloroform* until *complete extraction* of the alkaloids is effected, Appendix XI G. Wash each *chloroform* extract with the same 10 mL of *water*, combine the *chloroform* extracts, evaporate the *chloroform*, add 2 mL of *ethanol (96%)* to the residue, evaporate to dryness and dry the residue at 80° in a current of air for 5 minutes. Dissolve the residue in 2 mL of *ethanol (96%)* previously neutralised to *methyl red solution*, add 10 mL of 0.01M *sulfuric acid VS* and titrate the excess of acid with 0.02M *sodium hydroxide VS*

using methyl red solution as indicator. Each mL of 0.01M sulfuric acid VS is equivalent to 4.806 mg of  $C_{29}H_{46}N_2O_4$ .

## Isatis Root

(Ph. Eur. monograph 2566)

Ph Eur

### DEFINITION

Whole or fragmented, dried root of *Isatis tinctoria* L. (*I. indigonica* Fortune ex Lindl.) collected in autumn.

### Content

Minimum 1.0 per cent of arginine ( $C_6H_{14}N_4O_2$ ;  $M_r$  174.2) (dried drug).

### IDENTIFICATION

**A. Whole drug.** It is cylindrical, slightly tortuous, 8-22 cm long, 1.5 cm in diameter, externally greyish-yellow or brownish-yellow, wrinkled longitudinally and lenticellate transversally, with rootlets or rootlet scars. The root crown is slightly expanded, exhibiting dark green or dark brown petiole bases arranged in whorls, and dense tubercles. The texture is compact and easily broken. The transversely cut surface shows a yellowish-white, brown or dark brown bark, darkest near the cambium, sometimes appearing as a thin dark line, and a yellow or brown wood.

**Fragmented drug** It occurs as transverse or oblique slices, rounded or elliptical, or as short, thin, cylindrical pieces, 0.3-1.3 cm in diameter. It is externally greyish-yellow or brownish-yellow, wrinkled longitudinally, and transverse lenticels, rootlets and rootlet scars are sometimes visible. The transversely cut surface shows a yellowish-white, brown or dark brown bark, darkest near the cambium, sometimes appearing as a thin dark line, and a yellow or brown wood.

**B. Microscopic examination (2.8.23).** The powder is whitish-yellow, yellow or light brown. Examine under a microscope using chloral hydrate solution R. The powder shows the following diagnostic characters (Figure 2566.-1): fragments of cork consisting of thin-walled cells (surface view [A], transverse section [B]); fragments of xylem [D] consisting of reticulate, pitted or, more rarely, spiral vessels [Da] included in thin-walled parenchyma cells [Db]; groups of lignified xylem fibres, occasionally accompanying vessels, with sparse irregularly-positioned pits may be present; thin-walled parenchyma cells (longitudinal section [E], transverse section [F]); groups of greenish-yellow sclereids with thick, pitted walls embedded in parenchyma tissue may be present. Examine under a microscope using a 50 per cent V/V solution of glycerol R. The powder shows abundant, single or compound (mostly 2, or less frequently, 3 or 4) starch granules, 1.5-18  $\mu$ m in diameter, free [C] or included in parenchyma [G], with a punctiform, slit-shaped or V-shaped hilum.

**C. Thin-layer chromatography (2.2.27).**

**Test solution** To 0.5 g of the powdered herbal drug (355) (2.9.12) add 5 mL of ethanol (70 per cent V/V) R and sonicate for 10 min. Centrifuge and use the supernatant.

**Reference solution** Dissolve 4 mg of arginine R and 4 mg of cysteine hydrochloride R in 1 mL of ethanol (70 per cent V/V) R.

**Plate** TLC silica gel F<sub>254</sub> plate R (5-40  $\mu$ m) [or TLC silica gel F<sub>254</sub> plate R (2-10  $\mu$ m)].

Figure 2566.-1. – Illustration for identification test B of powdered herbal drug of isatis root

**Mobile phase** anhydrous formic acid R, water R, acetonitrile R (2:8:30 V/V/V).

**Application** 4  $\mu$ L as bands of 10 mm [or 8 mm].

**Development** Over a path of 8.5 cm [or 6 cm].

**Drying** In air.

**Detection** Expose to concentrated ammonia R vapour for 5 min, treat with ninhydrin solution R4, then heat at 120 °C for 3 min.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint coloured zones may be present in the chromatogram obtained with the test solution.

Top of the plate

	—
	—
Cysteine: a brown zone	A prominent brown zone
	A brown zone
Arginine: a brown zone	A brown zone (arginine)
	A faint brown zone
Reference solution	Test solution

### TESTS

**Loss on drying (2.2.32)**

Maximum 9.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

**Total ash (2.4.16)**

Maximum 5.0 per cent.

**Ash insoluble in hydrochloric acid (2.8.1)**

Maximum 1.0 per cent.

**ASSAY**

Liquid chromatography (2.2.29).

**Test solution** To 0.100 g of the powdered herbal drug (355) (2.9.12) add 20 mL of *ethanol (70 per cent V/V) R*, sonicate for 20 min, filter, and evaporate the filtrate to dryness. Dissolve the residue in *ethanol (70 per cent V/V) R* and dilute to 10.0 mL with the same solvent.

**Reference solution (a)** Dissolve 25.0 mg of *arginine CRS* in *ethanol (70 per cent V/V) R* and dilute to 50.0 mL with the same solvent.

**Reference solution (b)** Dissolve 3.0 mg of *cysteine hydrochloride R* in 6.0 mL of reference solution (a) and dilute to 10.0 mL with *ethanol (70 per cent V/V) R*.

**Reference solutions (c), (d), (e), (f), (g), (h)** Dilute reference solution (a) to obtain 6 reference solutions of arginine, the concentrations of which span the expected value in the test solution.

**Column:**

- size:  $l = 0.15$  m,  $\emptyset = 4.6$  mm;
- stationary phase: base-deactivated end-capped octadecylsilyl silica gel for chromatography R (3  $\mu$ m);
- temperature: 30 °C.

**Mobile phase** trifluoroacetic acid R, water for chromatography R (0.2:99.8 V/V).

**Flow rate** 0.2 mL/min.

**Detection** Evaporative light-scattering detector; the following settings have been found to be suitable; if the detector has different setting parameters, adjust the detector settings so as to comply with the system suitability criterion for the signal-to-noise ratio:

- carrier gas: nitrogen R;
- pressure: 330 kPa;
- evaporator temperature: 80 °C.

**Injection** 10  $\mu$ L.

**Run time** 25 min.

**System suitability:**

- resolution: minimum 1.5 between the peaks due to cysteine and arginine in the chromatogram obtained with reference solution (b);
- signal-to-noise ratio: minimum 50 for the peak due to arginine in the chromatogram obtained with reference solution (a).

Establish a calibration curve with the logarithm of the concentration (in milligrams per 10 mL) of reference solutions (c), (d), (e), (f), (g) and (h) (corrected by the assigned percentage content of *arginine CRS*) as the abscissa and the logarithm of the corresponding peak areas as the ordinate.

Calculate the percentage content of arginine using the following expression:

$$\frac{10^A}{m \times 10}$$

- A* = logarithm of the concentration of arginine in the test solution, determined from the calibration curve;
- m* = mass of the herbal drug to be examined used to prepare the test solution, in grams.

Ph Eur

**Ispaghula Husk**

(Ph. Eur. monograph 1334)

**Preparations**

Ispaghula Husk Oral Powder

Ispaghula Husk Granules

Ispaghula Husk Effervescent Granules

Ph Eur

**DEFINITION**

Episperm and collapsed adjacent layers removed from the seeds of *Plantago ovata* Forssk. (*P. ispaghula* Roxb.).

**IDENTIFICATION**

**A.** The husk consists of pinkish-beige fragments or flakes up to about 2 mm long and 1 mm wide, some showing a light brown spot corresponding to the location of the embryo before it was removed from the seed.

**B.** Microscopic examination (2.8.23). The powder is pale yellow. Examine under a microscope using *lactic reagent R*. The powder shows the following diagnostic characters: mainly fragments of the episperm with polygonal cells filled with mucilage; fragments of the inner layers of the testa with brownish thin-walled cells often associated with the outer layers of the endosperm. Examine under a microscope using a 50 per cent V/V solution of *glycerol R*. The powder shows occasional starch granules, single or in groups of 2-4, measuring 3-25  $\mu$ m in diameter.

**C.** Thin-layer chromatography (2.2.27).

**Test solution** To 10 mg of the powdered herbal drug (355) (2.9.12) in a thick-walled centrifuge tube, add 2 mL of a 230 g/L solution of *trifluoroacetic acid R* and shake vigorously. Stopper the test tube and heat at 120 °C for 1 h. Centrifuge the hydrolysate, transfer the clear supernatant into a 50 mL flask, add 10 mL of *water R* and evaporate to dryness under reduced pressure. Take up the residue in 10 mL of *water R* and evaporate again to dryness under reduced pressure. Take up the residue with 2 mL of *methanol R*.

**Reference solution (a)** Dissolve 10 mg of *arabinose R* in a small quantity of *water R* and dilute to 10 mL with *methanol R*.

**Reference solution (b)** Dissolve 10 mg of *xylose R* in a small quantity of *water R* and dilute to 10 mL with *methanol R*.

**Reference solution (c)** Dissolve 10 mg of *galactose R* in a small quantity of *water R* and dilute to 10 mL with *methanol R*.

**Plate** TLC silica gel plate R.

**Mobile phase** *water R*, *acetonitrile R* (15:85 V/V).

**Application** 10  $\mu$ L, as bands.

**Development** Over a path of 15 cm.

**Detection** Spray with *aminohippuric acid reagent R* and heat at 120 °C for 5 min; examine in daylight.

**Results** The chromatogram obtained with the test solution shows 2 orange-pink zones (arabinose and xylose) and a yellow zone (galactose) similar in position and colour to the zones in the chromatograms obtained with the reference solutions.

**TESTS**

**Foreign matter (2.8.2)**

Carry out the determination using 5.0 g.

**Loss on drying (2.2.32)**

Maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

**Total ash (2.4.16)**

Maximum 4.0 per cent.

**Swelling index (2.8.4)**

Minimum 40, determined on 0.1 g of the powdered herbal drug (355) (2.9.12).

Ph Eur

## Ispaghula Husk Granules

**DEFINITION**

Ispaghula Husk Granules contain Ispaghula Husk with or without suitable excipients.

*The granules comply with the requirements stated under Granules and with the following requirements.*

**IDENTIFICATION**

A. Powder the granules and examine under a microscope using *lactic reagent*. Fragments of the epispem with polygonal cells filled with mucilage and fragments of the inner layers of the testa with brownish thin-walled cells often associated with the outer layers of the endosperm are seen.

B. When mounted in *ruthenium red solution*, the particles of the powder are stained red.

**TESTS****Swelling index**

Not less than 40, Appendix XI C. Use a quantity of the granules containing 1.0 g of Ispaghula Husk and a 100-mL ground-glass-stoppered cylinder graduated in 1 mL divisions.

**Loss on drying**

When dried at 100° to 105°, loses not more than 12.0% of its weight. Use 1 g.

**Ash**

Not more than 5.0%, Appendix XI J, Method II.

**STORAGE**

Ispaghula Husk Granules should be protected from moisture.

## Ispaghula Husk Effervescent Granules

**DEFINITION**

Ispaghula Husk Effervescent Granules contain Ispaghula Husk in a suitable, effervescent basis.

*The granules comply with the requirements stated under Granules and with the following requirements.*

**TESTS****Disintegration**

Carry out the test stated under Effervescent Granules with the following modifications. Stir the contents of the beaker occasionally to disperse the mucilage formed; evolution of gas is complete after 5 minutes.

**Swelling index**

Not less than 40, Appendix XI C. Use a quantity of the powdered granules containing 1.0 g of Ispaghula Husk and a 100 mL ground-glass-stoppered cylinder graduated in 1 mL divisions.

## Ispaghula Husk Oral Powder

**DEFINITION**

Ispaghula Husk Oral Powder contains Ispaghula Husk with or without suitable excipients.

*The powder complies with the requirements stated under Oral Powders and with the following requirements.*

**IDENTIFICATION**

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Add 2 mL of a 23% w/v solution of *trifluoroacetic acid* to a quantity of the powder containing 10 mg of Ispaghula Husk in a thick-walled centrifuge tube, shake vigorously, close the tube and heat at 120° for 1 hour. Centrifuge the hydrolysate, transfer the clear supernatant liquid into a 50 mL flask, add 10 mL of *water* and evaporate the solution to dryness under reduced pressure. Take up the residue in 10 mL of *water*, again evaporate to dryness under reduced pressure and take up the residue in 2 mL of *methanol*.

(2) Dissolve 10 mg of *arabinose* in a small quantity of *water* and dilute to 10 mL with *methanol*.

(3) Dissolve 10 mg of *xylose* in a small quantity of *water* and dilute to 10 mL with *methanol*.

(4) Dissolve 10 mg of *galactose* in a small quantity of *water* and dilute to 10 mL with *methanol*.

**CHROMATOGRAPHIC CONDITIONS**

(a) Use as the coating silica gel.

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air, spray with *aminohippuric acid reagent*, heat at 120° for 5 minutes and examine in daylight.

**MOBILE PHASE**

15 volumes of *water* and 85 volumes of *acetomirile*.

**CONFIRMATION**

The chromatogram obtained with solution (1) shows two orange-pink zones (arabinose and xylose) and a yellow zone (galactose) similar in position and colour to the zones in the chromatograms obtained with solutions (2), (3) and (4).

B. When mounted in *ruthenium red solution*, the particles of the powder are stained red.

**TESTS****Swelling index**

Not less than 40, Appendix XI C. Use a quantity of the oral powder containing 1.0 g of Ispaghula Husk and a 100 mL ground-glass-stoppered cylinder graduated in 1 mL divisions.

**Ash**

Not more than 4.0%, Appendix XI J, Method II. Use a quantity of the powder containing 1 g of Ispaghula Husk.

**STORAGE**

Ispaghula Husk Oral Powder should be protected from moisture.

## Ispaghula Seed

(Ph. Eur. monograph 1333)

Ph Eur

### DEFINITION

Dried ripe seeds of *Plantago ovata* Forssk. (*P. ispaghula* Roxb.).

### IDENTIFICATION

A. Ispaghula seed is pinkish-beige, smooth, boat-shaped and curved. It is 1.5 mm to 3.5 mm long, 1.5 mm to 2 mm wide and 1 mm to 1.5 mm thick. The concave surface shows in the centre a light coloured spot corresponding to the hilum. The convex surface shows a light brown spot corresponding to the location of the embryo and takes up about one quarter of the length of the seed.

B. Microscopic examination (2.8.23). The powder is pale brown. Examine under a microscope using *lactic reagent R*. The powder shows mainly fragments of the epiderm with polygonal cells filled with mucilage; fragments of the inner layers of the testa with brownish thin-walled cells often associated with the outer layers of the endosperm; fragments of the endosperm with cells with thick cellulose walls containing aleurone grains and oil droplets; a few fragments of embryo with thin-walled cells. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows starch granules, single or in groups of 2 to 4 and measuring 3 µm to 25 µm in diameter.

C. Thin-layer chromatography (2.2.27).

**Test solution** To 50 mg of the powdered herbal drug (355) (2.9.12) in a thick-walled centrifuge tube add 2 mL of a 230 g/L solution of *trifluoroacetic acid R*, and shake vigorously. Stopper the test tube and heat the mixture at 120 °C for 1 h. Centrifuge the hydrolysate, transfer the clear supernatant into a 50 mL flask, add 10 mL of *water R* and evaporate the solution to dryness under reduced pressure. Take up the residue in 10 mL of *water R* and evaporate again to dryness under reduced pressure. Take up the residue in 2 mL of *methanol R*.

**Reference solution (a)** Dissolve 10 mg of *arabinose R* in a small quantity of *water R* and dilute to 10 mL with *methanol R*.

**Reference solution (b)** Dissolve 10 mg of *xylose R* in a small quantity of *water R* and dilute to 10 mL with *methanol R*.

**Reference solution (c)** Dissolve 10 mg of *galactose R* in a small quantity of *water R* and dilute to 10 mL with *methanol R*.

**Plate** TLC silica gel plate R

**Mobile phase** *water R*, *acetonitrile R* (15:85 *V/V*).

**Application** 10 µL, as bands.

**Development** Over a path of 15 cm.

**Detection** Spray with *aminohippuric acid reagent R* and heat at 120 °C for 5 min. Examine in daylight.

**Results** See below the sequence of the zones present in the chromatograms obtained with the reference and the test solutions.

Top of the plate	
Xylose: an orange-pink zone	An orange-pink zone (xylose)
Arabinose: an orange-pink zone	An orange-pink zone (arabinose)
Galactose: a yellow zone	A yellow zone (galactose)
Reference solution	Test solution

### TESTS

**Foreign matter (2.8.2)**

Carry out the determination using 10.0 g.

**Swelling index (2.8.4)**

Minimum 9.

**Loss on drying (2.2.32)**

Maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

**Total ash (2.4.16)**

Maximum 4.0 per cent.

Ph Eur

## Ivy Leaf

(Ph. Eur. monograph 2148)

Ph Eur

### DEFINITION

Whole or cut, dried leaves of *Hedera helix* L., collected in spring and summer.

### Content

Minimum 3.0 per cent of hederacoside C (C<sub>59</sub>H<sub>96</sub>O<sub>26</sub>; M<sub>r</sub> 1221) (dried drug).

### IDENTIFICATION

A. Whole leaves are coriaceous, 4-10 cm in length and width, cordate at the base. The lamina is palmately 3-5 lobed, the lobes more or less triangular with entire margins. The upper surface is dark green with a paler, radiate venation, the lower surface more greyish-green and the venation is distinctly raised. The petioles are long, cylindrical, about 2 mm in diameter and grooved longitudinally. Scattered white hairs occur on the petioles and on the surfaces of younger leaves, the older leaves are glabrous. Occasional entire, ovate-rhombic to lanceolate leaves 3-8 cm long from the flowering stems may be present.

B. Microscopic examination (2.8.23). The powder is green. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2148.-1): fragments of the upper epidermis (surface view [F]), showing cells with thickened, rather sinuous, finely pitted anticlinal walls [Fa] usually accompanied by underlying palisade parenchyma [Fb] including some cells containing cluster crystals of calcium oxalate [Fc]; fragments of the lower epidermis (surface view [E]), showing cells with sinuous, irregularly thickened and pitted walls [Ea], stomata that are mostly anomocytic [Eb] but occasionally anisocytic (2.8.3), surrounded by cells including some that show faint cuticular striations; the lower epidermis is accompanied by underlying spongy parenchyma [Ec] including some cells containing cluster crystals of calcium oxalate [Ed]; scattered stellate covering trichomes may be present, composed of 4-8 branches joined at the base on a multicellular, biseriate stalk (surface view [B], side view [A]); cluster crystals of

calcium oxalate, about 40  $\mu\text{m}$  in diameter, scattered [C] or occurring throughout the parenchyma [Ed, Fc]; groups of lignified fibro-vascular tissue from the veins [D].

Figure 2148-1. – Illustration for identification test B of powdered herbal drug of ivy leaf

#### C. Thin-layer chromatography (2.2.27).

**Test solution** Extract 0.50 g of the powdered herbal drug (355) (2.9.12) under a reflux condenser in a water-bath at 60 °C with 5 mL of methanol R for 30 min. Cool and filter.

**Reference solution** Dissolve 1.0 mg of hederacoside C R and 1.0 mg of  $\alpha$ -hederin R in 1.0 mL of methanol R.

**Plate** TLC silica gel plate R.

**Mobile phase** anhydrous formic acid R, acetone R, methanol R, ethyl acetate R (4:20:20:30 V/V/V/V).

**Application** 20  $\mu\text{L}$  as bands of 15 mm.

**Development** Over a path of 12 cm.

**Drying** At 100-105 °C.

**Detection** Treat with alcoholic solution of sulfuric acid R, heat at 110 °C for 10 min and examine in daylight.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
	A green zone
$\alpha$ -Hederin: a purple zone	A very faint purple zone ( $\alpha$ -hederin) A broad yellow zone 2-3 purple or green zones

Reference solution	Test solution

#### TESTS

##### Foreign matter (2.8.2)

Maximum 10 per cent of discoloured leaves, maximum 10 per cent of stems, and maximum 2 per cent of other foreign matter.

##### Loss on drying (2.2.32)

Maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

##### Total ash (2.4.16)

Maximum 10.0 per cent.

#### ASSAY

##### Liquid chromatography (2.2.29).

**Solvent mixture** water R, methanol R (20:80 V/V).

**Test solution** To 1.00 g of the powdered herbal drug (355) (2.9.12) in a 250 mL round-bottomed flask add 50 mL of the solvent mixture and heat under a reflux condenser in a water-bath at 80 °C for 1 h. Cool and filter through a plug of absorbent cotton into a 100 mL volumetric flask. The plug of absorbent cotton together with the residue is again extracted with 30 mL of the solvent mixture under reflux for 30 min. Filter and combine the filtrates. Rinse the round-bottomed flask and the plug of absorbent cotton with the solvent mixture and use the solvent mixture to dilute the contents of the volumetric flask to exactly 100.0 mL. Filter through a suitable membrane before use.

**Reference solution** To 20.0 mg of ivy leaf dry extract HRS add 5.0 mL of methanol R and sonicate for 10 min. Filter through a membrane filter (nominal pore size 0.45  $\mu\text{m}$ ).

##### Column:

— size:  $l = 0.125 \text{ m}$ ,  $\varnothing = 4 \text{ mm}$ ;

— stationary phase: end-capped octadecylsilyl silica gel for chromatography R (5  $\mu\text{m}$ ).

##### Mobile phase:

— mobile phase A: mix 14 volumes of acetonitrile R with 88 volumes of water R and adjust to pH 2.0 with phosphoric acid R;

— mobile phase B: phosphoric acid R, acetonitrile R (0.2:99.8 V/V);

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 5	100	0
5 - 6	100 → 94	0 → 6
6 - 40	94 → 60	6 → 40
40 - 41	60 → 0	40 → 100
41 - 55	0	100

**Flow rate** 1.5 mL/min.

**Detection** Spectrophotometer at 205 nm.

Injection 20 µL.

System suitability Reference solution:

— retention time: hederacoside C = about 20 min;  
if necessary, adjust the time intervals of the gradient.

Calculate the percentage content of hederacoside C with reference to the dried drug using the following expression:

$$\frac{A_1 \times m_2 \times 20 \times p}{A_2 \times m_1}$$

- $A_1$  = area of the peak due to hederacoside C in the chromatogram obtained with the test solution;  
 $A_2$  = area of the peak due to hederacoside C in the chromatogram obtained with the reference solution;  
 $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;  
 $m_2$  = mass of ivy leaf dry extract HRS used to prepare the reference solution, in grams;  
 $p$  = percentage content of hederacoside C in ivy leaf dry extract HRS.

Ph Eur

## Java Tea

(Ph. Eur. monograph 1229)

Ph Eur

### DEFINITION

Whole or fragmented, dried leaf and top of stem of *Orthosiphon aristatus* (Blume) Miq. var. *aristatus* (syn. *Orthosiphon stamineus* Benth.).

### Content

Minimum 0.3 per cent of rosmarinic acid ( $C_{18}H_{16}O_8$ ;  $M_r$  360.3) (dried drug).

### IDENTIFICATION

A. The leaf is friable, whole or fragmented, the entire leaf measuring on average 7.5 cm in length and 2.5 cm in width. The petiole is short. The lamina is oval or lanceolate, the apex acuminate and the base cuneate. The abaxial surface of the leaves is light greyish-green and the adaxial surface is green or dark green. The venation is pinnate with few secondary veins. Examined under a lens ( $\times 10$ ), the secondary veins, after running parallel to the midrib, diverge at an acute angle. The margin is irregularly and roughly dentate, sometimes crenate, and the abaxial surface is slightly curved. The petioles are thin, quadrangular, 4-8 mm long and, like the primary venation, usually violet-coloured. Occasionally, inflorescences in clusters of bluish-white or violet flowers, not yet opened, are found.

B. Microscopic examination (2.8.23). The powder is green or dark green. Examine under a microscope using chloral hydrate solution R. The powder shows the following diagnostic characters (Figure 1229.-1): articulated uniseriate covering trichomes up to 450 µm long, consisting of 3-8 cells with thick pitted walls, usually broken [C, E] but sometimes attached to epidermis (surface view [Hc], side view [J]); unicellular or bicellular conical covering trichomes [Fa], mainly present on the margins of the lamina [F]; secretory trichomes with unicellular stalks and tetracellular heads, isolated (surface view [G]) or attached to epidermis (surface view [Db], side view [Aa]); secretory trichomes with unicellular stalks and unicellular (surface view [Hb], side view [Ab]) or bicellular heads (surface view [Ba]); fragments of upper epidermis (surface view [B]) with cells with sinuous outlines, and with underlying palisade parenchyma [Bb];

fragments of lower epidermis [D, H] with diacytic stomata [Da, Ha] (2.8.3); fragments of lamina (transverse section [A]) showing usually 2 layers of palisade parenchyma [Ac].

Figure 1229.-1. – Illustration for identification test B of powdered herbal drug of Java tea

C. Thin-layer chromatography (2.2.27).

Test solution Shake 1 g of the powdered herbal drug (355) (2.9.12) with 10 mL of methanol R in a water-bath at 60 °C for 5 min and filter the cooled solution.

Reference solution Dissolve 1 mg of sinensetin R and 1 mg of scopoletin R in methanol R and dilute to 20 mL with the same solvent.

Plate TLC silica gel plate R (5-40 µm) [or TLC silica gel plate R (2-10 µm)].

Mobile phase methanol R, ethyl acetate R, toluene R (5:40:55 V/V/V).

Application 10 µL [or 2 µL] as bands of 15 mm [or 8 mm].

Development Over a path of 10 cm [or 6 cm].

Drying In air.

Detection Examine in ultraviolet light at 365 nm.

System suitability Reference solution:

— the zones due to sinensetin and scopoletin are clearly separated.

Results See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, red fluorescent zones are present in the lower third and near the solvent front of the chromatogram obtained with the test solution.

Top of the plate	
Scopoletin: a blue fluorescent zone	A blue fluorescent zone
Sinensetin: a blue fluorescent zone	A prominent blue fluorescent zone (sinensetin)
	1 or 2 bluish fluorescent zones
Reference solution	Test solution

### TESTS

#### Foreign matter (2.8.2)

Maximum 5 per cent of stems with a diameter greater than 1 mm and maximum 2 per cent of other foreign matter.

#### Loss on drying (2.2.32)

Maximum 11.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

#### Total ash (2.4.16)

Maximum 12.5 per cent.

### ASSAY

Liquid chromatography (2.2.29). Carry out the assay protected from light.

**Test solution** Disperse 0.500 g of the powdered herbal drug (355) (2.9.12) in 90 mL of ethanol (50 per cent V/V) R. Boil in a water-bath under a reflux condenser for 30 min, cool, and filter into a 100 mL volumetric flask. Rinse the flask and the filter with 10 mL of ethanol (50 per cent V/V) R and dilute to 100.0 mL with the same solvent. Filter through a membrane filter (nominal pore size 0.45 µm).

**Reference solution (a)** Dissolve 10.0 mg of rosmarinic acid CRS in ethanol (50 per cent V/V) R and dilute to 50.0 mL with the same solvent (solution A). Dilute 4.0 mL of solution A to 20.0 mL with ethanol (50 per cent V/V) R.

**Reference solution (b)** Dissolve 5.0 mg of ferulic acid R in ethanol (50 per cent V/V) R and dilute to 50.0 mL with the same solvent. To 5.0 mL of the solution add 5.0 mL of solution A.

#### Column:

- size:  $l = 0.25$  m,  $\varnothing = 4.6$  mm;
- stationary phase: end-capped octadecylsilyl silica gel for chromatography R (5 µm).

#### Mobile phase:

- mobile phase A: phosphoric acid R, acetonitrile R, water R (1:19:80 V/V/V);
- mobile phase B: phosphoric acid R, methanol R, acetonitrile R (1:40:59 V/V/V);

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 2	100	0
2 - 20	100 → 55	0 → 45
20 - 25	55 → 0	45 → 100

Flow rate 1.2 mL/min.

Detection Spectrophotometer at 330 nm.

Injection 20 µL.

**Relative retention** With reference to rosmarinic acid (retention time = about 11 min): ferulic acid = about 0.8.

**System suitability** Reference solution (b):

— resolution: minimum 4.0 between the peaks due to ferulic acid and rosmarinic acid.

Calculate the percentage content of rosmarinic acid using the following expression:

$$\frac{A_1 \times m_2 \times p \times 0.4}{A_2 \times m_1}$$

$A_1$  = area of the peak due to rosmarinic acid in the chromatogram obtained with the test solution;

$A_2$  = area of the peak due to rosmarinic acid in the chromatogram obtained with reference solution (a);

$m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;

$m_2$  = mass of rosmarinic acid CRS used to prepare reference solution (a), in grams;

$p$  = percentage content of rosmarinic acid in rosmarinic acid CRS.

Ph Eur

## Juniper

(Ph. Eur. monograph 1532)

Ph Eur

### DEFINITION

Dried ripe cone berry of *Juniperus communis* L.

### Content

Minimum 10 mL/kg of essential oil (anhydrous drug).

### CHARACTERS

Strongly aromatic odour reminiscent of terpinen-4-ol, especially if crushed.

### IDENTIFICATION

A. The berry-shaped cone is globular, up to 10 mm in diameter, and violet-brown or blackish-brown, frequently with a bluish bloom. It consists of 3 fleshy scales. The apex has a 3-rayed closed cleft and 3 not-very-clearly defined projections. A remnant of peduncle is frequently attached at the base. The fleshy part is crumbly and brownish.

It contains 3 or, more rarely, 2 small, elongated, extremely hard seeds that have 3 sharp edges and are slightly rounded at the back, acuminate at the apex. The seeds are fused with the fleshy part of the cone berry in the lower part on the outside of their bases. Very large, oval oil glands containing sticky resin lie at the outer surface of the seeds.

B. Microscopic examination (2.8.23). The powder is brown. Examine under a microscope using chloral hydrate solution R. The powder shows the following diagnostic characters (Figure 1532.-1): fragments of epidermis of the cone berry wall (surface view [C], transverse section [D]) consisting of cells with thick, pitted, colourless walls and brown granular contents [Ca, Da], occasionally with anomocytic stomata (2.8.3) [Cb]; fragments of the 3-rayed apical cleft of the cone berry with epidermal cells interlocked by papillous outgrowths (transverse section [G]); fragments of the hypodermis with thickened collenchymatous cells [J]; fragments of the mesocarp consisting of large, thin-walled parenchymatous cells, usually rounded, with large intercellular spaces and irregular, large, usually scarcely pitted, yellow idioblasts [F]; fragments of secretory canals

(transverse section [B]) with schizogenous oil cells; fragments of the testa with thick-walled, pitted, colourless sclereids [E] containing 1 or more prism crystals of calcium oxalate [Ea]; fragments of the seed (surface view [A], transverse section [H]) with a finely pitted testa [Aa, Ha] and thin-walled endosperm cells containing droplets of fatty oil and aleurone grains [Ab, Hb].

Figure 1532.-1. – Illustration for identification test B of powdered herbal drug of juniper

**C. Thin-layer chromatography (2.2.27).**

**Test solution** Dilute the oil-xylene mixture obtained in the assay to 5.0 mL with hexane R.

**Reference solution** Dissolve 4.0 mg of guaiazulene R and 50 µL of cineole R in 10 mL of hexane R.

**Plate** TLC silica gel plate R.

**Mobile phase** ethyl acetate R, toluene R (5:95 V/V).

**Application** 20 µL of the test solution and 10 µL of the reference solution, as bands.

**Development** Over a path of 15 cm.

**Drying** In air.

**Detection** Treat with anisaldehyde solution R, heat at 100-105 °C for 5-10 min and examine in daylight.

**Results** The chromatogram obtained with the reference solution shows a red zone (guaiazulene) in the upper half and a brownish-violet or greyish-violet zone (cineole) in the lower half; the chromatogram obtained with the test solution shows a strong violet zone (mono- and sesquiterpenes) similar in position to the zone due to guaiazulene in the chromatogram obtained with the reference solution, a reddish-violet zone a little above the zone due to cineole in the chromatogram obtained with the reference solution, a greyish-violet zone (terpinen-4-ol) a little below the zone due to cineole in the chromatogram obtained with the reference solution, and just

below that a blue zone; a faint violet zone may be present in a similar position to the zone due to cineole; further zones are present.

**TESTS**

**Foreign matter (2.8.2)**

Maximum 5 per cent of unripe or discoloured cone berries and maximum 2 per cent of other foreign matter.

**Water (2.2.13)**

Maximum 120 mL/kg, determined on 20.0 g of the crushed drug.

**Total ash (2.4.16)**

Maximum 4.0 per cent.

**ASSAY**

**Essential oil (2.8.12)**

Use 20.0 g of the herbal drug reduced to a coarse powder using a suitable mill immediately before the assay, a 500 mL round-bottomed flask, 200 mL of water R as the distillation liquid and 0.5 mL of xylene R in the graduated tube. Distil at a rate of 3-4 mL/min for 90 min.

Ph Eur

**Juniper Oil**

(Ph. Eur. monograph 1832)

Ph Eur

**DEFINITION**

Essential oil obtained by steam distillation from the ripe, non-fermented berry cones of *Juniperus communis* L. A suitable antioxidant may be added.

**CHARACTERS**

**Appearance**

Mobile, colourless or yellowish liquid.

Characteristic odour.

**IDENTIFICATION**

**First identification:** B.

**Second identification:** A.

**A. Thin-layer chromatography (2.2.27).**

**Test solution** Dissolve 0.2 mL of the substance to be examined in 5 mL of heptane R.

**Reference solution** Dissolve 20 mg of  $\alpha$ -terpineol R and 20 µL of terpinen-4-ol R in 25 mL of heptane R.

**Plate** TLC silica gel plate R.

**Mobile phase** ethyl acetate R, toluene R (5:95 V/V).

**Application** 20 µL, as bands.

**Development** Over a path of 12 cm.

**Drying** In air.

**Detection** Treat with anisaldehyde solution R and heat at 100-105 °C until the zones appear; examine immediately in daylight.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution.

Top of the plate	
	An intense brownish-violet zone
	A brown zone
	A violet-pink zone
Terpinen-4-ol: a brownish-violet zone	A brownish-violet zone (terpinen-4-ol)
	A violet zone
$\alpha$ -Terpineol: a violet or brownish-violet zone	A violet or brownish-violet zone ( $\alpha$ -terpineol)
Reference solution	Test solution

B. Examine the chromatograms obtained in the test for chromatographic profile.

**Results** The characteristic peaks in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with the reference solution.

#### TESTS

**Relative density** (2.2.5)  
0.857 to 0.876.

**Refractive index** (2.2.6)  
1.471 to 1.483.

**Optical rotation** (2.2.7)  
-15° to -0.5°.

**Peroxide value** (2.5.5)  
Maximum 20.

**Fatty oils and resinified essential oils** (2.8.7)

It complies with the test for fatty oils and resinified essential oils.

#### Chromatographic profile

Gas chromatography (2.2.28): use the normalisation procedure.

**Test solution** Dissolve 60 mg of the substance to be examined in trimethylpentane R and dilute to 5.0 mL with the same solvent.

**Reference solution** Mix 25  $\mu$ L each of  $\alpha$ -pinene R, sabinene R,  $\beta$ -pinene R,  $\beta$ -myrcene R,  $\alpha$ -phellandrene R, limonene R, terpinen-4-ol R, bornyl acetate R and  $\beta$ -caryophyllene R and dilute to 25.0 mL with trimethylpentane R.

#### Column:

- material: fused silica;
- size:  $l = 30$  m (a film thickness of 1  $\mu$ m may be used) to 60 m (a film thickness of 0.2  $\mu$ m may be used),  $\varnothing = 0.25$ -0.53 mm;
- stationary phase: phenyl(5)methyl(95)polysiloxane R.

Carrier gas helium for chromatography R.

Flow rate 2.0 mL/min.

Split ratio 1:50.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 1	60
	1 - 58	60 → 230
Injection port		250
Detector		250

Detection Flame ionisation.

Injection 0.5  $\mu$ L.

**Elution order** Order indicated in the composition of the reference solution. Record the retention times of these substances.

**System suitability** Reference solution:

— resolution: minimum 1.5 between the peaks due to sabinene and  $\beta$ -pinene.

Using the retention times determined from the chromatogram obtained with the reference solution, locate the components of the reference solution in the chromatogram obtained with the test solution.

Determine the percentage content of the components. Disregard the peak due to trimethylpentane and peaks comprising less than 0.01 per cent of the total surface area. The percentages are within the following ranges:

- $\alpha$ -pinene: 20 per cent to 50 per cent;
- sabinene: maximum 20 per cent;
- $\beta$ -pinene: 1.0 per cent to 12 per cent;
- $\beta$ -myrcene: 1.0 per cent to 35 per cent;
- $\alpha$ -phellandrene: maximum 1.0 per cent;
- limonene: 2.0 per cent to 12 per cent;
- terpinen-4-ol: 0.5 per cent to 10 per cent;
- bornyl acetate: maximum 2.0 per cent;
- $\beta$ -caryophyllene: maximum 7.0 per cent.

#### STORAGE

At a temperature not exceeding 25 °C.

Ph Eur

## Kelp

Bladderwrack Fucus

(Ph. Eur. monograph 1426)

Ph Eur

#### DEFINITION

Fragmented dried thallus of *Fucus vesiculosus* L. or *F. serratus* L. or *Ascophyllum nodosum* Le Jolis.

#### Content

Minimum 0.03 per cent and maximum 0.2 per cent of total iodine ( $A_r$  126.9) (dried drug).

#### CHARACTERS

Salty and mucilaginous taste.

Unpleasant marine odour.

#### IDENTIFICATION

A. The drug consists of fragments with a corneous consistency, blackish-brown to greenish-brown, sometimes covered with whitish efflorescence. The thallus consists of a ribbon-like blade, branching dichotomously with prominent central ribs (pseudoveins). *F. vesiculosus* typically shows a foliose blade with smooth edges and bears occasional ovoid, single or paired, air vesicles. The ends of certain branches are of ovoid shape and a little widened. They bear numerous reproductive organs (conceptacles). *F. serratus* has a foliose blade with a serrate margin and no vesicles, the branches bearing conceptacles are less swollen. The thallus of *A. nodosum* is irregularly branched, without pseudo-midrib. It shows single ovoid air vesicles; the falciform conceptacles are located at the end of small branches.

B. Microscopic examination (2.8.23). The powder is greenish-brown. Examine under a microscope using chloral hydrate solution R. The powder shows fragments of surface tissue with regular isodiametric cells with brown contents,

and fragments of deep tissue with colourless, elongated cells arranged in long filaments with large mucilaginous spaces between them. Thick-walled cells in files and in closely packed groups, from the pseudovain, are sometimes visible.

C. To 1 g of the powdered herbal drug (355) (2.9.12) add 20 mL of a 2 per cent *V/V* solution of *hydrochloric acid R*. Shake vigorously and filter. Wash the residue with 10 mL of *water R* and filter. To the residue add 10 mL of a 200 g/L solution of *sodium carbonate R*. Shake and centrifuge. Collect the supernatant. Adjust to pH 1.5 using *sulfuric acid R*. A white, flocculent precipitate is slowly formed.

#### TESTS

**Arsenic (2.4.27)**

Maximum 90 ppm.

**Cadmium (2.4.27)**

Maximum 4 ppm.

**Lead (2.4.27)**

Maximum 5 ppm.

**Mercury (2.4.27)**

Maximum 0.1 ppm.

**Swelling index (2.8.4)**

Minimum 6.

**Loss on drying (2.2.32)**

Maximum 15.0 per cent, determined on 1.000 g by drying in an oven at 105 °C, for 2 h.

**Total ash (2.4.16)**

Maximum 24 per cent.

**Ash insoluble in hydrochloric acid (2.8.1)**

Maximum 3.0 per cent.

#### ASSAY

##### Total iodine

To 1.000 g of the powdered herbal drug, in a tall silica crucible, add 5 mL of *water R* and 5 g of *potassium hydroxide R*. Stir with a magnesium rod. Heat on a water bath. Add 1 g of *potassium carbonate R*. Mix, add the tip of the magnesium rod with the residues of the drug and dry, first on a water-bath then over an open flame. Incinerate raising the temperature progressively to not more than 600 °C. Allow to cool. Add 20 mL of *water R* and heat gently to boiling, stirring with a glass rod. Filter the hot mixture through an unpleated filter, into a conical flask. Rinse the residue with 4 quantities, each of 20 mL, of hot *water R*. Rinse the filter and the crucible with 50 mL of hot *water R*. Combine the solutions. Allow to cool. Neutralise with *dilute sulfuric acid R* in the presence of *methyl orange solution R*. Add 3 mL of *dilute sulfuric acid R* and 1 mL of *bromine water R*. The solution is yellow. After 5 min add 0.6 mL of a 50 g/L solution of *phenol R*. The solution is clear. Acidify with 5 mL of *phosphoric acid R* and add 0.2 g of *potassium iodide R*. Allow to stand for 5 min protected from light. Add 1 mL of *starch solution R* and titrate with 0.01 M *sodium thiosulfate*.

1 mL of 0.01 M *sodium thiosulfate* is equivalent to 0.2115 mg of iodine.

#### LABELLING

The label states the species of kelp present.

## Knotgrass

(Ph. Eur. monograph 1885)

Ph Eur

#### DEFINITION

Whole or fragmented, dried flowering aerial parts of *Polygonum aviculare* L. s.l.

#### Content

Minimum 0.30 per cent of flavonoids, expressed as hyperoside (C<sub>21</sub>H<sub>20</sub>O<sub>12</sub>; M<sub>r</sub> 464.4) (dried drug).

#### IDENTIFICATION

A. The stem is 0.5-2 mm thick, branched, with nodes, cylindrical or slightly angular, and longitudinally striated. It bears sessile or shortly petiolate, glabrous, entire leaves, which differ widely in shape and size. The sheath-like stipules (ochrea) are lacerate and silvery. The small, axillary flowers have 5 greenish-white perianth segments, the tips of which are often red. The dry, indehiscent fruits are 2-4 mm, brown or black, triangular, usually punctate or striate.

B. Microscopic examination (2.8.23). The powder is greenish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 1885.-1): fragments of lower [A] and upper [D] leaf epidermises with a striated cuticle and anisocytic stomata (2.8.3) [Aa, Da]; polygonal cells of the upper epidermis [D] with slightly thickened beaded walls, often associated with palisade parenchyma [Db]; cells of the lower epidermis [A], with thin, sinuous walls; fragments of the margin of the lamina of the leaf with irregular cells [J]; fragments of parenchyma [G] with numerous cells containing cluster crystals of calcium oxalate, some of which are very large [Ga], often associated with vessels [Gb]; groups of fibres [B, C] with thick walls [Ba, Cb] from the hypodermis of the stem associated either with the epidermis [Ca] or with parenchyma consisting of cells containing cluster crystals of calcium oxalate [Bb]; fragments of the ochrea [E] with elongated, thin-walled cells [Ea], along which run very elongated fibres [Eb]; globular pollen grains with a smooth exine and 3 germinal pores [H]; occasional brown fragments of the exocarp composed of cells with thick, sinuous walls [F].

C. Thin-layer chromatography (2.2.27).

**Test solution** To 1.0 g of the powdered herbal drug (355) (2.9.12) add 10 mL of *methanol R*. Heat the mixture in a water-bath under a reflux condenser for 10 min. Cool and filter.

**Reference solution** Dissolve 1 mg of *caffeic acid R*, 1 mg of *chlorogenic acid R* and 2.5 mg of *hyperoside R* in 10 mL of *methanol R*.

**Plate** TLC silica gel plate R.

**Mobile phase** *anhydrous formic acid R*, *glacial acetic acid R*, *water R*, *ethyl acetate R* (7:7:14:72 *V/V/V/V*).

**Application** 20 µL as bands.

**Development** Over a path of 10 cm.

**Drying** At 100-105 °C.

**Detection** treat with a 10 g/L solution of *diphenylboric acid aminoethyl ester R* in *methanol R*; subsequently treat with a 50 g/L solution of *macrogol 400 R* in *methanol R*. Allow to dry in air for about 30 min. Examine in ultraviolet light at 365 nm.

Ph Eur

Figure 1885.-1. – Illustration for identification test B of powdered herbal drug of knotgrass

**Results** See below the sequence of fluorescent zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other fluorescent zones are present in the chromatogram obtained with the test solution.

Top of the plate	
Caffeic acid: a light blue fluorescent zone	1 or 2 blue fluorescent zones (caffeic acid)
	1 or 2 yellowish-green fluorescent zones
	A yellow fluorescent zone
Hyperoside: a yellowish-brown fluorescent zone	A yellowish-brown fluorescent zone
Chlorogenic acid: a light blue fluorescent zone	A light blue fluorescent zone (chlorogenic acid)
	A yellowish-brown fluorescent zone
Reference solution	Test solution

### TESTS

#### Foreign matter (2.8.2)

Maximum 2 per cent of roots and maximum 2 per cent of other foreign matter.

#### Loss on drying (2.2.32)

Maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (710) (2.9.12) by drying in an oven at 105 °C for 2 h.

#### Total ash (2.4.16)

Maximum 10.0 per cent.

### ASSAY

**Stock solution** In a 100 mL round-bottomed flask, place 0.800 g of the powdered herbal drug (355) (2.9.12), and add 1 mL of a 5 g/L solution of hexamethylenetetramine R, 20 mL of acetone R and 2 mL of hydrochloric acid R1. Boil the mixture under a reflux condenser for 30 min. Filter the liquid through a plug of absorbent cotton into a flask. Add the absorbent cotton to the residue in the round-bottomed flask and extract with 2 quantities, each of 20 mL, of acetone R, each time boiling under a reflux condenser for 10 min. Allow to cool, filter each extract through the plug of absorbent cotton into the flask. Filter the combined acetone extracts through a filter paper into a volumetric flask and dilute to 100.0 mL with acetone R, rinsing the flask and the filter paper. Introduce 20.0 mL of the solution into a separating funnel, add 20 mL of water R and shake the mixture with 1 quantity of 15 mL and then 3 quantities, each of 10 mL, of ethyl acetate R. Combine the ethyl acetate extracts in a separating funnel and wash with 2 quantities, each of 50 mL, of water R. Dry the extracts over 10 g of anhydrous sodium sulfate R, filter into a 50 mL volumetric flask and dilute to volume with ethyl acetate R.

**Test solution** To 10.0 mL of the stock solution add 1 mL of aluminium chloride reagent R and dilute to 25.0 mL with a 5 per cent V/V solution of glacial acetic acid R in methanol R.

**Compensation liquid** Dilute 10.0 mL of the stock solution to 25.0 mL with a 5 per cent V/V solution of glacial acetic acid R in methanol R.

Measure the absorbance (2.2.25) of the test solution after 30 min by comparison with the compensation liquid at 425 nm. Calculate the percentage content of flavonoids, calculated as hyperoside, using the following expression:

$$\frac{A \times 1.25}{m}$$

i.e. taking the specific absorbance of hyperoside to be 500.

*A* = absorbance at 425 nm;  
*m* = mass of the herbal drug to be examined, in grams.

Ph Eur

## Kudzuvine Root

(Ph. Eur. monograph 2434)

Ph Eur

### DEFINITION

Fragmented, dried root of *Pueraria montana* (Lour.) Merr. var. *lobata* (Willd.) Maesen & S.M.Almeida ex Sanjappa & Predeep (syn. *Pueraria lobata* (Willd.) Ohwi).

### Content

Minimum 6.5 per cent of total isoflavonoids, expressed as puerarin (C<sub>21</sub>H<sub>20</sub>O<sub>9</sub>; M<sub>r</sub> 416.4) (dried drug), of which minimum 45 per cent consists of puerarin.

**IDENTIFICATION**

A. Small, square pieces or thick, rectangular slices, 5-35 cm long and 0.5-1 cm thick. The outer bark is pale brown, with longitudinal wrinkles and rough; the section is yellowish-white and shows indistinct striations. The texture is strongly fibrous.

B. Microscopic examination (2.8.23). The powder is pale brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2434.-1): thick-walled lignified fibres, which occur in bundles, surrounded by a calcium oxalate prism sheath [E]; cork fragments with polygonal cells (surface view [D], transverse section [B]); fragments of xylem [C] consisting of relatively large vessels with hexagonal or elliptical bordered-pits, arranged very densely [Ca] and xylem parenchyma cells with slightly thickened and pitted walls [Cb]; rare sclereids, subrounded or elliptical, about 50 µm in diameter [F]; fragments of parenchyma [A]. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows numerous starch granules [G], simple or 2-20 compound; the individual starch granules, 15-30 µm in diameter, are spheroidal, semi-rounded or polygonal, with a punctiform, slit-shaped or stellate hilum.

Figure 2434.-1. – Illustration for identification test B of powdered herbal drug of kudzuvine root

**C. Thin-layer chromatography (2.2.27).**

**Test solution** Sonicate 0.5 g of the powdered herbal drug (355) (2.9.12) with 5 mL of *methanol R*, then centrifuge; use the supernatant.

**Reference solution** Dissolve 5 mg of *puerarin R* and 5 mg of *daidzin R* in 5 mL of *methanol R*.

**Plate** TLC silica gel  $F_{254}$  plate *R* (2-10 µm).

**Mobile phase** *water R*, *methylene chloride R*, *methanol R*, *ethyl acetate R* (10:20:22:40 *V/V/V/V*); use the lower layer.

**Application** 7 µL as bands of 8 mm.

**Development** Over a path of 6 cm.

**Drying** In air.

**Detection** Examine in ultraviolet light at 254 nm.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
	A weak quenching zone
	A quenching zone
Daidzin: a quenching zone	A quenching zone
Puerarin: a quenching zone	A quenching zone
	At least 5 quenching zones
Reference solution	Test solution

**TESTS****Foreign matter (2.8.2)**

Maximum 5 per cent.

**Loss on drying (2.2.32)**

Maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C.

**Total ash (2.4.16)**

Maximum 7.0 per cent.

**Ash insoluble in hydrochloric acid (2.8.1)**

Maximum 1.0 per cent.

**ASSAY**

Liquid chromatography (2.2.29).

**Test solution** Introduce 0.100 g of the powdered herbal drug (355) (2.9.12) into a 250 mL conical flask, add 50.0 mL of *ethanol (30 per cent V/V) R* and weigh. Heat under a reflux condenser for 30 min. Allow to cool and weigh again. Adjust to the initial mass with *ethanol (30 per cent V/V) R*, mix well and filter.

**Reference solution** Introduce an amount of *kudzuvine root dry extract HRS* corresponding to 3.0 mg of *puerarin* into a 250 mL conical flask, add 50.0 mL of *ethanol (30 per cent V/V) R* and weigh. Heat under a reflux condenser for 30 min. Allow to cool and weigh again. Adjust to the initial mass with *ethanol (30 per cent V/V) R*, mix well and filter.

**Column** 2 columns coupled in series:

— size:  $l = 0.10$  m,  $\varnothing = 4.6$  mm;

— stationary phase: end-capped monolithic octadecylsilyl silica gel for chromatography *R*.

**Mobile phase:**

— mobile phase A: *glacial acetic acid R*, *water for chromatography R* (0.1:99.9 *V/V*);

— mobile phase B: *acetonitrile R*;

Time (min)	Mobile phase A (per cent <i>V/V</i> )	Mobile phase B (per cent <i>V/V</i> )
0 - 16.5	90 → 71	10 → 29

**Flow rate** 3.0 mL/min.

**Detection** Spectrophotometer at 260 nm.

**Injection** 10 µL.

**Identification of peaks** Use the chromatogram supplied with *kudzuvine root dry extract HRS* and the chromatogram obtained with the reference solution to identify the peaks due to the isoflavonoids (3-hydroxypuerarin, puerarin, 3-methoxypuerarin, 6-O''-D-xylosylpuerarin and daidzin).

**Relative retention** With reference to puerarin (retention time = about 3.4 min): 3-hydroxypuerarin = about 0.7; 3-methoxypuerarin = about 1.09; 6-O''-D-xylosylpuerarin = about 1.15; daidzin = about 1.4.

**System suitability** Reference solution:

— **peak-to-valley ratio:** minimum 10, where  $H_p$  = height above the baseline of the peak due to 3-methoxypuerarin and  $H_v$  = height above the baseline of the lowest point of the curve separating this peak from the peak due to puerarin.

Calculate the percentage content of puerarin using the following expression:

$$\frac{A_1 \times m_2 \times p}{A_2 \times m_1}$$

- $A_1$  = area of the peak due to puerarin in the chromatogram obtained with the test solution;  
 $A_2$  = area of the peak due to puerarin in the chromatogram obtained with the reference solution;  
 $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;  
 $m_2$  = mass of *kudzuvine root dry extract HRS* used to prepare the reference solution, in grams;  
 $p$  = percentage content of puerarin in *kudzuvine root dry extract HRS*.

Calculate the percentage content of total isoflavonoids (3-hydroxypuerarin, puerarin, 3-methoxypuerarin, 6-O''-D-xylosylpuerarin and daidzin) using the following expression:

$$\frac{A_1 \times m_2 \times p}{A_2 \times m_1}$$

- $A_1$  = sum of the areas of the peaks due to the isoflavonoids (3-hydroxypuerarin, puerarin, 3-methoxypuerarin, 6-O''-D-xylosylpuerarin and daidzin) in the chromatogram obtained with the test solution;  
 $A_2$  = area of the peak due to puerarin in the chromatogram obtained with the reference solution;  
 $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;  
 $m_2$  = mass of *kudzuvine root dry extract HRS* used to prepare the reference solution, in grams;  
 $p$  = percentage content of puerarin in *kudzuvine root dry extract HRS*.

Ph Eur

## Thomson Kudzuvine Root

(Ph. Eur. monograph 2483)

Ph Eur

### DEFINITION

Whole or fragmented, dried root of *Pueraria montana* (Lour.) Merr. var. *thomsonii* (Benth.) M.R.Almeida (syn. *Pueraria thomsonii* (Benth.)), with the outer bark removed.

### Content

Minimum 0.4 per cent of total isoflavonoids, expressed as puerarin (C<sub>21</sub>H<sub>20</sub>O<sub>9</sub>; M<sub>r</sub> 416.4) (dried drug), of which minimum 55 per cent consists of puerarin.

### IDENTIFICATION

**A.** Cylindrical, subfusiform or semi-cylindrical, 12-15 cm long and 4-8 cm in diameter, sometimes in longitudinally or obliquely cut thick slices, varying in size. Externally yellowish-white or pale brown. The root is heavy, texture hard and starchy. A transverse section shows pale brown concentric rings formed by fibres. A longitudinal section shows several longitudinal striations formed by fibres.

**B.** Microscopic examination (2.8.23). The powder is yellowish-white. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2483.-1): thick-walled lignified fibres, which occur in bundles, surrounded by a calcium oxalate prism sheath [A]; rare sclereids, subrounded or elliptical, about 50 µm in diameter [B]; fragments of xylem [F] consisting of relatively large vessels with hexagonal or elliptical bordered-pits, arranged very densely [Fa] and xylem parenchyma cells with slightly thickened and pitted walls [Fb], fragments of parenchyma [C]; isolated prism crystals [D], simple or 2-20 compound; the individual granules, 15-30 µm in diameter, are spheroidal, semi-rounded or polygonal with a punctiform, slit-shaped or stellate hilum.

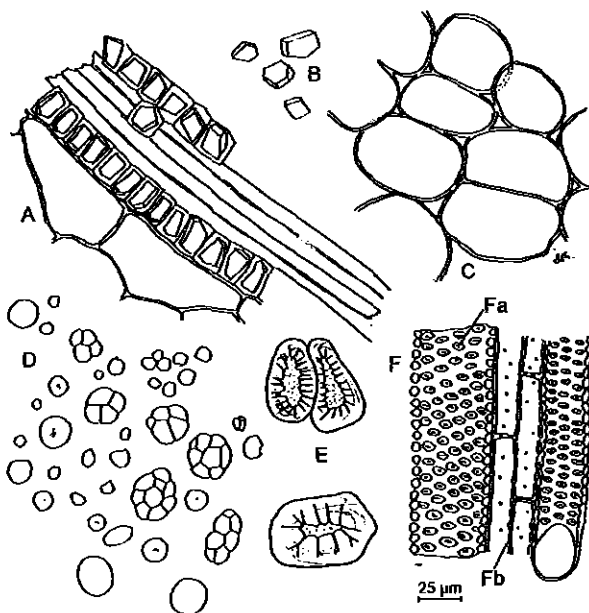

Figure 2483.-1 – Illustration for identification test B of powdered herbal drug of Thomson kudzuvine root

**C.** Thin-layer chromatography (2.2.27).

**Test solution** Sonicate 0.5 g of the powdered herbal drug (355) (2.9.12) with 5 mL of *methanol R*, then centrifuge; use the supernatant.

**Reference solution** Dissolve 5 mg of *daidzin R* and 5 mg of *puerarin R* in 5 mL of *methanol R*.

**Plate** TLC silica gel F<sub>254</sub> plate R (2-10 µm).

**Mobile phase** *water R*, *methylene chloride R*, *methanol R*, *ethyl acetate R* (10:20:22:40 V/V/V/V); use the lower layer.

**Application** 7 µL as bands of 8 mm.

**Development** Over a path of 6 cm.

**Drying** In air.

**Detection** Examine in ultraviolet light at 254 nm.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
	A weak quenching zone
Daidzin: a quenching zone	A weak quenching zone
Puerarin: a quenching zone	A weak quenching zone
	Several quenching zones
Reference solution	Test solution

### TESTS

**Foreign matter (2.8.2)**

Maximum 5 per cent.

**Loss on drying (2.2.32)**

Maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C.

**Total ash (2.4.16)**

Maximum 7.0 per cent.

**Ash insoluble in hydrochloric acid (2.8.1)**

Maximum 1.0 per cent.

### ASSAY

Liquid chromatography (2.2.29).

**Test solution** Introduce 1.00 g of the powdered herbal drug (355) (2.9.12) into a 250 mL conical flask, add 50.0 mL of ethanol (30 per cent V/V) R and weigh. Heat under a reflux condenser for 30 min. Allow to cool and weigh again. Adjust to the initial mass with ethanol (30 per cent V/V) R, mix well and filter.

**Reference solution** Introduce an amount of kudzuvine root dry extract HRS corresponding to 3.0 mg of puerarin into a 250 mL conical flask, add 50.0 mL of ethanol (30 per cent V/V) R and weigh. Heat under a reflux condenser for 30 min. Allow to cool and weigh again. Adjust to the initial mass with ethanol (30 per cent V/V) R, mix well and filter.

**Column** 2 columns coupled in series:

— size:  $l = 0.10$  m,  $\varnothing = 4.6$  mm;

— stationary phase: end-capped monolithic octadecylsilyl silica gel for chromatography R.

**Mobile phase:**

— mobile phase A: glacial acetic acid R, water for chromatography R (0.1:99.9 V/V);

— mobile phase B: acetonitrile R;

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 16.5	90 → 71	10 → 29

**Flow rate** 3.0 mL/min.

**Detection** Spectrophotometer at 260 nm.

**Injection** 10 µL.

**Identification of peaks** Use the chromatogram supplied with kudzuvine root dry extract HRS and the chromatogram obtained with the reference solution to identify the peaks due

to the isoflavonoids (puerarin, 3-methoxypuerarin, 6-O''-D-xylosylpuerarin and daidzin).

**Relative retention** With reference to puerarin (retention time = about 3.4 min): 6-O''-D-xylosylpuerarin = about 1.15; daidzin = about 1.4.

**System suitability** Reference solution:

— peak-to-valley ratio: minimum 10, where  $H_p$  = height above the baseline of the peak due to 3-methoxypuerarin and  $H_v$  = height above the baseline of the lowest point of the curve separating this peak from the peak due to puerarin.

Calculate the percentage content of puerarin using the following expression:

$$\frac{A_1 \times m_2 \times p}{A_2 \times m_1}$$

- $A_1$  = area of the peak due to puerarin in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to puerarin in the chromatogram obtained with the reference solution;
- $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;
- $m_2$  = mass of kudzuvine root dry extract HRS used to prepare the reference solution, in grams;
- $p$  = percentage content of puerarin in kudzuvine root dry extract HRS.

Calculate the percentage content of total isoflavonoids (puerarin, 6-O''-D-xylosylpuerarin and daidzin) using the following expression:

$$\frac{A_1 \times m_2 \times p}{A_2 \times m_1}$$

- $A_1$  = sum of the areas of the peaks due to the isoflavonoids (puerarin, 6-O''-D-xylosylpuerarin and daidzin) in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to puerarin in the chromatogram obtained with the reference solution;
- $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;
- $m_2$  = mass of kudzuvine root dry extract HRS used to prepare the reference solution, in grams;
- $p$  = percentage content of puerarin in kudzuvine root dry extract HRS.

Ph Eur

## Lavender Flower

(Ph. Eur. monograph 1534)

Ph Eur

### DEFINITION

Dried flower of *Lavandula angustifolia* Mill. (*L. officinalis* Chaix).

### Content

Minimum 13 mL/kg of essential oil (anhydrous drug).

### IDENTIFICATION

First identification: A, B, D.

Second identification: A, B, C.

A. The flower has a short peduncle and consists of a bluish-grey tubular calyx divided distally into 4 very short teeth and a small rounded lobe, a blue bilabial corolla with the upper lip bifid and the lower lip trilobate and 4 didynamous stamens with ovoid anthers.

B. Microscopic examination (2.8.23). The powder is bluish-grey. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 1534.-1): covering trichomes bifurcating at one or more levels [C, L]; secretory trichomes with short stalks and 8-celled heads of the *Lamiaceae* type (side view [H], surface view [M]); glandular trichomes with unicellular [O] or multicellular [K] stalks and unicellular heads; glandular trichomes with long uneven stalks and unicellular heads, separated from the stalk by an intermediary cell with a smooth cuticle, certain trichomes show a crown of small spheroid protuberances just below the insertion point of the intermediary cell on the stalk [G]; fragments of papillose epidermis from the inner surface of the petals (surface view [J], side view [P]); fragments of calyx epidermis with sinuous-walled cells and containing prismatic crystals of calcium oxalate [Q]; spherical pollen grains which have a diameter of about 45  $\mu\text{m}$  and an exine with 6 slit-like germinal pores and 6 ribbon-like groins radiating from the poles [A, D, E, F]; rare fragments of leaf epidermis with stomata, mostly of the diacytic type (2.8.3) [B]; fragments of vascular tissue with spiral vessels included in parenchyma with some cells containing small cluster crystals of calcium oxalate [N].

Figure 1534.-1. – Illustration for identification test B of powdered herbal drug of lavender flower

C. Examine the chromatograms obtained in the test for lavender flower.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
	A violet zone
Linalyl acetate: a violet zone	A violet zone
	A pink zone
1,8-Cineole: a violet or brown zone	
Linalol: a violet zone	A violet zone (linalol)
Reference solution	Test solution

D. Examine the chromatograms obtained in the test for other species and varieties of lavender.

**Results** The 5 principal peaks in the chromatogram obtained with the test solution are similar in retention time to the corresponding peaks in the chromatogram obtained with the reference solution; the 2 main peaks are due to linalol and linalyl acetate.

#### TESTS

##### Foreign matter (2.8.2)

Maximum 3 per cent of stems and maximum 2 per cent of other foreign matter.

##### Lavandin flower (*Lavandula x intermedia* Emeric ex Loisel)

##### Thin-layer chromatography (2.2.27).

**Test solution** To 0.5 g of the powdered herbal drug (355) (2.9.12) add 5 mL of *toluene R*, sonicate for 5 min and filter.

**Reference solution** Dilute 10  $\mu\text{L}$  of *cineole R*, 5  $\mu\text{L}$  of *linalol R* and 5  $\mu\text{L}$  of *linalyl acetate R* to 1 mL with *toluene R*.

**Plate** TLC silica gel F<sub>254</sub> plate R (2-10  $\mu\text{m}$ ).

**Mobile phase** *ethyl acetate R*, *toluene R* (5:95 V/V).

**Application** 4  $\mu\text{L}$  as bands of 8 mm.

**Development** Over a path of 6 cm.

**Drying** In air.

**Detection** Treat with *anisaldehyde solution R* and heat at 100 °C for 5 min; examine immediately in daylight.

**Results** The chromatogram obtained with the test solution shows no zone between the zones due to 1,8-cineole and linalol in the chromatogram obtained with the reference solution.

##### Other species and varieties of lavender

**Gas chromatography (2.2.28):** use the normalisation procedure.

**Test solution** Dilute 0.2 mL of the essential oil-xylene mixture obtained in the assay to 5 mL with *heptane R*, add 1 g of *anhydrous sodium sulfate R*, shake and use the supernatant.

**Reference solution** Dissolve 0.05 g of *camphor R* and 0.2 g of  $\alpha$ -*terpineol R* in *heptane R*, add 0.1 g of *limonene R*, 0.2 g of *cineole R*, 0.4 g of *linalol R* and 0.6 g of *linalyl acetate R*, then dilute to 100 mL with *heptane R*.

**Column:**

- material: fused silica;
- size:  $l = 60$  m,  $\varnothing = 0.25$  mm;
- stationary phase: macrogol 20 000 R (film thickness 0.25  $\mu$ m).

Carrier gas helium for chromatography R.

Flow rate 1.5 mL/min.

Split ratio 1:100.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 15	70
	15 - 70	70 → 180
Injection port		220
Detector		220

Detection Flame ionisation.

Injection The same volume of each solution.

Elution order Limonene, 1,8-cineole, camphor, linalol, linalyl acetate,  $\alpha$ -terpineol.

System suitability Reference solution:

- resolution: minimum 1.5 between the peaks due to limonene and 1,8-cineole;
- number of theoretical plates: minimum 30 000, calculated for the peak due to limonene at 110 °C.

Using the retention times determined from the chromatogram obtained with the reference solution, locate the 6 components of the reference solution in the chromatogram obtained with the test solution. Disregard the peaks due to heptane and xylene.

Limit:

- camphor: maximum 1 per cent.

Water (2.2.13)

Maximum 100 mL/kg, determined on 20.0 g.

Total ash (2.4.16)

Maximum 9.0 per cent.

**ASSAY**

Essential oil (2.8.12)

Use 20.0 g of the herbal drug, a 1000 mL round-bottomed flask, 500 mL of water R as the distillation liquid and 0.5 mL of xylene R in the graduated tube. Distil at a rate of 2-3 mL/min for 2 h.

Ph Eur

**Lavender Oil**

(Ph. Eur. monograph 1338)

Ph Eur

**DEFINITION**

Essential oil obtained by steam distillation of the flowering tops of *Lavandula angustifolia* Mill. (*Lavandula officinalis* Chaix).

**CHARACTERS****Appearance**

Colourless or pale yellow, clear liquid.

**Odour**

Complex, reminiscent of linalyl acetate.

**IDENTIFICATION**

First identification: B.

Second identification: A.

A. Thin-layer chromatography (2.2.27).

Test solution Dilute 20  $\mu$ L of the essential oil to be examined to 1 mL with toluene R.

Reference solution Dilute 10  $\mu$ L of cineole R, 5  $\mu$ L of linalol R and 5  $\mu$ L of linalyl acetate R to 1 mL with toluene R.

Plate TLC silica gel F<sub>254</sub> plate R (5-40  $\mu$ m) [or TLC silica gel F<sub>254</sub> plate R (2-10  $\mu$ m)].

Mobile phase ethyl acetate R, toluene R (5:95 V/V).

Application 6  $\mu$ L [or 2  $\mu$ L] as bands of 10 mm [or 8 mm].

Development Over a path of 10 cm [or 6 cm].

Drying In air.

Detection Treat with anisaldehyde solution R and heat at 100 °C for 5 min; examine immediately in daylight.

Results See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
	A violet zone
Linalyl acetate: a violet zone	An intense violet zone (linalyl acetate) A pink zone
1,8-Cineole: a violet or brown zone	Possibly a weak violet-brown zone (1,8-cineole)
Linalol: a violet zone	An intense violet zone (linalol) A greyish or brownish zone
Reference solution	Test solution

B. The essential oil to be examined complies with the limits of the test for chromatographic profile.

**TESTS**

Relative density (2.2.5)

0.878 to 0.892.

Refractive index (2.2.6)

1.455 to 1.466.

Optical rotation (2.2.7)

-12.5° to -6.0°.

Acid value (2.5.1)

Maximum 1.0, determined on 5.00 g of the essential oil to be examined dissolved in 50 mL of the prescribed mixture of solvents.

**Chromatographic profile**

Gas chromatography (2.2.28): use the normalisation procedure.

Test solution Dilute 200  $\mu$ L of the essential oil to be examined to 10.0 mL with heptane R.

Reference solution (a) Dilute 200  $\mu$ L of lavender oil for peak identification HRS to 10.0 mL with heptane R.

**Reference solution (b)** Dilute 5 µL of *limonene R* to 50.0 mL with *heptane R*. Dilute 0.5 mL of this solution to 5.0 mL with *heptane R*.

**Column:**

- **material:** fused silica;
- **size:**  $l = 60$  m,  $\varnothing = 0.25$  mm;
- **stationary phase:** *macrogol 20 000 R* (film thickness 0.25 µm).

**Carrier gas** *helium for chromatography R*.

**Flow rate** 1.5 mL/min.

**Split ratio** 1:50.

**Temperature:**

	Time (min)	Temperature (°C)
Column	0 - 15 15 - 70	70 70 → 180
Injection port		220
Detector		220

**Detection** Flame ionisation.

**Injection** 1 µL.

**Elution order** *limonene*, *1,8-cineole*, *3-octanone*, *camphor*, *linalol*, *linalyl acetate*, *terpinen-4-ol*, *lavandulyl acetate*, *lavandulol*,  $\alpha$ -*terpineol*.

**Identification of peaks** Use the chromatogram supplied with *lavender oil for peak identification HRS* and the chromatogram obtained with reference solution (a) to identify the peaks due to *limonene*, *1,8-cineole*, *3-octanone*, *camphor*, *linalol*, *linalyl acetate*, *terpinen-4-ol*, *lavandulyl acetate*, *lavandulol* and  $\alpha$ -*terpineol*.

**System suitability** Reference solution (a):

- **resolution:** minimum 1.4 between the peaks due to *terpinen-4-ol* and *lavandulyl acetate*.

Determine the percentage content of each of the following components. The percentages are within the following ranges:

- *limonene*: maximum 1.0 per cent;
- *1,8-cineole*: maximum 2.5 per cent;
- *3-octanone*: 0.1 per cent to 5.0 per cent;
- *camphor*: maximum 1.2 per cent;
- *linalol*: 20.0 per cent to 45.0 per cent;
- *linalyl acetate*: 25.0 per cent to 47.0 per cent;
- *terpinen-4-ol*: 0.1 per cent to 8.0 per cent;
- *lavandulyl acetate*: minimum 0.2 per cent;
- *lavandulol*: minimum 0.1 per cent;
- $\alpha$ -*terpineol*: maximum 2.0 per cent;
- **reporting threshold:** the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

**Chiral purity**

Gas chromatography (2.2.28).

**Test solution** Dilute 0.02 g of the essential oil to be examined to 10 mL with *pentane R*.

**Reference solution** Dissolve 5 mg of *borneol R* in *pentane R*, add 10 µL of *linalol R* (mixture of (*R*)-*linalol* and (*S*)-*linalol*) and 10 µL of *linalyl acetate R* (mixture of (*R*)-*linalyl acetate* and (*S*)-*linalyl acetate*) and dilute to 10 mL with *pentane R*.

**Column:**

- **material:** fused silica;
- **size:**  $l = 25$  m,  $\varnothing = 0.25$  mm;
- **stationary phase:** *modified  $\beta$ -cyclodextrin for chiral chromatography R* (film thickness 0.25 µm).

**Carrier gas** *helium for chromatography R*.

**Flow rate** 1.3 mL/min.

**Split ratio** 1:30.

**Temperature:**

	Time (min)	Temperature (°C)
Column	0 - 65	50 → 180
Injection port		230
Detector		230

**Detection** Flame ionisation.

**Injection** 1 µL.

**Elution order** (*R*)-*linalol*, (*S*)-*linalol*, *borneol*, (*R*)-*linalyl acetate*, (*S*)-*linalyl acetate*; depending on the operating conditions and the state of the column, *borneol* may elute before or after (*S*)-*linalol*.

**System suitability** Reference solution:

- **resolution:** minimum 5.5 between the peaks due to (*R*)-*linalol* and (*S*)-*linalol*; minimum 2.9 between the peaks due to (*S*)-*linalol* and *borneol*; minimum 2.0 between the peaks due to (*R*)-*linalyl acetate* and (*S*)-*linalyl acetate*.

Calculate the percentage content of the specified (*S*)-enantiomers using the following expression:

$$\frac{A_S}{A_S + A_R} \times 100$$

- $A_S$  = area of the peak due to the corresponding (*S*)-enantiomer;
- $A_R$  = area of the peak due to the corresponding (*R*)-enantiomer.

**Limits:**

- (*S*)-*linalol*: maximum 12 per cent;
- (*S*)-*linalyl acetate*: maximum 1 per cent.

**STORAGE**

At a temperature not exceeding 25 °C.

Ph Eur

## Spike Lavender Oil

(Ph. Eur. monograph 2419)

Ph Eur

**DEFINITION**

Essential oil obtained by steam distillation of the flowering tops of *Lavandula latifolia* Medik.

**CHARACTERS**

**Appearance**

Clear, mobile, light yellow or greenish-yellow liquid.

**Odour:** reminiscent of *cineole* and *camphor*.

**IDENTIFICATION**

**First identification** B.

**Second identification** A.

A. Thin-layer chromatography (2.2.27).

**Test solution** Dilute 20 µL of the essential oil to be examined to 1 mL with *toluene R*.

**Reference solution** Dilute 10 µL of *cineole R*, 5 µL of *linalol R* and 5 µL of *linalyl acetate R* to 1 mL with *toluene R*.

**Plate** TLC silica gel  $F_{254}$  plate R (5-40 µm) [or TLC silica gel  $F_{254}$  plate R (2-10 µm)].

**Mobile phase** ethyl acetate R, toluene R (5:95 V/V).

**Application** 6 µL [or 2 µL] as bands of 10 mm [or 8 mm].

**Development** Over a path of 10 cm [or 6 cm].

**Drying** In air.

**Detection** Treat with anisaldehyde solution R and heat at 100 °C for 5 min; examine immediately in daylight.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
	A violet zone
Linalyl acetate: a violet zone	A faint violet or brown zone may be present (linalyl acetate) A pink zone
1,8-Cineole: a violet or brown zone	A violet or brown zone (1,8-cineole)
Linalol: a violet zone	An intense violet zone (linalol) A greyish or brownish zone
Reference solution	Test solution

B. The essential oil to be examined complies with the limits of the test for chromatographic profile.

#### TESTS

**Relative density (2.2.5)**  
0.894 to 0.907.

**Refractive index (2.2.6)**  
1.461 to 1.468.

**Optical rotation (2.2.7)**  
-7° to +2°.

**Acid value (2.5.1)**  
Maximum 1.5, determined on 5.00 g of the essential oil to be examined.

**Solubility in alcohol (2.8.10)**  
1.0 mL of the essential oil to be examined is soluble, sometimes with opalescence, in 3.0 mL of ethanol (70 per cent V/V) R.

**Chromatographic profile**  
Gas chromatography (2.2.28): use the normalisation procedure.

**Test solution** Dilute 200 µL of the essential oil to be examined to 10.0 mL with heptane R.

**Reference solution (a)** Dilute 200 µL of spike lavender oil CRS to 10.0 mL with heptane R.

**Reference solution (b)** Dilute 5 µL of limonene R to 50.0 mL with heptane R. Dilute 0.5 mL of this solution to 5.0 mL with heptane R.

**Column:**

- material: fused silica;
- size:  $l = 60$  m,  $\varnothing = 0.25$  mm;
- stationary phase: macrogol 20 000 R (film thickness 0.25 µm).

**Carrier gas** helium for chromatography R.

**Flow rate** 1.5 mL/min.

**Split ratio** 1:50.

**Temperature:**

	Time (min)	Temperature (°C)
Column	0 - 15 15 - 70	70 70 → 180
Injection port		220
Detector		220

**Detection** Flame ionisation.

**Injection** 1 µL.

**Elution order** Limonene, 1,8-cineole, camphor, linalol, linalyl acetate,  $\alpha$ -terpineol, trans- $\alpha$ -bisabolene.

**Identification of peaks** Use the chromatogram supplied with spike lavender oil CRS and the chromatogram obtained with reference solution (a) to identify the peaks due to limonene, 1,8-cineole, camphor, linalol, linalyl acetate,  $\alpha$ -terpineol and trans- $\alpha$ -bisabolene.

**System suitability** Reference solution (a):

- the chromatogram obtained is similar to the chromatogram supplied with spike lavender oil CRS;
- resolution: minimum 1.5 between the peaks due to limonene and 1,8-cineole.

Determine the percentage content of each of the following components. The percentages are within the following ranges:

- limonene: 0.5 per cent to 3.0 per cent;
- 1,8-cineole: 16.0 per cent to 39.0 per cent;
- camphor: 8.0 per cent to 16.0 per cent;
- linalol: 34.0 per cent to 50.0 per cent;
- linalyl acetate: maximum 1.6 per cent;
- $\alpha$ -terpineol: 0.2 per cent to 2.0 per cent;
- trans- $\alpha$ -bisabolene: 0.4 per cent to 2.5 per cent;
- reporting threshold: the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

#### STORAGE

At a temperature not exceeding 25 °C.

Ph Eur

## Lemon Balm

(Melissa Leaf, Ph. Eur. monograph 1447)

#### Preparation

Lemon Balm Dry Extract

Ph Eur

#### DEFINITION

Dried leaf of *Melissa officinalis* L.

#### Content

Minimum 1.0 per cent of rosmarinic acid ( $C_{18}H_{16}O_8$ ;  $M_r$  360.3) (dried drug).

#### CHARACTERS

Odour reminiscent of lemon.

#### IDENTIFICATION

A. The leaves have a petiole of varying length; the lamina is broadly ovate, up to about 8 cm long and 5 cm wide, acute at the apex and rounded to cordate at the base; the margins

are crenate to dentate. The upper surface is intense green, the lower surface is paler green and shows a conspicuous midrib and a raised, reticulate venation; scattered hairs occur on the upper surface and along the veins on the lower surface, which is also finely punctuate.

**B. Microscopic examination (2.8.23).** The powder is greenish. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 1447.-1): fragments of the upper epidermis, in surface view, with sinuous walls [A, B, G], sometimes accompanied by palisade parenchyma [Aa]; fragments of the lower epidermis [D] with diacytic stomata (2.8.3) [Db]; short, straight, unicellular, conical covering trichomes with a finely striated cuticle, free [E] or attached to an epidermis [Da]; multicellular, uniseriate covering trichomes with pointed ends and thick, warty cuticles [C]; eight-celled secretory trichomes of lamiate type (surface view [Ga]); secretory trichomes with unicellular to tricellular stalks and unicellular or, more rarely, bicellular heads (surface view [Ba], transverse section [F]).

Figure 1447.-1.— Illustration for identification test B of powdered herbal drug of melissa leaf

**C. Thin-layer chromatography (2.2.27).**

**Test solution** Place 2.0 g of the powdered herbal drug (355) (2.9.12) in a 250 mL round-bottomed flask and add 100 mL of *water R*. Distil for 1 h using the apparatus for the determination of essential oils in herbal drugs (2.8.12) and 0.5 mL of *xylene R* in the graduated tube. After distillation transfer the organic phase to a 1 mL volumetric flask, rinsing the graduated tube of the apparatus with the aid of a small portion of *xylene R*, and dilute to 1.0 mL with the same solvent.

**Reference solution** Dissolve 1.0 µL of *citronellal R* and 10.0 µL of *citral R* (composed of neral and geranial) in 25 mL of *xylene R*.

**Plate** *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

**Mobile phase** *ethyl acetate R*, *hexane R* (10:90 *V/V*).

**Application** 20 µL [or 4 µL] as bands.

**Development** In an unsaturated tank over a path of 15 cm [or 6 cm].

**Drying** In air.

**Detection** Spray with *anisaldehyde solution R* and heat at 100-105 °C for 10-15 min; examine in daylight.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Citronellal: a grey or greyish-violet zone at the border between the upper and middle thirds	A grey or greyish-violet zone (citronella) at the border between the upper and middle thirds A reddish-violet zone
Citral: 2 greyish-violet or bluish-violet zones at the border between the middle and lower thirds	2 greyish-violet or bluish-violet zones (citral) at the border between the middle and lower thirds
Reference solution	Test solution

**TESTS**

**Foreign matter (2.8.2)**

Maximum 10 per cent of stems with a diameter greater than 1 mm and maximum 2 per cent of other foreign matter, determined on 20 g.

**Loss on drying (2.2.32)**

Maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

**Total ash (2.4.16)**

Maximum 12.0 per cent.

**ASSAY**

**Liquid chromatography (2.2.29).**

**Test solution** Use brown-glass flasks. Disperse 0.100 g of the powdered herbal drug (355) (2.9.12) in 90 mL of *ethanol (50 per cent V/V) R*. Boil in a water-bath under a reflux condenser for 30 min, cool, and filter into a 100 mL volumetric flask. Rinse the flask and the filter with 10 mL of *ethanol (50 per cent V/V) R* and dilute to 100.0 mL with the same solvent. Filter through a 0.45 µm filter.

**Reference solution (a)** Dissolve 20.0 mg of *rosmarinic acid CRS* in *ethanol (50 per cent V/V) R* and dilute to 100.0 mL with the same solvent. Dilute 20.0 mL of this solution to 100.0 mL with *ethanol (50 per cent V/V) R*.

**Reference solution (b)** Dissolve 5.0 mg of *ferulic acid R* in reference solution (a) and dilute to 50.0 mL with the same solution.

**Column:**

— size:  $l = 0.25$  m,  $\varnothing = 4.6$  mm;

— stationary phase: octadecylsilyl silica gel for chromatography R (5 µm).

**Mobile phase:**

— mobile phase A: *phosphoric acid R*, *acetonitrile R*, *water R* (1:19:80 *V/V/V*);

— mobile phase B: phosphoric acid R, methanol R, acetonitrile R (1:40:59 V/V/V);

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 20	100 → 55	0 → 45
20 - 25	55 → 0	45 → 100
25 - 30	0 → 100	100 → 0

Flow rate 1.2 mL/min.

Detection Spectrophotometer at 330 nm.

Injection 20 µL.

Relative retention With reference to rosmarinic acid (retention time = about 11 min): ferulic acid = about 0.8.

System suitability Reference solution (b):

— resolution: minimum 4.0 between the peaks due to ferulic acid and rosmarinic acid.

Calculate the percentage content of rosmarinic acid using the following expression:

$$\frac{A_1 \times m_2 \times p \times 0.2}{A_2 \times m_1}$$

- $A_1$  = area of the peak due to rosmarinic acid in the chromatogram obtained with the test solution;  
 $A_2$  = area of the peak due to rosmarinic acid in the chromatogram obtained with reference solution (a);  
 $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;  
 $m_2$  = mass of rosmarinic acid CRS used to prepare reference solution (a), in grams;  
 $p$  = percentage content of rosmarinic acid in rosmarinic acid CRS.

Ph Eur

## Lemon Balm Dry Extract

(Melissa Leaf Dry Extract, Ph. Eur. monograph 2524)

Ph Eur

### DEFINITION

Dry extract produced from *Melissa leaf* (1447).

### Content

Minimum 2.0 per cent of rosmarinic acid ( $C_{18}H_{16}O_8$ ;  $M_r$  360.3) (dried extract).

### PRODUCTION

The extract is produced from the herbal drug by a suitable procedure using either hot water (not less than 70 °C) or a hydroalcoholic solvent that is at most equivalent in strength to ethanol (70 per cent V/V).

### CHARACTERS

#### Appearance

Brown or greenish-brown, amorphous powder.

### IDENTIFICATION

Thin-layer chromatography (2.2.27).

Test solution To 0.2 g of the extract to be examined add 5 mL of methanol R. Sonicate for 5 min and filter.

Reference solution Dissolve 1.0 mg of hyperoside R, 1.0 mg of rutoside trihydrate R and 5.0 mg of rosmarinic acid R in 10 mL of methanol R.

Plate TLC silica gel plate R (5-40 µm) [or TLC silica gel plate R (2-10 µm)].

Mobile phase anhydrous formic acid R, water R, ethyl acetate R (6:6:90 V/V/V).

Application 10 µL [or 2 µL] as bands of 15 mm [or 8 mm].

Development Over a path of 8 cm [or 6 cm].

Drying In air.

Detection Heat at 100 °C for 5 min, spray the plate whilst still hot with a 5 g/L solution of diphenylboric acid aminoethyl ester R in ethyl acetate R, and examine in ultraviolet light at 365 nm.

Results See below the sequence of fluorescent zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other weaker fluorescent zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Rosmarinic acid: a light blue fluorescent zone	An intense light blue fluorescent zone (rosmarinic acid) A blue fluorescent zone
	A blue fluorescent zone
Hyperoside: an orange or greenish-yellow fluorescent zone	A light blue fluorescent zone
Rutoside: an orange or greenish-yellow fluorescent zone	
Reference solution	Test solution

### TESTS

Loss on drying (2.8.17)

Maximum 6.0 per cent.

### ASSAY

Liquid chromatography (2.2.29).

Test solution Use brown glass flasks. To 0.200 g of the extract to be examined add 50 mL of ethanol (50 per cent V/V) R. Sonicate for 10 min and dilute to 100.0 mL with ethanol (50 per cent V/V) R. Filter through a membrane filter (nominal pore size 0.45 µm).

Reference solution (a) Dissolve 20.0 mg of rosmarinic acid CRS in ethanol (50 per cent V/V) R and dilute to 100.0 mL with the same solvent. Dilute 20.0 mL of this solution to 100.0 mL with ethanol (50 per cent V/V) R.

Reference solution (b) Dissolve 5 mg of ferulic acid R in reference solution (a) and dilute to 50 mL with reference solution (a).

#### Column:

— size:  $l = 0.25$  m,  $\varnothing = 4.6$  mm;

— stationary phase: octadecylsilyl silica gel for chromatography R (5 µm).

#### Mobile phase:

— mobile phase A: phosphoric acid R, acetonitrile R, water R (1:19:80 V/V/V);

— mobile phase B: phosphoric acid R, methanol R, acetonitrile R (1:40:59 V/V/V);

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 20	100 → 55	0 → 45
20 - 25	55 → 0	45 → 100

Flow rate 1.2 mL/min.

Detection Spectrophotometer at 330 nm.

Injection 20 µL.

Relative retention With reference to rosmarinic acid (retention time = about 11 min): ferulic acid = about 0.8.

System suitability Reference solution (b):

— resolution: minimum 4.0 between the peaks due to ferulic acid and rosmarinic acid.

Calculate the percentage content of rosmarinic acid using the following expression:

$$\frac{A_1 \times m_2 \times p \times 0.2}{A_2 \times m_1}$$

- $A_1$  = area of the peak due to rosmarinic acid in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to rosmarinic acid in the chromatogram obtained with reference solution (a);
- $m_1$  = mass of the extract to be examined used to prepare the test solution, in grams;
- $m_2$  = mass of rosmarinic acid CRS used to prepare reference solution (a), in grams;
- $p$  = percentage content of rosmarinic acid in rosmarinic acid CRS.

Ph Eur

(c) Apply 20 µL of each solution as bands.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry the plate at 105° and spray the warm plate with a 1% w/v solution of diphenylboric acid aminoethyl ester in methanol and then with a 5% w/v solution of polyethylene glycol 400 in methanol. Allow the plate to stand for 30 minutes and examine under ultraviolet light (365 nm).

#### MOBILE PHASE

A mixture of 10 volumes of anhydrous formic acid, 10 volumes of water, 30 volumes of butan-2-one and 50 volumes of ethyl acetate.

#### CONFIRMATION

The chromatogram obtained with solution (1): exhibits a yellowish-brown fluorescent zone corresponding in colour and position to the zone for rutin in the chromatogram obtained with solution (2); above it an intense red fluorescent zone and further above a very weak greenish fluorescent zone corresponding in colour and position to the zone for naringin in the chromatogram obtained with solution (2); other coloured zones are present in the chromatogram.

#### TESTS

##### Volatile oil

Not less than 2.0% w/w (1.7% w/w), Appendix XI E, using 300 mL of water as the distillation liquid and no xylene in the graduated tube. Use 20 g, soaked in water and macerated in a suitable blender, and distil for 3 hours.

## Dried Lemon Peel

### DEFINITION

Dried Lemon Peel is the dried outer part of the pericarp of the ripe, or nearly ripe, fruit of *Citrus limon* (L.) Burm. f.

### CHARACTERISTICS

It has the macroscopical and microscopical characters described under Identification tests A and B.

### IDENTIFICATION

A. Dried Lemon Peel consists of strips or pieces, showing a marked thickening of the epicarp around the calyx. The outer surface is yellow and somewhat rough from the presence of numerous minute pits, each corresponding to an oil gland; the inner surface with only a small remnant of white, spongy pericarp. Fracture, short.

B. Prepare thin cross sections from material softened by soaking in water and examine under a microscope using chloral hydrate solution. The sections show a yellow epidermis composed of small, thin-walled cells and an underlying parenchyma with numerous large oil glands and scattered small strands of vascular tissue; prismatic crystals of calcium oxalate occur throughout the parenchyma and are particularly abundant in the layers adjacent to the epidermis.

C. Carry out the method for thin-layer chromatography, Appendix III A, using the following solutions.

(1) Add 1 g of freshly cut peel to 10 mL of methanol and heat in a water-bath at 65° for 5 minutes, shaking frequently. Allow to cool and filter.

(2) 0.01% w/v each of caffeic acid and naringin and 0.025% w/v of rutin in methanol.

### CHROMATOGRAPHIC CONDITIONS

(a) Using a TLC silica gel plate.

(b) Use the mobile phase as described below.

## Lemon Oil

(Ph. Eur. monograph 0620)

### Preparation

Terpeneless Lemon Oil

Ph Eur

### DEFINITION

Essential oil obtained by suitable mechanical means, without the aid of heat, from the fresh peel of *Citrus limon* (L.) Burman fil.

### CHARACTERS

#### Appearance

Clear, mobile, pale yellow or greenish-yellow liquid. It may become cloudy at low temperatures.

Characteristic odour.

### IDENTIFICATION

First identification: B.

Second identification: A.

A. Thin-layer chromatography (2.2.27).

Test solution Mix 1 mL of the substance to be examined in 1 mL of toluene R.

Reference solution Dissolve 10 mg of citropten R and 50 µL of citral R in toluene R and dilute to 10 mL with the same solvent.

Plate TLC silica gel GF<sub>254</sub> plate R.

Mobile phase ethyl acetate R, toluene R (15:85 V/V).

Application 10 µL, as bands.

Development Over a path of 15 cm.

Drying In air.

**Detection A** Examine in ultraviolet light at 254 nm.

**Results A** See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution.

Top of the plate	
Citral: a quenching zone	A quenching zone (bergamotín) A quenching zone (citral)
Citropten: a light blue fluorescent zone	A dark blue zone (5-geranyloxy-7-methoxycoumarin) A light blue fluorescent zone (citropten)
	A quenching zone (psoralen derivative) A quenching zone (biakangelicin)
Reference solution	Test solution

**Detection B** Examine in ultraviolet light at 365 nm.

**Results B** See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution.

Top of the plate	
Citral: a quenching zone	A yellow fluorescent zone (bergamotín) A quenching zone (citral)
Citropten: a bright blue fluorescent zone	A bright blue fluorescent zone (5-geranyloxy-7-methoxycoumarin) A bright violet-blue fluorescent zone (citropten)
	A yellow fluorescent zone (psoralen derivative) An orange zone (biakangelicin)
Reference solution	Test solution

B. Examine the chromatograms obtained in the test for chromatographic profile.

**Results** The characteristic peaks in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with the reference solution.

#### TESTS

**Relative density** (2.2.5)  
0.850 to 0.858.

**Refractive index** (2.2.6)  
1.473 to 1.476.

**Optical rotation** (2.2.7)  
+ 57° to + 70°.

**Absorbance** (2.2.25)  
Dissolve 0.250 g of the substance to be examined in alcohol R, mix and dilute to 100.0 mL with the same solvent. Measure the absorbance over the range 260 nm to 400 nm. If a manual instrument is used, measure the absorbance at 5 nm intervals from 260 nm to about 12 nm before the expected absorption maximum, then at 3 nm intervals for 3 readings and at 1 nm intervals to about 5 nm beyond the maximum and finally at 10 nm intervals to 400 nm. Plot a curve representing the absorption spectrum with the absorbances as ordinates and the wavelengths as abscissae.

Draw as a baseline the tangent between *A* and *B* (Figure 0620.-1). The absorption maximum *C* is situated at  $315 \pm 3$  nm. From *C* draw a line perpendicular to the axis of abscissae and intersecting *AB* at *D*. Deduct the absorbance corresponding to point *D* from that corresponding to point *C*. The value *C* - *D* is 0.20 to 0.96 and for Italian-type lemon oil it is not less than 0.45.

Figure 0620.-1. - Typical spectrum of lemon oil for the test for absorbance

#### Fatty oils and resinified essential oils (2.8.7)

It complies with the test for fatty oils and resinified essential oils.

#### Chromatographic profile

Gas chromatography (2.2.28): use the normalisation procedure.

**Test solution** The substance to be examined.

**Reference solution** Dissolve 20  $\mu$ L of  $\beta$ -pinene R, 10  $\mu$ L of sabinene R, 100  $\mu$ L of limonene R, 10  $\mu$ L of  $\gamma$ -terpinene R, 5  $\mu$ L of  $\beta$ -caryophyllene R, 20  $\mu$ L of citral R, 5  $\mu$ L of  $\alpha$ -terpineol R, 5  $\mu$ L of neryl acetate R and 5  $\mu$ L of geranyl acetate R in 1 mL of acetone R.

#### Column:

- material: fused silica,
- size:  $l = 30$  m (a film thickness of 1  $\mu$ m may be used) to 60 m (a film thickness of 0.2  $\mu$ m may be used),  
 $\varnothing = 0.25$ -0.53 mm,
- stationary phase: macrogol 20 000 R.

**Carrier gas** helium for chromatography R.

**Flow rate** 1.0 mL/min.

**Split ratio** 1:100.

## Temperature:

	Time (min)	Temperature (°C)
Column	0 - 6	45
	6 - 21	45 → 90
	21 - 39	90 → 180
	39 - 55	180
Injection port		220
Detector		220

**Detection** Flame ionisation.

**Injection** 0.5 µL of the reference solution and 0.2 µL of the test solution.

**Elution order** Order indicated in the composition of the reference solution. Record the retention times of these substances.

**System suitability** Reference solution:

- *resolution*: minimum 1.5 between the peaks due to β-pinene and sabinene and minimum 1.5 between the peaks due to geranial and geranyl acetate.

Using the retention times determined from the chromatogram obtained with the reference solution, locate the components of the reference solution in the chromatogram obtained with the test solution.

Determine the percentage content of these components.

The percentages are within the following ranges:

- β-pinene: 7.0 per cent to 17.0 per cent,
- sabinene: 1.0 per cent to 3.0 per cent,
- limonene: 56.0 per cent to 78.0 per cent,
- γ-terpinene: 6.0 per cent to 12.0 per cent,
- β-caryophyllene: maximum 0.5 per cent,
- neral: 0.3 per cent to 1.5 per cent,
- α-terpineol: maximum 0.6 per cent,
- neryl acetate: 0.2 per cent to 0.9 per cent,
- geranial: 0.5 per cent to 2.3 per cent,
- geranyl acetate: 0.1 per cent to 0.8 per cent.

**Residue on evaporation** (2.8.9)

1.8 per cent to 3.6 per cent after heating on the water-bath for 4 h.

**STORAGE**

At a temperature not exceeding 25 °C.

**LABELLING**

The label states, where applicable, that the contents are Italian-type lemon oil.

Ph Eur

**Terpeneless Lemon Oil****Preparations**

Lemon Spirit

Compound Orange Spirit

**DEFINITION**

Terpeneless Lemon Oil may be prepared by concentrating Lemon Oil under reduced pressure until most of the terpenes have been removed or by solvent partition. It contains not less than 40% w/w of aldehydes calculated as citral, C<sub>10</sub>H<sub>16</sub>O.

**CHARACTERISTICS**

A clear, colourless or pale yellow liquid, visibly free from water; odour and taste, those of lemon.

**TESTS****Optical rotation**

−5° to +2°, Appendix V F.

**Refractive index**

1.475 to 1.485, Appendix V E.

**Solubility in ethanol**

Soluble, at 20°, in 1 volume of ethanol (80%), Appendix X M.

**Weight per mL**

0.880 to 0.895 g, Appendix V G.

**ASSAY**

Carry out the method for *determination of aldehydes*, Appendix X K, using 1 g, omitting the toluene and using a volume, not less than 7 mL, of alcoholic hydroxylamine solution that exceeds by 1 to 2 mL the volume of 0.5M potassium hydroxide in ethanol (60%) VS required. Each mL of 0.5M potassium hydroxide in ethanol (60%) VS is equivalent to 76.73 mg of C<sub>10</sub>H<sub>16</sub>O.

**STORAGE**

Terpeneless Lemon Oil should be kept in a well-filled container and protected from light.

**Lemon Spirit****DEFINITION**

Terpeneless Lemon Oil	100 mL
Ethanol (96 per cent)	Sufficient to produce 1000 mL

The spirit complies with the requirements stated under *Spirits* and with the following requirements.

**Content of aldehydes**

3.45 to 4.60% w/v, calculated as citral, C<sub>10</sub>H<sub>16</sub>O.

**TESTS****Ethanol content**

84 to 88% v/v, Appendix VIII F.

**Weight per mL**

0.814 to 0.823 g, Appendix V G.

**ASSAY**

Carry out the method for the *determination of aldehydes*, Appendix X K, using 10 mL, omitting the toluene and using a volume, not less than 7 mL, of alcoholic hydroxylamine solution that exceeds by 1 to 2 mL the volume of 0.5M potassium hydroxide in ethanol (60%) VS required. Each mL of 0.5M potassium hydroxide in ethanol (60%) VS is equivalent to 76.73 mg of C<sub>10</sub>H<sub>16</sub>O.

**Lemon Syrup****DEFINITION**

Lemon Spirit	5 mL
Citric Acid Monohydrate	25 g
Invert Syrup	100 mL
Syrup	Sufficient to produce 1000 mL

**Extemporaneous preparation**

The following directions apply.

Dissolve the Citric Acid Monohydrate in some of the Syrup, add the Invert Syrup, the Lemon Spirit and sufficient Syrup to produce 1000 mL and mix.

**CHARACTERISTICS**

Lemon Syrup has a weight per mL of about 1.33 g.

The syrup complies with the requirements stated under Oral Liquids and with the following requirements.

Content of citric acid monohydrate,  $C_6H_8O_7 \cdot H_2O$  2.2 to 2.6% w/v.

**ASSAY**

Mix 8 g with 100 mL of water and titrate with 0.1M sodium hydroxide VS using phenolphthalein solution R1 as indicator. Each mL of 0.1M sodium hydroxide VS is equivalent to 7.005 mg of  $C_6H_8O_7 \cdot H_2O$ . Determine the weight per mL, Appendix V G, and calculate the content of  $C_6H_8O_7 \cdot H_2O$ , weight in volume.

**Lemon Verbena Leaf**

(Ph. Eur. monograph 1834)

Ph Eur

**DEFINITION**

Whole or fragmented, dried leaves of *Aloysia citrodora* Paláu (syn. *Aloysia triphylla* (L'Hér.) Kuntze; *Verbena triphylla* L'Hér.; *Lippia citrodora* Kunth).

**Content**

- **acteoside** ( $C_{29}H_{36}O_{15}$ ;  $M_r$  625): minimum 2.5 per cent, expressed as ferulic acid (dried drug);
- **essential oil**: minimum 3.0 mL/kg for the whole drug and minimum 2.0 mL/kg for the fragmented drug (dried drug).

**CHARACTERS**

After grinding, it has a characteristic odour reminiscent of lemon.

**IDENTIFICATION**

**A.** The leaves are simple with short petioles. They are narrow, lanceolate, and about 4 times longer than they are wide. The entire, slightly undulating margins are curled towards the upper surface. The upper surface is dark green and rough to the touch; the lower surface is paler green and shows a prominent midrib with secondary veins running to the margins.

**B.** Microscopic examination (2.8.23). The powder is light green. Examine under a microscope using chloral hydrate solution R. The powder shows the following diagnostic characters (Figure 1834.-1): fragments of the upper epidermis of the lamina (surface view [A, B, H]), composed of polygonal cells with numerous short, unicellular, thick-walled cystolithic trichomes, each arising from a rosette of cells at the base and containing calcium concretions [B], glandular trichomes with a unicellular stalk and a unicellular, globular head of variable size (surface view [Ha], transverse section [D, F]); these fragments are usually accompanied by palisade parenchyma [Aa, Hb]; fragments of the lower epidermis of the lamina (surface view [E]) covered by a striated cuticle and composed of cells more irregular and somewhat sinuous in outline, with abundant anomocytic stomata (2.8.3) [Ea] and numerous glandular trichomes in surface view [Eb] and/or their scars [Ec]; fragments of the lamina (transverse section [G]) with 2 layers of palisade parenchyma [Ga] and spongy parenchyma [Gb]; lignified tissue from the veins [C].

Figure 1834.-1. -- Illustration for identification test B of powdered herbal drug of lemon verbena leaf

**C.** Examine the chromatograms obtained in the test for *Verbena officinalis*.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution. Zones may be present in the chromatogram obtained with the test solution below the zone due to rutoside in the chromatogram obtained with the reference solution.

Top of the plate	
Arbutin: a blue or brown zone	An intense greyish-green zone
Rutoside: a dark brownish-yellow zone	A blue or violet zone
Reference solution	Test solution

**TESTS*****Verbena officinalis***

Thin-layer chromatography (2.2.27).

**Test solution** To 0.50 g of the powdered herbal drug (710) (2.9.12) add 5 mL of methanol R. Heat in a water-bath at 60 °C for 10 min. Cool and filter.

**Reference solution** Dissolve 10 mg of arbutin R and 10 mg of rutoside trihydrate R in methanol R and dilute to 10 mL with the same solvent.

**Plate** TLC silica gel plate R (5-40 µm) [or TLC silica gel plate R (2-10 µm)].

**Mobile phase** anhydrous formic acid R, glacial acetic acid R, water R, ethyl acetate R (11:11:27:100 V/V/V/V).

**Application** 20 µL [or 5 µL] as bands.

**Development** Over a path of about 12 cm [or 6 cm].

**Drying** In air.

**Detection** Spray with anisaldehyde solution R and dry at 100-105 °C for about 10 min; examine in daylight.

**Results** The chromatogram obtained with the test solution shows no brownish-grey zone at a position between that of arbutin and rutoside in the chromatogram obtained with the reference solution.

#### Loss on drying

(2.2.32) Maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (710) (2.9.12) by drying in an oven at 105 °C for 2 h.

#### Total ash (2.4.16)

Maximum 13.0 per cent.

#### Ash insoluble in hydrochloric acid (2.8.1)

Maximum 3.5 per cent.

### ASSAY

#### Acteoside

Liquid chromatography (2.2.29).

**Test solution** To 1.00 g of the powdered herbal drug (710) (2.9.12) add 50.0 mL of the reference solution and stir for 2 h with a magnetic stirrer. Centrifuge for 15 min and pass the supernatant through a membrane filter (nominal pore size 0.45 µm).

**Reference solution** Dissolve 10.0 mg of ferulic acid CRS in ethanol (60 per cent V/V) R and dilute to 100.0 mL with the same solvent.

#### Precolumn:

— size:  $l = 0.01$  m,  $\varnothing = 4.0$  mm;

— stationary phase: octadecylsilyl silica gel for chromatography R (5 µm).

#### Column:

— size:  $l = 0.25$  m,  $\varnothing = 4.0$  mm;

— stationary phase: octadecylsilyl silica gel for chromatography R (5 µm);

— temperature: 20 °C.

#### Mobile phase:

— mobile phase A: 0.3 per cent V/V solution of phosphoric acid R;

— mobile phase B: acetonitrile R;

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 20	93 → 83	7 → 17
20 - 30	83	17
30 - 35	83 → 75	17 → 25
35 - 40	75 → 20	25 → 80
40 - 45	20 → 93	80 → 7

**Flow rate** 1.0 mL/min.

**Detection** Spectrophotometer at 330 nm.

**Injection** 20 µL.

**System suitability** Test solution:

— resolution: minimum 3.5 between the peaks due to ferulic acid and acteoside.

Calculate the percentage content of acteoside, expressed as ferulic acid, using the following expression:

$$\frac{A_1 \times m_2 \times p \times 0.5 \times 3.1}{A_2 \times m_1}$$

- $A_1$  = area of the peak due to acteoside in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to ferulic acid in the chromatogram obtained with the reference solution;
- $m_1$  = mass of the herbal drug in the test solution, in grams;
- $m_2$  = mass of ferulic acid CRS in the reference solution, in grams;
- $p$  = percentage content of ferulic acid in ferulic acid CRS;
- 3.1 = correlation factor between acteoside and ferulic acid.

#### Essential oil (2.8.12)

Introduce 25.0 g of the freshly crushed herbal drug into a 1000 mL flask and add 500 mL of a 10 g/L solution of sodium chloride R as the distillation liquid. Use 0.50 mL of xylene R in the graduated tube. Distil at a rate of 3.0-3.5 mL/min for 3 h.

Ph Eur

## Ligusticum Root and Rhizome

(Ph. Eur. monograph 2431)

Ph Eur

### DEFINITION

Whole or fragmented, dried rhizome and root of *Ligusticum sinense* Oliv. or *Ligusticum jeholense* (Nakai & Kitag.) Nakai & Kitag.

### Content

Minimum 5.0 mL/kg of essential oil (dried drug).

### IDENTIFICATION

**A.** The rhizome is short, up to 3 cm in diameter, brown or yellowish-brown, simple or somewhat twisted. The roots are usually up to 1.5 mm thick, show no ramification, and are the same colour as the rhizome; the fracture is usually fibrous; the remaining stem bases are cylindrical, 5-6 mm thick and their longitudinal fracture shows a yellowish-white medulla. The fragmented rhizome occurs as more or less thick slices.

The rhizome of *Ligusticum sinense* shows an irregular brown or blackish-brown outer surface; the yellowish-white or pale yellowish-brown transverse section is fibrous, porous and cracked.

The rhizome of *Ligusticum jeholense* shows root scars and the spiny remains of roots on its outer surface; a transverse section shows radial striations and cracks in the xylem.

**B.** Microscopic examination (2.8.23). The powder is brownish-beige. Examine under a microscope using chloral hydrate solution R. The powder shows the following diagnostic characters (Figure 2431.-1): cork fragments made up of cells with brown contents which are polygonal in surface view [C]; numerous fragments of parenchyma consisting of rounded or ovoid cells, with thin or slightly thickened walls [H]; fragments of brownish-yellow secretory canals up to 170 µm wide (transverse section [A], longitudinal section [E]); fragments of reticulate vessels about 80 µm in diameter, isolated or in groups of 2 or 3 [B]; groups of smaller reticulate vessels surrounded by either xylem parenchyma [G] or by lignified fibres with thick, moderately pitted walls [J]; fibres are isolated [L] or in groups of 2 or 3, colourless, often whole with pitted walls, sometimes reaching 700 µm in length and about 20 µm wide; round or rectangular sclereids, isolated [F] or grouped in clusters [D], with thickened and channelled walls (some of the larger sclereids may be up to

100 µm long). Examine under a microscope using a 50 per cent V/V solution of glycerol R. The powder shows many isolated, small (5-10 µm), round or ovoid starch granules [K].

Figure 2431.-1. – Illustration for identification test B of powdered herbal drug of ligusticum root and rhizome

C. Thin-layer chromatography (2.2.27).

Examine the chromatograms obtained in the test for official species of *Angelica* and *Levisticum*.

**Results A** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint fluorescent zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
(Z)-Ligustilide: a bluish-white fluorescent zone	A bluish-white fluorescent zone ((Z)-ligustilide) A faint bluish-white fluorescent zone
Osthole: a blue fluorescent zone	
Imperatorin: a whitish fluorescent zone	A faint blue fluorescent zone
	A faint bluish-white fluorescent zone
Reference solution	Test solution

**Results B** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint quenching zones may

be present in the chromatogram obtained with the test solution.

Top of the plate

Imperatorin: a reddish-grey zone	A broad reddish zone A violet zone
	Several faint violet zones
Reference solution	Test solution

TESTS

Official species of *Angelica* and *Levisticum*

Thin-layer chromatography (2.2.27).

**Test solution** To 1 g of the freshly powdered herbal drug (355) (2.9.12) add 4 mL of methanol R and sonicate for 5 min. Centrifuge and use the supernatant.

**Reference solution** Dissolve 1 mg of imperatorin R, 1 mg of (Z)-ligustilide R and 1 mg of osthole R in 1 mL of methanol R.

**Plate** TLC silica gel F<sub>254</sub> plate R (2-10 µm).

**Mobile phase** glacial acetic acid R, ethyl acetate R, toluene R (1:10:90 V/V/V).

**Application** 4 µL as bands of 8 mm.

**Development** Over a path of 6 cm.

**Drying** In air.

**Detection A** Examine in ultraviolet light at 365 nm.

**Results A** The chromatogram obtained with the test solution shows no prominent blue fluorescent zone directly below or above the zone due to imperatorin in the chromatogram obtained with the reference solution.

**Detection B** Examine in ultraviolet light at 254 nm.

**Results B** The chromatogram obtained with the test solution shows no zone corresponding in position to, or directly below, the zone due to imperatorin in the chromatogram obtained with the reference solution.

**Detection C** Treat with a 10 per cent *V/V* solution of sulfuric acid *R* in methanol *R*; heat at 100 °C for 5 min and examine in daylight.

**Results C** The chromatogram obtained with the test solution shows no distinct greenish zone below the zone due to imperatorin in the chromatogram obtained with the reference solution.

#### Foreign matter (2.8.2)

Maximum 3 per cent, determined on 50 g.

#### Loss on drying (2.2.32)

Maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C.

#### Total ash (2.4.16)

Maximum 6.0 per cent.

#### Ash insoluble in hydrochloric acid (2.8.1)

Maximum 2.0 per cent.

#### ASSAY

##### Essential oil (2.8.12)

Use 25.0 g of the powdered herbal drug (500) (2.9.12) immediately before the assay using a blade grinder refrigerated at 5 °C, a 1000 mL round-bottomed flask, 500 mL of water *R* as the distillation liquid, 10 drops of liquid paraffin *R*, a few grains of pumice and 0.50 mL of *o*-xylene *R* in the graduated tube. Distil at a rate of 2-3 mL/min for 3 h.

Ph Eur

## Lime Flower

(Ph. Eur. monograph 0957)

Ph Eur

#### DEFINITION

Whole, dried inflorescence of *Tilia cordata* Mill., of *Tilia platyphyllos* Scop., of *Tilia × europaea* L. or a mixture of these.

#### IDENTIFICATION

**A.** The inflorescence is yellowish-green. The main axis of the inflorescence bears a linguiform bract, membranous, yellowish-green, practically glabrous, the central vein of which is joined for up to about half of its length with the peduncle. The inflorescence usually consists of 2-7 flowers, occasionally up to 16. The sepals are detached easily from the perianth; they are up to 6 mm long, their abaxial surface is usually glabrous, their adaxial surface and their borders are strongly pubescent. The 5 spatulate, thin petals are yellowish-white, up to 8 mm long. They show fine venation and their borders only are sometimes covered with isolated trichomes. The numerous stamens are free and usually constitute 5 groups. The superior ovary has a pistil with a somewhat 5-lobate stigma.

**B.** Microscopic examination (2.8.23). The powder is yellowish-green. Examine under a microscope using chloral hydrate solution *R*. The powder shows the following diagnostic characters (Figure 0957.-1): fragments of the bract showing an adaxial epidermis with cells with straight or slightly

sinuous anticlinal walls [H] and an abaxial epidermis [C] with cells with wavy-sinuous walls [Ca] and anomocytic stomata (2.8.3) [Cb], covered by a finely striated cuticle; fragments of the sepals [A] with epidermal cells with rigid anticlinal walls [Aa] with rounded to oval covering trichome scars with thick, channelled and coarsely pitted walls [Ac], thick-walled covering trichomes, unicellular, isolated [Ab] or stellate with up to 5 cells and measuring up to 350 µm [K]; fragments of the mesophyll of the sepals or of the lamina of the petals (transverse section [J]), composed of parenchymatous cells containing cluster crystals of calcium oxalate [Ja] and large mucilaginous cells [Jb]; fragments of the adaxial epidermis of the petals [B] consisting of straight-walled cells [Ba] and elongated multicellular glandular trichomes [Bb]; pollen grains with 3 germinal pores and a finely granulated exine, about 30-40 µm in diameter [G]; twisted, unicellular trichomes from the ovary may be present, isolated [D, E, F] or stellate with 2-4 branches.

Figure 0957.-1. – Illustration for identification test B of powdered herbal drug of lime flower

#### C. High-performance thin-layer chromatography (2.8.25).

**Test solution** To 0.5 g of the powdered herbal drug (355) (2.9.12) add 5.0 mL of methanol *R*. Sonicate for 15 min, filter or centrifuge and use the filtrate or supernatant.

**Reference solution (a)** Dissolve 5.0 mg of hyperoside *R* and 5.0 mg of rutoside trihydrate *R* in methanol *R* and dilute to 10.0 mL with the same solvent.

**Reference solution (b)** Dilute 2.5 mL of reference solution (a) to 10.0 mL with methanol *R*.

**Reference solution (c)** Dissolve 5 mg of hyperoside *R* and 2 mg of chlorogenic acid *R* in methanol *R* and dilute to 10 mL with the same solvent.

**Intensity markers** Hyperoside for the yellow or orange zones in the middle third of the chromatogram and rutoside for the

yellow or orange zones at the top of the lower third of the chromatogram.

**Plate** TLC silica gel F<sub>254</sub> plate R (2-10 µm).

**Mobile phase** anhydrous formic acid R, water R, methyl ethyl ketone R, ethyl acetate R (10:10:30:50 V/V/V/V).

**Application** 4 µL as bands of 8 mm.

**Development** 70 mm from the lower edge of the plate.

**Drying** In a current of air at room temperature for 5 min.

**Detection** Heat at 100-105 °C for 5 min; spray the warm plate with a 10 g/L solution of diphenylboric acid aminoethyl ester R in methanol R, then with a 50 g/L solution of macrogol 400 R in methanol R or, alternatively, dip the warm plate in a 5 g/L solution of diphenylboric acid aminoethyl ester R in ethyl acetate R, then in a 50 g/L solution of macrogol 400 R in methylene chloride R; allow to dry in air for about 1 min and examine in ultraviolet light at 366 nm.

**System suitability** Reference solution (c):

- the chromatogram shows in the middle third 2 distinct zones, which may be touching; the lower zone (chlorogenic acid) shows a light blue fluorescence and the upper zone (hyperoside) shows a yellow or orange fluorescence.

**Results** See below the sequence of fluorescent zones present in the chromatograms obtained with reference solution (a) and the test solution. Furthermore, other faint blue, yellow or orange, brownish and greenish fluorescent zones may be present in the chromatogram obtained with the test solution, especially in the upper and lower thirds. The zones below hyperoside show a relatively high variation in intensity and colour.

Top of the plate	
	A blue zone, faint to equivalent
	2 yellow or orange zones, faint to equivalent
	A yellow or orange zone, equivalent
Hyperoside: a yellow or orange zone	A brownish zone, very faint to faint
	A yellow, orange or greenish zone, faint
Rutoside: a yellow or orange zone	A yellow, orange or bluish zone, faint to equivalent
Reference solution (a)	Test solution

## TESTS

### Foreign matter (2.8.2)

Maximum 2 per cent, determined on 30 g.

### *Tilia americana* L. or *Tilia tomentosa* Moench

There are no inflorescences with a bract bearing on the abaxial surface, stellate, 5- to 8-rayed covering trichomes and flowers having an apparent double corolla by transformation of 5 stamens into petal-like staminoids, the pistil is neither lobular nor indented.

### Loss on drying (2.2.32)

Maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

### Total ash (2.4.16)

Maximum 8.0 per cent.

Ph Eur

## Linseed

(Ph. Eur. monograph 0095)

When Powdered Linseed is prescribed or demanded, material complying with the appropriate requirements below shall be dispensed or supplied.

Ph Eur

### DEFINITION

Dried, ripe seeds of *Linum usitatissimum* L.

### IDENTIFICATION

- A. The seed has a flattened, elongated ovoid shape. The testa is dark reddish-brown or yellow, smooth and shiny. The seeds are 4-6 mm long, 2-3 mm wide and 1.5-2 mm thick; one end is rounded and the other end forms an oblique point near which the hilum appears as a slight depression. When viewed with a lens, the surface of the seed-coat is seen to be minutely pitted. Inside the testa a narrow, whitish endosperm and an embryo composed of 2 large, flattened, yellowish and oily cotyledons are present; the radicle points towards the hilum.
- B. Microscopic examination (2.8.23). The powder is greasy to the touch. Examine under a microscope using chloral hydrate solution R. The powder shows the following diagnostic characters (Figure 0095.-1): fragments of the outer testa [A, B] with cells that are polygonal (surface view [Aa]) or narrow (transverse section [Ba]) and filled with mucilage [Bb]; fragments of the collenchymatously thickened sub-epidermal layer (transverse section [Bc], surface view [Ab]) with rounded cells with triangular intercellular spaces often attached to the sclerenchymatous layer composed of elongated cells, with thickened and pitted walls [Ca], some with strongly thickened and pitted walls [G]; fragments (surface view [C]) consisting of the hyaline layer with thin-walled cells [Cb] often remaining attached to the layer of elongated sclereids and crossing them at approximately right angles [Ca]; fragments of the inner testa (surface view [D]), composed of moderately thickened polygonal cells filled with brown-orange pigment; small polyhedral masses of pigment [H]; numerous fragments of parenchyma from the testae, with large, slightly and regularly thickened cells (surface view [J, L]); parenchyma of the endosperm [K] and cotyledons [E] containing aleurone grains and oil droplets; very numerous isolated oil droplets [F].

Figure 0095.-1. - Illustration for identification test B of powdered herbal drug of linseed

**TESTS**

**Foreign matter (2.8.2)**

Maximum 10 per cent of seeds with a dull coat and maximum 1.5 per cent of other foreign matter.

**Swelling index (2.8.4)**

Minimum 4.

**Cadmium (2.4.27)**

Maximum 0.5 ppm.

**Loss on drying (2.2.32)**

Maximum 8.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

**Total ash (2.4.16)**

Maximum 5.0 per cent.

Ph Eur

**Liquorice**

(Liquorice Root, Ph. Eur. monograph 0277)

**Preparations**

Liquorice Dry Extract for Flavouring Purposes

Liquorice Liquid Extract

When Powdered Liquorice is prescribed or demanded, material complying with the appropriate requirements below shall be dispensed or supplied.

Ph Eur

**DEFINITION**

Dried, unpeeled or peeled, whole or cut root and stolons of *Glycyrrhiza glabra* L. and/or of *Glycyrrhiza inflata* Bat. and/or *Glycyrrhiza uralensis* Fisch.

**Content**

Minimum 4.0 per cent of 18β-glycyrrhizic acid (C<sub>42</sub>H<sub>62</sub>O<sub>16</sub>; M<sub>r</sub> 823) (dried drug).

**IDENTIFICATION**

**A.** The root has few branches. Its bark is brown or brownish-grey with longitudinal striations and bears traces of lateral roots. The cylindrical stolons are 1-2 cm in diameter; their external appearance is similar to that of the root but there are occasional small buds. The fracture of the root and the stolon is granular and fibrous. The cork layer is thin; the secondary phloem region is thick and light yellow with radial striations. The yellow xylem cylinder is compact, with a radiate structure. The stolon has a central pith, which is absent from the root. The external part of the bark is absent from the peeled root.

**B.** Microscopic examination (2.8.23). The powder is light yellow or faintly greyish. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of yellow thick-walled fibres, 700-1200 µm long and 10-20 µm wide with a punctiform lumen, often accompanied by crystal sheaths containing prisms of calcium oxalate 10-35 µm long and 2-5 µm wide. The walls of the vessels are yellow, 5-10 µm thick, lignified and have numerous bordered pits with a slit-shaped aperture; fragments of cork consisting of thin-walled cells and isolated prisms of calcium oxalate occur as well as fragments of parenchymatous tissue. Fragments of cork are absent from the peeled root. Examine under a microscope using a mixture of equal volumes of *glycerol R* and *water R*. The powder shows the following diagnostic characters: simple, round or oval starch granules, 2-20 µm in diameter.

**C.** Thin-layer chromatography (2.2.27).

**Test solution** To 0.50 g of the powdered herbal drug (180) (2.9.12) in a 50 mL round-bottomed flask add 16.0 mL of *water R* and 4.0 mL of *hydrochloric acid R1* and heat on a water-bath under a reflux condenser for 30 min. Cool and filter. Dry the filter and the round-bottomed flask at 105 °C for 60 min. Place the filter in the round-bottomed flask, add 20.0 mL of *ether R* and heat in a water-bath at 40 °C under a reflux condenser for 5 min. Cool and filter. Evaporate the filtrate to dryness. Dissolve the residue in 5.0 mL of *ether R*.

**Reference solution** Dissolve 5.0 mg of *glycyrrhetic acid R* and 5.0 mg of *thymol R* in 5.0 mL of *ether R*.

**Plate** TLC silica gel F<sub>254</sub> plate R.

**Mobile phase** concentrated ammonia R, water R, ethanol (96 per cent) R, ethyl acetate R (1:9:25:65 V/V/V/V).

**Application** 10 µL.

**Development** Over a path of 15 cm.

**Drying** In air for 5 min.

**Detection A** Examine in ultraviolet light at 254 nm.

**Results A** The chromatograms obtained with the test solution and the reference solution show in the lower half a quenching zone due to glycyrrhetic acid.

**Detection B** Treat with *anisaldehyde solution R*, and heat at 100-105 °C for 5-10 min; examine in daylight.

**Results B** The chromatogram obtained with the reference solution shows in the lower half a violet zone due to glycyrrhetic acid and in the upper third a red zone due to thymol. The chromatogram obtained with the test solution shows in the lower half a violet zone corresponding to the zone of glycyrrhetic acid in the chromatogram obtained with the reference solution and a yellow zone (isoliquiridigenine) in the upper third under the zone of thymol in the

chromatogram obtained with the reference solution. Further zones may be present.

#### TESTS

##### Loss on drying (2.2.32)

Maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

##### Total ash (2.4.16)

Maximum 10.0 per cent for the unpeeled drug and maximum 6.0 per cent for the peeled drug.

##### Ash insoluble in hydrochloric acid (2.8.1)

Maximum 2.0 per cent for the unpeeled drug and maximum 0.5 per cent for the peeled drug.

##### Ochratoxin A (2.8.22)

Maximum 20 µg per kilogram of herbal drug.

#### ASSAY

Liquid chromatography (2.2.29).

**Test solution** Place 1.000 g of the powdered herbal drug (180) (2.9.12) in a 150 mL ground-glass conical flask. Add 100.0 mL of an 8 g/L solution of *ammonia R* and treat in an ultrasonic bath for 30 min. Centrifuge a part of the solution and dilute 1.0 mL of the supernatant layer to 5.0 mL with an 8 g/L solution of *ammonia R*. Filter through a membrane filter (nominal pore size 0.45 µm); use the filtrate as the test solution.

**Solution A** Dissolve 0.130 g of *monoammonium glycyrrhizate CRS* in an 8 g/L solution of *ammonia R* and dilute to 100.0 mL with the same solvent.

**Reference solution (a)** Dilute 5.0 mL of solution A to 100.0 mL with an 8 g/L solution of *ammonia R*.

**Reference solution (b)** Dilute 10.0 mL of solution A to 100.0 mL with an 8 g/L solution of *ammonia R*.

**Reference solution (c)** Dilute 15.0 mL of solution A to 100.0 mL with an 8 g/L solution of *ammonia R*.

##### Column:

— size:  $l = 0.10$  m,  $\varnothing = 4$  mm;

— stationary phase: octadecylsilyl silica gel for chromatography *R* (5 µm).

**Mobile phase** glacial acetic acid *R*, acetonitrile *R*, water *R* (6:30:64 V/V/V).

**Flow rate** 1.5 mL/min.

**Detection** Spectrophotometer at 254 nm.

**Injection** 10 µL.

Establish a calibration curve with the mass of monoammonium glycyrrhizate in the reference solutions, in grams, as the abscissa and the corresponding peak areas as the ordinate.

Using the retention times and the peak areas determined from the chromatograms obtained with the reference solutions, locate and integrate the peak due to 18β-glycyrrhizic acid in the chromatogram obtained with the test solution.

Calculate the percentage content of 18β-glycyrrhizic acid using the following expression:

$$A \times \frac{5}{m} \times B \times \frac{823}{840}$$

*A* = mass equivalent of monoammonium glycyrrhizate in the test solution, determined from the calibration curve, in grams;

*B* = declared percentage content of *monoammonium glycyrrhizate CRS*;

*m* = mass of the herbal drug to be examined used to prepare the test solution, in grams;

823 = molecular mass of 18β-glycyrrhizic acid;  
840 = molecular mass of monoammonium glycyrrhizate (without any water of crystallisation).

#### LABELLING

The label states whether the drug is peeled or unpeeled.

Ph Eur

## Liquorice Dry Extract for Flavouring Purposes

(Ph. Eur. monograph 2378)

Ph Eur

#### DEFINITION

Dry extract produced from *Liquorice root* (0277).

#### Content

5.0 per cent to 7.0 per cent of 18β-glycyrrhizic acid (C<sub>42</sub>H<sub>62</sub>O<sub>16</sub>; *M<sub>r</sub>* 823) (dried extract).

#### PRODUCTION

The extract is produced from the cut herbal drug by a suitable procedure using water.

#### CHARACTERS

##### Appearance

Yellowish-brown or brown powder.

Very sweet taste.

#### IDENTIFICATION

Thin-layer chromatography (2.2.27).

**Solvent mixture** ethyl acetate *R*, methanol *R* (50:50 V/V).

**Test solution** To 0.30 g of the extract to be examined add 30 mL of hydrochloric acid *R1* and boil on a water-bath under a reflux condenser for 60 min. After cooling, extract the mixture with 2 quantities, each of 20 mL, of ethyl acetate *R*. Combine the organic layers and filter through a filter covered with anhydrous sodium sulfate *R*. Evaporate the filtrate to dryness *in vacuo* and dissolve the residue in 2.0 mL of the solvent mixture.

**Reference solution** Dissolve 5.0 mg of glycyrrhetic acid *R* and 5.0 mg of thymol *R* in 5.0 mL of the solvent mixture.

**Plate** TLC silica gel *F<sub>254</sub>* plate *R* (5–40 µm) [or TLC silica gel *F<sub>254</sub>* plate *R* (2–10 µm)].

**Mobile phase** concentrated ammonia *R*, water *R*, ethanol (96 per cent) *R*, ethyl acetate *R* (1:9:25:65 V/V/V/V).

**Application** 20 µL [or 10 µL] as bands.

**Development** Over a path of 15 cm [or 7 cm].

**Drying** In air for 5 min.

**Detection** Spray with anisaldehyde solution *R* and heat at 100–105 °C for 5–10 min; examine in daylight.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Thymol: a red zone	A yellow zone
Glycyrrhetic acid: a violet zone	A violet zone (glycyrrhetic acid)
Reference solution	Test solution

$A_1$	=	area of the peak due to 18 $\beta$ -glycyrrhizic acid in the chromatogram obtained with the test solution;
$A_2$	=	area of the peak due to 18 $\beta$ -glycyrrhizic acid in the chromatogram obtained with the reference solution;
$m_1$	=	mass of the extract to be examined used to prepare the test solution, in grams;
$m_2$	=	mass of monoammonium glycyrrhizate CRS used to prepare the reference solution, in grams;
$p$	=	percentage content of 18 $\beta$ -glycyrrhizic acid in monoammonium glycyrrhizate CRS;
0.979	=	peak correlation factor between 18 $\beta$ -glycyrrhizic acid and monoammonium glycyrrhizate.

Ph Eur

**TESTS****Loss on drying (2.8.17)**

Maximum 7.0 per cent.

**Ochratoxin A (2.8.22)**Maximum 80  $\mu$ g per kilogram of extract.

The maximum content applies to the pure undiluted extract. Where excipients are added to reduce the strength of the extract, the maximum content should be reduced proportionally.

**ASSAY**

Liquid chromatography (2.2.29).

**Solvent mixture** water R, methanol R (20:80 V/V).

**Test solution** Place 0.200 g of the extract to be examined in a 150 mL ground-glass conical flask. Add 100.0 mL of the solvent mixture and sonicate for 2 min. Filter through a membrane filter (nominal pore size 0.45  $\mu$ m).

**Reference solution** Dissolve 50.0 mg of monoammonium glycyrrhizate CRS in the solvent mixture and dilute to 50.0 mL with the solvent mixture. Dilute 1.0 mL of this solution to 10.0 mL with the solvent mixture.

**Column:**— size:  $l = 0.10$  m,  $\varnothing = 4.0$  mm;— stationary phase: octadecylsilyl silica gel for chromatography R (5  $\mu$ m).

**Mobile phase** glacial acetic acid R, acetonitrile R, water R (6:30:64 V/V/V).

**Flow rate** 1.5 mL/min.**Detection** Spectrophotometer at 254 nm.**Injection** 10  $\mu$ L.**Run time** 3 times the retention time of 18 $\beta$ -glycyrrhizic acid.**Retention time** 18 $\beta$ -glycyrrhizic acid = about 9 min.

**Identification of peaks** Use the chromatogram supplied with monoammonium glycyrrhizate CRS and the chromatogram obtained with the reference solution to identify the peaks due to 18 $\beta$ -glycyrrhizic acid and 18 $\alpha$ -glycyrrhizic acid.

**System suitability** Reference solution:

- the chromatogram obtained with the reference solution is similar to the chromatogram supplied with monoammonium glycyrrhizate CRS;
- resolution: minimum 2.0 between the peaks due to 18 $\beta$ -glycyrrhizic acid and 18 $\alpha$ -glycyrrhizic acid.

Calculate the percentage content of 18 $\beta$ -glycyrrhizic acid, using the following expression:

$$\frac{A_1 \times m_2 \times p \times 0.979}{A_2 \times m_1 \times 5}$$

**Liquorice Liquid Extract****DEFINITION**

Liquorice Liquid Extract is produced from Liquorice. It contains not less than 1.4% w/v of 18 $\beta$ -glycyrrhizic acid,  $C_{42}H_{62}O_{16}$ .

**CHARACTERISTICS**

A dark brown, clear liquid containing no more than a trace of deposit.

**PRODUCTION**

The liquid extract is produced from Liquorice by extraction with water, precipitation of unwanted constituents, followed by concentration of the extraction liquors and the addition of sufficient ethanol (96%) and water to produce the required volume. The liquid extract must stand for a minimum of 4 to 8 weeks prior to decantation of the clear supernatant liquid. The extract complies with the requirements stated under Extracts and with the following requirements.

**IDENTIFICATION**

Carry out the method for high performance thin-layer chromatography, Appendix XI W, using the following solutions.

- (1) Dilute 1 volume of the preparation being examined to 10 volumes with ethanol (70%).
- (2) 0.05% w/v of hyperoside and 0.05% w/v of rutin in methanol.
- (3) Dilute 1 volume of solution (2) to 4 volumes of methanol.
- (4) 0.05% w/v of hyperoside and 0.05% w/v of chlorogenic acid in methanol.
- (5) 1.4% w/v of 18 $\beta$ -glycyrrhizic acid in methanol.

**CHROMATOGRAPHIC CONDITIONS**

- (a) Use as the coating silica gel F<sub>254</sub> (Merck silica gel 60 F<sub>254</sub> plates are suitable).
- (b) Use the mobile phase as described below.
- (c) Apply 2  $\mu$ L of each solution as 8 mm bands.
- (d) Develop the plate to 7 cm.
- (e) Remove the plate and allow to dry in air.
- (f) Dip the plate in methanolic sulfuric acid (10%), heat at 100° for 10 minutes and examine under white light.

**MOBILE PHASE**

1 volume of glacial acetic acid, 1 volume of anhydrous formic acid, 2 volumes of water and 15 volumes of ethyl acetate.

**SYSTEM SUITABILITY**

The test is not valid unless the chromatogram obtained with solution (4) shows two clearly separated bands.

## CONFIRMATION

When examined in daylight, the chromatogram obtained with solution (1) shows a yellow band at the top of the plate. There is a faint yellow band above a faint to equivalent yellow band in the middle third of the plate. There are two yellow bands above the brown band corresponding to 18 $\beta$ -glycyrrhizic acid and a broad brown band in the bottom third of the plate. Other faint bands may be present.

Top of the plate			
A yellow band			
A faint yellow band A faint to equivalent yellow band	A yellow band (hyperoside)	A yellow band (hyperoside) A pink band (chlorogenic acid)	
A yellow band A yellow band A brown band (glycyrrhizic acid) A broad brown band	A yellow band (Rutin)		A brown band (glycyrrhizic acid)
Solution (1)	Solution (2) and (3)	Solution (4)	Solution (5)

## TESTS

## Ethanol

16 to 20 % v/v, Appendix VIII F, Method III.

## Methanol

Not more than 0.05% v/v, Appendix VIII G, Method B.

## Ochratoxin A

Not more than 20 ppb, Appendix XI S2.

## ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using an aqueous solvent mixture containing 8 g/L solution of *ammonia*.

- (1) Dilute 2 mL of the preparation being examined to 100 mL and centrifuge. Dilute 10 mL of the supernatant liquid to 25 mL.
- (2) 0.0065% w/v of *monoammonium glycyrrhizate EPCRS*.
- (3) 0.013% w/v of *monoammonium glycyrrhizate EPCRS*.
- (4) 0.020% w/v of *monoammonium glycyrrhizate EPCRS*.

## CHROMATOGRAPHIC CONDITIONS

- (a) Use a stainless steel column (10 cm  $\times$  4 mm) packed with *octadecylsilyl silica gel for chromatography* (5  $\mu$ m) (Hypersil BDS C18 is suitable).
- (b) Use isocratic elution and the mobile phase described below.
- (c) Use a flow rate of 1.5 mL per minute.
- (d) Use a detection wavelength of 254 nm.
- (e) Inject 10  $\mu$ L of each solution.

## MOBILE PHASE

6 volumes of *glacial acetic acid*, 30 volumes of *acetonitrile* and 64 volumes of *water*.

## DETERMINATION OF CONTENT

Establish a calibration curve with the content of *monoammonium glycyrrhizate* in solutions (2) to (4), in % w/v, as the abscissa and the corresponding peak areas as the ordinate.

Using the retention times and the peak areas determined from the chromatograms obtained with the solutions (2) to (4), locate and integrate the peak due to 18 $\beta$ -glycyrrhizic acid in the chromatogram obtained with solution (1).

Calculate the percentage content of 18 $\beta$ -glycyrrhizic acid using the following expression:

$$\frac{A \times 1.25 \times P \times 823}{840}$$

Where:

- A = Percentage equivalent of *monoammonium glycyrrhizate* in solution (1) determined from the calibration curve in % w/v;  
 P = declared percentage content of *monoammonium glycyrrhizate EPCRS*;  
 823 = molecular weight of 18 $\beta$ -glycyrrhizic acid;  
 840 = molecular weight of *monoammonium glycyrrhizate* (without any water of crystallisation).

## Liquorice Root for use in TCM

## DEFINITION

Liquorice Root for use in TCM is the dried unpeeled root and rhizome of *Glycyrrhiza uralensis* Fisch., and/or *Glycyrrhiza inflata* Bat. and/or *Glycyrrhiza glabra* L.

It is collected in spring and autumn, separated from the rootlets and dried in the sun.

It contains not less than 2.0% of glycyrrhizic acid (C<sub>42</sub>H<sub>62</sub>O<sub>16</sub>), calculated with reference to the dried material.

## IDENTIFICATION

A. The root has few branches. Its bark is brownish-grey or brown with longitudinal striations and bears traces of lateral roots. The cylindrical stolons are 1-2 cm in diameter; their external appearance is similar to that of the root but there are occasional small buds. The fracture of the root and the stolon is granular and fibrous. The cork layer is thin; the secondary phloem region is thick and light yellow with radial striations. The yellow xylem cylinder is compact, with a radiate structure. The stolon has a central pith, which is absent from the root.

B. Reduce to a powder. The powder is yellowish-brown. Examine under a microscope using *chloral hydrate solution*. The powder shows abundant fibres occurring in groups, each group surrounded by a calcium oxalate prism crystal sheath, the individual fibres with very thick, partially lignified walls and few small pits; lignified bordered-pitted vessels, singly or in small groups and sometimes accompanied by lignified parenchymatous cells with moderately thickened and pitted walls, some of the individual vessels are very large, with pit apertures much elongated and the borders difficult to discern; prism crystals of calcium oxalate up to about 35  $\mu$ m long occur scattered and in parenchymatous tissue; fragments of cork composed of thin-walled, slightly lignified polygonal cells. Examine under a microscope using 50% w/w glycerol in water. The powder shows abundant starch granules, mostly simple, spherical to ovoid, 3  $\mu$ m to 20  $\mu$ m in diameter.

C. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

- (1) Add 16 mL of *water* and 4 mL of *hydrochloric acid R1* to 0.5 g of the powdered drug, heat on a water-bath under reflux for 30 minutes, cool and filter. Dry the filter paper and residue in a flask at 105° for 60 minutes, add 20 mL of *ether*, heat on a water-bath at 40°C under reflux for 5 minutes, cool and filter. Evaporate the filtrate to dryness and dissolve the residue in 5 mL of *ether*.
- (2) 0.1% w/v each of *glycyrrhetic acid* and *thymol* in *ether*.

## CHROMATOGRAPHIC CONDITIONS

- Use as the coating substance *silica gel F<sub>254</sub>* (Merck 10 × 20 cm plates are suitable).
- Use the mobile phase as described below.
- Apply 10 µL of each solution as a band.
- Develop the plate to 15 cm.
- Remove the plate and allow it to dry in air for 5 minutes. Examine under *ultraviolet light (254 nm)*. Spray the plate with *anisaldehyde solution* and heat at 100° to 105° for 10 minutes and examine in daylight.

## MOBILE PHASE

1 volume of *concentrated ammonia*, 9 volumes of *water*, 25 volumes of *ethanol (96%)* and 65 volumes of *ethyl acetate*.

## SYSTEM SUITABILITY

Under ultra-violet light, the chromatogram obtained with solution (2) shows in the lower half a quenching zone due to *glycyrrhetic acid*. When sprayed, the chromatogram obtained with solution (2) shows in the lower half the violet zone of *glycyrrhetic acid* and in the upper third the red zone of *thymol*.

## CONFIRMATION

The chromatogram obtained with solution (1) shows in the lower half a violet zone corresponding to the zone of *glycyrrhetic acid* in the chromatogram obtained with solution (2) and a yellow zone (*isoliquiridigenine*) in the upper third under the zone of *thymol* in the chromatogram obtained with solution (2). Further zones may be present.

## TESTS

## Total Ash

Not more than 7.0%, Appendix XI J, Method II.

## Acid-insoluble ash

Not more than 2.0%, Appendix XI K, Method II.

## Loss on drying

When dried for 2 hours at 100° to 105°, loses not more than 12.0%. Use 1 g.

## Ochratoxin A

Not more than 20 ppb, Appendix XI S2.

## ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

- Mix 1 g of the powdered drug with 100 mL of 0.8% w/v of *ammonia*, place in an ultrasonic bath for 30 minutes, centrifuge, dilute 1 mL of supernatant solution to 5 mL with 0.8% w/v of *ammonia* and filter through a 0.45-µm filter.
- 0.0065% w/v of *monoammonium glycyrrhizate EPCRS* in 0.8% w/v of *ammonia*.
- 0.013% w/v of *monoammonium glycyrrhizate EPCRS* in 0.8% w/v of *ammonia*.
- 0.0195% w/v of *monoammonium glycyrrhizate EPCRS* in 0.8% w/v of *ammonia*.

## CHROMATOGRAPHIC CONDITIONS

- Use a stainless steel column (12.5 cm × 4 mm) packed with *octadecylsilyl silica gel for chromatography (5 µm)* (Hypersil ODS SS is suitable).
- Use isocratic elution and the mobile phase described below.
- Use a flow rate of 1.5 mL per minute.
- Use ambient column temperature.
- Use a detection wavelength of 254 nm.
- Inject 10 µL of each solution.

## MOBILE PHASE

6 volumes of *glacial acetic acid*, 30 volumes of *acetonitrile* and 64 volumes of *water*.

## SYSTEM SUITABILITY

The assay is not valid unless (a) the *column efficiency*, determined on the peak due to *glycyrrhizic acid* in the chromatogram obtained with solution (2), is at least 30,000 theoretical plates per metre and (b) the *symmetry factor* of the peak is not more than 1.3.

## DETERMINATION OF CONTENT

Inject solution (4). Adjust the sensitivity of the system so that the height of the peaks is at least 50% of the full scale of the recorder. Inject solutions (2), (3) and (4) and determine the peak areas. Prepare a calibration curve with the concentration of the solutions (g per 100 mL) as the abscissa and the corresponding areas as the ordinate. Inject solution (1). Using the retention time and the peak area from the chromatograms obtained with solutions (2), (3) and (4), locate and integrate the peak due to *glycyrrhizic acid* in the chromatogram obtained with solution (1).

Calculate the percentage content of *glycyrrhizic acid* from the following expression:

$$A \times \frac{5}{m} \times B \times \frac{822}{840}$$

- A* = concentration of *monoammonium glycyrrhizate* in solution (1) determined from the calibration curve, in g per 100 mL,  
*B* = declared percentage content of *monoammonium glycyrrhizate EPCRS*,  
*m* = weight of the substance being examined in grams,  
 822 = molecular weight of *glycyrrhizic acid*,  
 840 = molecular weight of *monoammonium glycyrrhizate* (without any water of crystallisation).

## STORAGE

Liquorice Root for use in TCM should be protected from moisture.

## Processed Liquorice Root for use in TCM

## DEFINITION

Processed Liquorice Root for use in TCM is the processed Liquorice Root for use in TCM.

It contains not less than 2.0% of *glycyrrhizic acid* (C<sub>42</sub>H<sub>62</sub>O<sub>16</sub>) calculated with reference to the dried material.

## PRODUCTION

Processed Liquorice Root for use in TCM is cleaned, softened thoroughly, sliced transversely or longitudinally to form uniform pieces and dried.

## IDENTIFICATION

A. The transversely-cut pieces are 0.5 to 2.5 cm in diameter, irregularly circular to ovoid, up to about 3 mm thick. The outer surface is dark reddish-brown and longitudinally wrinkled. The transverse surface is cream to yellow and shows a thin layer of cork and a pale brown cambium line separating the radiate phloem region from the distinctly radiate xylem. In pieces cut from the rhizome there is a central, whitish pith; in those cut from the roots the radiate xylem continues to the centre.

The longitudinally-cut pieces have been sliced obliquely and usually include a small portion of the outer surface at the

tapering ends; they are about 6 to 8 cm long, 1 to 1.5 cm wide and 3 mm thick. The outer surface is reddish-brown and longitudinally wrinkled with scattered transverse ridges; the smooth cut surface is cream to yellow, faintly fibrous and shows a distinct cambium; on some of the pieces the vessel cavities are visible in the central region.

B. Reduce to a powder. The powder is yellowish-brown. Examine under a microscope using chloral hydrate solution. The powder shows abundant fibres occurring in groups, each group surrounded by a calcium oxalate prism crystal sheath, the individual fibres have very thick, partially lignified walls and few small pits; lignified bordered-pitted vessels, singly or in small groups and sometimes accompanied by lignified parenchymatous cells with moderately thickened and pitted walls, some of the individual vessels are very large, with pit apertures much elongated and the borders difficult to discern; prism crystals of calcium oxalate up to about 35 µm long occur scattered and in parenchymatous tissue; fragments of cork composed of thin-walled, slightly lignified polygonal cells. Examine under a microscope using 50% w/w glycerol in water. The powder shows abundant starch granules, mostly simple, spherical to ovoid, 3 µm to 20 µm in diameter.

C. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Add 16 mL of water and 4 mL of hydrochloric acid (25%) to 0.5 g of the powdered drug, heat on a water-bath under reflux for 30 minutes, cool and filter. Dry the filter paper and residue in a flask at 105° for 60 minutes, add 20 mL of ether, heat on a water-bath at 40° under reflux for 5 minutes, cool and filter. Evaporate the filtrate to dryness and dissolve the residue in 5 mL of ether.

(2) 0.1% w/v each of *glycyrrhetic acid* and *thymol* in ether.

#### CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating substance *silica gel F<sub>254</sub>* (Merck 10 × 20 cm plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution as a band.

(d) Develop the plate to 15 cm.

(e) Remove the plate and allow it to dry in air for 5 minutes. Examine under *ultraviolet light* (254 nm). Spray the plate with *anisaldehyde solution* and heat at 100° to 105° for 10 minutes and examine in daylight.

#### MOBILE PHASE

1 volume of concentrated ammonia, 9 volumes of water, 25 volumes of ethanol (96%) and 65 volumes of ethyl acetate.

#### SYSTEM SUITABILITY

Under ultra-violet light, the chromatogram obtained with solution (2) shows in the lower half a quenching zone due to *glycyrrhetic acid*. When sprayed, the chromatogram obtained with solution (2) shows in the lower half the violet zone of *glycyrrhetic acid* and in the upper third the red zone of thymol.

#### CONFIRMATION

The chromatogram obtained with solution (1) shows in the lower half of violet zone corresponding to the zone of *glycyrrhetic acid* in the chromatogram obtained with solution (2) and a yellow zone (*isoliquiridigenine*) in the upper third under the zone of thymol in the chromatogram obtained with solution (2). Further zones may be present.

#### TESTS

##### Total Ash

Not more than 5.0%, Appendix XI J, Method II.

##### Acid-insoluble ash

Not more than 1.0%, Appendix XI K, Method II.

##### Loss on drying

When dried for 2 hours at 100° to 105°, loses not more than 10.0% of its weight. Use 1 g.

##### Ochratoxin A

Not more than 20 ppb, Appendix XI S2.

#### ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Mix 1 g of the powdered drug with 100 mL of 0.8% w/v of ammonia, place in an ultrasound bath for 30 minutes, centrifuge, dilute 1 mL of the supernatant solution to 5 mL with 0.8% w/v of ammonia and filter through a 0.45-µm filter.

(2) 0.0065% w/v of *monoammonium glycyrrhizate EPCRS* in 0.8% w/v of ammonia.

(3) 0.013% w/v of *monoammonium glycyrrhizate EPCRS* in 0.8% w/v of ammonia.

(4) 0.0195% w/v of *monoammonium glycyrrhizate EPCRS* in 0.8% w/v of ammonia.

#### CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (12.5 cm × 4 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil ODS SS is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use ambient column temperature.

(e) Use a detection wavelength of 254 nm.

(f) Injection 10 µL of each solution.

#### MOBILE PHASE

6 volumes of *glacial acetic acid*, 30 volumes of *acetonitrile* and 64 volumes of water.

#### SYSTEM SUITABILITY

The assay is not valid unless (a) the *column efficiency*, determined on the peak due to *glycyrrhizic acid* in the chromatogram obtained with solution (2), is at least 30,000 theoretical plates per metre and (b) the *symmetry factor* of the peak is not more than 1.3.

#### DETERMINATION OF CONTENT

Inject solution (4). Adjust the sensitivity of the system so that the height of the peaks is at least 50% of the full scale of the recorder. Inject solutions (2), (3) and (4) and determine the peak areas. Prepare a calibration curve with the concentration of the solutions (g per 100 mL) as the abscissa and the corresponding areas as the ordinate. Inject solution (1). Using the retention time and the peak area from the chromatograms obtained with solutions (2), (3) and (4), locate and integrate the peak due to *glycyrrhizic acid* in the chromatogram obtained with solution (1).

Calculate the percentage content of *glycyrrhizic acid* from the following expression:

$$A \times \frac{5}{m} \times B \times \frac{822}{840}$$

- A = concentration of monoammonium glycyrrhizate in the solution (1) determined from the calibration curve, in g per 100 mL,  
 B = declared percentage content of monoammonium glycyrrhizate EPCRS,  
 m = weight of the substance being examined in grams,  
 822 = molecular weight of glycyrrhizic acid,  
 840 = molecular weight of the monoammonium glycyrrhizate (without any water of crystallisation).

**STORAGE**

Processed Licorice Root for use in TCM should be protected from moisture.

**Long Pepper**

(Ph. Eur. monograph 2453)

Ph Eur

**DEFINITION**

Dried, ripe or nearly ripe fruiting spikes of *Piper longum* L. or *Piper retrofractum* Vahl (syn. *P. chaba* Hunter and *P. officinarum* (Miq.) C. DC.) or a mixture of both species.

**Content**

- essential oil: minimum 6.0 mL/kg (dried drug);
- piperine (C<sub>17</sub>H<sub>19</sub>NO<sub>3</sub>; M<sub>r</sub> 285.3): minimum 3.0 per cent (dried drug).

**IDENTIFICATION**

**A. *P. longum*.** The fruiting spikes are cylindrical or irregularly cylindrical, 1-2.5 cm long (rarely longer than 2.5 cm), 3-5 mm in diameter, blackish-brown or almost black.

The spikes are quite compact, tough, composed of small fruits firmly fixed on the receptacle in regular or oblique rows. The berries are spherical, about 1 mm in diameter. The bracts are black, small, punctiform, confined to depressions between adjacent berries. The remains of the peduncle may be present at the base of the cylinder. Spikes can be easily broken; the fracture is irregular and granular.

***P. retrofractum*** The fruiting spikes are similar to those of *P. longum* but clearly more robust, straight and cylindrical, 2.5-4 cm long (rarely smaller than 2.5 cm), 5-8 mm in diameter, brown or reddish-brown. The berries are also firmly fixed on the receptacle but, in contrast to those of *P. longum*, arranged more obviously in spiral rows. The bracts are more prominent than those of *P. longum*.

**B. Microscopic examination (2.8.23).** The powder is grey or light brown. Examine under a microscope using chloral hydrate solution R. The powder shows the following diagnostic characters (Figure 2453.-1): fragments of the endocarp (surface view [A]), consisting of sclereids, more or less elongated, about 75 µm long, pitted, with irregularly thickened walls and wide channels [Aa], associated with the reddish-brown pigmented layer of the testa with indistinct cells [Ab] and also associated with the inner testa with rectangular, brown, thin-walled cells [Ac]; fragments of the endocarp (transverse section [D]), showing sclereids with irregularly thickened inner walls on the 3 lower sides [Da], usually associated with the testa (namely the pigmented layer with indistinct cells [Db] and the layer of the inner testa [Dc]); fragments of the parenchyma of the mesocarp [B, C] containing more or less polygonal sclereids, isolated [Ba] or in groups [Bb], and oil cells about 50 µm in diameter [Ca]; numerous ovoid or polygonal cells of the parenchyma of the seed [Dd]; fragments of the epicarp [F] with thin-walled cells; rare fragments from the centre of the spike [E], consisting of parenchymatous cells [Eb] and elongated

sclereids up to 400 µm long [Ea]; a few fragments of vascular tissue [H] with spiral or striated vessels [Ha] and fibres [Hb]. Examine under a microscope using a 50 per cent V/V solution of glycerol R. Starch is visible as rounded, compound granules, each about 20 µm in diameter [Ga], made up of tiny individual granules, ovoid or polyhedral by compression, free [Gb] or included in the parenchymatous cells of the seed [G].

Figure 2453.-1. – Illustration for identification test B of powdered herbal drug of long pepper

**C. Thin-layer chromatography (2.2.27).**

**Test solution** To 0.5 g of the powdered herbal drug (355) (2.9.12) add 5 mL of methanol R. Sonicate for 10 min, centrifuge and use the supernatant.

**Reference solution** Dissolve 10 mg of borneol R and 15 mg of piperine R in 10 mL of methanol R.

**Plate** TLC silica gel F<sub>254</sub> plate R (5-40 µm) [or TLC silica gel F<sub>254</sub> plate R (2-10 µm)].

**Mobile phase** ethyl acetate R, cyclohexane R (30:50 V/V).

**Application** 10 µL [or 5 µL] as bands of 10 mm [or 8 mm].

**Development** Over a path of 15 cm [or 6 cm].

**Drying** In air.

**Detection A** Examine in ultraviolet light at 254 nm.

**Results A** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint quenching zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
	2 strong quenching zones
	A quenching zone
	A quenching zone
Piperine: a quenching zone	A strong quenching zone (piperine)
Reference solution	Test solution

**Detection B** Treat with *anisaldehyde solution R* and heat at 100 °C for 5 min; examine in daylight.

**Results B** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.

Top of the plate

## TESTS

### Foreign matter (2.8.2)

Maximum 3 per cent.

### Loss on drying (2.2.32)

Maximum 11.0 per cent, determined on 1.000 g of the freshly powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

### Total ash (2.4.16)

Maximum 5.0 per cent.

## ASSAY

### Essential oil (2.8.12)

Use 25.0 g of the freshly powdered herbal drug (1400) (2.9.12), a 1000 mL round-bottomed flask, 400 mL of *water R* as the distillation liquid and 0.5 mL of *xylene R* in the graduated tube. Distil at a rate of 2-3 mL/min for 3 h.

### Piperine

Liquid chromatography (2.2.29). Carry out the assay protected from light.

**Test solution** Disperse 0.250 g of the powdered herbal drug (355) (2.9.12) in 40 mL of *ethanol (96 per cent) R*. Sonicate for 20 min and filter. Rinse the flask and the filter with 5 mL of *ethanol (96 per cent) R*, combine the filtrate and washings and dilute to 50.0 mL with the same solvent. Filter through a membrane filter (nominal pore size 0.45 µm).

**Reference solution (a)** Dissolve 15.0 mg of *piperine CRS* in *ethanol (96 per cent) R* and dilute to 100.0 mL with the same solvent.

**Reference solution (b)** Disperse 0.250 g of *long pepper for system suitability HRS (355) (2.9.12)* in 40 mL of *ethanol (96 per cent) R*. Sonicate for 20 min and filter. Rinse the flask and the filter with 5 mL of *ethanol (96 per cent) R*, combine the filtrate and washings and dilute to 50.0 mL with the same solvent. Filter through a membrane filter (nominal pore size 0.45 µm).

### Column:

— size:  $l = 0.15$  m,  $\varnothing = 4.6$  mm;

— stationary phase: end-capped octadecylsilyl silica gel for chromatography R (5 µm).

### Mobile phase:

— mobile phase A: *water R*;

— mobile phase B: *acetonitrile R*;

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 5	50	50
5 - 20	50 → 5	50 → 95
20 - 22	5 → 0	95 → 100

**Flow rate** 1.0 mL/min.

**Detection** Spectrophotometer at 343 nm.

**Injection** 10 µL.

**Identification of peaks** Use the chromatogram supplied with *long pepper for system suitability HRS* and the chromatogram obtained with reference solution (b) to identify the peak due to piperine and peak 2.

**Retention time** Piperine = about 10 min.

**System suitability** Reference solution (b):

— *peak-to-valley ratio*: minimum 4, where  $H_p$  = height above the baseline of peak 2 and  $H_v$  = height above the baseline of the lowest point of the curve separating the peak due to piperine from peak 2.

Calculate the percentage content of piperine using the following expression:

$$\frac{A_1 \times m_2 \times p}{A_2 \times m_1 \times 2}$$

- $A_1$  = area of the peak due to piperine in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to piperine in the chromatogram obtained with reference solution (a);
- $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;
- $m_2$  = mass of *piperine CRS* used to prepare reference solution (a), in grams;
- $p$  = percentage content of piperine in *piperine CRS*.

Ph Eur

## Loosestrife

(Ph. Eur. monograph 1537)

Ph Eur

### DEFINITION

Dried flowering tops, whole or cut, of *Lythrum salicaria* L.

### Content

Minimum 5.0 per cent of tannins, expressed as pyrogallol ( $C_6H_6O_3$ ;  $M_r$  126.1) (dried drug).

**IDENTIFICATION**

**A.** The stems are rigid, 4-angled, branching at the top, brownish-green, longitudinally wrinkled and pubescent. The leaves are opposite, decussate, rarely verticillate in threes and sometimes alternate at the inflorescence which forms a long terminal spike. The leaves are sessile, lanceolate and cordate at the base, 5-15 cm long and 1-2.5 cm wide, pubescent on the lower surface; the subsidiary veins form arcs that anastomose near the leaf margin. The flowers have a pubescent, tubular, persistent gamosepalous calyx, 4-8 mm long, consisting of 6 sepals bearing 6 small, triangular teeth alternating with 6 large, acute teeth at least half as long as the tube; a polypetalous corolla consisting of 6 violet-pink petals, each expanded at the top with a wavy outline and narrowing at the base. The androecium consists of 2 verticils of 6 stamens (1 verticil with short, barely emerging stamens, the other with long stamens extending well out of the corolla). The fruit, if formed, is a small capsule included in the persistent calyx.

**B.** Microscopic examination (2.8.23). The powder is greenish-yellow. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 1537.-1): unicellular [Ea] or bicellular [Aa], uniseriate, thick-walled, finely pitted covering trichomes from the epidermis of the leaf [A] and stem [E]; numerous uniseriate, unicellular [Ga] or bicellular [Gb], thin-walled, finely pitted, annularly striated covering trichomes from the calyx (side view [G]); transparent violet-pink fragments from the petals [F] consisting of epidermal cells with sinuous walls and a grainy cuticle [Fa], covering fine spiral vessels [Fb]; fragments of parenchyma from the leaf [D] with numerous cells containing cluster crystals of calcium oxalate [Da], associated with spiral vessels [Db]; pollen grains with 3 pores and a thin and slightly granular exine [C]; fragments of the upper epidermis of the leaf [A] with large polygonal cells and sinuous walls, covered by a finely striated cuticle [Ab]; fragments of the lower epidermis of the leaf [B] with smaller polygonal cells [Ba] and anomocytic stomata [Bb] (2.8.3); fragments of the stem [E] consisting of polygonal cells with straight anticlinal walls and a striated cuticle [Eb].

**C.** Thin-layer chromatography (2.2.27).

**Test solution** To 1.0 g of the powdered herbal drug (355) (2.9.12) add 10 mL of *methanol R* and heat in a water-bath at 65 °C for 5 min with frequent shaking. Cool and filter. Dilute the filtrate to 10 mL with *methanol R*.

**Reference solution** Dissolve 0.5 mg of *chlorogenic acid R*, 1 mg of *hyperoside R*, 1 mg of *rutoside trihydrate R* and 1 mg of *vitexin R* in 10 mL of *methanol R*.

**Plate** TLC silica gel plate R.

**Mobile phase** *anhydrous acetic acid R*, *anhydrous formic acid R*, *water R*, *ethyl acetate R* (7.5:7.5:18:67 V/V/V/V).

**Application** 10 µL as bands.

**Development** Over a path of 15 cm.

**Drying** At 100-105 °C.

**Detection** treat the still-warm plate with a 10 g/L solution of *diphenylboric acid aminoethyl ester R* in *methanol R*.

Subsequently treat with a 50 g/L solution of *macrogol 400 R* in *methanol R*. Allow to dry in air for 30 min and examine in ultraviolet light at 365 nm.

Figure 1537.-1. – Illustration for identification test B of powdered herbal drug of loosestrife

**Results** The chromatogram obtained with the reference solution shows in the lower third a yellowish-brown fluorescent zone due to rutoside and in the middle third a light blue fluorescent zone due to chlorogenic acid, above it a yellowish-brown fluorescent zone due to hyperoside and a green fluorescent zone due to vitexin. The chromatogram obtained with the test solution shows a bright green fluorescent zone slightly above the zone due to rutoside in the chromatogram obtained with the reference solution, a yellow fluorescent zone similar in position to the zone due to chlorogenic acid in the chromatogram obtained with the reference solution, a yellow fluorescent zone similar in position to the zone due to hyperoside in the chromatogram obtained with the reference solution, and a bright green fluorescent zone corresponding to the zone due to vitexin in the chromatogram obtained with the reference solution.

**TESTS**

**Loss on drying** (2.2.32)

Maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C.

**Total ash** (2.4.16)

Maximum 7.0 per cent.

**ASSAY**

**Tannins** (2.8.14)

Use 0.750 g of the powdered herbal drug (180) (2.9.12).

Ph Eur

# Lovage Root

(Ph. Eur. monograph 1233)

Ph Eur

## DEFINITION

Whole or cut, dried rhizome and root of *Levisticum officinale* W.D.J.Koch.

### Essential oil content:

- for the whole drug, minimum 4.0 mL/kg (dried drug);
- for the cut drug, minimum 3.0 mL/kg (dried drug).

## IDENTIFICATION

A. The rhizome and the large roots are often split longitudinally. The rhizome is short, up to 5 cm in diameter, light greyish-brown or yellowish-brown, simple or with several protuberances. The roots, showing little ramification, are the same colour as the rhizome; they are usually up to 1.5 cm thick and up to about 25 cm long; the fracture is usually smooth and shows a very wide yellowish-white bark and a narrow brownish-yellow wood.

Figure 1233.-1. – Illustration for identification test B of powdered herbal drug of lovage root

B. Microscopic examination (2.8.23). The powder is yellowish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 1233.-1): cork cells, polygonal or rounded (surface view [C]), with brown contents; abundant parenchyma, consisting of mostly thin-walled and rounded cells (transverse section [E]) but some with thicker walls, some elongated with walls showing fine criss-cross striations (longitudinal section [H]); groups of small, reticulately thickened vessels embedded in small-celled, unligified parenchyma [G]; isolated fragments of reticulate vessels [F] up to 125 µm in diameter; fragments of secretory canals (transverse section [A], longitudinal section [B]) up to

180 µm wide. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows starch granules, simple, rounded or ovoid, up to about 12 µm in size, and numerous larger, compound granules, many with several components [D].

C. Examine the chromatograms obtained in the test for species of *Angelica* and *Ligusticum* described in the European Pharmacopoeia.

**Results A** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other weak fluorescent zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
(Z)-Ligustilide: a bluish-white fluorescent zone	A bluish-white fluorescent zone
Osthole: a blue fluorescent zone	
Imperatorin: a whitish fluorescent zone	A weak whitish fluorescent zone
	A weak whitish fluorescent zone
Reference solution	Test solution

**Results B** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other weak quenching zones may be present in the chromatogram obtained with the test solution.

(Z)-Ligustilide: a bluish fluorescent zone	A bluish fluorescent zone
Osthole: a quenching zone	A weak quenching zone
Imperatorin: a quenching zone	
Reference solution	Test solution

**Results C** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
(Z)-Ligustilide: a grey zone	2 prominent reddish zones
	A grey zone
Osthole: a violet zone	
Imperatorin: a grey zone	
	2 purple zones
	A distinct brown zone
Reference solution	Test solution

## TESTS

Species of *Angelica* and *Ligusticum* described in the European Pharmacopoeia

Thin-layer chromatography (2.2.27).

**Test solution** To 1 g of the freshly powdered herbal drug (355) (2.9.12) add 4 mL of *heptane R* and sonicate for 5 min. Centrifuge the mixture and use the supernatant.

**Reference solution** Dissolve 1 mg of *imperatorin R*, 1 mg of (*Z*)-*ligustilide R* and 1 mg of *osthole R* in *methanol R* and dilute to 10 mL with the same solvent.

**Plate** TLC silica gel *F<sub>254</sub>* plate *R* (2-10 µm).

**Mobile phase** *glacial acetic acid R*, *ethyl acetate R*, *toluene R* (1:10:90 V/V/V).

**Application** 4 µL, as bands of 8 mm.

**Development** Over a path of 6 cm.

**Drying** In air.

**Detection A** Examine in ultraviolet light at 365 nm.

**Results A** The chromatogram obtained with the test solution shows no blue fluorescent zone just below or above the zone due to *imperatorin* in the chromatogram obtained with the reference solution.

**Detection B** Examine in ultraviolet light at 254 nm.

**Results B** The chromatogram obtained with the test solution shows no zone at or just below the zone due to *imperatorin* in the chromatogram obtained with the reference solution.

**Detection C** Treat the plate with a solution of 20 mL of *sulfuric acid R* in 180 mL of ice-cooled *methanol R*; heat at 100-105 °C for 5 min and examine in daylight.

**Results C** The chromatogram obtained with the test solution shows no purple zone between the 2 reddish zones at the top of the chromatogram and the zone due to (*Z*)-*ligustilide* in the chromatogram obtained with the reference solution; the chromatogram obtained with the test solution shows no purple zone between the zones due to (*Z*)-*ligustilide* and *osthole* in the chromatogram obtained with the reference solution.

**Foreign matter (2.8.2)**

Maximum 3 per cent, determined on 50 g.

**Loss on drying**

(2.2.32): maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

**Total ash (2.4.16)**

Maximum 8.0 per cent.

**Ash insoluble in hydrochloric acid (2.8.1)**

Maximum 2.0 per cent.

## ASSAY

**Essential oil (2.8.12)**

Use 40.0 g of the herbal drug reduced to a powder (500) (2.9.12) immediately before the determination, a 2 L flask, 10 drops of *liquid paraffin R*, 500 mL of *water R* as the distillation liquid and 0.50 mL of *xylene R* in the graduated tube. Distil at a rate of 2-3 mL/min for 4 h.

Ph Eur

**Lycopus Lucidus** Herb

(Ph. Eur. monograph 2723)

Ph Eur

## DEFINITION

Whole or fragmented, dried aerial parts of *Lycopus lucidus* var. *hirtus* (Regel) Makino & Nemoto.

## Content

Minimum 0.15 per cent of rosmarinic acid (C<sub>18</sub>H<sub>16</sub>O<sub>8</sub>; M<sub>r</sub> 360.3) (dried drug).

## IDENTIFICATION

**A. Whole drug.** The stems are square in cross-section with a hollowed pith and few branches, 50-100 cm long and 2-6 mm in diameter; the greenish-yellow or reddish outer surface shows, on each side, shallow longitudinal furrows and reddish nodes covered in white hairs. The leaves are opposite, with short petioles or almost sessile; when whole, the lamina, usually crumpled, is lanceolate or oblong, 5-10 cm long, with dentate margins, an acute apex and a slightly decurrent base, and is pubescent on both surfaces; the upper surface is dark green or blackish-green while the lower surface is greyish-green, and densely dotted with glandular trichomes; the inflorescence is grouped in axillary whorls and consists only of persistent calyces and leaf-like bracts, as the corollas have usually fallen off. The bracts are lanceolate with hairs on the margins. The calyx is hairy, and 2-lipped with 5 teeth. The texture is fragile.

**Fragmented drug** It occurs in various sizes 1-3 cm long. The fragments of the stems are flattened, angular, longitudinally striated and have a hollowed whitish pith; some fragments have nodes covered in white hairs; the fragments of the leaves often show the dentate margin of the lamina, and prominent veins on the lower surface; some fragments have inflorescences in axillary whorls, reduced to brown 2-lipped calyces.

**B. Microscopic examination (2.8.23).** The powder is dark green or brownish-green. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2723.-1): fragments of the upper epidermis of the leaves (surface view [B]) consisting of cells usually with rigid walls [Ba] bearing covering trichomes and glandular trichomes; the covering trichomes have spiny walls, some are unicellular, short and conical [Bb], others are uni- [C, E] or multicellular (2-5 cells) [G], occasionally remaining only as circular, thickened scars on the epidermis [F]; the glandular trichomes, rarer, have a unicellular stalk and an ovoid head, either uni- or bicellular [Bc], sometimes associated with loosely arranged palisade parenchyma [Bd]; fragments of the lower epidermis of the lamina (surface view [A]) covered by a striated cuticle composed of cells with sinuous walls [Aa], diacytic stomata [Ab], uni- or multicellular covering trichomes similar to those of the upper epidermis, mainly visible on the veins, and numerous glandular trichomes, sometimes with a unicellular stalk and a unicellular head ([Ac], isolated side view [D]), or a unicellular stalk and a bicellular head [Ad], or a unicellular stalk and an octocellular head of laminaceous type [Ae] about 60-80 µm in diameter; bundles of long fibres [H, K] from the stems, with thick walls [Ha, Ka], sometimes associated with bordered-pitted vessels [Hb] or parenchymatous cells of the pith [Kb]; frequent sclereids [J], usually isolated [Ja, Jb] or in small groups [Jc], ovoid to rectangular, with varying thickened and channelled walls, from the pith near the nodes.

Figure 2723-1. – Illustration for identification test B of powdered herbal drug of *lycopus lucidus* herb

#### C. Thin-layer chromatography (2.2.27).

**Test solution** To 1 g of the powdered herbal drug (355) (2.9.12) add 5 mL of *ethyl acetate R*. Sonicate for 10 min. Centrifuge and use the supernatant.

**Reference solution** Dissolve 1.0 mg of *luteolin R* and 1.0 mg of *ursolic acid R* in 2.0 mL of *ethyl acetate R*.

**Plate** TLC silica gel plate R (2-10 µm).

**Mobile phase** *anhydrous formic acid R*, *methylene chloride R*, *ethyl acetate R*, *cyclohexane R* (1:5:8:20 V/V/V/V).

**Application** 4 µL as bands of 8 mm.

**Development** Over a path of 6 cm.

**Drying** In air.

**Detection** Treat with 2.5 M alcoholic sulfuric acid R and heat at 110 °C for 3 min. Examine in daylight.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
	A pale violet zone
	A reddish-violet zone
Ursolic acid: a violet zone	A violet zone (ursolic acid)
	2 dark violet zones
Luteolin: a yellow zone	
Reference solution	Test solution

#### TESTS

##### Loss on drying (2.2.32)

Maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

##### Total ash (2.4.16)

Maximum 8.0 per cent.

#### ASSAY

Liquid chromatography (2.2.29).

**Test solution** To 1.000 g of the powdered herbal drug (355) (2.9.12) add 25.0 mL of a 70 per cent V/V solution of *methanol R* and weigh. Boil on a water-bath under a reflux condenser for 30 min. Allow to cool and weigh again. Compensate for the loss of solvent with a 70 per cent V/V solution of *methanol R* and mix. Filter the solution and dilute 2.0 mL of the filtrate to 10.0 mL with a 70 per cent V/V solution of *methanol R*. Filter this solution through a membrane filter (nominal pore size 0.45 µm).

**Reference solution (a)** Dissolve 10.0 mg of *rosmarinic acid CRS* in 20.0 mL of a 70 per cent V/V solution of *methanol R*. Dilute 1.0 mL of this solution to 25.0 mL with a 70 per cent V/V solution of *methanol R*.

**Reference solution (b)** Dissolve 5 mg of *ferulic acid R* in 25 mL of a 70 per cent V/V solution of *methanol R*. Dilute 1 mL of this solution to 10.0 mL with reference solution (a).

**Column:**

— size:  $l = 0.25$  m,  $\varnothing = 4.0$  mm;

— stationary phase: end-capped octadecylsilyl silica gel for chromatography R (5 µm).

**Mobile phase:**

— mobile phase A: *phosphoric acid R*, *acetonitrile R*, water for chromatography R (1:19:80 V/V/V);

— mobile phase B: *phosphoric acid R*, *methanol R*, *acetonitrile R* (1:40:59 V/V/V);

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 20	100 → 70	0 → 30
20 - 25	70 → 0	30 → 100
25 - 30	0 → 100	100 → 0

**Flow rate** 1.0 mL/min.

**Detection** Spectrophotometer at 330 nm.

**Injection** 20 µL.

**Identification of peaks** Use the chromatogram obtained with reference solution (a) to identify the peak due to rosmarinic acid.

**Retention time** Ferulic acid = about 10 min; rosmarinic acid = about 14 min.

**System suitability** Reference solution (b):

— **resolution:** minimum 5.0 between the peaks due to ferulic acid and rosmarinic acid.

Calculate the percentage content of rosmarinic acid using the following expression:

$$\frac{A_1 \times m_2 \times p}{A_2 \times m_1 \times 4}$$

- $A_1$  = area of the peak due to rosmarinic acid in the chromatogram obtained with the test solution;  
 $A_2$  = area of the peak due to rosmarinic acid in the chromatogram obtained with reference solution (a);  
 $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;  
 $m_2$  = mass of rosmarinic acid CRS used to prepare reference solution (a), in grams;  
 $p$  = percentage content of rosmarinic acid in rosmarinic acid CRS.

Ph Eur

## Magnolia Biondii Flower

(Ph. Eur. monograph 2742)

Ph Eur

### DEFINITION

Whole, dried flower bud of *Magnolia biondii* Pamp. (syn. *Yulania biondii* (Pamp.) D.L.Fu).

### Content

- **essential oil:** minimum 14.0 mL/kg (anhydrous drug);  
 — **magnolol** ( $C_{23}H_{28}O_7$ ;  $M_r$  416.5): minimum 3.0 per cent (anhydrous drug).

### IDENTIFICATION

**A.** The flower bud, whose texture is light and fragile, is ovoid to elongated-ovoid, whitish-grey, yellowish-grey or greenish-grey, silky, pubescent, with a pointed apex; 1.2–3.0 cm long and 8–16 mm in diameter. The ligneous, short peduncle, covered in whitish lenticels, is usually present at the base of the flower bud. The flower bud is surrounded by 2–3 whorls of bracts: each bract has an outer surface densely covered in silky hairs, and a glabrous, brownish inner surface. The perianth consists of 9 light yellow or brownish tepals arranged in 3 whorls; the outer whorl consists of 3 sepaloïd tepals, linear, whose length is about a quarter of that of the other tepals; the petaloïd tepals are arranged in 2 inner whorls, each consisting of 3 tepals. The stamens and carpels are numerous, arranged in a spiral.

**B.** Microscopic examination (2.8.23). The unsieved powder is greenish to brownish-grey, dark-brown or slightly greenish-yellow. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2742.-1): isolated and fragmented, multicellular (2–6 cells when whole) covering trichomes [B, C, D], whose cells have thick walls, often with spiral striations [Ba]; their bases are enlarged and consist of cells with very thick walls like sclereids, with granular orange-brown contents [Bb]; numerous sclereids, more or less branched, isolated [F] or in groups [E], with very thick, striated, channelled walls, up to 60 µm in diameter;

fragments of perianth segments (surface view [A]; sectional view [G]) covered by a cuticle [Ga] and composed of polyhedral epidermal cells [Aa, Gb], paracytic stomata (2.8.3) [Ab] and parenchyma consisting of rounded cells [Ad, Gc] and including rounded oil cells (up to 100 µm in diameter) with orange-yellow contents [Ac, Gd].

Figure 2742.-1. – Illustration for identification test B of powdered herbal drug of *Magnolia biondii* flower bud

**C.** Thin-layer chromatography (2.2.27) as described in the test for *Magnolia officinalis* Rehder & E.H.Wilson with the following modifications.

**Detection A** Examine in ultraviolet light at 254 nm.

**Results A** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Fargesin: a dark blue fluorescent zone	A dark blue fluorescent zone (fargesin)
Magnolol: a quenching zone	A quenching zone (magnolol)
Reference solution	Test solution

**Detection B** Treat with *vanillin reagent R*, heat at 100–105 °C for 5–7 min and examine in daylight.

**Results B** See below the sequence of zones present in the chromatograms obtained with the reference solution and the

test solution. Furthermore, other faint zones of various colours may be present in the chromatogram obtained with the test solution.

Top of the plate	
	A faint violet zone
Fargesin: a brown zone	A brown zone (fargesin)
	A dark blue zone
	A faint pinkish-violet zone
Magnolin: a pinkish-violet zone	A pinkish-violet zone (magnolin)
Reference solution	Test solution

## TESTS

**Magnolia officinalis** Rehder & E.H.Wilson  
Thin-layer chromatography (2.2.27).

**Test solution** Reduce the herbal drug to a powder using a blade grinder to prevent heating. To 0.5 g of the powdered herbal drug add 3.0 mL of *methanol R*. Sonicate for 15 min and centrifuge for 15 min. Transfer the supernatant to a 5 mL flask. Add 2 mL of *methanol R* to the residue, sonicate for 15 min and centrifuge. Transfer the supernatant into the same 5 mL flask. Dilute the combined supernatants to 5.0 mL with *methanol R*. Filter through a membrane filter (nominal pore size 0.45 µm) if necessary.

**Reference solution** Dissolve 2.0 mg of *fargesin R* and 2.0 mg of *magnolin R* in *methanol R* and dilute to 5.0 mL with the same solvent.

**Plate** TLC silica gel *F<sub>254</sub>* plate *R* (2-10 µm).

**Mobile phase** *methanol R*, *ethyl acetate R*, *toluene R* (1:5:30 V/V/V).

**Application** 5 µL as bands of 8 mm.

**Development** Over a path of 7 cm.

**Drying** In air.

**Detection** Treat with *vanillin reagent R*, heat at 100-105 °C for 5-7 min and examine in daylight.

**Results** The chromatogram obtained with the test solution shows no pinkish zone (due to magnolin) just below the zone due to fargesin in the chromatogram obtained with the reference solution.

**Water** (2.2.13)

Maximum 100 mL/kg, determined on 25.0 g of the finely cut herbal drug.

**Total ash** (2.4.16)

Maximum 4.0 per cent.

## ASSAY

**Essential oil** (2.8.12)

Use 15.0 g of freshly, finely cut herbal drug, a 1 L round-bottomed flask, 300 mL of *water R* as the distillation liquid and 0.50 mL of *xylene R* in the graduated tube. Distil at a rate of 2-3 mL/min for 3 h.

**Magnolin**

Liquid chromatography (2.2.29).

**Test solution** Reduce the herbal drug to a powder using a blade grinder to prevent heating. To 0.250 g of the powdered herbal drug add 35 mL of *methanol R*. Sonicate for 1 h,

changing the water of the ultrasonic bath after 30 min of sonication to prevent heating. Centrifuge for 15 min. Transfer the supernatant to a 100 mL volumetric flask. Repeat the extraction twice, adding to the residue 35 mL of *methanol R* the first time and 20 mL of *methanol R* the second time. Combine the supernatants, cool, and dilute to 100.0 mL with *methanol R*. Dilute 1.0 mL of the solution to 2.0 mL with a mixture of 10 volumes of *acetonitrile R* and 90 volumes of *water for chromatography R*. Filter through a membrane filter (nominal pore size 0.45 µm).

**Reference solution (a)** Dissolve 5.0 mg of *magnolin CRS* in *methanol R* and dilute to 10.0 mL with the same solvent. Dilute 1.0 mL of the solution to 5.0 mL with a mixture of 10 volumes of *acetonitrile R* and 90 volumes of *water for chromatography R*.

**Reference solution (b)** To 0.250 g of *magnolia biondii flower for system suitability HRS* add 35 mL of *methanol R*. Sonicate for 1 h, changing the water of the ultrasonic bath after 30 min of sonication to prevent heating. Centrifuge for 15 min. Transfer the supernatant to a 100 mL volumetric flask. Repeat the extraction twice, adding to the residue 35 mL of *methanol R* the first time and 20 mL of *methanol R* the second time. Combine the supernatants, cool, and dilute to 100.0 mL with *methanol R*. Dilute 1.0 mL of the solution to 2.0 mL with a mixture of 10 volumes of *acetonitrile R* and 90 volumes of *water for chromatography R*. Filter through a membrane filter (nominal pore size 0.45 µm).

**Column:**

- size:  $l = 0.15$  m,  $\varnothing = 4.6$  mm;
- stationary phase: end-capped octadecylsilyl silica gel for chromatography *R* (5 µm);
- temperature: 30 °C.

**Mobile phase:**

- mobile phase A: anhydrous acetic acid *R*, *acetonitrile R*, *water for chromatography R* (0.1:14:85.9 V/V/V);
- mobile phase B: anhydrous acetic acid *R*, *water for chromatography R*, *acetonitrile R* (0.1:4.9:95 V/V/V);

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 12	68	32
12 - 20	68 → 0	32 → 100
20 - 28	0	100

**Flow rate** 1.0 mL/min.

**Detection** Spectrophotometer at 278 nm.

**Injection** 20 µL.

**Identification of peaks** Use the chromatogram supplied with *magnolia biondii flower for system suitability HRS* and the chromatogram obtained with reference solution (b) to identify the peak due to eudesmin; use the chromatogram obtained with reference solution (a) to identify the peak due to magnolin.

**Retention time** Eudesmin = about 12 min; magnolin = about 13 min.

**System suitability** Reference solution (b):

- resolution: minimum 1.8 between the peaks due to eudesmin and magnolin.

If necessary, dilute the test solution with a mixture of 10 volumes of *acetonitrile R* and 90 volumes of *water for chromatography R* to obtain a peak due to magnolin with a height that is similar to or smaller than the height of the corresponding peak in the chromatogram obtained with

reference solution (a). Take into account the additional dilution factor *d*.

Calculate the percentage content of magnolin using the following expression:

$$\frac{A_1 \times m_2 \times p \times 4 \times d}{A_2 \times m_1}$$

- A*<sub>1</sub> = area of the peak due to magnolin in the chromatogram obtained with the test solution;  
*A*<sub>2</sub> = area of the peak due to magnolin in the chromatogram obtained with reference solution (a);  
*m*<sub>1</sub> = mass of the herbal drug to be examined used to prepare the test solution, in grams;  
*m*<sub>2</sub> = mass of magnolin CRS used to prepare reference solution (a), in grams;  
*p* = percentage content of magnolin in magnolin CRS;  
*d* = additional dilution factor.

Ph Eur

## Magnolia Officinalis Bark

(Ph. Eur. monograph 2567)

Ph Eur

### DEFINITION

Dried bark from the stem and branch of *Magnolia officinalis* Rehder et E.H. Wilson.

### Content

Minimum 2.0 per cent for the sum of magnolol (C<sub>18</sub>H<sub>18</sub>O<sub>2</sub>; *M<sub>r</sub>* 266.3) and honokiol (C<sub>18</sub>H<sub>18</sub>O<sub>2</sub>; *M<sub>r</sub>* 266.3) (dried drug).

### IDENTIFICATION

A. Fragments of stem and branch bark, quilled singly or double quilled, about 30 cm long and 2-7 mm thick.

The outer surface is brownish-grey, rough, sometimes scaly, easily exfoliated, with distinct lenticels and longitudinal striations. The inner surface is reddish-brown or dark brown, smooth, with numerous fine, longitudinal striations.

The texture is hard and difficult to break. The fracture is granular, brownish-grey in the outer layers and reddish-brown or dark brown in the inner layers.

B. Microscopic examination (2.8.23). The powder is yellowish-brown. Examine under a microscope using chloral hydrate solution R. The powder shows the following diagnostic characters (Figure 2567.-1): numerous sclereids [D] of various shapes and sizes, free or in groups, often branched, up to 100 µm long, with very thick, striated walls and conspicuous pit canals; oval [F] or rounded [G] oil cells, up to 100 µm in diameter, with orange-yellow contents; narrow, thick-walled fibres, often in bundles [C, H], accompanied by fusiform medullary rays (tangential section [Ca]) or consisting of files of rectangular cells (longitudinal section [Ha]); brown cork fragments with regularly and finely thickened walls [B]; fragments of phloem parenchyma [A] consisting of cells with irregular walls [Aa], accompanied by fusiform medullary rays (tangential section [Ab]). Examine under a microscope using a 50 per cent V/V solution of glycerol R. The powder shows rounded, ovoid or polyhedral starch granules, about 2-12 µm in diameter, simple or 2-6 compound, free [J] or included in parenchyma cells [E].

C. Thin-layer chromatography (2.2.27).

*Test solution* Reduce to a powder (355) (2.9.12), avoiding heating. To 0.5 g of the powdered herbal drug add 5 mL of methanol R, sonicate for 5 min, centrifuge, and use the supernatant. Filter through a membrane filter (nominal pore size 0.45 µm) if necessary.

Figure 2567.-1. – Illustration for identification test B of powdered herbal drug of *Magnolia officinalis* bark

*Reference solution* Dissolve 1 mg of honokiol R, 1 mg of magnolol R and 2 mg of eugenol R in 1 mL of methanol R.

*Plate* TLC silica gel F<sub>254</sub> plate R (5-40 µm) [or TLC silica gel F<sub>254</sub> plate R (2-10 µm)].

*Mobile phase* methanol R, ethyl acetate R, toluene R (4:8:120 V/V/V).

*Application* 5 µL [or 2 µL] as bands of 15 mm [or 8 mm].

*Development* Over a path of 15 cm [or 7 cm].

*Drying* In air.

*Detection A* Examine in ultraviolet light at 254 nm.

*Results A* See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Eugenol: a faint quenching zone	
Magnolol: a dark blue fluorescent zone	A dark blue fluorescent zone (magnolol)
Honokiol: a quenching zone	A quenching zone (honokiol)
Reference solution	Test solution

*Detection B* Treat with vanillin reagent R, heat at 100-105 °C for 5-10 min and examine in daylight.

**Results B** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones of various colours may be present in the chromatogram obtained with the test solution.

Honokiol: a dark violet zone	A dark violet zone (honokiol)
	A bluish-violet zone
Reference solution	Test solution

### TESTS

#### Loss on drying (2.2.32)

Maximum 11.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

#### Total ash (2.4.16)

Maximum 5.0 per cent.

#### Ash insoluble in hydrochloric acid (2.8.1)

Maximum 3.0 per cent.

### ASSAY

#### Liquid chromatography (2.2.29).

**Test solution** To 0.500 g of the powdered herbal drug (355) (2.9.12) add 80 mL of *methanol R* and heat in a water-bath under a reflux condenser for 30 min. Cool, then dilute to 100.0 mL with *methanol R*. Filter through a membrane filter (nominal pore size 0.45 µm).

**Reference solution (a)** Dissolve 4.0 mg of *honokiol CRS* and 4.0 mg of *magnolol CRS* in *methanol R* and dilute to 20.0 mL with the same solvent.

**Reference solution (b)** Dissolve 2.0 mg of *honokiol CRS* in 2.0 mL of *acetonitrile R*. To 1.0 mL of the solution add 15 µL of *acetic anhydride R* and mix. Heat at 50 °C for 60 min. Cool. Add successively, mixing after each addition, 16 µL of *concentrated ammonia R*, 1.0 mL of *acetonitrile R* and 2.0 mL of *water R*. Filter through a membrane filter (nominal pore size 0.45 µm).

#### Column:

- size:  $l = 0.25$  m,  $\varnothing = 4.6$  mm;
- stationary phase: end-capped octadecylsilyl silica gel for chromatography R1 (5 µm);
- temperature: 30 °C.

**Mobile phase** 0.5 per cent *V/V* solution of *acetic acid R*, *acetonitrile for chromatography R* (40:60 *V/V*).

**Flow rate** 1.0 mL/min.

**Detection** Spectrophotometer at 290 nm.

**Injection** 10 µL.

**Run time** Twice the retention time of honokiol for the test solution and reference solution (a); 3 times the retention time of honokiol for reference solution (b).

**Relative retention** With reference to honokiol (retention time = about 8 min): magnolol = about 1.4; honokiol

monoacetate isomer 1 = about 1.5; honokiol monoacetate isomer 2 = about 1.6; honokiol diacetate = about 2.6.

#### System suitability Reference solution (b):

— resolution: minimum 1.8 between the peaks due to honokiol monoacetate isomers 1 and 2.

Calculate the sum of the percentage contents of honokiol and magnolol using the following expression:

$$\frac{A_1 \times m_2 \times p_1 \times 5}{A_2 \times m_1} + \frac{A_3 \times m_3 \times p_2 \times 5}{A_4 \times m_1}$$

- $A_1$  = area of the peak due to honokiol in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to honokiol in the chromatogram obtained with reference solution (a);
- $A_3$  = area of the peak due to magnolol in the chromatogram obtained with the test solution;
- $A_4$  = area of the peak due to magnolol in the chromatogram obtained with reference solution (a);
- $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;
- $m_2$  = mass of *honokiol CRS* used to prepare reference solution (a), in grams;
- $m_3$  = mass of *magnolol CRS* used to prepare reference solution (a), in grams;
- $p_1$  = percentage content of honokiol in *honokiol CRS*;
- $p_2$  = percentage content of magnolol in *magnolol CRS*.

Ph Eur

## Magnolia Officinalis Flower

(Ph. Eur. monograph 2568)

Ph Eur

### DEFINITION

Steamed and dried, unopened flower of *Magnolia officinalis* Rehder et E.H. Wilson.

### Content

Minimum 0.20 per cent of the sum of magnolol ( $C_{18}H_{18}O_2$ ;  $M_r$  266.3) and honokiol ( $C_{18}H_{18}O_2$ ;  $M_r$  266.3) (dried drug).

### IDENTIFICATION

**A.** The greyish-yellow pedicel is short (0.5-2 cm) and densely tomentose. The brown or reddish-brown flower bud is elongated, conical, 4-7 cm long and 1.5-2.5 cm in diameter at the base; it usually consists of 12 perianth segments in several whorls. The stamens are numerous with a fine, short filament and a linear, yellowish-brown anther. The carpels are free and numerous, spirally arranged on a conical receptacle.

**B.** Microscopic examination (2.8.23). The powder is reddish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of the perianth segments with polyhedral or elliptical epidermal cells, with irregularly thickened walls and anomocytic stomata (4-6 subsidiary cells) (2.8.3), accompanied by parenchyma that includes oval or rounded oil cells about 50 µm in diameter with orange-yellow contents; certain fragments contain epidermal cells with rounded papillae; numerous, branched sclereids, with channelled walls and a large lumen, about 15 µm in diameter; numerous elliptical pollen grains about 50 µm long and 40 µm wide, with a smooth exine.

**C.** Examine the chromatograms obtained in the test for other *Magnolia* species.

**Detection A** Examine in ultraviolet light at 254 nm.

**Results A** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Eugenol: a faint quenching zone	
Magnolol: a dark blue fluorescent zone	A dark blue fluorescent zone (magnolol)
Honokiol: a quenching zone	A quenching zone (honokiol)
Reference solution	Test solution

**Detection B** Treat with *vanillin reagent R*, heat at 100-105 °C for 5-10 min and examine in daylight.

**Results B** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones of various colours may be present in the chromatogram obtained with the test solution.

Top of the plate	
Eugenol: a brown zone	A bluish-violet zone
Magnolol: a pinkish-violet zone	A pinkish-violet zone (magnolol)
Honokiol: a dark violet zone	A dark violet zone (honokiol) A bluish-violet zone
Reference solution	Test solution

## TESTS

### Other *Magnolia* species

Thin-layer chromatography (2.2.27).

**Test solution** Reduce the herbal drug to a powder (710) (2.9.12), avoiding heating. To 0.5 g of the powdered herbal drug add 2.5 mL of *methanol R*. Sonicate for 15 min at a power of 80 W and a frequency of 37 kHz (sonication time may be adapted according to the power and frequency used), then centrifuge at 1500-2000 *g* for 10 min and transfer the supernatant to a 5 mL flask. Add 2 mL of *methanol R* to the residue, sonicate for 15 min and centrifuge. Transfer the supernatant into the same 5 mL flask. Dilute to 5 mL with *methanol R*. Filter through a membrane filter (nominal pore size 0.45 µm) if necessary.

**Reference solution** Dissolve 1 mg of *honokiol R*, 1 mg of *magnolol R* and 2 mg of *eugenol R* in 4 mL of *methanol R*.

**Plate** TLC silica gel *F<sub>254</sub>* plate *R* (2-10 µm).

**Mobile phase** *methanol R*, *ethyl acetate R*, *toluene R* (1:5:30 *V/V/V*).

**Application** 8 µL as bands of 8 mm.

**Development** Over a path of 7 cm.

**Drying** In air.

**Detection** Examine in ultraviolet light at 365 nm.

**Results** The chromatogram obtained with the test solution shows no blue fluorescent zone in the lower part of the plate and no green fluorescent zone in the upper part, nor any other fluorescent zone.

### Loss on drying (2.2.32)

Maximum 11.0 per cent, determined on 1.000 g of the powdered herbal drug (710) (2.9.12) by drying in an oven at 105 °C.

### Total ash (2.4.16)

Maximum 8.0 per cent.

## ASSAY

Liquid chromatography (2.2.29).

**Test solution** Reduce the herbal drug to a powder (710) (2.9.12) using a blade grinder equipped with a double-walled grinding chamber cooled to a temperature of about 10 °C. To 0.500 g of the powdered herbal drug add 10 mL of *methanol R*. Sonicate for 1 h at a power of 80 W and a frequency of 37 kHz (sonication time may be adapted according to the power and frequency used). Change the water of the ultrasonic bath after 30 min of sonication to prevent heating. Centrifuge at 1500-2000 *g* for 15 min. Transfer the supernatant to a 20.0 mL flask. Add 9.5 mL of *methanol R* to the residue. Repeat the sonication for 1 h. Change the water of the ultrasonic bath after 30 min of sonication to prevent heating. Centrifuge. Transfer the supernatant to the same 20.0 mL flask. Cool, then dilute to 20.0 mL with *methanol R*. Filter through a membrane filter (nominal pore size 0.45 µm).

**Reference solution (a)** Dissolve 5.0 mg of *honokiol CRS* in *methanol R* and dilute to 5.0 mL with the same solvent. Dilute 1.0 mL of the solution to 25.0 mL with *methanol R*.

**Reference solution (b)** Dissolve 6.0 mg of *magnolol CRS* in *methanol R* and dilute to 20.0 mL with the same solvent.

**Reference solution (c)** Dissolve 2.0 mg of *honokiol R* in 2.0 mL of *acetonitrile R*. Add 30 µL of *acetic anhydride R* and mix. Heat at 50 °C for 60 min. Cool. Add successively, mixing after each addition, 32 µL of *concentrated ammonia R*, 2.0 mL of *acetonitrile R* and 4.0 mL of *water R*. Filter through a membrane filter (nominal pore size 0.45 µm).

### Column:

- size:  $l = 0.15$  m,  $\varnothing = 4.6$  mm;
- stationary phase: end-capped ethylene-bridged polar-embedded octadecylsilyl silica gel for chromatography (hybrid material) *R* (3.5 µm);
- temperature:  $25 \pm 2$  °C.

### Mobile phase:

- mobile phase A: *anhydrous formic acid R*, *water R* (0.1:99.9 *V/V*);
- mobile phase B: *acetonitrile for chromatography R*;

Time (min)	Mobile phase A (per cent <i>V/V</i> )	Mobile phase B (per cent <i>V/V</i> )
0 - 20	47	53
20 - 22	47 → 5	53 → 95
22 - 27	5	95

**Flow rate** 1.0 mL/min.

**Detection** Spectrophotometer at 292 nm.

**Injection** 20 µL.

**Relative retention** With reference to *honokiol* (retention time = about 10 min): *magnolol* = about 1.3; *honokiol*

monoacetate isomer 1 = about 1.4; honokiol monoacetate isomer 2 = about 1.5; honokiol diacetate = about 1.9.

**System suitability** Reference solution (c):

— **resolution:** minimum 2.0 between the peaks due to honokiol monoacetate isomers 1 and 2.

If necessary, dilute the test solution to obtain peaks of honokiol and magnolol that are similar in height to the corresponding peaks in reference solutions (a) and (b).

Calculate the sum of the percentage contents of honokiol and magnolol using the following expression:

$$\frac{A_1 \times m_2 \times 0.16 \times p_1 \times d}{A_2 \times m_1} + \frac{A_3 \times m_3 \times p_2 \times d}{A_4 \times m_1}$$

- $A_1$  = area of the peak due to honokiol in the chromatogram obtained with the test solution;  
 $A_2$  = area of the peak due to honokiol in the chromatogram obtained with reference solution (a);  
 $A_3$  = area of the peak due to magnolol in the chromatogram obtained with the test solution;  
 $A_4$  = area of the peak due to magnolol in the chromatogram obtained with reference solution (b);  
 $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;  
 $m_2$  = mass of honokiol CRS used to prepare reference solution (a), in grams;  
 $m_3$  = mass of magnolol CRS used to prepare reference solution (b), in grams;  
 $p_1$  = percentage content of honokiol in honokiol CRS;  
 $p_2$  = percentage content of magnolol in magnolol CRS;  
 $d$  = dilution factor of the test solution.

Ph Eur

## Mallow Flower

(Ph. Eur. monograph 1541)

Ph Eur

### DEFINITION

Whole or fragmented dried flower of *Malva sylvestris* L. or its cultivated varieties.

### IDENTIFICATION

A. The flower consists of an epicalyx with 3 oblong or elliptical-lanceolate parts that are shorter than those of the calyx and situated immediately below it; a calyx with 5 pubescent triangular lobes, gamosepalous at the base; a corolla 3-4 times longer than the calyx with 5 wedge-shaped, notched petals fused to the staminal tube at their base; numerous stamens, the filaments of which fuse into a staminal tube covered by small star-shaped trichomes and occasional simple trichomes visible using a lens; numerous wrinkled carpels, glabrous or sometimes pubescent, enclosed in the staminal tube and arranged into a circle around a central style ending with numerous filiform stigmas. In cultivated varieties, the epicalyx is 3-7 partite, the calyx 5-8 partite and the corolla 5-10 partite.

B. Microscopic examination (2.8.23). The powder is bluish-grey. Examine under a microscope using chloral hydrate solution R. The powder shows the following diagnostic characters (Figure 1541.-1): unicellular, thick-walled, flexuous covering trichomes, from the calyx and the epicalyx, up to 2 mm in length, whole [L] or, most often, fragmented [Q]; fragments of the epidermis of the sepals (surface view [D, J]) with anomocytic stomata (2.8.3) [Dc]; club-shaped glandular trichomes with multicellular heads [Db] and short unicellular covering trichomes, somewhat curved, either

isolated [J] or in star-shaped groups of 2-6 [Da]; fragments of covering trichomes [N]; isolated glandular trichomes (surface view [F], transverse section [G]); fragments of the mesophyll of the calyx and the epicalyx whose cells contain small cluster crystals of calcium oxalate [K]; veins of the sepals [P] with vessels [Pa] accompanied by cells with cluster crystals of calcium oxalate [Pb]; fragments of petal epidermis, with elongated cells and sinuous margins, narrow in the wild plant [A], shorter and broader in the cultivated varieties [B], bearing sessile glandular trichomes with multicellular club-shaped heads [Ba, C, E]; fragments of petal mesophyll [H] consisting of large mucilage cells [Hc], sometimes cells with small cluster crystals of calcium oxalate [Hb] and spiral vessels [Ha]; spherical pollen grains, about 150 µm in diameter, with a roughly spiny exine [M].

Figure 1541.-1. – Illustration for identification test B of powdered herbal drug of mallow flower

C. Thin-layer chromatography (2.2.27).

**Test solution** To 1 g of the powdered herbal drug (355) (2.9.12) add 10 mL of ethanol (60 per cent V/V) R. Stir for 15 min and filter.

**Reference solution** 0.5 g/L solution of quinaldine red R in ethanol (96 per cent) R.

**Plate** TLC silica gel plate R.

**Mobile phase** glacial acetic acid R, water R, butanol R (15:30:60 V/V/V).

**Application** 10 µL of the test solution and 5 µL of the reference solution, as bands.

**Development** Over a path of 10 cm.

**Drying** In air.

**Detection** Examine in daylight.

**Results** The chromatogram obtained with the reference solution shows an orange-red zone in the upper part of the middle third; the chromatogram obtained with the test

solution shows, below the zone in the chromatogram obtained with the reference solution, 2 violet zones in the middle third, with the principal zone (6''-malonyl malvin) situated just below the other violet zone (malvin).

#### TESTS

##### Loss on drying (2.2.32)

Maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug by drying in an oven at 105 °C.

##### Total ash (2.4.16)

Maximum 14.0 per cent.

##### Ash insoluble in hydrochloric acid (2.8.1)

Maximum 2.0 per cent.

##### Swelling index (2.8.4)

Minimum 15, determined on 0.2 g of the powdered herbal drug (710) (2.9.12) moistened with 0.5 mL of *anhydrous ethanol R*.

Ph Eur

## Mallow Leaf

(Ph. Eur. monograph 2391)

Ph Eur

#### DEFINITION

Whole or fragmented, dried leaf of *Malva sylvestris* L., *Malva neglecta* Wallr. or a mixture of both species.

#### IDENTIFICATION

A. The leaves of *M. sylvestris* are up to 12 cm long and up to 15 cm wide with 3, 5 or 7 lobes and sinuate at the base; the leaves of *M. neglecta* are up to 9 cm long and wide, round or kidney-shaped with 5-7 indistinct lobes. The leaves of both species have irregular dentate margins and are green or brownish-green. The abaxial surface of the lamina bears more hairs and shows a more prominent venation than the adaxial surface. The major veins on the upper surface of the leaves and the petioles may be violet. The petioles are as long as the leaves, up to 2 mm wide, rounded and somewhat flattened, longitudinally slightly grooved, green or brownish-green or violet. The fragmented drug consists of occasionally agglomerated, crumpled pieces of leaves showing prominent veins.

B. Microscopic examination (2.8.23). The powder is green or yellowish-green. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2391.-1): fragments of the lamina (transverse section [F]), consisting of the lower epidermis (surface view [C]) and the upper epidermis (surface view [D]), transverse section [Fb]), with cells that show straight, or more or less sinuous anticlinal walls; stomata mostly anisocytic (2.8.3) on both surfaces [Ca, Da]; long covering trichomes with thickened walls and tapering to a point at the apex, usually unicellular, whole [A, Fa] or fragmented [Db], but in *M. Sylvestris* they may be stellate with 2-8 components [H], each strongly pitted at the base; club-shaped glandular trichomes composed of 2-6 cells [E] occur in both species; fragments of the mesophyll consisting of palisade parenchyma (surface view [Dc], transverse section [Fc]) and spongy mesophyll cells containing mucilage, cells containing cluster crystals of calcium oxalate, often associated with vessels [B]; occasional spherical pollen grains, 110-170 µm in diameter, with a spiny exine [G].

Figure 2391.-1. – Illustration for identification test B of powdered herbal drug of mallow leaf

#### C. Thin-layer chromatography (2.2.27).

**Test solution** To 2.0 g of the powdered herbal drug (710) (2.9.12) add 20 mL of an 80 per cent *V/V* solution of *tetrahydrofuran R*; extract for 10 min using sonication and filter.

**Reference solution** Dissolve 3 mg of *hyperoside R* and 3 mg of *rutoside trihydrate R* in 20 mL of *methanol R*.

**Plate** TLC silica gel plate R (5-40 µm) [or TLC silica gel plate R (2-10 µm)].

**Mobile phase** *anhydrous formic acid R*, *anhydrous acetic acid R*, *water R*, *ethyl formate R*, *3-pentanone R* (4:11:14:20:50 *V/V/V/V/V*).

**Application** 10 µL [or 4 µL] as bands of 10 mm [or 8 mm].

**Development** Over a path of 10-12 cm [or 6 cm].

**Drying** In air.

**Detection** Heat at 100 °C for 10 min; spray or dip the warm plate in a 10 g/L solution of *diphenylboric acid aminoethyl ester R* in *methanol R*; remove the solvent with cold air; spray or dip the plate in a 50 g/L solution of *macrogol 400 R* in *methanol R*, dry in air and examine after 15 min in ultraviolet light at 365 nm.

**Results** See below the sequence of fluorescent zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint fluorescent zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Hyperoside: a yellow fluorescent zone	A yellow fluorescent zone
Rutoside: a yellow fluorescent zone	A yellow fluorescent zone A light blue fluorescent zone An orange fluorescent zone An orange fluorescent zone
Reference solution	Test solution

**TESTS****Foreign matter (2.8.2)**

Maximum 5 per cent of foreign organs, maximum 5 per cent of leaves with blisters of spores of *Puccinia malvacearum* and maximum 2 per cent of foreign elements.

Foreign organs can be flowers, fruits and parts of the stem. The blisters of spores on the leaves are mostly 1 mm wide, and red or brown. Examine under a microscope using *chloral hydrate solution R*. The spores of *Puccinia malvacearum* are oblong or oval with brownish walls and a small appendage.

**Loss on drying (2.2.32)**

Maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (710) (2.9.12) by drying in an oven at 105 °C for 2 h.

**Total ash (2.4.16)**

Maximum 17.0 per cent.

**Ash insoluble in hydrochloric acid (2.8.1)**

Maximum 3.0 per cent.

**Swelling index (2.8.4)**

Minimum 7, determined on 1.0 g of the powdered herbal drug (710) (2.9.12).

Ph Eur

**Mandarin Epicarp and Mesocarp**

(Ph. Eur. monograph 2430)

Ph Eur

**DEFINITION**

Dried epicarp and mesocarp of the ripe fruit of *Citrus reticulata* Blanco or its cultivars, partly freed from the white spongy tissue of the mesocarp.

**Content**

Minimum 3.5 per cent of hesperidin (C<sub>28</sub>H<sub>34</sub>O<sub>15</sub>; M<sub>r</sub> 611) (dried drug).

**IDENTIFICATION**

A. The pericarp consists of variously sized irregular pieces, or it is cut into strips, which may be folded or form compressed loops. The larger pieces are mostly lobed, the lobes attached at the base of the pericarp where the remains of a fruit stalk or stalk scar may be present. Isolated lobes of pericarp may also be present. Irregular pieces 0.5-7.6 cm long, and 0.4-4.6 cm wide; strips up to 7.6 cm long and up to 2 cm wide; both forms 1-4.5 mm thick. The outer surface is

yellowish-brown or orange, reddish-brown or more rarely, blackish- or greenish-brown; often finely wrinkled and slightly shiny. Scattered, concave or raised oil glands are dense on the outer surface; when visible in transverse section oil glands appear as irregularly shaped cavities beneath the epicarp. The inner surface of the pericarp appears whitish or whitish-yellowish, rough and often fibrous in texture, bearing yellowish-white or yellowish-brown raised, often branched vascular bundles. The texture is mostly hard, stiff and fragile, easily broken.

B. Microscopic examination (2.8.23). The powder is light yellowish or orange-brown, more rarely reddish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2430.-1): fragments of epicarp (surface view [H]) consisting of small polygonal cells, sub-square or rectangular, with slightly thickened anticlinal walls [Ha] and occasional rounded stomata [Hb] (18-27 µm in diameter) encircled by a combination of small polygonal plus narrow, elongate subsidiary cells; epicarp usually accompanied by sub-epicarpal layers of thin-walled cells containing prisms of calcium oxalate [Hc]; prisms commonly biconical, also rhomboidal or polyhedral prisms present, 5-30 µm long and 3-18 µm in diameter; fragments of pericarp (transverse section [E]) showing the epicarp covered by a thick cuticle [Ea] and sub-epicarpal layers composed of cells, some of which contain prisms of calcium oxalate [Eb]; sometimes more than 1 prism crystal is found in the same cell [Aa, Hd]; fragments of schizolysigenous oil glands [C]; numerous groups of mesocarp cells (transverse section [A], longitudinal section [D]) with irregularly thickened, weakly lignified cell walls; free prism crystals of calcium oxalate or single crystals within isolated cells [B]; yellow hesperidin crystals sometimes abundant in cells; small droplets of orange-yellow essential oil occasionally present; numerous small vascular bundles [F] with narrow reticulate or spiral xylem [Fa] (4-23 µm in diameter), and occasional pitted tracheids; vasculature, sometimes accompanied by crystal sheaths [Fb]; occasional isolated, short vessels [G]. Examine under a microscope using a 20 g/L solution of *potassium hydroxide R*. The mounting medium becomes yellow because of the presence of hesperidin.

C. Thin-layer chromatography (2.2.27).

**Test solution** To 1 g of the powdered herbal drug (355) (2.9.12) add 10 mL of *methanol R* and heat in a water-bath at 65 °C for 5 min, shaking frequently. Allow to cool and filter.

**Reference solution** Dissolve 1 mg of *caffeic acid R* and 2 mg of *hesperidin R* in 5 mL of *methanol R*.

**Plate** TLC silica gel plate R (2-10 µm).

**Mobile phase** *water R*, *anhydrous formic acid R*, *ethyl acetate R* (10:15:75 V/V/V).

**Application** 5 µL of the test solution and 10 µL of the reference solution as bands of 8 mm.

**Development** Over a path of 6 cm.

**Drying** In air, then heat at 110-120 °C for 5 min.

**Detection** Treat with a 10 g/L solution of *aluminium chloride R* in *ethanol (96 per cent) R* and heat at 110-120 °C for 5 min; treat the warm plate with a 10 g/L solution of *diphenylboric acid aminoethyl ester R* in *methanol R*, and then with a 50 g/L solution of *macrogol 400 R* in *methanol R*. After 60 min examine the chromatograms in ultraviolet light at 365 nm.

Figure 2430.-1. – Illustration for identification test B of powdered herbal drug of mandarin epicarp and mesocarp

**Results** See below the sequence of fluorescent zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint fluorescent zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Caffeic acid: a light blue fluorescent zone	A blue fluorescent zone
Hesperidin: a greenish-brown fluorescent zone	A greenish-brown fluorescent zone (hesperidin)
	A yellowish-green fluorescent zone
	A greenish fluorescent zone
Reference solution	Test solution

**TESTS**

**Bitter-orange epicarp and mesocarp**

Examine the chromatograms obtained in the assay.

**Results** The chromatogram obtained with the test solution shows no peak at the retention time of naringin with an area of more than 1 per cent of the area of the peak due to hesperidin.

**Loss on drying (2.2.32)**

Maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

**Total ash (2.4.16)**

Maximum 7.0 per cent.

**ASSAY**

Liquid chromatography (2.2.29).

**Test solution** Place 0.125 g of the powdered herbal drug (355) (2.9.12) in a 100 mL round-bottomed flask. Add 50.0 mL of methanol R, stir for 2 h and filter through a membrane filter (nominal pore size 0.45 µm).

**Reference solution (a)** Dissolve 10.0 mg of hesperidin CRS in methanol R and dilute to 50.0 mL with the same solvent.

**Reference solution (b)** Dissolve 5.0 mg of naringin R in reference solution (a) and dilute to 25.0 mL with reference solution (a).

**Column:**

- size:  $l = 0.25$  m,  $\varnothing = 4.6$  mm;
- stationary phase: end-capped octadecylsilyl silica gel for chromatography R (5 µm);
- temperature: 40 °C.

**Mobile phase** acetonitrile R, glacial acetic acid R, methanol R, water R (2.7:3.7:22:71.6 V/V/V/V).

**Flow rate** 1 mL/min.

**Detection** Spectrophotometer at 283 nm.

**Injection** 10 µL.

**Run time** Twice the retention time of hesperidin.

**Retention time** Naringin = about 15 min; hesperidin = about 20 min.

**System suitability** Reference solution (b):

- resolution: minimum 2.0 between the peaks due to naringin and hesperidin.

Calculate the percentage content of hesperidin using the following expression:

$$\frac{A_1 \times m_2 \times p}{A_2 \times m_1}$$

- $A_1$  = area of the peak due to hesperidin in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to hesperidin in the chromatogram obtained with reference solution (a);
- $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;
- $m_2$  = mass of hesperidin CRS used to prepare reference solution (a), in grams;
- $p$  = percentage content of hesperidin in hesperidin CRS.

Ph Eur

**Mandarin Oil**

(Ph. Eur. monograph 2355)

Ph Eur

**DEFINITION**

Essential oil obtained without heating, by suitable mechanical treatment, from the peel of the fresh fruit of *Citrus reticulata* Blanco.

**CHARACTERS**

**Appearance**

Greenish, yellow or reddish orange liquid showing blue fluorescence.

Characteristic odour.

**IDENTIFICATION**

**First identification: B.**

**Second identification: A.**

A. Thin-layer chromatography (2.2.27).

**Test solution** Dilute 0.1 mL of the substance to be examined to 1 mL with *toluene R*.

**Reference solution** Dissolve 2 µL of *methyl N-methylanthranilate R*, 4 mg of *guaiazulene R* and 10 mg of *α-terpineol R* in 10 mL of *toluene R*.

**Plate** TLC silica gel plate R (5-40 µm) [or TLC silica gel plate R (2-10 µm)].

**Mobile phase** *ethyl acetate R*, *toluene R* (15:85 V/V).

**Application** 10 µL [or 2 µL] as bands.

**Development** Over a path of 15 cm [or 6 cm].

**Drying** In air.

**Detection A** Examine in ultraviolet light at 365 nm.

**Results A** The intense blue fluorescent zone in the chromatogram obtained with the test solution is similar in position and fluorescence to the zone due to *methyl N-methylanthranilate* in the chromatogram obtained with the reference solution. Furthermore, other fluorescent zones may be present in the chromatogram obtained with the test solution.

**Detection B** Spray with a 200 g/L solution of *phosphomolybdic acid R* in *ethanol (96 per cent) R* and heat at 100 °C for 10 min; examine in daylight.

**Results B** See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Guaiazulene: a blue zone	A blue zone
	A blue zone
	A blue zone
	A blue zone
α-Terpineol: a blue zone	A blue zone (α-terpineol)
Reference solution	Test solution

B. Examine the chromatograms obtained in the test for chromatographic profile.

**Results** The characteristic peaks in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with the reference solution.

#### TESTS

**Relative density (2.2.5)**  
0.848 to 0.855.

**Refractive index (2.2.6)**  
1.474 to 1.478.

**Optical rotation (2.2.7)**  
+ 64° to + 75°.

**Fatty oils and resinified essential oils (2.8.7)**  
It complies with the test.

#### Chromatographic profile

Gas chromatography (2.2.28): use the normalisation procedure.

**Test solution** Dilute 0.20 g of the substance to be examined to 10.0 mL with *heptane R*.

**Reference solution (a)** Dilute 5 µL of *α-pinene R*, 5 µL of *sabinene R*, 5 µL of *β-pinene R*, 5 µL of *β-myrcene R*, 5 µL of *p-cymene R*, 70 µL of *limonene R*, 20 µL of *γ-terpinene R* and 5 µL of *methyl N-methylanthranilate R* to 5.0 mL with *heptane R*.

**Reference solution (b)** Dissolve 5 µL of *limonene R* in 50 mL of *heptane R*. Dilute 0.5 mL of this solution to 5.0 mL with *heptane R*.

#### Column:

- **material:** fused silica;
- **size:**  $l = 60$  m,  $\varnothing = 0.25$  mm;
- **stationary phase:** *phenyl(5)methyl(95)polysiloxane R* (film thickness 0.25 µm).

**Carrier gas** *helium for chromatography R*.

**Flow rate** 1.4 mL/min.

**Split ratio** 1:70.

**Temperature:**

	Time (min)	Temperature (°C)
Column	0 - 90	50 → 230
Injection port		250
Detector		250

**Detection** Flame ionisation.

**Injection** 1 µL.

**Elution order** Order indicated in the composition of reference solution (a); record the retention times of these substances.

**System suitability** Reference solution (a):

- **resolution:** minimum 1.5 between the peaks due to *sabinene* and *β-pinene* and minimum 1.5 between the peaks due to *p-cymene* and *limonene*.

**Identification of components** Using the retention times determined from the chromatogram obtained with reference solution (a), locate the components of reference solution (a) in the chromatogram obtained with the test solution.

Disregard the peak due to *heptane*.

Determine the percentage content of each of these components. The limits are within the following ranges:

- *α-pinene*: 1.6 per cent to 3.0 per cent;
- *sabinene*: maximum 0.3 per cent;
- *β-pinene*: 1.2 per cent to 2.0 per cent;
- *β-myrcene*: 1.5 per cent to 2.0 per cent;
- *p-cymene*: maximum 1.0 per cent;
- *limonene*: 65.0 per cent to 75.0 per cent;
- *γ-terpinene*: 16.0 per cent to 22.0 per cent;
- *methyl N-methylanthranilate*: 0.30 per cent to 0.60 per cent;
- **disregard limit:** area of the principal peak in the chromatogram obtained with reference solution (b)  $\leq$

#### Residue on evaporation (2.8.9)

1.6 per cent to 4.0 per cent, determined after heating on a water-bath for 4 h.

#### STORAGE

At a temperature not exceeding 25 °C.

Ph Eur

## Marshmallow Leaf

(Ph. Eur. monograph 1856)

Ph.Eur

### DEFINITION

Whole or cut, dried leaf of *Althaea officinalis* L.

### IDENTIFICATION

A. The leaves have long petioles and are about 7-10 cm long; the lamina is cordate or ovate with 3-5 shallow lobes and crenate or dentate margins; the venation is palmate. The petioles and both surfaces of the lamina are greyish-green and densely pubescent. Rarely, fragments of the inflorescence or immature fruits may be present.

B. Microscopic examination (2.8.23). The powder is greyish-green. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 1856.-1): numerous long, rigid, unicellular covering trichomes with thick walls, pointed at the apex, often fragmented [C], angular and pitted at the base where they are sometimes still united to form stellate structures with up to 8 components (surface view [B], transverse section [E]); few secretory trichomes, isolated, with unicellular stalks and globular, multicellular heads [F]; fragments of the lower [A] and upper [D] leaf epidermises in surface view with anomocytic [Aa] or paracytic [Da] stomata (2.8.3), glandular trichomes [Ab] and basal cells of covering trichomes [Ac], often accompanied by palisade parenchyma [Db]; cluster crystals of calcium oxalate, isolated [H] or included in the parenchyma of the mesophyll [Gc, Kb]; fragments of veins [G] with small, spiral [Gb] or annular [Ga] vessels, often accompanied by sheaths containing cluster crystals of calcium oxalate [Gc]; fragments of the lamina, in transverse section [K], showing the epidermises bearing broken covering trichomes [Ka], a symmetrical, heterogeneous mesophyll with some cells containing cluster crystals of calcium oxalate [Kb]; occasional pollen grains, spherical, with a roughly spiny exine, about 150 µm in diameter [J]. Examine under a microscope using *ruthenium red solution R*. The powder shows groups of parenchyma containing mucilage, which stains orange-red.

C. Thin-layer chromatography (2.2.27).

**Test solution** To 1 g of the powdered herbal drug (355) (2.9.12) add 10 mL of *methanol R*. Heat in a water-bath under a reflux condenser for 5 min. Allow to cool and filter. Distil the filtrate under reduced pressure until the total volume is about 2 mL.

**Reference solution** Dissolve 2.5 mg of *chlorogenic acid R* and 2.5 mg of *quercitrin R* in 10 mL of *methanol R*.

**Plate** TLC silica gel plate R.

**Mobile phase** *anhydrous formic acid R*, *glacial acetic acid R*, *water R*, *ethyl acetate R* (11:11:27:100 V/V/V/V).

**Application** 10 µL as bands.

**Development** Over a path of 15 cm.

**Drying** At 100-105 °C.

**Detection** Spray with a 10 g/L solution of *diphenylboric acid aminoethyl ester R* in *methanol R*, then with a 50 g/L solution of *macrogol 400 R* in *methanol R*; allow to dry in air for 30 min and examine in ultraviolet light at 365 nm.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other fluorescent zones may be present in the chromatogram obtained with the test solution.

Test solution	

### TESTS

#### Foreign matter (2.8.2)

Maximum 4 per cent of leaves infected by *Puccinia malvacearum*, showing red spots, and maximum 2 per cent of other foreign matter.

#### Loss on drying (2.2.32)

Maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

Total ash (2.4.16)  
Maximum 18.0 per cent.

Ash insoluble in hydrochloric acid (2.8.1)  
Maximum 2.0 per cent.

Swelling index (2.8.4)  
Minimum 12, determined on 0.2 g of the powdered herbal drug (355) (2.9.12).

Ph Eur

## Marshmallow Root

(Ph. Eur. monograph 1126)

Ph Eur

### DEFINITION

Peeled or unpeeled, whole or cut, dried root of *Althaea officinalis* L.

### IDENTIFICATION

A. The unpeeled, non-fragmented drug consists of cylindrical, slightly twisted roots, up to 2 cm thick, with deep longitudinal furrows. The outer surface is greyish-brown and bears numerous rootlet scars. The fracture is fibrous externally, rugged and granular internally. The section shows a more or less thick, whitish bark with brownish periderm, separated by the well-marked, brownish cambium from a white xylem. The stratified structure of the bark and the radiate structure of xylem become more distinct when moistened.

The peeled drug has a greyish-white, finely fibrous outer surface. Cork and external cortical parenchyma are absent.

B. Microscopic examination (2.8.23). The powder is greyish-brown (unpeeled root) or whitish (peeled root). Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 1126.-1): fragments of colourless, mainly unligified, thick-walled fibres [C, D, M] with split or pointed ends [D], sometimes accompanied by parenchymatous cells of the medullary rays [M], or grouped [C]; fragments of vessels, bordered-pitted or with reticulate or scalariform thickenings [G, H]; cluster crystals of calcium oxalate about 20-35 µm, mostly 25-30 µm in size, isolated [K] or included in parenchymatous cells [B]; fragments of parenchyma [E] with cells containing mucilage [Ea, F]; fragments of cork with thin-walled, tabular cells (surface view [A], transverse section [L]) (unpeeled root). Examine under a microscope using *ruthenium red solution R*. The powder shows groups of parenchyma containing mucilage, which stains orange-red. Examine under a microscope using *water R*. The powder shows numerous starch granules [J], about 3-25 µm in size, occasionally with a longitudinal hilum. The starch granules are mostly simple [Ja], a few being 2-4 compound [Jb].

Figure 1126.-1. – Illustration for identification test B of powdered herbal drug of marshmallow root

### TESTS

Foreign matter (2.8.2)

Maximum 2 per cent of brown deteriorated drug.

Loss on drying (2.2.32)

Maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (710) (2.9.12) by drying in an oven at 105 °C for 2 h.

Total ash (2.4.16)

Maximum 6.0 per cent for the peeled root and maximum 8.0 per cent for the unpeeled root.

Swelling index (2.8.4)

Minimum 10, determined on the powdered herbal drug (710) (2.9.12).

Ph Eur

## Mastic

(Ph. Eur. monograph 1876)

Ph Eur

### DEFINITION

Dried resinous exudate obtained from stems and branches of *Pistacia lentiscus* L.

### Content

Minimum 10 mL/kg of essential oil (anhydrous drug).

### IDENTIFICATION

A. Small light yellow to greenish-yellow, non-uniform, spherical or pyriform, clear or opaque, hard glassy fragments.

**B. Thin-layer chromatography (2.2.27).**

**Test solution** Dissolve 1 g of the substance to be examined in 10 mL of *methylene chloride R* and filter after 1-2 min.

**Reference solution** Dissolve 25 mg of *eugenol R* and 25 mg of *borneol R* in 3 mL of *methylene chloride R*.

**Plate** TLC silica gel plate *R*.

**Mobile phase** *light petroleum R*, *toluene R* (5:95 *V/V*).

**Application** 1 µL as bands.

**Development** Over a path of 10 cm.

**Drying** In air.

**Detection** Spray with *vanillin reagent R* and heat at 100-105 °C for 5 min.

**Results** See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones of various colours may be present in the chromatogram obtained with the test solution.

Top of the plate	
	A violet zone
	A pale violet zone
	A very pale violet zone
Eugenol: a brown zone	A blue zone
Borneol: a greenish-blue zone	A bluish-violet zone
	A dark violet zone
Reference solution	Test solution

**TESTS****Acid value (2.5.1)**

50 to 70, determined on 1.0 g.

**Water (2.2.13)**

Maximum 10 mL/kg, determined on 25.0 g of the drug reduced to a powder (1400) (2.9.12).

**Total ash (2.4.16)**

Maximum 0.5 per cent.

**ASSAY****Essential oil (2.8.12)**

Use a 500 mL round-bottomed flask and 200 mL of *water R* as the distillation liquid. Reduce the drug to a powder (1400) (2.9.12) and immediately use 20.0 g for the determination. Introduce 0.50 mL of *xylene R* in the graduated tube. Distil at a rate of 2-3 mL/min for 2 h.

**STORAGE**

Do not powder.

Ph Eur

**Mate Leaf**

(Ph. Eur. monograph 2678)

Ph Eur

**DEFINITION**

Leaf of *Ilex paraguariensis* A.St.-Hil., rapidly desiccated by heating and cut.

**Content**

Minimum 1.0 per cent of caffeine ( $C_8H_{10}N_4O_2$ ;  $M_r$  194.2) (dried drug).

**IDENTIFICATION**

**A.** The yellowish-green or brownish-green leaf is tough and brittle with a short petiole. It is 8-12 cm long and 5-6 cm wide. The lamina is elliptic oval and glabrous, with dentate margins. The venation is pinnate and prominent on the lower surface. The cut herbal drug occurs as glabrous, yellowish-green, irregular, angular pieces ranging in length from 2-4 mm.

Figure 2678.-1. – Illustration for identification test B of powdered herbal drug of mate leaf

**B. Microscopic examination (2.8.23).** The powder is brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2678.-1): fragments of the upper epidermis of the lamina (surface view [F], transverse section [B]), covered with an irregularly striated cuticle [Fa, Ba] and consisting of cells with slightly and regularly thickened walls [Fa, Bb], with some cells containing a prism of calcium oxalate [Fb, Bc], and accompanied by underlying palisade parenchyma [Fc, Bd]; fragments of the upper epidermis of the lamina from the area near a vein (surface view [K]), consisting of nearly rectangular cells in a regular arrangement; fragments of the lower epidermis of the lamina (surface view [A], transverse section [L]), covered by a striated cuticle [Aa, La] consisting of polygonal cells [Aa] and anomocytic stomata (2.8.3) [Lb,

Ab]; fragments of spongy parenchyma (surface view [D]), sometimes accompanying the lower epidermis (transverse section [Lc]); cluster crystals of calcium oxalate of various sizes that may exceed 30 µm in diameter, isolated [J] or included in parenchyma cells [G]; groups of pericyclic fibres [C]; rectangular, thick-walled and channelled cells from the endodermis [E], often accompanying pericyclic fibres [Ba]; vascular bundles [H] consisting of spiral vessels with a small diameter [Ha], accompanied by fibres [Hb] and sometimes by parenchyma, with some cells containing a cluster crystal of calcium oxalate [Hc].

#### C. Thin-layer chromatography (2.2.27).

**Test solution** To 1.0 g of the powdered herbal drug (355) (2.9.12) add 10 mL of *methanol R* and sonicate for 10 min. Centrifuge or filter.

**Reference solution** Dissolve 7 mg of *caffeine R*, 1 mg of *chlorogenic acid R* and 1 mg of *rutoside trihydrate R* in 5 mL of *methanol R*.

**Plate** TLC silica gel  $F_{254}$  plate *R* (2-10 µm).

**Mobile phase** *toluene R*, *water R*, *anhydrous formic acid R*, *ethyl formate R* (3:6:8:60 *V/V/V/V*).

**Application** 4 µL as bands of 8 mm.

**Development** Over a path of 6 cm.

**Drying** In a current of air at room temperature.

**Detection A** Examine in ultraviolet light at 254 nm.

**Results A** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint quenching zones may be present in the chromatogram obtained with the test solution.

#### TESTS

##### Loss on drying (2.2.32)

Maximum 8.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C.

##### Total ash (2.4.16)

Maximum 8.0 per cent.

#### ASSAY

##### Liquid chromatography (2.2.29).

**Solution A** Dissolve 30.0 mg of *caffeine CRS* in the mobile phase and dilute to 100.0 mL with the mobile phase.

**Test solution** Introduce 1.500 g of the powdered herbal drug (355) (2.9.12) into a 100 mL round-bottomed flask and add 40 mL of *methanol R*. Heat in a water-bath at 70 °C under a reflux condenser for 30 min. Allow to cool and filter through a plug of absorbent cotton into a 100 mL volumetric flask. Transfer the absorbent cotton with the drug residue into the round-bottomed flask. Add 40 mL of *methanol R*, proceed as before and filter into the same volumetric flask. Rinse the round-bottomed flask and the filter with *methanol R*, add the rinsings to the volumetric flask and dilute to 100.0 mL with *methanol R*. Shake to obtain a homogeneous solution. Transfer 10.0 mL of this solution into a volumetric flask, add 30 mL of *water R* and dilute to 50.0 mL with the mobile phase. Filter through a membrane filter (nominal pore size 0.45 µm).

**Reference solution (a)** Dilute 5.0 mL of solution A to 50.0 mL with the mobile phase.

**Reference solution (b)** Dissolve 15.0 mg of (-)-*epicatechin R* in the mobile phase and dilute to 25.0 mL with the mobile phase. To 10.0 mL of the solution add 5.0 mL of solution A and dilute to 50.0 mL with the mobile phase.

##### Column:

— size:  $l = 0.25$  m,  $\varnothing = 4.6$  mm;

— stationary phase: end-capped octadecylsilyl silica gel for chromatography *R* (5 µm).

**Mobile phase** *methanol R*, *water for chromatography R* (25:75 *V/V*).

**Flow rate** 1 mL/min.

**Detection** Spectrophotometer at 272 nm.

**Injection** 10 µL.

**Run time** 3 times the retention time of caffeine.

**Retention time** Caffeine = about 11 min.

**System suitability** Reference solution (b):

— **resolution:** minimum 2.0 between the peaks due to caffeine and (–)-epicatechin.

Calculate the percentage content of caffeine using the following expression:

$$\frac{A_1 \times m_2 \times p}{A_2 \times m_1 \times 2}$$

- $A_1$  = area of the peak due to caffeine in the chromatogram obtained with the test solution;  
 $A_2$  = area of the peak due to caffeine in the chromatogram obtained with reference solution (a);  
 $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;  
 $m_2$  = mass of caffeine CRS used to prepare solution A, in grams;  
 $p$  = percentage content of caffeine in caffeine CRS.

Ph Eur

## Matricaria Flowers

(*Matricaria* Flower, Ph. Eur. monograph 0404)

### Preparation

Matricaria Liquid Extract

Ph Eur

### DEFINITION

Dried capitula of *Matricaria recutita* L. (*Chamomilla recutita* (L.) Rauschert).

### Content

- **blue essential oil:** minimum 4 mL/kg (dried drug);  
 — **total apigenin 7-glucoside** ( $C_{21}H_{20}O_{10}$ ;  $M_r$  432.4): minimum 0.25 per cent (dried drug).

### IDENTIFICATION

**A.** Capitula, when spread out, consisting of an involucre made up of many bracts arranged in 1-3 rows; an elongated-conical receptacle, occasionally hemispherical (young capitula); 12-20 marginal ligulate florets with a white ligule; several dozen yellow central tubular florets. The involucre bracts are ovate or lanceolate, with a brownish-grey scarios margin. The receptacle is hollow, without paleae. The corolla of the ligulate florets has a brownish-yellow tube at the base extending to form a white, elongated-oval ligule. The inferior ovary is dark brown, ovoid or spherical, and has a long style and bifid stigma. The tubular florets are yellow and have a five-toothed corolla tube, 5 syngenesious, epipetalous stamens and a gynoeceium similar to that of the ligulate florets.

**B.** Microscopic examination (2.8.23). The powder is light yellowish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 0404.-1): fragments of the outer epidermis of the bracts of the involucre (surface view [K]), consisting of, on the margin, thin-walled cells covered by a finely striated cuticle [Ka], anomocytic stomata (2.8.3) [Kb] and occasional biserial glandular trichomes [Kc], and a central region [J] composed of elongated sclereids with moderately thickened and channelled walls [Ja]; fragments of the inner epidermis of the corolla of the ligulate florets consisting of thin-walled, polygonal cells, slightly papillose [B]; fragments of the outer epidermis of the ligulate florets consisting of sinuous cells, covered by a striated cuticle [D], often accompanied by underlying narrow vessels [Da]; fragments

[A] with elongated cells on the margin [Aa] and slightly papillose cells [Ab]; biserial glandular trichomes with a short stalk (1 or 2 tiers of 2 cells) and a head of 2-3 tiers of 2 cells, on the epidermises of the corollas of both types of floret and of the bracts of the involucre and on the ovary (surface view [Eb, G, Kc], side view [Ha]); fragments of the base of the flower where the ovary is located, with a ring of thick-walled sclerous cells [C]; fragments of the epidermis surrounding the ovary (surface view [E]) consisting of thin, longitudinally elongated cells [Ea], with numerous glandular trichomes [Eb], alternating with large elongated cells filled with mucilage in transversally folded layers [Ec]; fragments of the epidermis surrounding the ovary (side view [H]) bearing glandular trichomes [Ha] and underlying parenchymatous cells containing small cluster crystals of calcium oxalate [Hb]; groups of cells at the apex of the stigmas forming elongated papillae [L]; pollen grains spherical or triangular, about 25 µm in diameter, with 3 pores and a spiny exine [F].

Figure 0404.-1. – Illustration for identification test B of powdered herbal drug of *matricaria* flower

### C. Thin-layer chromatography (2.2.27).

**Test solution** Dilute 50 µL of essential oil obtained in the assay of essential oil in 1 mL of *xylene R*.

**Reference solution** Dissolve 2 µL of *chamazulene R*, 5 µL of (–)- $\alpha$ -*bisabolol R* and 10 mg of *bornyl acetate R* in 5 mL of *toluene R*.

**Plate** TLC silica gel plate R.

**Mobile phase** *ethyl acetate R*, *toluene R* (5:95 V/V).

**Application** 10 µL as bands.

**Development** Over a path of 10 cm.

**Drying** In air.

**Detection** Spray with *anisaldehyde solution R* and heat at 100-105 °C for 5-10 min; examine immediately in daylight.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones are present in the chromatogram obtained with the test solution.

Top of the plate	
Chamazulene: a red or reddish-violet zone	1 or 2 blue or bluish-violet zones A red or reddish-violet zone (chamazulene)
Bornyl acetate: a yellowish-brown zone	A brown zone (en-yne-dicycloether)
(-)- $\alpha$ -Bisabolol: a reddish-violet or bluish-violet zone	A reddish-violet or bluish-violet zone ((-)- $\alpha$ -bisabolol)
Reference solution	Test solution

## TESTS

### Broken drug

Maximum 25 per cent, determined on 20.0 g, passes through a sieve (710) (2.9.12).

### Loss on drying (2.2.32)

Maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

### Total ash (2.4.16)

Maximum 13.0 per cent.

## ASSAY

### Essential oil (2.8.12)

Use 30 g of whole herbal drug, a 1000 mL flask, 500 mL of water R as distillation liquid and 0.50 mL of 1,2,4-trimethylbenzene R in the graduated tube. Distil at a rate of 3-4 mL/min for 4 h. Towards the end of this period, stop the flow of water to the condenser assembly but continue distilling until the blue, steam-volatile components have reached the lower end of the condenser. Immediately re-start the flow of water to the condenser assembly to avoid warming the separation space. Stop the distillation after a further 10 min.

### Total apigenin 7-glucoside

Liquid chromatography (2.2.29).

**Solvent mixture** Mobile phase B, mobile phase A (25:75 V/V).

**Test solution** Reduce 40 g of the herbal drug to a powder (500) (2.9.12). Place 2.00 g of the powdered herbal drug in a 500 mL round-bottomed flask. Add 200 mL of ethanol (96 per cent) R. Heat the mixture under a reflux condenser on a water-bath for 15 min. Cool and filter. Rinse the filter and the residue with a few millilitres of ethanol (96 per cent) R. To the filtrate add 10 mL of freshly prepared dilute sodium hydroxide solution R and heat the mixture under a reflux condenser on a water-bath for about 1 h. Cool. Dilute to 250.0 mL with ethanol (96 per cent) R. To 50.0 mL of the solution add 0.5 g of citric acid monohydrate R. Shake for 5 min and filter. Dilute 5.0 mL of this solution to 10.0 mL with the solvent mixture.

**Reference solution (a)** Dissolve 10.0 mg of apigenin 7-glucoside CRS in 100.0 mL of methanol R. Dilute 25.0 mL of this solution to 200.0 mL with the solvent mixture.

**Reference solution (b)** Dissolve 10.0 mg of 5,7-dihydroxy-4-methylcoumarin R in 100.0 mL of methanol R. Dilute 25.0 mL of this solution to 100.0 mL with the solvent mixture. To 4.0 mL of this solution add 4.0 mL of reference solution (a) and dilute to 10.0 mL with the solvent mixture.

### Precolumn:

— size:  $l = 8$  mm,  $\varnothing = 4.6$  mm;

— stationary phase: octadecylsilyl silica gel for chromatography R (5  $\mu$ m).

### Column:

— size:  $l = 0.25$  m,  $\varnothing = 4.6$  mm;

— stationary phase: end-capped octadecylsilyl silica gel for chromatography R (5  $\mu$ m).

### Mobile phase:

— mobile phase A: 0.5 per cent V/V solution of phosphoric acid R;

— mobile phase B: phosphoric acid R, acetonitrile R (0.5:99.5 V/V);

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 9	75	25
9 - 19	75 → 25	25 → 75
19 - 24	25	75

**Flow rate** 1 mL/min.

**Detection** Spectrophotometer at 340 nm.

**Injection** 20  $\mu$ L.

**System suitability** Reference solution (b):

— resolution: minimum 1.8 between the peaks due to apigenin 7-glucoside and 5,7-dihydroxy-4-methylcoumarin.

Calculate the percentage content of total apigenin 7-glucoside using the following expression:

$$\frac{A_1 \times m_2 \times p \times 0.625}{A_2 \times m_1}$$

- $A_1$  = area of the peak due to apigenin 7-glucoside in the chromatogram obtained with the test solution;  
 $A_2$  = area of the peak due to apigenin 7-glucoside in the chromatogram obtained with reference solution (a);  
 $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;  
 $m_2$  = mass of apigenin 7-glucoside CRS used to prepare reference solution (a), in grams;  
 $p$  = percentage content of apigenin 7-glucoside in apigenin 7-glucoside CRS.

Ph Eur

## Matricaria Oil

(Ph. Eur. monograph 1836)

Ph Eur

### DEFINITION

Blue essential oil obtained by steam distillation from the fresh or dried flower-heads or flowering tops of *Matricaria recutita* L. (*Chamomilla recutita* L. Rauschert). There are 2 types of matricaria oil which are characterised as rich in bisabolol oxides, or rich in (-)- $\alpha$ -bisabolol.

### CHARACTERS

#### Appearance

Clear, intensely blue, viscous liquid.

Intense characteristic odour.

Figure 1836.-1. - Chromatogram of matricaria oil rich in bisabolol oxides

Figure 1836.-2. - Chromatogram of matricaria oil rich in (-)- $\alpha$ -bisabolol

**IDENTIFICATION***First identification: B.**Second identification: A.*

A. Thin-layer chromatography (2.2.27).

*Test solution* Dissolve 20 µL of the substance to be examined in 1.0 mL of *toluene R*.*Reference solution* Dissolve 2 mg of *guaiazulene R*, 5 µL of (-)- $\alpha$ -*bisabolol R* and 10 mg of *bornyl acetate R* in 5.0 mL of *toluene R*.*Plate* TLC silica gel plate R.*Mobile phase* ethyl acetate R, toluene R (5:95 V/V).*Application* 10 µL, as bands.*Development* Over a path of 10 cm.*Drying* In air.*Detection A* Examine in daylight.*Results A* See below for the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution.

Top of the plate	
Guaiazulene: a blue zone	A blue zone (chamazulene)
Reference solution	Test solution

*Detection B* Spray with *anisaldehyde solution R* and heat at 100-105 °C for 5-10 min. Examine immediately in daylight.*Results B* See below for the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, yellowish-brown to greenish-yellow zones (lower third), violet zones (lower third) and further weak zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Guaiazulene: a red to reddish-violet zone	1 or 2 blue to bluish-violet zones A red to reddish-violet zone (chamazulene)
Bornyl acetate: a yellowish-brown to greyish-green zone	A brown zone (en-yne-dicycloether)
(-)- $\alpha$ -Bisabolol: a reddish-violet to bluish-violet zone	A reddish-violet to bluish-violet zone ((-)- $\alpha$ -bisabolol) A brownish zone
Reference solution	Test solution

B. Examine the chromatograms obtained in the test for chromatographic profile.

*Results* The characteristic peaks due to (-)- $\alpha$ -bisabolol and chamazulene in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with the reference solution.**TESTS****Chromatographic profile**

Gas chromatography (2.2.28): use the normalisation procedure.

*Test solution* Dissolve 20 µL of the essential oil to be examined in *cyclohexane R* and dilute to 5.0 mL with the same solvent.*Reference solution* Dissolve 20 µL of (-)- $\alpha$ -bisabolol R, 5 mg of *chamazulene R* and 6 mg of *guaiazulene R* in *cyclohexane R* and dilute to 5.0 mL with the same solvent.*Column:*— *material:* fused silica,— *size:*  $l = 30$  m (a film thickness of 1 µm may be used) to 60 m (a film thickness of 0.2 µm may be used),  $\varnothing = 0.25$ -0.53 mm, when using a column longer than 30 m, an adjustment of the temperature programme may be necessary,— *stationary phase:* macrogol 20 000 R.*Carrier gas* helium for chromatography R.*Flow rate* 1-2 mL/min.*Split ratio* 1:100.*Temperature:*

	Time (min)	Temperature (°C)

Injection port		250
Detector		250

*Detection* Flame ionisation.*Injection* 1.0 µL.*Elution order* Order indicated in the composition of the reference solution. Record the retention times of these substances.*Relative retention* With reference to chamazulene (retention time = about 34.4 min):  $\beta$ -farnesene = about 0.5; bisabolol oxide B = about 0.8; bisabolone = about 0.87; (-)- $\alpha$ -bisabolol = about 0.9; bisabolol oxide A = about 1.02.*System suitability* Reference solution:— *resolution:* minimum 1.5 between the peaks due to chamazulene and guaiazulene.Using the retention times determined from the chromatogram obtained with the reference solution, locate (-)- $\alpha$ -bisabolol and chamazulene in the chromatogram obtained with the test solution; locate bisabolol oxides (bisabolol oxide B, bisabolone and bisabolol oxide A) using Figures 1836.-1 and 1836.-2 (disregard the peak due to cyclohexane). The chromatogram obtained with the test solution does not show a peak with the retention time of guaiazulene.

Determine the percentage content of the components. The limits are within the following ranges.

	Matricaria oil rich in bisabolol oxides (per cent)	Matricaria oil rich in (-)- $\alpha$ -bisabolol (per cent)
Bisabolol oxides	29 - 81	
(-)- $\alpha$ -Bisabolol		10 - 65
Chamazulene	≥ 1.0	≥ 1.0
Total of bisabolol oxides and (-)- $\alpha$ -Bisabolol		≥ 20

**STORAGE**

At a temperature not exceeding 25 °C.

Ph Eur

## Matricaria Liquid Extract

(Ph. Eur. monograph 1544)

Ph Eur

### DEFINITION

Liquid extract produced from *Matricaria flower* (0404).

### Content

Minimum 0.30 per cent of blue residual oil.

### PRODUCTION

The extract is produced from the herbal drug by a suitable procedure for liquid extracts using a mixture of 2.5 volumes of a 10 per cent *m/m* solution of ammonia (NH<sub>3</sub>), 47.5 volumes of water and 50 volumes of ethanol (96 per cent).

### CHARACTERS

#### Appearance

Brownish, clear liquid.

Intense characteristic odour and characteristic bitter taste.

#### Solubility

Miscible with water and with ethanol (96 per cent) with development of turbidity, soluble in ethanol (50 per cent *V/V*).

### IDENTIFICATION

#### A. Thin-layer chromatography (2.2.27).

**Test solution** Place 10 mL of the extract to be examined in a separating funnel and shake with 2 quantities, each of 10 mL, of *pentane R*. Combine the pentane layers, dry over 2 g of *anhydrous sodium sulfate R* and filter. Evaporate the filtrate to dryness on a water-bath and dissolve the residue in 0.5 mL of *toluene R*.

**Reference solution** Dissolve 4 mg of *guaiazulene R*, 20 mg of (-)- $\alpha$ -*bisabolol R* and 20 mg of *bornyl acetate R* in 10 mL of *toluene R*.

**Plate** TLC silica gel F<sub>254</sub> plate R.

**Mobile phase** *ethyl acetate R*, *toluene R* (5:95 *V/V*).

**Application** 10  $\mu$ L as bands.

**Development** Over a path of 10 cm.

**Drying** In air.

**Detection A** Examine in ultraviolet light at 254 nm.

**Results A** The chromatogram obtained with the test solution shows several quenching zones, of which 2 main zones are in the middle third (en-yne-dicycloether).

**Detection B** Examine in ultraviolet light at 365 nm.

**Results B** The chromatogram obtained with the test solution shows in the middle part an intense blue fluorescent zone (herniarin).

**Detection C** Spray with *anisaldehyde solution R* and examine in daylight while heating at 100-105 °C for 5-10 min.

**Results C** The chromatogram obtained with the reference solution shows in the lower third a reddish-violet or bluish-violet zone ((-)- $\alpha$ -*bisabolol*), in the middle third a yellowish-brown or greyish-green zone (*bornyl acetate*) and in the upper third a red or reddish-violet zone (*guaiazulene*).

The chromatogram obtained with the test solution shows in the lower third yellowish-brown or greenish-yellow and violet zones and a reddish-violet or bluish-violet zone due to (-)- $\alpha$ -*bisabolol* in the chromatogram obtained with the reference solution; a brownish zone (en-yne-dicycloether) similar in position to the zone due to *bornyl acetate* in the chromatogram obtained with the reference solution; a red or

reddish-violet zone (*chamazulene*) corresponding to *guaiazulene* in the chromatogram obtained with the reference solution and immediately above it 1 or 2 blue or bluish-violet zones; further weak zones may be present in the chromatogram obtained with the test solution.

#### B. Thin-layer chromatography (2.2.27).

**Test solution** The extract to be examined.

**Reference solution** Dissolve 1.0 mg of *chlorogenic acid R*, 2.5 mg of *hyperoside R* and 2.5 mg of *rutoside trihydrate R* in 10 mL of *methanol R*.

**Plate** TLC silica gel plate R.

**Mobile phase** *anhydrous formic acid R*, *glacial acetic acid R*, *water R*, *ethyl acetate R* (7.5:7.5:18:67 *V/V/V/V*).

**Application** 10  $\mu$ L as bands.

**Development** Over a path of 15 cm.

**Drying** At 100-105 °C.

**Detection** Spray the warm plate with a 10 g/L solution of *diphenylboric acid aminoethyl ester R* in *methanol R*; subsequently spray with a 50 g/L solution of *macrogol 400 R* in *methanol R*; allow to dry in air for about 30 min and examine in ultraviolet light at 365 nm.

**Results** The chromatogram obtained with the reference solution shows in the middle part a light blue fluorescent zone (*chlorogenic acid*), below it a yellowish-brown fluorescent zone (*rutoside*) and above it a yellowish-brown fluorescent zone (*hyperoside*). The chromatogram obtained with the test solution shows a yellowish-brown fluorescent zone corresponding to the zone of *rutoside* in the chromatogram obtained with the reference solution, a light blue fluorescent zone corresponding to the zone of *chlorogenic acid* in the chromatogram obtained with the reference solution, a yellowish-brown fluorescent zone similar in position to the zone of *hyperoside* in the chromatogram obtained with the reference solution; it also shows above the yellowish-brown fluorescent zone a green fluorescent zone, then several bluish or greenish fluorescent zones and near the solvent front a yellowish fluorescent zone.

### TESTS

#### Ethanol (2.9.10)

38 per cent *V/V* to 53 per cent *V/V*.

#### Dry residue (2.8.16)

Minimum 12.0 per cent.

### ASSAY

Place 20.0 g in a 1000 mL round-bottomed flask, add 300 mL of *water R* and distil until 200 mL has been collected in a flask. Transfer the distillate into a separating funnel. Dissolve 65 g of *sodium chloride R* in the distillate and shake with 3 quantities, each of 30 mL, of *pentane R* previously used to rinse the reflux condenser and the flask. Combine the pentane layers, dry over 2 g of *anhydrous sodium sulfate R* and filter into a tared 100 mL round-bottomed flask which has been dried in a desiccator for 3 h. Rinse the anhydrous sodium sulfate and the filter with 2 quantities, each of 20 mL, of *pentane R*. Evaporate the pentane in a water-bath at 45 °C. The residue of pentane is eliminated in a current of air for 3 min. Dry the flask in a desiccator for 3 h and weigh. The residual oil is blue (*chamazulene*).

Ph Eur

## Meadowsweet

(Ph. Eur. monograph 1868)

Ph Eur

### DEFINITION

Whole or cut, dried flowering tops of *Filipendula ulmaria* (L.) Maxim. (syn. *Spiraea ulmaria* L.).

### Content

Minimum 1 mL/kg of essential oil (dried drug).

### CHARACTERS

Aromatic odour of methyl salicylate, after crushing.

### IDENTIFICATION

**A.** The stem, up to 5 mm in diameter, is greenish-brown, stiff, angular, hollow except at the apex, and has regular, straight, longitudinal furrows. The petiolate leaf, compound imparipinnate, has 2 reddish-brown angular stipules. It consists of 3-9 pairs of leaflets, unevenly dentate, some of which are small and fan-shaped. The leaflets are dark green and glabrous on the upper surface, tomentose and lighter, sometimes silvery on the lower surface. The terminal leaflet, the largest, is divided into 3 segments. The veins are prominent and brown on the lower surface. The inflorescence is complex and composed of very numerous flowers arranged in irregular cymose panicles. The flowers are creamish-white and about 3-6 mm in diameter; the calyx consists of 5 dark green, reflexed and hairy sepals fused at the base to a concave receptacle; the 5 free petals, which are readily detached, are pale yellow, obovate and distinctly narrowed at the base; the stamens are numerous with rounded anthers and they extend beyond the petals; the gynoecium consists of about 4-6 carpels, each with a short style and a globular stigma; the carpels become twisted together spirally to form yellowish-brown fruits with a helicoidal twist. Unopened flower buds are frequently present. If the fruit is present, it has a helicoidal twist and contains brownish seeds.

**B.** Microscopic examination (2.8.23). The powder is green or yellowish-green. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 1868.-1): fragments of the epidermises of the leaves and sepals [C, E, F] with sinuous or wavy cells [Ca, Ea, Fa], short, thick-walled, conical covering trichomes thickened at the base (surface view [Eb], side view [J]), unicellular covering trichomes, thin-walled, very long and flexuous, with pointed ends (surface view [Fc], side view [A]) or their scars (flexuous trichome [Fd], conical trichome [Fe]) and occasional clavate glandular trichomes with a 1- to 3-celled ([Ed] and [G], respectively), uniseriate stalk, a multicellular head and dense brown contents; fragments of the upper epidermis often accompanied by palisade parenchyma [Cb] including some hypertrophied cells containing a cluster crystal of calcium oxalate [Cc]; fragments of the lower epidermis with anomocytic stomata (2.8.3) [Ec, Fb], sometimes accompanied by spongy parenchyma [Ff] with some cells containing cluster crystals of calcium oxalate [Fg]; fragments of the petals [H] with thin-walled epidermal cells, some showing rounded papillae [Ha]; numerous spherical pollen grains with 3 pores and a faintly pitted exine [Bb]; fragments of the anther [B, D] whose fibrous layer shows specific thickenings (surface view [D], side view [Ba]); fragments of the ovary [K] with an epidermis bearing stomata [Ka] and with parenchyma containing prism crystals of calcium oxalate [Kb]; fragments of vascular

tissue [L] with annular, spiral or pitted vessels from the leaves and stems.

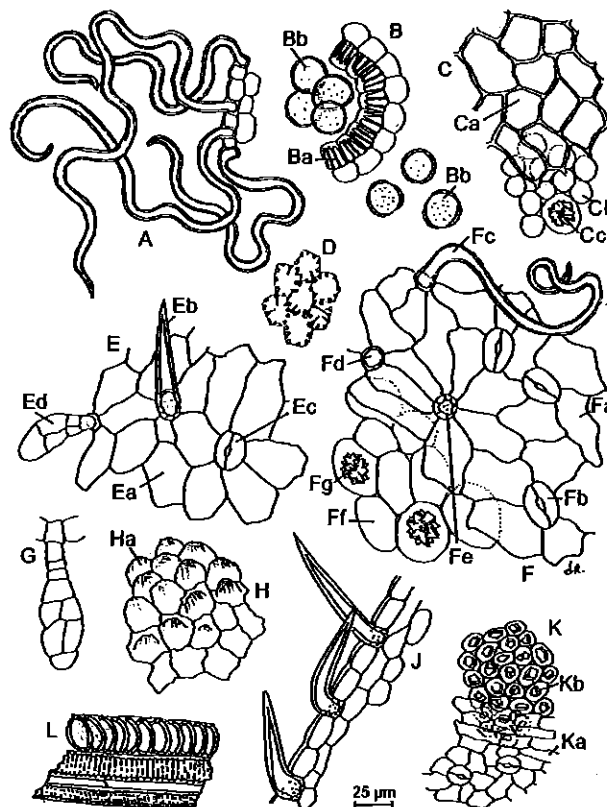

Figure 1868.-1. – Illustration for identification test B of powdered herbal drug of meadowsweet

### C. Thin-layer chromatography (2.2.27).

**Test solution** Xylene solution obtained in the assay.

**Reference solution** Dissolve 0.1 mL of *methyl salicylate R* and 0.1 mL of *salicylaldehyde R* in *xylene R* and dilute to 5 mL with the same solvent.

**Plate** TLC silica gel plate R.

**Mobile phase** *hexane R*, *toluene R* (50:50 V/V).

**Application** 10 µL as bands.

**Development** Over a path of 10 cm.

**Drying** In air.

**Detection** treat with 3 mL of *ferric chloride solution R3* and examine in daylight.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones are present in the chromatogram obtained with the test solution.

Top of the plate	
Methyl salicylate: a violet-brown zone	A violet-brown zone (methyl salicylate)
Salicylaldehyde: a violet-brown zone	A violet-brown zone (salicylaldehyde)
Reference solution	Test solution

**TESTS****Foreign matter (2.8.2)**

Maximum 5.0 per cent of stems with a diameter greater than 5 mm and maximum 2.0 per cent of other foreign matter.

**Loss on drying (2.2.32)**

Maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

**Total ash (2.4.16)**

Maximum 7.0 per cent.

**ASSAY****Essential oil (2.8.12)**

Use 50.0 g of the cut herbal drug, a 1000 mL flask, 300 mL of dilute hydrochloric acid R as the distillation liquid, and 0.5 mL of xylene R in the graduated tube. Distil at a rate of 2-3 mL/min for 2 h.

Ph Eur

**Melilot**

(Ph. Eur. monograph 2120)

Ph Eur

**DEFINITION**

Whole or cut, dried aerial parts of *Melilotus officinalis* (L.) Lam.

**Content**

Minimum 0.3 per cent of coumarin (C<sub>9</sub>H<sub>6</sub>O<sub>2</sub>; M<sub>r</sub> 146.1) (dried drug).

**IDENTIFICATION**

**A.** The stem is green, cylindrical, glabrous and finely ridged. The leaves are alternate, petiolate and trifoliate with 2 lanceolate stipules; the leaflets are up to about 3 cm long and 20 mm wide, elongated or ovate with a finely dentate margin, acute at the apex and base; the upper surface is dark green and glabrous, the lower surface paler green with short, fine hairs, especially at the base. The inflorescence is racemose with numerous pale yellow flowers, about 7 mm long, each having a hairy calyx with 5 deeply-divided, unequal teeth, and a papilionate corolla. The fruit is an indehiscent pod, often persistent within the calyx, yellowish-brown, short and tapering at the apex; the surface is glabrous and transversely wrinkled.

**B.** Microscopic examination (2.8.23). The powder is yellowish-green. Examine under a microscope using chloral hydrate solution R. The powder shows the following diagnostic characters (Figure 2120.-1): fragments of the leaf lamina (surface view [D]) showing unevenly thickened, slightly sinuous epidermal cells; numerous stomata [Db], mostly anomocytic (2.8.3) with 3-6 subsidiary cells [Da] and frequently, underlying palisade parenchyma [Dc]; uniseriate covering trichomes with 2 short, smooth-walled basal cells and a long terminal cell, bent at right angles, with a thick wall and a warty cuticle [A, B]; occasional glandular trichomes with a short, 2- or 3- celled stalk and ovoid, biserial head with 4 indistinct cells [H]; fragments of the petals composed of cells with wavy walls [M]; fragments of vascular tissue from the stem [F, G], including large vessels [G], sometimes associated with unlignified septate fibres [Fa] and a sheath of parenchymatous cells containing prisms of calcium oxalate [Fb]; fragments of mesophyll [J] including some cells which may occasionally contain cluster

crystals of calcium oxalate [Ja]; fragments of the stem epidermis with elongated, straight-walled cells and anomocytic (2.8.3) stomata [L]; fragments of the fibrous layer of the anthers (surface view [E], transverse section [K]); spherical or ovoid pollen grains about 25 µm long with 3 germinal pores and a smooth exine [C].

Figure 2120.-1. – Illustration for identification test B of powdered herbal drug of melilot

**C.** Thin-layer chromatography (2.2.27).

**Test solution** To 0.3 g of the powdered herbal drug (355) (2.9.12) add 3 mL of methanol R. Heat on a water-bath at 100 °C for 1 min and filter.

**Reference solution** Dissolve 50 mg of coumarin CRS and 20 mg of o-coumaric acid R in 50 mL of methanol R.

**Plate** TLC silica gel plate R (5-40 µm) [or TLC silica gel plate R (2-10 µm)].

**Mobile phase** dilute acetic acid R, ether R, toluene R (10:50:50 V/V/V); use the upper layer.

**Application** 25 µL [or 3 µL] as bands of 10 mm [or 8 mm].

**Development** Over a path of 12 cm [or 6 cm].

**Drying** In air.

**Detection** Spray with 2 M alcoholic potassium hydroxide R and examine in ultraviolet light at 365 nm.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones of various colours may be present in the chromatogram obtained with the test solution.

Top of the plate	
Coumarin: a greenish-yellow fluorescent zone	A greenish-yellow fluorescent zone (coumarin)
	A blue fluorescent zone
<i>o</i> -Coumaric acid: a greenish-yellow fluorescent zone	A greenish-yellow fluorescent zone ( <i>o</i> -coumaric acid) may be present
Reference solution	Test solution

**TESTS****Foreign matter (2.8.2)**

Maximum 2 per cent of stems with a diameter greater than 3 mm and maximum 2 per cent of other foreign matter.

**Loss on drying (2.2.32)**

Maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

**Total ash (2.4.16)**

Maximum 10.0 per cent.

**ASSAY**

Liquid chromatography (2.2.29).

**Test solution** Completely reduce about 50 g of the herbal drug to a powder (500) (2.9.12). To 5.00 g of the powdered herbal drug add 90 mL of *methanol R* and boil under a reflux condenser for 30 min. Allow to cool. Filter under vacuum through a fibre-glass filter. Take up the residue and the fragmented filter with 90 mL of *methanol R*. Treat in the same manner as before. Combine the filtrates and dilute to 250.0 mL with *methanol R*.

**Reference solution** Dissolve 25.0 mg of *coumarin CRS* in *methanol R* and dilute to 250.0 mL with the same solvent.

**Column:**

- size:  $l = 0.25$  m,  $\varnothing = 4$  mm;
- stationary phase: end-capped octadecylsilyl silica gel for chromatography R (5  $\mu$ m).

**Mobile phase** acetonitrile R, 5 g/L solution of phosphoric acid R (22:78 V/V).

**Flow rate** 1.7 mL/min.

**Detection** Spectrophotometer at 275 nm.

**Injection** 20  $\mu$ L.

**System suitability:**

- retention time: coumarin = about 7.8 min.

Calculate the percentage content of coumarin using the following expression:

$$\frac{A_1 \times m_2 \times p}{A_2 \times m_1}$$

- $A_1$  = area of the peak due to coumarin in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to coumarin in the chromatogram obtained with the reference solution;
- $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;
- $m_2$  = mass of *coumarin CRS* used to prepare the reference solution, in grams;
- $p$  = percentage content of coumarin in *coumarin CRS*.

Benzoin Inhalation

20 g  
Sufficient to produce 1000 mL

**Extemporaneous preparation**

The following directions apply.

Dissolve the Racementhol or the Levomenthol in a portion of the Benzoin Inhalation, add sufficient Benzoin Inhalation to produce 1000 mL and mix.

*The inhalation complies with the requirements stated under Preparations for Inhalation and with the following requirements.*

**Content of total balsamic acids**

Not less than 2.8% w/v, calculated as cinnamic acid,  $C_9H_8O_2$ .

**Total solids**

9.0 to 12.0% w/v when determined by drying at 105° for 4 hours, Appendix XI A. Use 2 mL.

**ASSAY**

Boil 10 mL with 25 mL of 0.5M *ethanolic potassium hydroxide* under a reflux condenser for 1 hour. Evaporate the ethanol, disperse the residue in 50 mL of hot *water*, cool, add 80 mL of *water* and 1.5 g of *magnesium sulfate* dissolved in 50 mL of *water*. Mix thoroughly and allow to stand for 10 minutes. Filter, wash the residue on the filter with 20 mL of *water*, acidify the combined filtrate and washings with *hydrochloric acid* and extract with four 40 mL quantities of *ether*. Discard the aqueous solution, combine the ether extracts and extract with successive quantities of 20, 20, 10, 10 and 10 mL of *sodium hydrogen carbonate solution*, washing each aqueous extract with the same 20 mL of *ether*. Discard the ether layers, carefully acidify the combined aqueous extracts with *hydrochloric acid* and extract with successive quantities of 30, 20, 20 and 10 mL of *chloroform*, filtering each extract through *anhydrous sodium sulfate* supported on absorbent cotton. Distil the chloroform from the combined filtrates until 10 mL remains and remove the remainder in a current of air. Dissolve the residue, with the aid of gentle heat, in 10 mL of *ethanol (96%)*, previously neutralised to *phenol red solution*, cool and titrate with 0.1M *sodium hydroxide VS* using *phenol red solution* as indicator. Each mL of 0.1M *sodium hydroxide VS* is equivalent to 14.82 mg of total balsamic acids, calculated as cinnamic acid,  $C_9H_8O_2$ .

**Milk-thistle Fruit**

(Ph. Eur. monograph 1860)

**Preparation**

Refined and Standardised Milk Thistle Dry Extract

Ph Eur

**DEFINITION**

Mature fruit, devoid of the pappus, of *Silybum marianum* L. Gaertn.

**Content**

Minimum 1.5 per cent of silymarin, expressed as silibinin ( $C_{25}H_{22}O_{10}$ ;  $M_r$  482.4) (dried drug).

**CHARACTERS**

No rancid odour.

**IDENTIFICATION**

A. The achene is strongly compressed, elongate-obovate, about 6-8 mm long, 3 mm broad and 1.5 mm thick; the outer surface is smooth and shiny with a grey or pale brown ground colour variably streaked dark brown longitudinally to give an overall pale greyish or brown colour; the fruit is tapering at the base and crowned at the apex with a glistening, pale yellow extension forming a collar about 1 mm high surrounding the remains of the style. Cut transversely, the fruit shows a narrow, brown outer area and 2 large, dense, white oily cotyledons.

B. Microscopic examination (2.8.23). The powder is brownish-yellow with darker specks. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of the epicarp composed of colourless cells, polygonal in surface view, the lumen appearing fairly large or as a small slit, depending on the orientation; groups of parenchymatous cells from the pigment layer, some of them containing colouring matter which appears bright red; very abundant groups of large sclereids from the testa with bright yellow pitted walls and a narrow lumen; occasionally fragments of small-celled parenchyma with pitted and beaded walls; abundant thin-walled parenchymatous cells from the cotyledons containing oil globules and scattered cluster crystals of calcium oxalate; a few larger, prismatic crystals of calcium oxalate.

C. Thin-layer chromatography (2.2.27).

**Test solution** To 1.0 g of the powdered herbal drug (500) (2.9.12) add 10 mL of *methanol R*. Heat under reflux in a water-bath at 70 °C for 5 min. Cool and filter. Evaporate the filtrate to dryness and dissolve the residue in 1.0 mL of *methanol R*.

**Reference solution** Dissolve 2 mg of *silibinin R* and 5 mg of *taxifolin R* in 10 mL of *methanol R*.

**Plate** TLC silica gel plate R.

**Mobile phase** *anhydrous formic acid R*, *acetone R*, *methylene chloride R* (8.5:16.5:75 V/V/V).

**Application** 30 µL of the test solution and 10 µL of the reference solution, as bands.

**Development** Over a path of 10 cm.

**Drying** At 100-105 °C.

**Detection** Treat the still-warm plate with a 10 g/L solution of *diphenylboric acid aminoethyl ester R* in *methanol R* and subsequently treat with a 50 g/L solution of *macrogol 400 R* in *methanol R*. Allow to dry for 30 min and examine in ultraviolet light at 365 nm.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other orange and yellowish-green fluorescent zones are present between the zones due to silibinin and taxifolin in the chromatogram obtained with the test solution.

Top of the plate	
Silibinin: a yellowish-green fluorescent zone	A yellowish-green fluorescent zone (silibinin)
Taxifolin: an orange fluorescent zone	An orange fluorescent zone (taxifolin)
	A yellowish-green fluorescent zone (silicristin)
	A light blue fluorescent zone (line of application)
Reference solution	Test solution

**TESTS**

**Loss on drying** (2.2.32)

Maximum 8.0 per cent, determined on 1.000 g of the powdered herbal drug (500) (2.9.12) by drying in an oven at 105 °C for 2 h.

**Total ash** (2.4.16)

Maximum 8.0 per cent.

**ASSAY**

Liquid chromatography (2.2.29).

**Test solution** Place 5.00 g of the powdered herbal drug (500) (2.9.12) in a continuous-extraction apparatus. Add 100 mL of *light petroleum R* and heat in a water-bath for 8 h. Allow the defatted drug to dry at room temperature. In a continuous-extraction apparatus, extract the latter with 100 mL of *methanol R* in a water-bath for 5 h. Evaporate the methanolic extract *in vacuo* to a volume of about 30 mL. Filter into a 50 mL volumetric flask, rinsing the extraction flask and the filter, and diluting to 50.0 mL with *methanol R*. Dilute 5.0 mL of this solution to 50.0 mL with *methanol R*.

**Reference solution** Dissolve a quantity of *milk thistle dry extract HRS* corresponding to 10.0 mg of silibinin in *methanol R* and dilute to 100.0 mL with the same solvent.

**Column:**

— size:  $l = 0.125$  m,  $\varnothing = 4$  mm;

— stationary phase: end-capped octadecylsilyl silica gel for chromatography R (5 µm).

**Mobile phase:**

— mobile phase A: *phosphoric acid R*; *methanol R*, *water R* (0.5:35:65 V/V/V);

— mobile phase B: *phosphoric acid R*; *methanol R*, *water R* (0.5:50:50 V/V/V);

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 28	100 → 0	0 → 100
28 - 35	0	100
35 - 36	0 → 100	100 → 0
36 - 51	100	0

**Flow rate** 0.8 mL/min.

**Detection** Spectrophotometer at 288 nm.

**Injection** 10 µL.

**Identification of peaks** Use the chromatogram supplied with *milk thistle dry extract HRS* and the chromatogram obtained with the reference solution to identify the peaks due to silicristin, silidianin, silibinin A, silibinin B, isosilibinin A and isosilibinin B. In the chromatogram obtained with the test

solution the peak due to silidianin may vary in size, be absent or be present as the principal peak.

**Retention time** Silibinin B = about 30 min; if necessary, adjust the time periods of the gradient.

**System suitability** Reference solution:

- resolution: minimum 1.8 between the peaks due to silibinin A and silibinin B;
- the chromatogram obtained is similar to the chromatogram supplied with *milk thistle dry extract HRS*.

Calculate the percentage content of total silymarin, expressed as silibinin, using the following expression:

$$\frac{(A_1 + A_2 + A_3 + A_4 + A_5 + A_6) \times m_1 \times p \times 5}{(A_7 + A_8) \times m_2}$$

- $A_1$  = area of the peak due to silicristin in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to silidianin in the chromatogram obtained with the test solution;
- $A_3$  = area of the peak due to silibinin A in the chromatogram obtained with the test solution;
- $A_4$  = area of the peak due to silibinin B in the chromatogram obtained with the test solution;
- $A_5$  = area of the peak due to isosilibinin A in the chromatogram obtained with the test solution;
- $A_6$  = area of the peak due to isosilibinin B in the chromatogram obtained with the test solution;
- $A_7$  = area of the peak due to silibinin A in the chromatogram obtained with the reference solution;
- $A_8$  = area of the peak due to silibinin B in the chromatogram obtained with the reference solution;
- $m_1$  = mass of *milk thistle dry extract HRS* used to prepare the reference solution, in grams;
- $m_2$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;
- $p$  = combined percentage content of silibinin A and silibinin B in *milk thistle dry extract HRS*.

Ph Eur

## Refined and Standardised Milk Thistle Dry Extract

(Ph. Eur. monograph 2071)

Ph Eur

### DEFINITION

Dry extract, refined and standardised, produced from *Milk thistle fruit* (1860).

### Content

90 per cent to 110 per cent of the nominal content of silymarin, expressed as silibinin ( $C_{25}H_{22}O_{10}$ ;  $M_r$  482.4), stated on the label. The nominal content of silymarin is within the range 30 per cent *m/m* to 65 per cent *m/m* (anhydrous extract).

The content of silymarin corresponds to:

- sum of the contents of silicristin and silidianin (both  $C_{25}H_{22}O_{10}$ ;  $M_r$  482.4): 20 per cent to 45 per cent, calculated with reference to total silymarin;
- sum of the contents of silibinin A and silibinin B (both  $C_{25}H_{22}O_{10}$ ;  $M_r$  482.4): 40 per cent to 65 per cent, calculated with reference to total silymarin;
- sum of the contents of isosilibinin A and isosilibinin B (both  $C_{25}H_{22}O_{10}$ ;  $M_r$  482.4): 10 per cent to 20 per cent, calculated with reference to total silymarin.

### PRODUCTION

The extract is produced from the herbal drug by an appropriate procedure, using one or more of the following solvents:

- ethyl acetate;
- acetone or mixture of acetone and water;
- ethanol or mixture of ethanol and water;
- methanol or mixture of methanol and water.

### CHARACTERS

#### Appearance

Yellowish-brown, amorphous powder.

#### IDENTIFICATION

Thin-layer chromatography (2.2.27).

**Test solution** Dissolve 0.250 g of the extract to be examined in 5 mL of *methanol R*.

**Reference solution** Dissolve 2 mg of *silibinin R* and 5 mg of *taxifolin R* in 10 mL of *methanol R*.

**Plate** TLC silica gel plate R (5-40  $\mu\text{m}$ ) [or TLC silica gel plate R (2-10  $\mu\text{m}$ )].

**Mobile phase** anhydrous formic acid R, acetone R, methylene chloride R (8.5:16.5:75 V/V/V).

**Application** 10  $\mu\text{L}$  [or 8  $\mu\text{L}$ ] of the test solution and 10  $\mu\text{L}$  [or 2  $\mu\text{L}$ ] of the reference solution, as bands.

**Development** Over a path of 10 cm [or 6 cm].

**Drying** At 100-105 °C.

**Detection** Treat the still-warm plate with a 10 g/L solution of *diphenylboric acid aminoethyl ester R* in *methanol R* and subsequently treat with a 50 g/L solution of *macrogol 400 R* in *methanol R*; allow to dry for 30 min and examine in ultraviolet light at 365 nm.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other yellowish-green fluorescent zones may be present between the zones due to silibinin and taxifolin in the chromatogram obtained with the test solution.

Top of the plate	
Silibinin: a yellowish-green fluorescent zone	A yellowish-green fluorescent zone (silibinin)
Taxifolin: an orange fluorescent zone	An orange fluorescent zone (taxifolin)
	A yellowish-green fluorescent zone (silicristin)
	A fluorescent zone (line of application)
Reference solution	Test solution

### TESTS

#### Water (2.5.12)

Maximum 4.0 per cent, determined on 0.500 g.

#### ASSAY

Liquid chromatography (2.2.29).

**Test solution** Dissolve 60.0 mg of the extract to be examined in *methanol R* and dilute to 100.0 mL with the same solvent.

**Reference solution** Dissolve a quantity of *milk thistle dry extract HRS* corresponding to 10.0 mg of silibinin in *methanol R* and dilute to 100.0 mL with the same solvent.

**Column:**

- size:  $l = 0.125$  m,  $\varnothing = 4$  mm;
- stationary phase: end-capped octadecylsilyl silica gel for chromatography R (5  $\mu$ m).

**Mobile phase:**

- mobile phase A: phosphoric acid R, methanol R, water for chromatography R (0.5:35:65 V/V/V);
- mobile phase B: phosphoric acid R, methanol R, water for chromatography R (0.5:50:50 V/V/V);

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 28	100 → 0	0 → 100
28 - 35	0	100
35 - 36	0 → 100	100 → 0
36 - 51	100	0

Flow rate 0.8 mL/min.

Detection Spectrophotometer at 288 nm.

Injection 10  $\mu$ L.

**Identification of peaks** Use the chromatogram supplied with milk thistle dry extract HRS and the chromatogram obtained with the reference solution to identify the peaks due to silicristin, silidianin, silibinin A, silibinin B, isosilibinin A and isosilibinin B. In the chromatogram obtained with the test solution the peak due to silidianin may vary in size or be absent.

**Retention time** Silibinin B = about 30 min; if necessary, adjust the time periods of the gradient.

**System suitability** Reference solution:

- resolution: minimum 1.8 between the peaks due to silibinin A and silibinin B;
- the chromatogram is similar to the chromatogram supplied with milk thistle dry extract HRS.

Calculate the percentage content of total silymarin, expressed as silibinin, using the following expression:

$$\frac{(A_1 + A_2 + A_3 + A_4 + A_5 + A_6) \times m_1 \times p}{(A_7 + A_8) \times m_2}$$

Calculate the percentage content of the sum of silicristin and silidianin, with reference to total silymarin, using the following expression:

$$\frac{(A_1 + A_2) \times 100}{A_1 + A_2 + A_3 + A_4 + A_5 + A_6}$$

Calculate the percentage content of the sum of silibinin A and silibinin B, with reference to total silymarin, using the following expression:

$$\frac{(A_3 + A_4) \times 100}{A_1 + A_2 + A_3 + A_4 + A_5 + A_6}$$

Calculate the percentage content of the sum of isosilibinin A and isosilibinin B, with reference to total silymarin, using the following expression:

$$\frac{(A_5 + A_6) \times 100}{A_1 + A_2 + A_3 + A_4 + A_5 + A_6}$$

- $A_1$  = area of the peak due to silicristin in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to silidianin in the chromatogram obtained with the test solution;
- $A_3$  = area of the peak due to silibinin A in the chromatogram obtained with the test solution;
- $A_4$  = area of the peak due to silibinin B in the chromatogram obtained with the test solution;

- $A_5$  = area of the peak due to isosilibinin A in the chromatogram obtained with the test solution;
- $A_6$  = area of the peak due to isosilibinin B in the chromatogram obtained with the test solution;
- $A_7$  = area of the peak due to silibinin A in the chromatogram obtained with the reference solution;
- $A_8$  = area of the peak due to silibinin B in the chromatogram obtained with the reference solution;
- $m_1$  = mass of milk thistle dry extract HRS used to prepare the reference solution, in grams;
- $m_2$  = mass of the extract to be examined used to prepare the test solution, in grams;
- $p$  = combined percentage content of silibinin A and silibinin B in milk thistle dry extract HRS.

Ph Eur

**Dementholised Mint Oil**

(Partly Dementholised Mint Oil, Ph. Eur. monograph 1838)

Ph Eur

**DEFINITION**

Essential oil obtained by steam distillation from the fresh, flowering aerial parts, recently gathered from *Mentha canadensis* L. (syn. *M. arvensis* L. var. *glabrata* (Benth) Fern., *M. arvensis* var. *piperascens* Malinv. ex Holmes), followed by partial separation of menthol by crystallisation.

**CHARACTERS****Appearance**

Colourless, pale yellow or greenish-yellow liquid.

Characteristic odour.

**IDENTIFICATION**

First identification: B.

Second identification: A.

A. Thin-layer chromatography (2.2.27).

**Test solution** Dissolve 0.1 mL of the substance to be examined in 1.0 mL of toluene R.

**Reference solution** Dissolve 4  $\mu$ L of carvone R, 4  $\mu$ L of pulegone R, 10  $\mu$ L of menthyl acetate R, 20  $\mu$ L of cineole R and 50 mg of menthol R in 5 mL of toluene R.

**Plate** TLC silica gel F<sub>254</sub> plate R.

**Mobile phase** ethyl acetate R, toluene R (5:95 V/V).

**Application** 10  $\mu$ L, as bands.

**Development** Over a path of 15 cm.

**Drying** In air.

**Detection A** Examine in ultraviolet light at 254 nm.

**Results A** See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, a quenching zone may be present in the upper third of the chromatogram obtained with the test solution.

Top of the plate	
Carvone and pulegone: a quenching zone	A quenching zone
	A quenching zone
Reference solution	Test solution

**Detection B** Spray with aminaldehyde solution R and heat at 100-105 °C for 5-10 min. Examine immediately in daylight.

**Results B** See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, the zone due to cineole in the reference solution is absent in the chromatogram obtained with the test solution. No yellowish-brown zone below the intense reddish-violet zone is present in the chromatogram obtained with the test solution.

Top of the plate	
Menthyl acetate: a bluish-violet zone	An intense reddish-violet zone (near the solvent front) A bluish-violet zone (menthyl acetate) A strongly greenish zone A greenish zone
Carvone and pulegone: a reddish zone	A reddish zone
Cineole: a violet zone	A distinctly violet zone
Menthol: an intense blue zone	A very intense blue zone (menthol)
Reference solution	Test solution

**B.** Examine the chromatograms obtained in the test for chromatographic profile.

**Results** The characteristic peaks in the chromatogram obtained with the test solution are approximately similar in retention time to those in the chromatogram obtained with the reference solution. Carvone may be absent from the chromatogram obtained with the test solution.

#### TESTS

**Relative density (2.2.5)**  
0.888 to 0.910.

**Refractive index (2.2.6)**  
1.456 to 1.470.

**Optical rotation (2.2.7)**  
-16.0° to -34.0°.

**Acid value (2.5.1)**

Maximum 1.0, determined on 5.00 g of the substance to be examined dissolved in 50 mL of the prescribed mixture of solvents.

#### Chromatographic profile

Gas chromatography (2.2.28): use the normalisation procedure.

**Test solution** Dissolve 0.20 g of the substance to be examined in hexane R and dilute to 10.0 mL with the same solvent.

**Reference solution** Dissolve 10 mg of limonene R, 20 mg of cineole R, 40 mg of menthone R, 10 mg of (+)-isomenthone R, 40 mg of menthyl acetate R, 20 mg of isopulegol R, 60 mg of menthol R, 20 mg of pulegone R and 10 mg of carvone R in hexane R and dilute to 10.0 mL with the same solvent.

**Column:**

- **material:** fused silica,
- **size:**  $l = 30$  m (a film thickness of 1  $\mu$ m may be used) to 60 m (a film thickness of 0.2  $\mu$ m may be used),  
 $\varnothing = 0.25$ -0.53 mm,
- **stationary phase:** macrogol 20 000 R.

**Carrier gas** helium for chromatography R.

**Flow rate** 1.5 mL/min.

**Split ratio** 1:100.

**Temperature:**

	Time (min)	Temperature (°C)
Column	0 - 10	60
	10 - 70	60 → 180
	70 - 75	180
Injection port		200
Detector		220

**Detection** Flame ionisation.

**Injection** 1.0  $\mu$ L.

**Elution order** Order indicated in the composition of the reference solution. Record the retention times of these substances.

**System suitability** Reference solution:

- **resolution:** minimum 1.5 between the peaks due to limonene and cineole.

Using the retention times determined from the chromatogram obtained with the reference solution, locate the components of the reference solution in the chromatogram obtained with the test solution.

Determine the percentage content of these components.

The percentages are within the following ranges:

- **limonene:** 1.5 per cent to 7.0 per cent,
- **cineole:** maximum 1.5 per cent,
- **menthone:** 17.0 per cent to 35.0 per cent,
- **isomenthone:** 5.0 per cent to 13.0 per cent,
- **menthyl acetate:** 1.5 per cent to 7.0 per cent,
- **isopulegol:** 1.0 per cent to 3.0 per cent,
- **menthol:** 30.0 per cent to 50.0 per cent,
- **pulegone:** maximum 2.5 per cent,
- **carvone:** maximum 2.0 per cent.

The ratio of cineole content to limonene content is less than 1.

#### STORAGE

At a temperature not exceeding 25 °C.

Ph Eur

## Morinda Root

(Ph. Eur. monograph 2977)

Ph Eur

#### DEFINITION

Dried, whole root of *Gynochthodes officinalis* (F.C.How) Razafim. & B.Bremer (syn. *Morinda officinalis* F.C.How), gently beaten to flatten it, with secondary roots removed.

#### Content

Minimum 1.3 per cent for the sum of monotropein and deacetylasperulosidic acid, expressed as monotropein ( $C_{16}H_{22}O_{11}$ ;  $M_r$  390.3) (dried drug).

#### IDENTIFICATION

**A.** The root is slightly curved, varying in length and 0.4-2 cm in diameter. The outer surface is dull and yellowish-grey to brownish-grey. When flattened, the roots are 0.2-0.5 cm thick and their external surface is longitudinally wrinkled and transversely cracked; pieces of bark may become detached from the central xylem (wood), resulting in the characteristic

segmented appearance of the roots, with broad bark fragments alternating with sections of narrow wood; wood 0.1–0.6 cm in diameter. The texture is tough. The fractured surface shows a thin yellowish-grey cork layer and a thick, horny reddish-violet to dark brown (to blackish-violet in older roots) bark. The central xylem is hard and often protrudes from the fractured surface; it is yellowish-white to yellowish-brown (or darker brown in older roots); raphides are often visible on its outer surface.

**B. Microscopic examination (2.8.23).** The powder is variable in colour, pale or dark reddish-violet to violet-brown.

Examine under a microscope using *chloral hydrate solution R*.

The powder shows the following diagnostic characters (Figure 2977.-1): numerous sclereids, isolated [G] or in groups [C], variable in shape (e.g. rounded, elliptical, subrectangular) and up to 95 µm in diameter, some sclereids with very thick walls, others with thin walls; walls are often greenish-yellow or golden brownish-yellow, with distinct pit canals and sparse pits, some sclereids showing distinctly striated walls [Bc]; needle-shaped crystals of calcium oxalate up to 180 µm long, occasionally longer (up to 280 µm), isolated [E] or included in parenchymatous cells [F]; the needle-shaped crystals are often broken; fragments of cork with superimposed, polyhedral cells (surface view [A]); fragments of dermal tissue (transverse section [B]), consisting of cork [Ba] and phelloderm [Bb] containing sclereids [Bc]; numerous fragments of thin-walled parenchyma cells, occasionally violet or violet-brown in colour; fragments of xylem vessels [D, H] bordered-pitted [Da, Ha], up to 105 µm in diameter, mostly associated with yellowish fibre-tracheids [Db, Hb, Hc] which show sparse bordered pits whose central openings may be slit-shaped, V-shaped or cross-shaped; rare free xylem vessels; a few fragments of medullary rays consisting of rectangular cells with slightly thickened and pitted walls [Hd].

**C. High-performance thin-layer chromatography (2.8.25).**

**Test solution** To 0.1 g of the powdered herbal drug (710) (2.9.12) add 5.0 mL of *methanol R*. Sonicate for 15 min. Centrifuge and use the supernatant.

**Reference solution (a)** Dissolve 5.0 mg of *nystose R* and 10.0 mg of *glucose R* in 3.0 mL of *water R* and dilute to 5.0 mL with *methanol R*.

**Reference solution (b)** Dilute 2.5 mL of reference solution (a) to 10.0 mL with *methanol R*.

**Reference solution (c)** Dissolve 2.5 mg of *sucrose R* and 10 mg of *glucose R* in 3 mL of *water R* and dilute to 5 mL with *methanol R*.

**Intensity marker** Glucose.

**Plate** TLC silica gel F<sub>254</sub> plate R (2–10 µm).

**Mobile phase** glacial acetic acid R, anhydrous formic acid R, water R, ethyl acetate R (20:25:30:60 V/V/V/V).

**Application** 3 µL as bands of 8 mm.

**Development** 70 mm from the lower edge of the plate.

**Drying** In a current of cold air for 5 min.

**Detection** Treat with a 100 g/L solution of *sulfuric acid R* in *ethanol (96 per cent) R* and heat at 120 °C for 3 min; examine in daylight.

**System suitability** Reference solution (c):

- the chromatogram shows in the middle third 2 distinct zones, which may be touching; the lower zone (sucrose) is brown and the upper zone (glucose) is intense brown.

Figure 2977.-1. – Illustration for identification test B of powdered herbal drug of morinda root

**Results** See below the sequence of zones present in the chromatograms obtained with reference solution (a) and the test solution. Furthermore, in the chromatogram obtained with the test solution, other intense brown zones may be present.

Top of the plate	
	A brown zone, faint
Glucose: a brown zone	A brown zone, equivalent (glucose)
	A brown zone, faint
	A brown zone, very faint
Nystose: a brown zone	A brown zone, faint (nystose)
	A series of 5 brown zones, equivalent
Reference solution (a)	Test solution

## TESTS

### Loss on drying (2.2.32)

Maximum 15.0 per cent, determined on 1.000 g of the powdered herbal drug (710) (2.9.12) by drying in an oven at 105 °C for 3 h.

### Total ash (2.4.16)

Maximum 6.0 per cent.

### Ash insoluble in hydrochloric acid (2.8.1)

Maximum 1.5 per cent.

**ASSAY**

Liquid chromatography (2.2.29).

**Test solution** To 0.500 g of the powdered herbal drug (710) (2.9.12) add 25.0 mL of a 30 per cent V/V solution of methanol R. Weigh and sonicate for 10 min. Cool and weigh again. Compensate the loss of solvent with a 30 per cent V/V solution of methanol R. Shake thoroughly. Filter through a membrane filter (nominal pore size 0.45 µm).

**Reference solution (a)** Dissolve 2.5 mg of *monotropein CRS* in a 30 per cent V/V solution of methanol R and dilute to 25.0 mL with the same solution.

**Reference solution (b)** To 0.5 g of *morinda root for system suitability HRS* add 25 mL of a 30 per cent V/V solution of methanol R. Sonicate for 10 min and shake thoroughly. Filter through a membrane filter (nominal pore size 0.45 µm).

**Column:**

- size:  $l = 0.25$  m,  $\varnothing = 4.6$  mm;
- stationary phase: silica gel for chromatography, alkyl-bonded for use with highly aqueous mobile phases R (5 µm).

**Mobile phase** phosphoric acid R, methanol R1, water for chromatography R (0.01:49.99:950 V/V/V).

**Flow rate** 1.0 mL/min.

**Detection** Spectrophotometer at 237 nm.

**Injection** 10 µL.

**Run time** Twice the retention time of monotropein.

**Identification of peaks** Use the chromatogram supplied with *morinda root for system suitability HRS* and the chromatogram obtained with reference solution (b) to identify the peak due to deacetylasperulosidic acid; use the chromatogram obtained with reference solution (a) to identify the peak due to monotropein.

**Relative retention** With reference to monotropein (retention time = about 7 min): deacetylasperulosidic acid = about 1.2.

**System suitability** Reference solution (b):

- resolution: minimum 1.5 between the peaks due to monotropein and deacetylasperulosidic acid.

Calculate the percentage content of the sum of monotropein and deacetylasperulosidic acid, expressed as monotropein, using the following expression:

$$\frac{A_1 \times m_2 \times p}{A_2 \times m_1} + \frac{A_3 \times m_2 \times p \times 1.16}{A_2 \times m_1}$$

- $A_1$  = area of the peak due to monotropein in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to monotropein in the chromatogram obtained with reference solution (a);
- $A_3$  = area of the peak due to deacetylasperulosidic acid in the chromatogram obtained with the test solution;
- $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;
- $m_2$  = mass of *monotropein CRS* used to prepare reference solution (a), in grams;
- $p$  = percentage content of monotropein in *monotropein CRS*;
- 1.16 = peak correlation factor between monotropein and deacetylasperulosidic acid.

Ph Eur

**Motherwort**

(Ph. Eur. monograph 1833)

Ph Eur

**DEFINITION**

Whole or cut, dried flowering aerial parts of *Leonurus cardiaca* L.

**Content**

Minimum 0.2 per cent of flavonoids, expressed as hyperoside ( $C_{21}H_{20}O_{12}$ ;  $M_r$  464.4) (dried drug).

**IDENTIFICATION**

A. The stem pieces are hairy, longitudinally striated, quadrangular, hollow, and up to about 10 mm wide; they bear opposite and decussate, petiolate leaves and, in the axils of the upper leaves, about 6-12 small flowers, arranged in sessile whorls forming a long, leafy spike. The lower leaves are ovate-orbicular, palmately 3- to 5-lobed, rarely 7-lobed, the lobes irregularly dentate. The upper leaves are entire or slightly trifid, lanceolate with a serrate margin and cuneate at the base. The upper surface of the leaves is green with scattered hairs, the lower surface is paler green, densely pubescent and shows a prominent palmate and reticulate venation. The flowers have a funnel-shaped calyx, 3 mm to 5 mm long with 5 stiff, recurved teeth; the corolla is 2-lipped, the upper lip pink and pubescent on the outer surface, the lower lip white with purplish spots; stamens 4, densely pubescent.

B. Microscopic examination (2.8.23). The powder is green. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 1833.-1): numerous covering trichomes [A], whole [Aa] or fragmented [Ab], uniseriate, with warty walls, composed of 2-8 cells with slight swellings at the junctions, up to 1500 µm long; fragments of the upper epidermis (surface view [B]) with cells with straight or sinuous anticlinal walls [Ba], often accompanied by palisade parenchyma [Bb]; fragments of the lower epidermis (surface view [C]) with cells with sinuous anticlinal walls [Ca], diacytic stomata (2.8.3) [Cb], bearing glandular trichomes with a short unicellular stalk and a globular head composed of 8-16 cells [Cc], glandular trichomes with a uni- or bicellular stalk and a bi- or tetracellular head [Cd] and sometimes covering trichomes; fragments of the lamina, in transverse section [D], composed of epidermises bearing glandular trichomes with a globular head consisting of 8-16 cells [Da] or a bi- or tetracellular head [Db], a 1-layered palisade mesophyll extending almost halfway across the section [Dc], and a loosely arranged spongy parenchyma [Dd]; fragments of the calyx [G] with an epidermis consisting of polygonal cells bearing uni- or bicellular conical covering trichomes, with spiny walls [Ga], often associated with fusiform mesophyll cells with thick walls and containing small prism crystals of calcium oxalate [Gb]; isolated glandular trichomes [H], either with a multicellular stalk and a unicellular head from the anthers [Ha] or a uni- or multicellular stalk and bi- to tetracellular head [Hb]; spherical pollen grains, about 25-30 µm in diameter, with 3 pores and 3 furrows and a smooth exine [E]; thick-walled, lignified fibres [F]; fragments from the stem with spirally and annularly thickened vessels [K]; occasional fragments of pericarp [J] consisting of lobed cells with thick, pitted walls, each containing a single prism crystal of calcium oxalate [Ja].

Figure 1833.-1. – Illustration for identification test B of powdered herbal drug of motherwort

**C. Thin-layer chromatography (2.2.27).**

**Test solution** To 0.5 g of the powdered herbal drug (355) (2.9.12) add 5 mL of *methanol R*. Heat on a water-bath at 65 °C for 5 min with shaking. Cool and filter.

**Reference solution** Dissolve 5 mg of *naphthol yellow S R* and 2.0 mg of *catalpol R* in 5.0 mL of *methanol R*.

**Plate** TLC silica gel plate R.

**Mobile phase** *glacial acetic acid R*, *water R*, *ethyl acetate R* (20:20:60 V/V/V).

**Application** 20 μL as bands.

**Development** Over a path of 10 cm.

**Drying** In air.

**Detection** Treat with *dimethylaminobenzaldehyde solution R2*, using about 5 mL for a plate 200 mm square; heat at 100-105 °C for 10 min until the spots appear; examine in daylight.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other weak greyish-blue zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
	A wide white zone
	A greyish-blue zone (iridoid)
Naphthol yellow S: an intense yellow zone	1 or 2 greyish-blue zones (iridoid)
Catalpol: a greyish-blue zone	
Reference solution	Test solution

**TESTS**

**Foreign matter (2.8.2)**

Maximum 2 per cent of brown or yellow leaves and maximum 2 per cent of other foreign matter.

**Loss on drying (2.2.32)**

Maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

**Total ash (2.4.16)**

Maximum 12.0 per cent.

**ASSAY**

**Stock solution** In a 100 mL round-bottomed flask place 1.00 g of the powdered herbal drug (355) (2.9.12), add 1 mL of a 5 g/L solution of *hexamethylenetetramine R*, 20 mL of *acetone R* and 2 mL of *hydrochloric acid R1*. Boil the mixture under a reflux condenser for 30 min. Filter the liquid through a plug of absorbent cotton into a flask. Add the absorbent cotton to the residue in the round-bottomed flask and extract with 2 quantities, each of 20 mL, of *acetone R*, each time boiling under a reflux condenser for 10 min. Allow to cool and filter each extract through the plug of absorbent cotton into the flask. After cooling, filter the combined acetone extracts through a paper filter into a volumetric flask and dilute to 100.0 mL with *acetone R* by rinsing the flask and the paper filter. Introduce 20.0 mL of the solution into a separating funnel, add 20 mL of *water R* and shake the mixture with 1 quantity of 15 mL and then 3 quantities, each of 10 mL, of *ethyl acetate R*. Combine the ethyl acetate extracts in a separating funnel, wash with 2 quantities, each of 50 mL, of *water R*, filter the extracts over 10 g of *anhydrous sodium sulfate R* into a volumetric flask and dilute to 50.0 mL with *ethyl acetate R*.

**Test solution** To 10.0 mL of the stock solution add 1 mL of *aluminium chloride reagent R* and dilute to 25.0 mL with a 5 per cent V/V solution of *glacial acetic acid R* in *methanol R*.

**Compensation liquid** Dilute 10.0 mL of the stock solution to 25.0 mL with a 5 per cent V/V solution of *glacial acetic acid R* in *methanol R*.

Measure the absorbance (2.2.25) of the test solution after 30 min, by comparison with the compensation liquid at 425 nm. Calculate the percentage content of flavonoids, calculated as hyperoside, using the following expression:

$$\frac{A \times 1.25}{m}$$

i.e. taking the specific absorbance of hyperoside to be 500.

*A* = absorbance at 425 nm;  
*m* = mass of the substance to be examined, in grams.

## Moutan Bark

(Ph. Eur. monograph 2474)

Ph Eur

### DEFINITION

Dried, whole or fragmented, scraped or unscraped root bark of *Paeonia × suffruticosa* Andrews, collected in autumn.

### Content

- *paeonol* ( $C_9H_{10}O_3$ ;  $M_r$  166.2): minimum 2.2 per cent (dried drug);
- *paeoniflorin* ( $C_{23}H_{28}O_{11}$ ;  $M_r$  480.5): minimum 1.1 per cent (dried drug).

### IDENTIFICATION

A. The whole bark is quilled or crescent-shaped, about 2-4 mm thick, 0.6-1.4 cm in diameter and up to 20 cm long. The fragmented bark occurs as cleft rings, about 2-4 mm thick and 0.5-1 cm in diameter. The greyish-brown or yellowish-brown outer surface of the unscraped bark shows long transverse lenticels and rootlet scars; where the dermal tissue is absent, the exposed surface is pink. The outer surface of the scraped bark is pinkish to greyish-white; transverse lenticels and rootlet scars are present; sometimes remains of the outer bark are visible. The pale greyish-yellow or pale brown inner surface shows fine longitudinal striations. The texture is hard and fragile, easily broken. The fracture is greyish-white to pinkish or light brown and finely granular.

B. Microscopic examination (2.8.23). The powder is pale brown to pinkish. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2474.-1): numerous fragments of parenchyma consisting of cells of various shapes and sizes: some rounded with slightly and regularly thickened and pitted walls [D], some with irregularly thickened beaded walls [J] and some [H] containing one [Ha] or more [Hb] cluster crystals of calcium oxalate up to 45  $\mu$ m in diameter; files of cells containing cluster crystals of calcium oxalate may be present [A]; very numerous free cluster crystals of calcium oxalate [C]; more or less abundant fragments of cork with superimposed polyhedral cells (surface view [B], longitudinal section [E]). Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows very numerous rounded or polygonal starch granules about 3-15  $\mu$ m in diameter, simple or 2-6 compound, free [G] or included in parenchyma cells [F]; the punctiform, cleft, V-, Y-, or X-shaped hilum is clearly visible.

C. Thin-layer chromatography (2.2.27).

**Test solution** To 0.5 g of the powdered herbal drug (355) (2.9.12) add 5 mL of *methanol R* and heat in a water-bath at 60 °C for 1 min. Centrifuge and use the supernatant.

**Reference solution** Dissolve 1 mg of *paeoniflorin R* and 1 mg of *paeonol R* in 1 mL of *methanol R*.

**Plate** TLC silica gel  $F_{254}$  plate R (2-10  $\mu$ m).

**Mobile phase** *anhydrous formic acid R*, *ethyl acetate R*, *methanol R*, *methylene chloride R* (3:5:5:35 *V/V/V/V*).

**Application** 8  $\mu$ L as bands of 8 mm.

**Development** Over a path of 6 cm.

**Drying** In air.

**Detection A** Examine in ultraviolet light at 254 nm.

**Results A** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Figure 2474.-1. – Illustration for identification test B of powdered herbal drug of moutan bark

## TESTS

### Foreign matter (2.8.2)

Maximum 1.0 per cent.

### Loss on drying (2.2.32)

Maximum 11.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

### Total ash (2.4.16)

Maximum 5.0 per cent.

### Ash insoluble in hydrochloric acid (2.8.1)

Maximum 1.0 per cent.

## ASSAY

Liquid chromatography (2.2.29).

**Test solution** To 0.200 g of the powdered herbal drug (355) (2.9.12) add 3.0 mL of *methanol RI* and sonicate for 30 min. Dilute to 10.0 mL with a 6.8 g/L solution of *potassium dihydrogen phosphate R* and filter through a membrane filter (nominal pore size 0.45 µm).

**Reference solution (a)** Dissolve 5.0 mg of *paeoniflorin CRS* in *methanol RI* and dilute to 5.0 mL with the same solvent.

**Reference solution (b)** Dissolve 7.0 mg of *paeonol CRS* in *methanol RI* and dilute to 10.0 mL with the same solvent. Dilute 3.0 mL of the solution to 10.0 mL with a 6.8 g/L solution of *potassium dihydrogen phosphate R*.

**Reference solution (c)** Dissolve 2.5 mg of *4'-hydroxyacetophenone R* in 2.5 mL of reference solution (a), add 12.5 mL of *methanol RI* and dilute to 50.0 mL with a 6.8 g/L solution of *potassium dihydrogen phosphate R*.

**Reference solution (d)** Dilute 2.5 mL of reference solution (a) to 7.5 mL with *methanol RI*. Dilute this solution to 25.0 mL with a 6.8 g/L solution of *potassium dihydrogen phosphate R*.

**Column:**

— size:  $l = 0.15$  m,  $\varnothing = 4.6$  mm;

— stationary phase: end-capped octadecylsilyl silica gel for chromatography R (5 µm).

**Mobile phase:**

— mobile phase A: 6.8 g/L solution of *potassium dihydrogen phosphate R*;

— mobile phase B: *methanol RI*;

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 15	70	30
15 - 18	70 → 40	30 → 60
18 - 25	40	60

**Flow rate** 1.0 mL/min.

**Detection** Spectrophotometer at 230 nm.

**Injection** 10 µL of the test solution and reference solutions (b), (c) and (d).

**Retention time** Paeoniflorin = about 9.5 min;  
4'-hydroxyacetophenone = about 10.5 min; paeonol = about 23 min.

**System suitability** Reference solution (c):

— resolution: minimum 1.5 between the peaks due to paeoniflorin and 4'-hydroxyacetophenone.

Calculate the percentage content of paeoniflorin using the following expression:

$$\frac{A_1 \times m_2 \times p_1}{A_2 \times m_1 \times 5}$$

- $A_1$  = area of the peak due to paeoniflorin in the chromatogram obtained with the test solution;  
 $A_2$  = area of the peak due to paeoniflorin in the chromatogram obtained with reference solution (d);  
 $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;  
 $m_2$  = mass of *paeoniflorin CRS* used to prepare reference solution (a), in grams;  
 $p_1$  = percentage content of paeoniflorin in *paeoniflorin CRS*.

Calculate the percentage content of paeonol using the following expression:

$$\frac{A_3 \times m_3 \times p_2 \times 0.3}{A_4 \times m_1}$$

- $A_3$  = area of the peak due to paeonol in the chromatogram obtained with the test solution;  
 $A_4$  = area of the peak due to paeonol in the chromatogram obtained with reference solution (b);  
 $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;  
 $m_3$  = mass of *paeonol CRS* used to prepare reference solution (b), in grams;  
 $p_2$  = percentage content of paeonol in *paeonol CRS*.

Ph Eur

## Mullein Flower

(Ph. Eur. monograph 1853)

Ph Eur

### DEFINITION

Dried flower, reduced to the corolla and the androecium, of *Verbascum thapsus* L., *V. densiflorum* Bertol. (*V. thapsiforme* Schrad), and *V. phlomoides* L.

### IDENTIFICATION

A. The corolla of *V. thapsus* is pale yellow, yellow or brown, funnel-shaped, about 20 mm in diameter, with 5 slightly unequal and spreading lobes. The corolla lobes are densely hairy on the outer surface, glabrous on the inner surface, with a fine network of light brown veins. There are 5 stamens, alternating with the petal lobes; 2 of these are long, with glabrous filaments, the other 3 shorter, with densely tomentose filaments. The anthers are attached transversely. In *V. phlomoides* the corolla is up to about 30 mm in diameter, bright yellow or orange, and the anthers are obliquely attached to the filaments. The corolla of *V. densiflorum*, about 30 mm in diameter, is almost flat and deeply divided into 5 slightly unequal lobes, with rounded apices.

B. Microscopic examination (2.8.23). The powder is yellow or yellowish-brown. Examine under a microscope using chloral hydrate solution R. The powder shows the following diagnostic characters (Figure 1853.-1): many covering trichomes from the corolla, whole and fragmented, pluricellular, of the candelabra type, with a central uniseriate axis from which whorls of branch cells arise at the position of the cross walls and at the apex (side view [A, B], surface view [F]); the covering trichomes from the stamen filaments [G] are unicellular, long, thin-walled and tubular, have a distinctly granular or striated surface with a sharp tip [Ga] or sometimes with a club-shaped tip [Gb, Gc]; numerous pollen grains, ovoid with a finely granular exine with 3 pores [D]; fragments of the fibrous layer of the anther with thickened walls giving a characteristic star-shaped appearance [C]; yellow fragments of the petals (surface view [E]) with polygonal and isodiametric epidermal cells [Ea]; fragments of the underlying mesophyll consisting of irregular parenchymatous cells [Eb] sometimes accompanied by spiral vessels [Ec].

C. Thin-layer chromatography (2.2.27).

**Test solution** Heat 1.0 g of the powdered herbal drug (355) (2.9.12) in 10 mL of methanol R in a water-bath at 60 °C for 5 min, with stirring. Cool and filter.

**Reference solution** Dissolve 1 mg of caffeic acid R, 2.5 mg of hyperoside R and 2.5 mg of rutoside trihydrate R in methanol R and dilute to 10 mL with the same solvent.

**Plate** TLC silica gel plate R.

**Mobile phase** anhydrous formic acid R, water R, methyl ethyl ketone R, ethyl acetate R (10:10:30:50 V/V/V/V).

**Application** 10 µL of the reference solution and 30 µL of the test solution, as bands.

**Development** Over a path of 15 cm.

**Drying** At 100-105 °C.

**Detection** Spray the warm plate with a 10 g/L solution of diphenylboric acid aminoethyl ester R in methanol R, then with a 50 g/L solution of macrogol 400 R in methanol R; allow to dry in air for 30 min and examine in ultraviolet light at 365 nm.

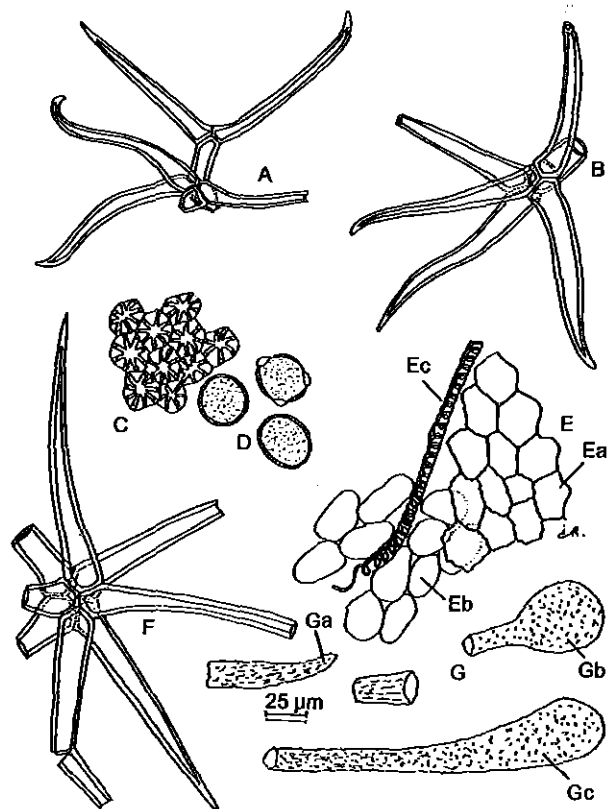

Figure 1853.-1. – Illustration for identification test B of powdered herbal drug of mullein flower

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Caffeic acid: a greenish-blue fluorescent zone	A yellow or yellowish-green fluorescent zone

	A greenish fluorescent zone
Reference solution	Test solution

D. Boil 1.0 g of the powdered herbal drug (355) (2.9.12) with 15 mL of water R for 1 min. Filter. Add 1 mL of hydrochloric acid R and boil for 1 min. A greenish-blue colour develops and, after a few minutes, cloudiness appears and then a blackish precipitate (iridoids).

**TESTS****Foreign matter (2.8.2)**

Maximum 5 per cent of brown petals and maximum 2 per cent of fragments of the calyx and other foreign matter, determined on 20 g.

**Swelling index (2.8.4)**

Minimum 9, determined on the powdered herbal drug (710) (2.9.12), moistened with 2 mL of *ethanol (96 per cent) R*.

**Loss on drying (2.2.32)**

Maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (710) (2.9.12) by drying in an oven at 105 °C for 2 h.

**Total ash (2.4.16)**

Maximum 6.0 per cent.

**Ash insoluble in hydrochloric acid (2.8.1)**

Maximum 2.0 per cent.

**STORAGE**

In an airtight container.

Ph Eur

**Myrrh**

(Ph. Eur. monograph 1349)

**Preparation**

Myrrh Tincture

Ph Eur

**DEFINITION**

Gum-resin, hardened in air, obtained by incision or produced by spontaneous exudation from the stem and branches of *Commiphora myrrha* (Nees) Engl. (syn. *Commiphora molmol* (Engl.) Engl. ex Tschirch) and/or other species of *Commiphora*.

**CHARACTERS**

Bitter taste.

**IDENTIFICATION**

A. The light or dark orange-brown, irregular or roundish grains or pieces of different size show components of various colours. Their surface is mostly covered with grey or yellowish-brown dust.

B. Microscopic examination (2.8.23). The powder is brownish-yellow or reddish-brown. Examine under a microscope, using *chloral hydrate solution R*. The powder shows the following diagnostic characters: a few tissue fragments from the original plants including: reddish-brown cork fragments; single or grouped polyhedral or elongated stone cells with partly strongly thickened, pitted and lignified walls with a brownish content; fragments of thin-walled parenchyma and sclerenchymatous fibres; irregular prismatic or polyhedral crystals of calcium oxalate, about 10-25 µm in size.

C. Examine the chromatograms obtained in the test for *Commiphora mukul*.

**Results B** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Anethole: a violet zone	A reddish-violet zone
Thymol: an orange zone	A red zone
	A violet zone
	A brown zone
Reference solution	Test solution

**TESTS****Commiphora mukul****Thin-layer chromatography (2.2.27).**

**Test solution** To 0.2 g of the powdered herbal drug (355) (2.9.12) add 4.0 mL of *ethanol (96 per cent) R*, sonicate for 10 min and filter.

**Reference solution** Dissolve 10 mg of *thymol R* and 40 µL of *anethole R* in 10 mL of *ethanol (96 per cent) R*.

**Plate** TLC silica gel F<sub>254</sub> plate R (2-10 µm).

**Mobile phase** glacial acetic acid R, di-isopropyl ether R, cyclohexane R (10:40:60 V/V/V).

**Application** 5 µL as bands of 8 mm.

**Development** Over a path of 6 cm.

**Drying** In air.

**Detection A** Examine in ultraviolet light at 366 nm.

**Results A** The chromatogram obtained with the test solution shows no blue or violet fluorescent zones in the lower third of the chromatogram.

**Detection B** Treat with *anisaldehyde solution R*, heat at 100 °C for 2 min and examine in daylight.

**Matter insoluble in ethanol**

Maximum 75 per cent.

Place 1.00 g of the powdered herbal drug (250) (2.9.12) in a flask. Add 30 mL of *ethanol (96 per cent) R* and shake vigorously for 10 min. Filter the supernatant through a tared sintered-glass filter (16) (2.1.2), avoiding the transfer of sediment from the flask. Repeat the extraction with 2 quantities, each of 20 mL, of *ethanol (96 per cent) R*. Quantitatively transfer the sediment to the filter by rinsing the flask with *ethanol (96 per cent) R*. Dry the filter and the residue in an oven at 100-105 °C and weigh.

**Loss on drying (2.2.32)**

Maximum 15.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

**Total ash (2.4.16)**

Maximum 7.0 per cent.

Ph Eur

## Myrrh Tincture

(Ph. Eur. monograph 1877)

Ph Eur

### DEFINITION

Tincture produced from *Myrrh* (1349).

### PRODUCTION

The tincture is produced from 1 part of the drug and 5 parts of ethanol (90 per cent *V/V*) by a suitable procedure.

### CHARACTERS

#### Appearance

Clear, yellowish-brown or orange-brown liquid.

### IDENTIFICATION

Thin-layer chromatography (2.2.27).

**Test solution** Dilute 5 mL of the tincture to be examined to 10 mL with ethanol (96 per cent) *R*.

**Reference solution** Dissolve 10 mg of thymol *R* and 40 µL of anethole *R* in 10 mL of ethanol (96 per cent) *R*.

**Plate** TLC silica gel *F*<sub>254</sub> plate *R* (2-10 µm).

**Mobile phase** glacial acetic acid *R*, di-isopropyl ether *R*, cyclohexane *R* (10:40:60 *V/V/V*).

**Application** 5 µL as bands of 8 mm.

**Development** Over a path of 6 cm.

**Drying** In air.

**Detection** Treat with anisaldehyde solution *R*, heat at 100 °C for 2 min and examine in daylight.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Anethole: a violet zone	A reddish-violet zone
Thymol: an orange zone	A red zone
	A violet zone
	A brown zone
Reference solution	Test solution

### TESTS

#### Ethanol (2.9.10)

82 per cent *V/V* to 88 per cent *V/V*.

#### Methanol and 2-propanol (2.9.11)

Maximum 0.05 per cent *V/V* of methanol and maximum 0.05 per cent *V/V* of 2-propanol.

#### Dry residue (2.8.16)

Minimum 4.0 per cent.

### STORAGE

Plastic containers are not recommended.

## Cineole Type Niaouli Oil

(Ph. Eur. monograph 2468)

Ph Eur

### DEFINITION

Essential oil obtained by steam distillation from young leafy branches of *Melaleuca quinquenervia* (Cav.) S.T.Blake.

### CHARACTERS

#### Appearance

Colourless or pale yellow liquid.

Aromatic odour of cineole.

### IDENTIFICATION

**First identification** B.

**Second identification** A.

A. Thin-layer chromatography (2.2.27).

**Test solution** Dissolve 100 µL of the essential oil to be examined in toluene *R* and dilute to 10.0 mL with the same solvent.

**Reference solution** Dissolve 25 µL of *trans-nerolidol R* and 50 µL of cineole *R* in toluene *R* and dilute to 5.0 mL with the same solvent.

**Plate** TLC silica gel plate *R* (5-40 µm) [or TLC silica gel plate *R* (2-10 µm)].

**Mobile phase** ethyl acetate *R*, toluene *R* (5:95 *V/V*).

**Application** 10 µL [or 2 µL] as bands of 10 mm [or 8 mm].

**Development** Over a path of 15 cm [or 6 cm].

**Drying** In air.

**Detection** Treat with anisaldehyde solution *R* and heat at 100-105 °C for 3 min; examine in daylight.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
1,8-Cineole: a violet-brown zone	A faint grey zone
<i>trans</i> -Nerolidol: a dark violet zone	A purple zone
	An intense violet-brown zone (1,8-cineole)
	An intense violet-brown zone
	A violet-brown zone
Reference solution	Test solution

B. Examine the chromatograms obtained in the test for chromatographic profile.

**Results** The characteristic peaks in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with reference solution (a).

Ph Eur

**TESTS**

**Relative density** (2.2.5)  
0.904 to 0.925.

**Refractive index** (2.2.6)  
1.463 to 1.472.

**Optical rotation** (2.2.7)  
-4° to +1°.

**Methyleugenol and isomethyleugenol**

Gas chromatography (2.2.28) as described in the test for chromatographic profile with the following modifications.

**Reference solution** Dissolve 5 µL of *methyleugenol R* and 5 µL of *isomethyleugenol R* in *heptane R* and dilute to 50.0 mL with the same solvent. Dilute 0.5 mL of the solution to 5.0 mL with *heptane R*.

**Elution order** Order indicated in the composition of the reference solution; record the retention times of methyleugenol and isomethyleugenol.

**Identification of peaks** Using the retention times determined from the chromatogram obtained with the reference solution, locate the components of the reference solution in the chromatogram obtained with the test solution.

**Limits:**

- *methyleugenol*: maximum 0.05 per cent;
- *isomethyleugenol*: maximum 0.05 per cent.

**Chromatographic profile**

Gas chromatography (2.2.28): use the normalisation procedure.

**Test solution** Dilute 0.2 mL of the essential oil to be examined to 10.0 mL with *heptane R*.

**Reference solution (a)** Dilute 10 µL of *α-pinene R*, 5 µL of *β-pinene R*, 10 µL of *limonene R*, 50 µL of *cineole R*, 5 µL of *p-cymene R*, 5 µL of *benzaldehyde R*, 5 mg of *α-terpineol R* and 5 µL of *trans-nerolidol R* in *heptane R* and dilute to 10 mL with the same solvent.

**Reference solution (b)** Dissolve 5 µL of *limonene R* in *heptane R* and dilute to 50.0 mL with the same solvent. Dilute 0.5 mL of the solution to 5.0 mL with *heptane R*.

**Column:**

- *material*: fused silica;
- *size*:  $l = 60$  m,  $\varnothing = 0.25$  mm;
- *stationary phase*: *macrogol 20 000 R* (film thickness 0.25 µm).

**Carrier gas** *helium for chromatography R*.

**Flow rate** 1.3 mL/min.

**Split ratio** 1:50.

**Temperature:**

	Time (min)	Temperature (°C)
Column	0 - 5	65
	5 - 65	65 → 185
	65 - 80	185 → 230
Injection port		230
Detector		250

**Detection** Flame ionisation.

**Injection** 1 µL.

**Elution order** Order indicated in the composition of reference solution (a); record the retention times of these substances.

**Identification of peaks** Using the retention times determined from the chromatogram obtained with reference solution (a),

locate the components of reference solution (a) in the chromatogram obtained with the test solution; the peak due to *viridiflorol* elutes with a relative retention of about 1.02 with reference to *trans-nerolidol*.

**System suitability** Reference solution (a):

- **resolution**: minimum 1.5 between the peaks due to limonene and 1,8-cineole.

Determine the percentage content of each of the following components. The limits are within the following ranges:

- *α-pinene*: 5.0 per cent to 15.0 per cent;
- *β-pinene*: 1.0 per cent to 4.0 per cent;
- *limonene*: 5.0 per cent to 10.0 per cent;
- *1,8-cineole*: 45.0 per cent to 65.0 per cent;
- *p-cymene*: 0.05 per cent to 4.0 per cent;
- *benzaldehyde*: 0.05 per cent to 0.5 per cent;
- *α-terpineol*: 3.0 per cent to 8.0 per cent;
- *trans-nerolidol*: 0.05 per cent to 1.5 per cent;
- *viridiflorol*: 2.5 per cent to 9.0 per cent;
- **disregard limit**: the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

**STORAGE**

At a temperature not exceeding 25 °C.

Ph Eur

**Neroli Oil**

(Ph. Eur. monograph 1175)

Ph Eur

**DEFINITION**

Neroli oil is obtained by steam distillation from the fresh flowers of *Citrus aurantium L.* subsp. *aurantium L.* (*C. aurantium L.* subsp. *amara Engl.*).

**CHARACTERS****Appearance**

Clear, pale-yellow or dark-yellow liquid.

Characteristic odour.

**IDENTIFICATION**

**First identification:** B.

**Second identification:** A.

A. Examine the chromatograms obtained in the test for bergapten.

**Results A** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore other zones may be present in the chromatograms obtained with the test solution.

Top of the plate	
Methyl anthranilate: a blue fluorescent zone	A faint blue fluorescent zone (methyl anthranilate)
Bergapten: a greenish-yellow fluorescent zone	
Reference solution	Test solution

**Detection B** Spray with *anisaldehyde solution R*; heat at 100-105 °C for 10 min; examine the chromatograms in ultraviolet light at 365 nm.

**Results B** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. In the chromatogram obtained with the test solution the zone due to linalol is more intense than the zone due to linalyl acetate.

Top of the plate	
Linalyl acetate: a brownish-red fluorescent zone	A brown fluorescent zone An intense brownish-red fluorescent zone (linalyl acetate)
Methyl anthranilate: a blue fluorescent zone	A faint blue fluorescent zone (methyl anthranilate)
Linalol: a brownish-red fluorescent zone	A faint brownish-red fluorescent zone A brownish-red fluorescent zone (linalol)
Bergapten: a greenish-yellow fluorescent zone	Several blue and brownish-red fluorescent zones
Reference solution	Test solution

B. Examine the chromatograms obtained in the test for chromatographic profile.

**Results** The principal peaks in the chromatogram obtained with the test solution are similar in retention time to the principal peaks in the chromatogram obtained with the reference solution.

#### TESTS

**Relative density (2.2.5)**  
0.863 to 0.880.

**Refractive index (2.2.6)**  
1.464 to 1.474.

**Optical rotation (2.2.7)**  
+ 1.5° to + 11.5°.

**Acid value (2.5.1)**  
Maximum 2.0.

#### Bergapten

Thin-layer chromatography (2.2.27).

**Test solution** Dissolve 0.1 g of the substance to be examined in *ethanol (96 per cent) R* and dilute to 5.0 mL with the same solvent.

**Reference solution** Dissolve 2 µL of *methyl anthranilate R*, 10 µL of *linalyl acetate R*, 20 µL of *linalol R* and 5 mg of *bergapten R* in *ethanol (96 per cent) R* and dilute to 10.0 mL with the same solvent.

**Plate** TLC silica gel plate R (5-40 µm) [or TLC silica gel plate R (2-10 µm)].

**Mobile phase** *ethyl acetate R*, *toluene R* (15:85 V/V).

**Application** 10 µL [or 2 µL] as bands.

**Development** Over a path of 15 cm [or 8 cm].

**Drying** In air.

**Detection** Examine in ultraviolet light at 365 nm.

**Results** The chromatogram obtained with the test solution does not show a zone corresponding to the zone due to bergapten in the chromatogram obtained with the reference solution.

#### Chromatographic profile

Gas chromatography (2.2.28): use the normalisation procedure.

**Test solution** The substance to be examined.

**Reference solution (a)** Dissolve 20 µL of *β-pinene R*, 5 mg of *sabinene R*, 40 µL of *limonene R*, 40 µL of *linalol R*, 20 µL of *linalyl acetate R*, 5 mg of *α-terpineol R*, 5 µL of *neryl acetate R*, 5 µL of *geranyl acetate R*, 5 µL of *trans-nerolidol R*, 5 µL of *methyl anthranilate R* and 5 µL (*E,E*)-*farnesol R* in 2 mL of *heptane R*.

**Reference solution (b)** Dissolve 5 µL of *methyl anthranilate R* in *heptane R* and dilute to 10 mL with the same solvent.

#### Column:

- **material:** fused silica,
- **size:**  $l = 60$  m,  $\varnothing = 0.25$  mm,
- **stationary phase:** *macrogol 20 000 R* (film thickness 0.25 µm).

**Carrier gas** *helium for chromatography R*.

**Flow rate** 1.5 mL/min.

**Split ratio** 1:100.

**Temperature:**

	Time (min)	Temperature (°C)
Column	0 - 4	75
	4 - 42.8	75 → 230
	42.8 - 63	230
Injection port		270
Detector		270

**Detection** Flame ionisation.

**Injection** 0.2 µL.

**Elution order** Order indicated in the composition of reference solution (a). Record the retention times of these substances.

**System suitability** Reference solution (a):

- **resolution:** minimum 1.5 between the peaks due to *β-pinene* and *sabinene*.

Using the retention times determined from the chromatogram obtained with reference solution (a), locate the components of reference solution (a) in the chromatogram obtained with the test solution.

#### Limis:

- *β-pinene*: 7.0 per cent to 17.0 per cent,
- *limonene*: 9.0 per cent to 18.0 per cent,
- *linalol*: 28.0 per cent to 44.0 per cent,
- *linalyl acetate*: 2.0 per cent to 15.0 per cent,
- *α-terpineol*: 2.0 per cent to 5.5 per cent,
- *neryl acetate*: maximum 2.5 per cent,
- *geranyl acetate*: 1.0 per cent to 5.0 per cent,
- *trans-nerolidol*: 1.0 per cent to 5.0 per cent,
- *methyl anthranilate*: 0.1 per cent to 1.0 per cent,
- (*E,E*)-*farnesol*: 0.8 per cent to 4.0 per cent,
- **disregard limit:** area of the peak in the chromatogram obtained with reference solution (b).

#### Chiral purity

Gas chromatography (2.2.28).

**Test solution** Dissolve 20 mg of the substance to be examined in *pentane R* and dilute to 10.0 mL with the same solvent.

**Reference solution** To 10 µL of *linalol R* add 10 µL of *linalyl acetate R*. Dilute to 10.0 mL with *pentane R*.

**Column:**

- **material:** fused silica,
- **size:**  $l = 25\text{ m}$ ,  $\varnothing = 0.25\text{ mm}$ ,
- **stationary phase:** modified  $\beta$ -cyclodextrin for chiral chromatography *R* (film thickness 0.25 µm).

**Carrier gas** helium for chromatography *R*.

**Flow rate** 1.3 mL/min.

**Split ratio** 1:30.

**Temperature:**

	Time (min)	Temperature (°C)
Column	0 - 65	50 → 180
Injection port		230
Detector		230

**Detection** Flame ionisation.

**Injection** 1 µL.

**System suitability** Reference solution:

- **resolution:** minimum 5.5 between the peaks due to (*R*)(-)-linalol (1<sup>st</sup> peak) and (*S*)(+)-linalol (2<sup>nd</sup> peak); minimum 2.7 between the peaks due to (*R*)(-)-linalyl acetate (3<sup>rd</sup> peak) and (*S*)(+)-linalyl acetate (4<sup>th</sup> peak).

Calculate the percentage content of the specified (*S*)-enantiomers from the following expression:

$$\frac{A_1}{A_1 + A_2} \times 100$$

- $A_1$  = area of the corresponding (*S*)-enantiomer,
- $A_2$  = area of the corresponding (*R*)-enantiomer.

**Limits:**

- (*S*)(+)-linalol: maximum 30 per cent,
- (*S*)(+)-linalyl acetate: maximum 5 per cent.

**STORAGE**

At a temperature not exceeding 25 °C.

Ph Eur

## Nettle Leaf

(Ph. Eur. monograph 1897)

Ph Eur

### DEFINITION

Whole or cut dried leaves of *Urtica dioica* L., *Urtica urens* L., or a mixture of the 2 species.

### Content

Minimum 0.3 per cent for the sum of caffeoylmalic acid and chlorogenic acid, expressed as chlorogenic acid ( $C_{16}H_{18}O_9$ ;  $M_r$  354.3) (dried drug).

### IDENTIFICATION

A. The leaves are dark green, dark greyish-green or brownish-green on the upper surface, paler on the lower surface; scattered stinging hairs occur on both surfaces, also small covering trichomes that are more numerous along the margins and on the veins on the lower surface. The lamina is

strongly shrunken, ovate or oblong, up to 100 mm long and 50 mm wide, with a coarsely serrate margin and a cordate or rounded base. The venation is reticulate and distinctly prominent on the lower surface. The petiole is green or brownish-green, rounded or flattened, about 1 mm wide, longitudinally furrowed and twisted; it bears stinging hairs and covering trichomes.

B. Microscopic examination (2.8.23). The powder is green or greyish-green. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 1897.-1): fragments of unicellular stinging hairs [A, B, C], up to 2 mm long, composed of an elongated tapering cell with a slightly swollen stinging tip that readily breaks off, arising from a raised, multicellular base [Ca]; small glandular trichomes [F] (35-65 µm), with a uni- or bicellular stalk and a bi- or quadricellular head, isolated [Fa], or on fragments of the epidermis [Fb]; fragments of the upper epidermis of the leaves (surface view [G], transverse section [D]) showing slightly sinuous cells [Da, Gc], unicellular, straight or slightly curved covering trichomes, enlarged at the base, up to 700 µm long [Dc, Ga] and abundant large cystoliths [Db, Ea, Gb], empty or containing dense, granular masses of calcium carbonate; palisade parenchyma (surface view [E]) with rounded cells [Eb] surrounding cystoliths [Ea] (transverse section [Dd]); fragments of lower epidermis of leaves showing sinuous or wavy-walled cells [H], anomocytic [Ha] or anisocytic stomata [Hb] (2.8.3) accompanied by spongy mesophyll (surface view [Hc], transverse section [De]) containing small cluster crystals of calcium oxalate (surface view [Hd], transverse section [Df]); occasional small groups of vessels, accompanied by parenchyma containing cluster crystals of calcium oxalate [J].

Figure 1897.-1. – Illustration for identification test B of powdered herbal drug of nettle leaf

## C. Thin-layer chromatography (2.2.27).

**Test solution** To 1 g of the powdered herbal drug (355) (2.9.12) add 10 mL of *methanol R*. Boil under a reflux condenser for 15 min. Cool and filter. Evaporate to dryness *in vacuo* at 40 °C. Dissolve the residue in 2 mL of *methanol R*.

**Reference solution** Dissolve 1 mg of *scooletin R* and 2 mg of *chlorogenic acid R* in 20 mL of *methanol R*.

**Plate** TLC silica gel plate R (5-40 µm) [or TLC silica gel plate R (2-10 µm)].

**Mobile phase** *anhydrous formic acid R*, *methanol R*, *water R*, *ethyl acetate R* (2.5:4:4:50 *V/V/V/V*).

**Application** 10 µL [or 4 µL] as bands of 10 mm [or 8 mm].

**Development** Over a path of 8 cm [or 6 cm].

**Drying** In air.

**Detection** Heat at 100 °C for 5 min; spray the still-warm plate with a 10 g/L solution of *diphenylboric acid aminoethyl ester R* in *methanol R*; examine in ultraviolet light at 365 nm.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint blue or yellow fluorescent zones may be present in the lower half of the chromatogram obtained with the test solution.

Top of the plate	
Scooletin: an intense blue fluorescent zone	2 red zones
	A blue fluorescent zone (scooletin)
Chlorogenic acid: a blue fluorescent zone	A blue fluorescent zone
	A blue fluorescent zone (chlorogenic acid)
Reference solution	A brownish-yellow zone
	Test solution

## TESTS

## Foreign matter (2.8.2)

Maximum 5 per cent of stems and maximum 5 per cent of other foreign matter (including inflorescences).

## Loss on drying (2.2.32)

Maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

## Total ash (2.4.16)

Maximum 20.0 per cent.

## Ash insoluble in hydrochloric acid (2.8.1)

Maximum 4.0 per cent.

## ASSAY

Liquid chromatography (2.2.29).

**Test solution** To 0.200 g of the powdered herbal drug (355) (2.9.12) add 25.0 mL of a 40 per cent *V/V* solution of *methanol R*. Extract for 30 min in an ultrasonic bath at 40 °C and filter.

**Reference solution** Dissolve 10.0 mg of *chlorogenic acid CRS* in 100.0 mL of a 40 per cent *V/V* solution of *methanol R*.

Dilute 5.0 mL of this solution to 25.0 mL with a 40 per cent *V/V* solution of *methanol R*.

## Precolumn:

— size:  $l = 4$  mm,  $\varnothing = 4$  mm;

— stationary phase: end-capped octadecylsilyl silica gel for chromatography R (5 µm).

## Column:

— size:  $l = 0.125$  m,  $\varnothing = 4$  mm;

— stationary phase: end-capped octadecylsilyl silica gel for chromatography R (5 µm);

— temperature: 25 °C.

## Mobile phase:

— mobile phase A: mix 15 volumes of *methanol R* and 85 volumes of *water R* and adjust to pH 2.0 with *dilute phosphoric acid R*;

— mobile phase B: *methanol R*;

Time (min)	Mobile phase A (per cent <i>V/V</i> )	Mobile phase B (per cent <i>V/V</i> )
0 - 1	100	0
1 - 25	100 → 85	0 → 15
25 - 35	85	15
35 - 36	85 → 0	15 → 100

**Flow rate** 1 mL/min.

**Detection** Spectrophotometer at 330 nm.

**Injection** 20 µL.

**Relative retention** With reference to chlorogenic acid (retention time = about 13 min): caffeoylmalic acid = about 2.2.

Calculate the percentage content of caffeoylmalic acid and chlorogenic acid, expressed as chlorogenic acid, using the following expression:

$$\frac{A_1 \times m_2 \times p}{A_2 \times m_1 \times 20}$$

- $A_1$  = sum of the areas of the peaks due to caffeoylmalic acid and chlorogenic acid in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to chlorogenic acid in the chromatogram obtained with the reference solution;
- $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;
- $m_2$  = mass of *chlorogenic acid CRS* used to prepare the reference solution, in grams;
- $p$  = percentage content of chlorogenic acid in *chlorogenic acid CRS*.

Ph Eur

## Nettle Root

(Ph. Eur. monograph 2538)

Ph Eur

## DEFINITION

Dried, whole or fragmented underground parts of *Urtica dioica* L. or *Urtica urens* L., their hybrids or their mixtures.

## IDENTIFICATION

A. Irregular cylindrical rhizome, greyish-brown, sporadically purple or greenish, 3-10 mm in diameter, the internodes are up to 2-3 cm long, with deep longitudinal furrows, alternating with short, slightly swollen nodes; the nodes bear numerous roots that are externally greyish-brown, 0.5-2 mm in diameter and up to about 10 cm long. The transverse

section shows a thin, dark bark, the inner part is creamish-white with a hollow centre. The fracture of the rhizome is fibrous and uneven, especially in the inner part.

**B. Microscopic examination (2.8.23).** The powder is pale yellowish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of brownish cork with thin-walled cells; fragments of vessels with bordered pits, 50-150 µm in diameter; fragments of fibres with thick lignified walls, occurring singly or in groups; abundant fragments of parenchyma with thin-walled cells, some containing large cluster crystals of calcium oxalate; rare, scattered, simple crystals of calcium oxalate; fragments of the medullary rays with moderately thick-walled, pitted cells.

**C. Thin-layer chromatography (2.2.27).**

**Test solution** To 2 g of the powdered herbal drug (355) (2.9.12) add 10 mL of *methanol R*. Sonicate for 10 min and filter. Evaporate the filtrate to dryness and dissolve the residue in 2 mL of *methanol R*.

**Reference solution** Dissolve 1 mg of *scopoletin R* in 10 mL of *methanol R* (solution A). Dissolve 10 mg of *arbutin R* and 20 mg of *β-sitosterol R* in *methanol R*, add 1 mL of solution A and dilute to 10 mL with *methanol R*.

**Plate** TLC silica gel *F<sub>254</sub> plate R* (5-40 µm) [or TLC silica gel *F<sub>254</sub> plate R* (2-10 µm)].

**Mobile phase** *anhydrous formic acid R, methanol R, water R, ethyl acetate R* (2.5:4:4:50 V/V/V/V).

**Application** 20 µL [or 10 µL] as bands of 10 mm [or 8 mm].

**Development** Over a path of 8 cm [or 6 cm].

**Drying** In air for 5 min.

**Detection A** Examine in ultraviolet light at 365 nm.

**Results A** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other fluorescent zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
	A blue or greenish-blue fluorescent zone
Scopoletin: a blue fluorescent zone	A blue fluorescent zone (scopoletin)
Reference solution	Test solution

**Detection B** Treat with *anisaldehyde solution R* and heat at 100-105 °C for 5-10 min; examine in daylight.

**Results B** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
	A purple zone
β-sitosterol: a purple zone	A purple zone (β-sitosterol)
	A faint purple zone
Arbutin: a greenish-brown zone	
Reference solution	Test solution

### TESTS

**Loss on drying (2.2.32)**

Maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

**Lead (2.4.27)**

Maximum 7.0 ppm.

**Total ash (2.4.16)**

Maximum 12.0 per cent.

**Ash insoluble in hydrochloric acid (2.8.1)**

Maximum 4.0 per cent.

**Extractable matter**

Minimum 7.0 per cent.

To 2.000 g of the powdered herbal drug (250) (2.9.12) add a mixture of 6 g of *water R* and 14 g of *ethanol (96 per cent) R* and extract for 2 h, shaking frequently. Filter, evaporate 5.000 g of the filtrate to dryness on a water-bath and dry in an oven at 105 °C for 2 h. The residue weighs a minimum of 35 mg.

Ph Eur

## Notoginseng Root

(Ph. Eur. monograph 2383)

Ph Eur

### DEFINITION

Whole or fragmented taproot, without secondary roots, of *Panax notoginseng* (Burkill) F.H.Chen [*Panax pseudoginseng* var. *notoginseng* (Burkill) G.Hoo & C.L.Tseng] treated with steam and dried.

### Content

Minimum 3.8 per cent for the sum of ginsenosides Rg1 (C<sub>42</sub>H<sub>72</sub>O<sub>14</sub>·2H<sub>2</sub>O; M<sub>r</sub> 837) and Rb1 (C<sub>54</sub>H<sub>92</sub>O<sub>23</sub>·3H<sub>2</sub>O; M<sub>r</sub> 1163) (dried drug).

### IDENTIFICATION

**A.** The primary root is conical, subconical or cylindrical, up to 6 cm long and 4 cm in diameter. The outer surface, showing shallow transverse striations and secondary root scars, is brownish-grey or yellowish-grey. The aerial stem scar is surrounded by warty protuberances at the crown. The texture of the root is compact. The fracture is smooth, shiny, brownish-grey and shows a yellowish-grey ring (cambial zone) and many radial striations.

B. Microscopic examination (2.8.23). The powder is light yellowish-grey. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2383.-1): abundant fragments of parenchymatous cells with rounded or ovoid cells [D]; fragments of secretory canals (transverse section [G], longitudinal section [E]) with thin-walled cells [Ea, Ga] and containing a granular yellowish-brown resin diffused in the cells [Eb, Gb]; rare vessels, reticulate [B] or pitted, ranging from 20-50  $\mu\text{m}$  in diameter; rare fragments of cork (surface view [A], transverse section [F]). Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The starch granules, sometimes deformed, single, with a diameter of 2-20  $\mu\text{m}$ , or in groups of 2-9, are very abundant [C].

Figure 2383.-1. – Illustration for identification test B of powdered herbal drug of notoginseng root

C. Examine the chromatograms obtained in the test for *Panax ginseng* or *Panax quinquefolium*.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Arbutin: a brown zone	A violet zone (at the solvent front)
	A violet zone
	A violet zone (ginsenosides Rg1 + Rg2)
	2 violet zones
	2 faint violet zones
Aescin: a grey zone	A violet zone
	Several violet and greenish zones
Reference solution	Test solution

### TESTS

*Panax ginseng* or *Panax quinquefolium*

Thin-layer chromatography (2.2.27).

**Test solution** To 1.0 g of the powdered herbal drug (355) (2.9.12) add 10 mL of a 70 per cent *V/V* solution of *methanol R* and boil under a reflux condenser for 15 min. Filter after cooling and dilute to 10.0 mL with *methanol R*.

**Reference solution** Dissolve 5.0 mg of *aescin R* and 5.0 mg of *arbutin R* in 1 mL of *methanol R*.

**Plate** TLC silica gel plate R (5-40  $\mu\text{m}$ ) [or TLC silica gel plate R (2-10  $\mu\text{m}$ )].

**Mobile phase** *ethyl acetate R*, *water R*, *butanol R* (25:50:100 *V/V/V*); allow to stand for 10 min and use the upper layer.

**Application** 20  $\mu\text{L}$ , as bands of 15 mm [or 4  $\mu\text{L}$  of the test solution and 2  $\mu\text{L}$  of the reference solution, as bands of 8 mm].

**Development** In an unsaturated tank, over a path of 10 cm [or 5 cm].

**Drying** In air for 30 min.

**Detection** Treat with *anisaldehyde solution R* and heat at 105-110  $^{\circ}\text{C}$  for 5-10 min; examine in daylight.

**Results** In the chromatogram obtained with the test solution, the absence of a violet zone immediately above the zone due to arbutin in the chromatogram obtained with the reference solution indicates the presence of *Panax ginseng*; in the chromatogram obtained with the test solution, the presence of a brown zone immediately below the violet zone due to ginsenosides Rg1 + Rg2 indicates adulteration with *Panax quinquefolium*.

**Loss on drying** (2.2.32)

Maximum 2.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105  $^{\circ}\text{C}$  for 2 h.

**Total ash** (2.4.16)

Maximum 6.0 per cent.

**Ash insoluble in hydrochloric acid** (2.8.1)

Maximum 1.0 per cent.

### ASSAY

Liquid chromatography (2.2.29).

**Test solution** Reduce about 50 g to a powder (355) (2.9.12). Place 0.250 g of the powdered herbal drug and 70 mL of a 50 per cent *V/V* solution of *methanol R* in a 250 mL round-

bottomed flask. After adding a few grains of pumice, boil on a water-bath under a reflux condenser for 1 h. After cooling, centrifuge and collect the supernatant. Treat the residue as described above. Mix the collected liquids and evaporate to dryness under reduced pressure at a temperature not exceeding 60 °C. Take up the residue with 10.0 mL of a buffer solution, adjusted to pH 4.5, containing 3.5 g of sodium dihydrogen phosphate R and 7.2 g of potassium dihydrogen phosphate R in 1000 mL of water R (solution A). Wash a cartridge containing about 0.36 g of octadecylsilyl silica gel for chromatography R with 5 mL of methanol R followed by 20 mL of water for chromatography R. Apply 5.0 mL of solution A to the cartridge. Elute with 20 mL of water for chromatography R, followed by 15 mL of a 30 per cent V/V solution of methanol R. Discard the eluates after confirming that no ginsenosides are present, otherwise repeat the assay with another type of cartridge. Elute the cartridge with 20 mL of methanol R and evaporate the eluate to dryness. Take up the residue with 5.0 mL of methanol R.

**Reference solution** Dissolve 3.0 mg of ginsenoside Rb1 CRS, 3.0 mg of ginsenoside Rf R and 3.0 mg of ginsenoside Rg1 CRS in methanol R and dilute to 5.0 mL with the same solvent.

**Column:**

- size:  $l = 0.10$  m,  $\varnothing = 4.6$  mm;
- stationary phase: aminopropylsilyl silica gel for chromatography R (3  $\mu$ m).

**Mobile phase:**

- mobile phase A: acetonitrile R1;
- mobile phase B: water for chromatography R;

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 14	90	10
14 - 18	90 → 80	10 → 20
18 - 55	80	20

**Flow rate** 2 mL/min.

**Detection** Spectrophotometer at 203 nm.

**Injection** 20  $\mu$ L.

**System suitability** Reference solution:

- resolution: minimum 3.0 between the peaks due to ginsenosides Rg1 and Rf.

Calculate the sum of the percentage contents of ginsenosides Rb1 and Rg1 using the following expression:

$$\frac{A_1 \times m_2 \times 2 \times p_1}{m_1 \times A_3} + \frac{A_2 \times m_3 \times 2 \times p_2}{m_1 \times A_4}$$

- $A_1$  = area of the peak due to ginsenoside Rb1 in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to ginsenoside Rg1 in the chromatogram obtained with the test solution;
- $A_3$  = area of the peak due to ginsenoside Rb1 in the chromatogram obtained with the reference solution;
- $A_4$  = area of the peak due to ginsenoside Rg1 in the chromatogram obtained with the reference solution;
- $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;
- $m_2$  = mass of ginsenoside Rb1 CRS used to prepare the reference solution, in grams;
- $m_3$  = mass of ginsenoside Rg1 CRS used to prepare the reference solution, in grams;
- $p_1$  = percentage content of ginsenoside Rb1 in ginsenoside Rb1 CRS;
- $p_2$  = percentage content of ginsenoside Rg1 in ginsenoside Rg1 CRS.

## Nutmeg

### DEFINITION

Nutmeg is the endosperm of dried seeds of *Myristica fragrans* Houtt. It contains not less than 5.0% v/w of essential oils, calculated with reference to the dried drug.

### IDENTIFICATION

A. Seed ellipsoid, 20 to 30 mm long and up to 20 mm broad; externally greyish-brown and reticulately furrowed, sometimes marked with small irregular darker brown patches or points; one end is a small lighter-coloured area with brown lines radiating from the hilum, and surrounded by a raised ring, from which an ill-defined groove, an imprint or the raphe, runs to the chalaza at the opposite end, where there is a small, dark, depression.

B. Reduce to a powder, Appendix XVII A. The powder is dark brown. Examine under a microscope using chloral hydrate solution. The powder contains numerous fragments of reddish-brown parenchyma of the perisperm, those from the outer layers composed of polygonal or rounded with slightly thickened walls and occasional small intercellular spaces; some containing prism crystals; parenchyma of the inner layers composed of smaller cells with darker reddish-brown contents and large, rounded oil cells which occur singly or in groups and are frequently broken; small groups of lignified vessels; thin-walled parenchyma of the endosperm composed of closely-packed polygonal cells filled with starch granules; when fully cleared of starch these cells can be seen to contain elongated prism crystals. Examine under glycerol: abundant, small starch granules, usually simple and spherical, but occasionally compound 2-8, with a stellate or slit-shaped hilum.

C. Carry out the method for high performance thin-layer chromatography, Appendix XI W, using the following solutions.

- (1) To 0.5 g of powdered herbal drug (355) add 5 mL of methanol. Mix with the aid of ultrasound, centrifuge, and use the supernatant liquid.
- (2) 0.09% w/v of myristicine and 0.1% v/v of terpinen-4-ol in methanol.
- (3) Dilute 1 volume of solution (2) to 4 volumes with toluene.
- (4) 0.025% v/v of isoeugenol and 0.05% v/v of isoeugenyl acetate in toluene.

### CHROMATOGRAPHIC CONDITIONS

- (a) Use as the coating high performance silica gel F<sub>254</sub> (Merck silica gel 60 F<sub>254</sub> HPTLC plates are suitable).
- (b) Use the mobile phase as described below.
- (c) Apply 4  $\mu$ L of each solution as 8 mm bands.
- (d) Develop the plate to 7 cm.
- (e) After the removal of the plate, dry in a current of cold air, and examine under ultraviolet light (254 nm). To a mixture of 1 volume of sulfuric acid, 2 volumes of acetic acid, and 17 volumes of methanol, add 0.1 volumes of anisaldehyde. Dip the plate in this solution, and heat the plate to 100° for 3 minutes, and examine under white light.

### MOBILE PHASE

5 volumes of ethyl acetate and 95 volumes of toluene.

### SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solutions (2) and (3) shows a zone corresponding to myristicin.

Ph Eur

Table 1: Visualisation at 254 nm

Top of the plate		
A quenching zone A quenching zone A quenching zone	Myristicine (A quenching zone)	Isoeugenol acetate (A quenching zone) Isoeugenol (A quenching zone)
A quenching zone		
Solution (1)	Solution (2) and (3)	Solution (4)

Table 2: Visualisation under white light

Top of the plate		
A faint grey-brown band A brownish band A purple band A purple band	Myristicine (A brownish band)	Isoeugenol acetate (A purple band) Isoeugenol (A purple band)
An orange-brown band A faint purple band A purple band An intense violet band	Terpinen-4-ol (A purple band)	
Solution (1)	Solution (2) and (3)	Solution (4)

**CONFIRMATION**

The chromatogram obtained with solution (1) shows the zones in Table 1 when examined under ultraviolet light and the fluorescent zones in Table 2 when examined under white light. Other bands may be present.

**TESTS****Foreign matter**

Not more than 2.0%, Appendix XI D.

**Water**

Not more than 10.0% v/w, Appendix IX C, method II. Use 8 g of powdered drug.

**Total Ash**

Not more than 3.0%, Appendix XI J, Method II. Use 1 g of powdered drug.

**ASSAY**

Carry out the method for *Essential Oils in Herbal Drugs*, Appendix XI E, using 18 g of freshly prepared powdered drug (425) with 250 mL of water as the distillation liquid. Distil at a rate of 2 to 3 mL per minute for 2 hours using 0.50 mL of toluene in the graduated tube. Measure the quantity of essential oil distilled.

**ANNEX**

This section is non-mandatory.

**DNA reference sequence**

A DNA reference sequence for the identity of Nutmeg is published in *Supplementary Chapter VII D*.

**Nutmeg Oil**

(Ph. Eur. monograph 1552)

Ph Eur

**DEFINITION**

Essential oil obtained by steam distillation of the dried and crushed kernels of *Myristica fragrans* Houtt.

**CHARACTERS****Appearance**

Colourless or pale yellow liquid.

Spicy odour.

**IDENTIFICATION**

*First identification: B.*

*Second identification: A.*

**A. Thin-layer chromatography (2.2.27).**

*Test solution* Dissolve 1 mL of the substance to be examined in toluene R and dilute to 10 mL with the same solvent.

*Reference solution* Dissolve 20 µL of myristicine R in 10 mL of toluene R.

*Plate* TLC silica gel plate R.

*Mobile phase* ethyl acetate R, toluene R (5:95 V/V).

*Application* 10 µL as bands.

*Development* Over a path of 15 cm.

*Drying* In air.

*Detection* Spray with vanillin reagent R, heat at 100-105 °C for 10 min and examine in daylight.

*Results* The chromatogram obtained with the reference solution shows in the upper third a pink or reddish-brown zone (myristicine); the chromatogram obtained with the test solution shows a series of zones of which 1 is similar in position and colour to the zone in the chromatogram obtained with the reference solution; above this zone a brownish zone (safrole) and a violet zone (hydrocarbons) are present; below the myristicine zone, 5 blue zones of variable intensity are present.

**B. Examine the chromatograms obtained in the test for chromatographic profile.**

*Results* The principal peaks in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with the reference solution.

**TESTS**

**Relative density (2.2.5)**

0.885 to 0.905.

**Refractive index (2.2.6)**

1.475 to 1.485.

**Optical rotation (2.2.7)**

+ 8° to + 18°.

**Chromatographic profile**

**Gas chromatography (2.2.28):** use the normalisation procedure.

*Test solution* The substance to be examined.

*Reference solution* Dissolve 15 µL of  $\alpha$ -pinene R, 15 µL of  $\beta$ -pinene R, 15 µL of sabinene R, 5 µL of car-3-ene R, 5 µL of limonene R, 5 µL of  $\gamma$ -terpinene R, 5 µL of terpinen-4-ol R,

5 µL of *safrole R* and 10 µL of *myristicine R* in 1 mL of *hexane R*.

**Column:**

- *material*: fused silica;
- *size*:  $l = 25\text{--}60\text{ m}$ ,  $\varnothing = \text{about } 0.3\text{ mm}$ ;
- *stationary phase*: *macrogol 20 000 R*.

*Carrier gas* helium for chromatography R.

*Flow rate* 1.5 mL/min.

*Split ratio* 1:100.

*Temperature:*

	Time (min)	Temperature (°C)
Column	0 - 10	50
	10 - 75	50 → 180
	75 - 130	180
Injection port		200 - 220
Detector		240 - 250

*Detection* Flame ionisation.

*Injection* 0.2 µL.

*Elution order* Order indicated in the composition of the reference solution; record the retention times of these substances.

*System suitability* Reference solution:

- *resolution*: minimum 1.5 between the peaks due to  $\beta$ -pinene and sabinene.

*Identification of components* Using the retention times determined from the chromatogram obtained with the reference solution, locate the components of the reference solution in the chromatogram obtained with the test solution.

Determine the percentage content of each of these components. The percentages are within the following ranges:

- $\alpha$ -pinene: 15 per cent to 28 per cent;
- $\beta$ -pinene: 13 per cent to 18 per cent;
- sabinene: 14 per cent to 29 per cent;
- *car-3-ene*: 0.5 per cent to 2.0 per cent;
- limonene: 2.0 per cent to 7.0 per cent;
- $\gamma$ -terpinene: 2.0 per cent to 6.0 per cent;
- *terpinen-4-ol*: 2.0 per cent to 6.0 per cent;
- *safrole*: maximum 2.5 per cent;
- *myristicine*: 5.0 per cent to 12.0 per cent.

**STORAGE**

Protected from heat.

Ph Eur

## Oak Bark

(Ph. Eur. monograph 1887)

Ph Eur

**DEFINITION**

Cut and dried bark from the fresh young branches of *Quercus robur* L., *Q. petraea* (Matt.) Liebl. and *Q. pubescens* Willd.

**Content**

Minimum 3.0 per cent of tannins, expressed as pyrogallol ( $C_6H_6O_3$ ;  $M_r$  126.1) (dried drug).

**IDENTIFICATION**

A. The bark occurs in channelled or quilled pieces, not more than 3 mm thick. The outer surface is light grey or greenish-

grey, rather smooth, with occasional lenticels. The inner surface is dull brown or reddish-brown and has slightly raised longitudinal striations about 0.5-1 mm wide. The fracture is splintery and fibrous.

B. Microscopic examination (2.8.23). The powder is light brown or reddish-brown and fibrous. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: groups of thick-walled fibres surrounded by a moderately thickened parenchymatous sheath containing prism crystals of calcium oxalate; fragments of cork composed of thin-walled tabular cells filled with brownish or reddish contents; abundant sclereids, isolated and in groups, some large with thick, stratified walls and branching pits, others smaller and thinner-walled with simple pits, often with dense brown contents; fragments of parenchyma containing cluster crystals of calcium oxalate; occasional fragments of sieve tissue, thin-walled, some showing sieve areas on the oblique end-walls.

C. To 1 g of the powdered herbal drug (710) (2.9.12) add 10 mL of *ethanol (30 per cent V/V) R* and heat the mixture under a reflux condenser on a water-bath for 30 min. Cool and filter. To 1 mL of this solution add 2 mL of a 10 g/L solution of *vanillin R* in *hydrochloric acid R*. A red colour develops.

**TESTS**

**Loss on drying** (2.2.32)

Maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (710) (2.9.12) by drying in an oven at 105 °C for 2 h.

**Total ash** (2.4.16)

Maximum 8.0 per cent.

**ASSAY**

**Tannins** (2.8.14)

Use 0.700 g of the powdered herbal drug (710) (2.9.12).

Ph Eur

## Olive Leaf

(Ph. Eur. monograph 1878)

**Preparation**

Olive Leaf Dry Extract

Ph Eur

**DEFINITION**

Dried leaf of *Olea europaea* L.

**Content**

Minimum 5.0 per cent of oleuropein ( $C_{25}H_{32}O_{13}$ ;  $M_r$  540.5) (dried drug).

**IDENTIFICATION**

A. The leaf is simple, thick and coriaceous, lanceolate to obovate, 30-50 mm long and 10-15 mm wide, with a mucronate apex and tapering at the base to a short petiole; the margins are entire and reflexed abaxially. The upper surface is greyish-green, smooth and shiny, the lower surface paler and pubescent, particularly along the midrib and main lateral veins.

B. Microscopic examination (2.8.23). The powder is yellowish-green. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of the epidermis in surface view with small, thick-walled polygonal cells and, in the lower

epidermis only, small anomocytic stomata (2.8.3); fragments of the lamina in sectional view showing a thick cuticle, a palisade composed of 3 layers of cells and a small-celled spongy parenchyma; numerous sclereids, very thick-walled and mostly fibre-like with blunt or, occasionally, forked ends, isolated or associated with the parenchyma of the mesophyll; abundant, very large peltate trichomes, with a central unicellular stalk from which radiate some 10-30 thin-walled cells that become free from the adjoining cells at the margin of the shield, giving an uneven, jagged appearance.

A. Peltate trichome, seen from above  
B. Peltate trichome, seen from below  
C. Palisade parenchyma  
D, G, H and L. Fibre-like sclereids, some accompanied by parenchymatous fragments of the spongy mesophyll  
E. Spongy parenchyma

F. Fragment of the lamina, in transverse section, showing a thick cuticle (Fa), palisade parenchyma composed of 3 layers of cells (Fb), and spongy parenchyma (Fc)  
J. Fragment of lower epidermis with anomocytic stomata (Ja) and cicatrix of peltate trichome (Jb)  
K. Fragment of upper epidermis, in surface view, with underlying palisade parenchyma (Ka) and sclereids of the spongy mesophyll (Kb)

Figure 1878.-1. – Illustration of powdered herbal drug of olive leaf (see Identification B)

#### C. Thin-layer chromatography (2.2.27).

**Test solution** To 1.0 g of the powdered herbal drug (355) (2.9.12) add 10 mL of *methanol R*. Boil under a reflux condenser for 15 min. Cool and filter.

**Reference solution** Dissolve 10 mg of *oleuropein R* and 1 mg of *rutoside trihydrate R* in 1 mL of *methanol R*.

**Plate** TLC silica gel plate R.

**Mobile phase** *water R*, *methanol R*, *methylene chloride R* (1.5:15:85 V/V/V).

**Application** 10 µL, as bands.

**Development** Over a path of 10 cm.

**Drying** In air.

**Detection** Spray with *vanillin reagent R* and heat at 100-105 °C for 5 min; examine in daylight.

**Results** See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
	A dark violet-blue zone (solvent front)
	A dark violet-blue zone
Oleuropein: a brownish-green zone	A brownish-green zone (oleuropein)
Rutoside: a brownish-yellow zone	
Reference solution	Test solution

#### TESTS

##### Loss on drying (2.2.32)

Maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

##### Total ash (2.4.16)

Maximum 9.0 per cent.

#### ASSAY

##### Liquid chromatography (2.2.29).

**Test solution** In a flask, place 1.000 g of the powdered herbal drug (355) (2.9.12) and add 50 mL of *methanol R*. Heat in a water-bath at 60 °C for 30 min with shaking. Allow to cool and filter into a 100 mL volumetric flask. Rinse the flask and the filter with *methanol R* and dilute to 100.0 mL with the same solvent. Dilute 2.5 mL of this solution to 25.0 mL with *water R*.

**Reference solution** Dissolve 5.0 mg of *oleuropein CRS* in 5.0 mL of *methanol R*. Dilute 1.0 mL of this solution to 25.0 mL with *water R*.

##### Column:

— size:  $l = 0.15$  m,  $\varnothing = 3.9$  mm;

— stationary phase: *octadecylsilyl silica gel for chromatography R* (5 µm);

— temperature: 25 °C.

##### Mobile phase:

— mobile phase A: dilute 1.0 mL of *glacial acetic acid R* to 100 mL with *water R*;

— mobile phase B: *methanol R*;

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 5	85 → 40	15 → 60
5 - 12	40 → 20	60 → 80
12 - 15	20 → 85	80 → 15

**Flow rate** 1 mL/min.

**Detection** Spectrophotometer at 254 nm.

**Injection** 20 µL.

**Retention time** Oleuropein = about 9 min.

Calculate the percentage content of oleuropein using the following expression:

$$\frac{A_1 \times m_2 \times p \times 8}{A_2 \times m_1}$$

- $A_1$  = area of the peak due to oleuropein in the chromatogram obtained with the test solution;  
 $A_2$  = area of the peak due to oleuropein in the chromatogram obtained with the reference solution;  
 $m_1$  = mass of the herbal drug to be examined in the test solution, in grams;  
 $m_2$  = mass of oleuropein CRS in the reference solution, in grams;  
 $p$  = percentage content of oleuropein in oleuropein CRS.

Ph Eur

## Olive Leaf Dry Extract

(Ph. Eur. monograph 2313)

Ph Eur

### DEFINITION

Dry extract produced from *Olive leaf* (1878).

### Content

Minimum 16.0 per cent of oleuropein ( $C_{25}H_{32}O_{13}$ ;  $M_r$  540.5) (dried extract).

### PRODUCTION

The extract is produced from the herbal drug by a suitable procedure using ethanol (65-96 per cent V/V).

### CHARACTERS

#### Appearance

Greenish-brown or brown, amorphous powder.

### IDENTIFICATION

Thin-layer chromatography (2.2.27).

**Test solution** To 0.25 g of the extract to be examined add 10 mL of methanol R. Sonicate for 15 min and filter.

**Reference solution** Dissolve 5 mg of oleuropein R and 1 mg of rutoside trihydrate R in 1 mL of methanol R.

**Plate** TLC silica gel plate R (5-40  $\mu$ m) [or TLC silica gel plate R (2-10  $\mu$ m)].

**Mobile phase** water R, anhydrous formic acid R, ethyl acetate R (7:13:80 V/V/V).

**Application** 10  $\mu$ L [or 2  $\mu$ L] as bands of 10 mm [or 8 mm].

**Development** Over a path of 10 cm [or 6 cm].

**Drying** In air.

**Detection** Spray with anisaldehyde solution R and heat at 100-105 °C for 5 min; examine in daylight.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
	A dark violet-blue zone
Oleuropein: a brownish-green zone	A brownish-green zone (oleuropein)
Rutoside: a yellow zone	
Reference solution	Test solution

### TESTS

**Loss on drying** (2.8.17)

Maximum 8.0 per cent.

### ASSAY

Liquid chromatography (2.2.29). Prepare the solutions immediately before use.

**Test solution** To 0.250 g of the extract to be examined add 50 mL of methanol R. Sonicate for 15 min and filter into a 100 mL volumetric flask. Rinse the flask and the filter with 2 mL of methanol R and dilute to 100.0 mL with water R.

**Reference solution (a)** Dissolve 10.0 mg of oleuropein CRS in 10.0 mL of methanol R and dilute to 25.0 mL with water R.

**Reference solution (b)** Dissolve 4 mg of rutoside trihydrate R in 10 mL of reference solution (a).

**Column:**

— size:  $l = 0.15$  m,  $\varnothing = 4.6$  mm;

— stationary phase: end-capped octadecylsilyl silica gel for chromatography R (5  $\mu$ m);

— temperature: 25 °C.

**Mobile phase** trifluoroacetic acid R, methanol R, water R (1:400:600 V/V/V).

**Flow rate** 1 mL/min.

**Detection** Spectrophotometer at 233 nm.

**Injection** 20  $\mu$ L.

**Run time** Twice the retention time of oleuropein.

**Relative retention** With reference to oleuropein (retention time = about 11 min): rutoside = about 0.7.

**System suitability** Reference solution (b):

— resolution: minimum 3.0 between the peaks due to rutoside and oleuropein.

Calculate the percentage content of oleuropein using the following expression:

$$\frac{A_1 \times m_2 \times p \times 4}{A_2 \times m_1}$$

- $A_1$  = area of the peak due to oleuropein in the chromatogram obtained with the test solution;  
 $A_2$  = area of the peak due to oleuropein in the chromatogram obtained with reference solution (a);  
 $m_1$  = mass of the extract to be examined used to prepare the test solution, in grams;  
 $m_2$  = mass of oleuropein CRS used to prepare reference solution (a), in grams;  
 $p$  = percentage content of oleuropein in oleuropein CRS.

Ph Eur

## Opium

(Raw Opium, Ph. Eur. monograph 0777)

### Preparations

Opium Tincture

Prepared Opium

Standardised Opium Dry Extract

Standardised Opium Tincture

Ph Eur

Raw opium is intended only as starting material for the manufacture of galenic preparations. It is not dispensed as such.

### DEFINITION

Air-dried latex obtained by incision from the unripe capsules of *Papaver somniferum* L.

**Content**

- *morphine* ( $C_{17}H_{19}NO_3$ ;  $M_r$  285.3): minimum 10.0 per cent (dried drug);
- *codeine* ( $C_{18}H_{21}NO_3$ ;  $M_r$  299.4): minimum 2.0 per cent (dried drug).

**CHARACTERS****Appearance**

Blackish-brown masses of various sizes, which tend to be soft and shiny and, after drying, become hard and brittle.

**IDENTIFICATION**

Strip off any covering, cut the substance to be examined into thin slices, dry at about 60 °C for 48 h, if necessary, and reduce to a powder (500) (2.9.12).

A. Microscopic examination (2.8.23). The powder (500) (2.9.12) is light brown. Examine under a microscope using chloral hydrate solution R. Before heating, the powder shows the following diagnostic characters (Figure 0777.-1): granules of latex agglomerated in irregular masses [A] and light brown elongated filaments. After heating, some fragments of vessels [J, K] and rather elongated, refringent crystals [F] are also visible, as well as a smaller number of round pollen grains with 3 pores and a very finely pitted exine [E] and fragments of elongated fibres [D]. Fragments of epicarp (surface view [B, C, G], transverse section [H]), consisting of polygonal cells with thick walls defining a stellate lumen, and sometimes anomocytic stomata (2.8.3) [Ba] may also be present. Some elements of various origin introduced during handling of the latex may also be present in small quantities (fragments of covering trichomes and starch granules).

Figure 0777.-1. – Illustration for identification test A of powdered raw opium

**B. Thin-layer chromatography (2.2.27).**

**Test solution** Triturate 0.10 g of the powdered substance to be examined (500) (2.9.12) with 5 mL of ethanol (70 per cent V/V) R. Transfer to a 25 mL conical flask. Rinse with 3 mL of ethanol (70 per cent V/V) R and transfer the rinsings to the same 25 mL conical flask. Heat in a water-bath at 50-60 °C, while stirring, for 30 min. Cool, filter, wash the filter with ethanol (70 per cent V/V) R and dilute the combined filtrates to 10 mL with the same solvent.

**Reference solution** Dissolve 5 mg of *morphine hydrochloride* R in a solution prepared as follows and dilute to 5 mL with the

same solution: dissolve 2 mg of *papaverine hydrochloride* R, 12 mg of *codeine phosphate* R and 12 mg of *noscopine hydrochloride* R in ethanol (70 per cent V/V) R and dilute to 25 mL with the same solvent.

**Plate** TLC silica gel plate R (5-40 µm) [or TLC silica gel plate R (2-10 µm)].

**Mobile phase** concentrated ammonia R, ethanol (96 per cent) R, acetone R, toluene R (2:6:40:40 V/V/V/V); use a freshly prepared mixture.

**Application** 20 µL [or 6 µL] as bands of 10 mm [or 8 mm].

**Development** Over a path of 15 cm [or 8 cm].

**Drying** At 100-105 °C for 15 min.

**Detection** Allow to cool and treat with potassium iodobismuthate solution R2 and then with a 4 g/L solution of sulfuric acid R; examine in daylight.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. A dark red zone (thebaine) situated between the zone due to codeine and the zone due to papaverine may be present in the chromatogram obtained with the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Noscopine: an orange-red or red zone	An orange-red or red zone (noscopine)
Papaverine: an orange-red or red zone	An orange-red or red zone (papaverine)
Codeine: an orange-red or red zone	An orange-red or red zone (codeine)
Morphine: an orange-red or red zone	An orange-red or red zone (morphine)
Reference solution	Test solution

C. To 1.0 g of the powdered substance (500) (2.9.12) add 5 mL of water R, shake for 5 min and filter. To the filtrate add 0.25 mL of ferric chloride solution R2. A red colour develops which does not disappear upon the addition of 0.5 mL of dilute hydrochloric acid R.

**TESTS****Thebaine**

Liquid chromatography (2.2.29).

**Test solution** Suspend 1.000 g of the substance to be examined, cut into thin slices, in 50 mL of ethanol (50 per cent V/V) R, mix using sonication for 1 h, allow to cool and dilute to 100.0 mL with the same solvent. Allow to stand. To 10.0 mL of the supernatant add 5 mL of ammonium chloride buffer solution pH 9.5 R, dilute to 25.0 mL with water R and mix. Transfer 20.0 mL of this solution to a chromatography column about 0.15 m long and about 30 mm in internal diameter containing 15 g of kieselguhr for chromatography R. Allow to stand for 15 min. Elute with 2 quantities, each of 40 mL, of a mixture of 15 volumes of 2-propanol R and 85 volumes of methylene chloride R. Evaporate the combined eluates to dryness in vacuo at 40 °C. Transfer the residue to a volumetric flask using the mobile phase and dilute to 25.0 mL with the mobile phase.

**Reference solution** (a). Dissolve 5.0 mg of thebaine CRS in the mobile phase and dilute to 50.0 mL with the mobile phase.

**Reference solution (b)** Dissolve 12.0 mg of *morphine hydrochloride trihydrate CRS* in the mobile phase and dilute to 15.0 mL with the mobile phase.

**Reference solution (c)** Dissolve 10.0 mg of *codeine CRS* in the mobile phase and dilute to 50.0 mL with the mobile phase. To 10.0 mL of the solution add 10.0 mL of reference solution (b).

**Precolumn:**

- size:  $l = 4$  mm,  $\varnothing = 4.0$  mm;
- stationary phase: *octylsilyl silica gel for chromatography R* (5  $\mu$ m).

**Column:**

- size:  $l = 0.25$  m,  $\varnothing = 4.0$  mm;
- stationary phase: *end-capped octylsilyl silica gel for chromatography R* (5  $\mu$ m).

**Mobile phase** Dissolve 1.0 g of *sodium heptanesulfonate monohydrate R* in 420 mL of *water R*, adjust to pH 3.2 with a 4.9 g/L solution of *phosphoric acid R* and add 180 mL of *acetonitrile R*.

**Flow rate** 1.5 mL/min.

**Detection** Spectrophotometer at 280 nm.

**Injection** 20  $\mu$ L of the test solution and reference solutions (a) and (c).

**Run time** Twice the retention time of thebaine.

**System suitability** Reference solution (c):

- resolution: minimum 2.5 between the peaks due to morphine and codeine.

Calculate the percentage content of the relevant alkaloid using the following expression:

$$\frac{A_1 \times m_2 \times F \times p}{A_2 \times m_1}$$

- $A_1$  = area of the peak due to the relevant alkaloid in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to the relevant alkaloid in the chromatogram obtained with reference solution (a) for thebaine or reference solution (c) for morphine and codeine;
- $m_1$  = mass of the substance to be examined used to prepare the test solution, in grams;
- $m_2$  = mass of the relevant alkaloid used to prepare reference solution (a) for thebaine, reference solution (b) for morphine or reference solution (c) for codeine, in grams;
- $F$  = 6.250 for the determination of thebaine;
- $p$  = percentage content of the relevant alkaloid in the corresponding CRS.

**Limit:**

- *thebaine*: maximum 3.0 per cent (dried drug).

**Loss on drying (2.2.32)**

Maximum 15.0 per cent, determined on 1.000 g of the substance to be examined, cut into thin slices, by drying in an oven at 105 °C for 4 h.

**Total ash (2.4.16)**

Maximum 6.0 per cent.

**ASSAY**

Liquid chromatography (2.2.29) as described in the test for thebaine with the following modifications.

**Injection** Test solution and reference solution (c).

**System suitability** Reference solution (c):

- repeatability: maximum relative standard deviation of 1.0 per cent for the area of the peak due to morphine after 6 injections.

Calculate the percentage content of morphine and the percentage content of codeine using the expression given in

the test for thebaine, with  $F = 10.417$  for morphine and  $F = 3.125$  for codeine.

To obtain the  $p$  value to be used for the calculation of the morphine content, multiply the percentage content of morphine hydrochloride in *morphine hydrochloride trihydrate CRS* by 0.887.

Ph Eur

## Prepared Opium

(Ph. Eur. monograph 1840)

Ph Eur

### DEFINITION

*Raw opium (0777)* powdered (180) (2.9.12) and dried at a temperature not exceeding 70 °C, with a morphine content adjusted, if necessary, by adding a suitable excipient or raw opium powder with a lower alkaloidal content.

### Content

- *morphine* ( $C_{17}H_{19}NO_3$ ;  $M_r$  285.3): 9.5 per cent to 10.5 per cent (dried preparation);
- *codeine* ( $C_{18}H_{21}NO_3$ ;  $M_r$  299.4): minimum 1.0 per cent (dried preparation).

### CHARACTERS

#### Appearance

Yellowish-brown or dark brown powder.

#### IDENTIFICATION

**A. Microscopic examination (2.8.23).** The powder (500) (2.9.12) is light brown. Examine under a microscope using *chloral hydrate solution R*. Before heating, the powder shows the following diagnostic characters (Figure 1840.-1): granules of latex agglomerated in irregular masses [A] and light brown elongated filaments. After heating, some fragments of vessels [J, K] and rather elongated, refringent crystals [F] are also visible, as well as a smaller number of round pollen grains with 3 pores and a very finely pitted exine [E] and fragments of elongated fibres [D]. Fragments of epicarp (surface view [B, C, G], transverse section [H]), consisting of polygonal cells with thick walls defining a stellate lumen, and sometimes anomocytic stomata (2.8.3) [Ba] may also be present. Some elements of various origin introduced during handling of the latex may also be present in small quantities (fragments of covering trichomes and starch granules).

**B. Thin-layer chromatography (2.2.27).**

**Test solution** Triturate 0.10 g of the preparation to be examined with 5 mL of *ethanol (70 per cent V/V) R*. Transfer to a 25 mL conical flask. Rinse with 3 mL of *ethanol (70 per cent V/V) R* and transfer the rinsings to the same 25 mL conical flask. Heat in a water-bath at 50-60 °C, while stirring, for 30 min. Cool, filter, wash the filter with *ethanol (70 per cent V/V) R* and dilute the combined filtrates to 10 mL with the same solvent.

**Reference solution** Dissolve 5 mg of *morphine hydrochloride R* in a solution prepared as follows and dilute to 5 mL with the same solution: dissolve 2 mg of *papaverine hydrochloride R*, 12 mg of *codeine phosphate R* and 12 mg of *noscipine hydrochloride R* in *ethanol (70 per cent V/V) R* and dilute to 25 mL with the same solvent.

**Plate** TLC silica gel plate R (5-40  $\mu$ m) [or TLC silica gel plate R (2-10  $\mu$ m)].

Figure 1840.-1. - Illustration for identification test A of prepared opium

**Mobile phase** concentrated ammonia R, ethanol (96 per cent) R, acetone R, toluene R (2:6:40:40 V/V/V/V); use a freshly prepared mixture.

**Application** 20 μL [or 6 μL] as bands of 10 mm [or 8 mm].

**Development** Over a path of 15 cm [or 8 cm].

**Drying** At 100-105 °C for 15 min.

**Detection** Allow to cool and treat with potassium iodobismuthate solution R2 and then with a 4 g/L solution of sulfuric acid R; examine in daylight.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. A dark red zone (thebaine) situated between the zone due to codeine and the zone due to papaverine may be present in the chromatogram obtained with the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Noscapine: an orange-red or red zone	An orange-red or red zone (noscapine)
Papaverine: an orange-red or red zone	An orange-red or red zone (papaverine)
Codeine: an orange-red or red zone	An orange-red or red zone (codeine)
Morphine: an orange-red or red zone	An orange-red or red zone (morphine)
Reference solution	Test solution

C. To 1.0 g of the preparation to be examined add 5 mL of water R, shake for 5 min and filter. To the filtrate add 0.25 mL of ferric chloride solution R2. A red colour develops which does not disappear upon the addition of 0.5 mL of dilute hydrochloric acid R.

#### TESTS

##### Thebaine

Liquid chromatography (2.2.29).

**Test solution** Suspend 1.000 g of the preparation to be examined in 50 mL of ethanol (50 per cent V/V) R, mix using sonication for 1 h, allow to cool and dilute to 100.0 mL with the same solvent. Allow to stand. To 10.0 mL of the supernatant add 5 mL of ammonium chloride buffer solution pH 9.5 R, dilute to 25.0 mL with water R and mix. Transfer 20.0 mL of this solution to a chromatography column about 0.15 m long and about 30 mm in internal diameter containing 15 g of kieselguhr for chromatography R. Allow to stand for 15 min. Elute with 2 quantities, each of 40 mL, of a mixture of 15 volumes of 2-propanol R and 85 volumes of methylene chloride R. Evaporate the combined eluates to dryness in vacuo at 40 °C. Transfer the residue to a volumetric flask using the mobile phase and dilute to 25.0 mL with the mobile phase.

**Reference solution (a)** Dissolve 5.0 mg of thebaine CRS in the mobile phase and dilute to 50.0 mL with the mobile phase.

**Reference solution (b)** Dissolve 12.0 mg of morphine hydrochloride trihydrate CRS in the mobile phase and dilute to 15.0 mL with the mobile phase.

**Reference solution (c)** Dissolve 10.0 mg of codeine CRS in the mobile phase and dilute to 50.0 mL with the mobile phase.

To 10.0 mL of the solution add 10.0 mL of reference solution (b).

##### Precolumn:

— size:  $l = 4$  mm,  $\varnothing = 4.0$  mm;

— stationary phase: octylsilyl silica gel for chromatography R (5 μm).

##### Column:

— size:  $l = 0.25$  m,  $\varnothing = 4.0$  mm;

— stationary phase: end-capped octylsilyl silica gel for chromatography R (5 μm).

**Mobile phase** Dissolve 1.0 g of sodium heptanesulfonate monohydrate R in 420 mL of water R, adjust to pH 3.2 with a 4.9 g/L solution of phosphoric acid R and add 180 mL of acetonitrile R.

**Flow rate** 1.5 mL/min.

**Detection** Spectrophotometer at 280 nm.

**Injection** 20 μL of the test solution and reference solutions (a) and (c).

**Run time** Twice the retention time of thebaine.

**System suitability** Reference solution (c):

— resolution: minimum 2.5 between the peaks due to morphine and codeine.

Calculate the percentage content of the relevant alkaloid using the following expression:

$$\frac{A_1 \times m_2 \times F \times p}{A_2 \times m_1}$$

$A_1$  = area of the peak due to the relevant alkaloid in the chromatogram obtained with the test solution;

$A_2$  = area of the peak due to the relevant alkaloid in the chromatogram obtained with reference solution (a) for thebaine or reference solution (c) for morphine and codeine;

$m_1$  = mass of the preparation to be examined used to prepare the test solution, in grams;

$m_2$  = mass of the relevant alkaloid used to prepare reference solution (a) for thebaine, reference solution (b) for morphine or reference solution (c) for codeine, in grams;

$F$  = 6.250 for the determination of thebaine;

$p$  = percentage content of the relevant alkaloid in the corresponding CRS.

##### Limit:

— thebaine: maximum 3.0 per cent (dried preparation).

**Loss on drying (2.2.32)**

Maximum 8.0 per cent, determined on 1.000 g of the preparation to be examined by drying in an oven at 105 °C for 4 h.

**Total ash (2.4.16)**

Maximum 6.0 per cent.

**ASSAY**

Liquid chromatography (2.2.29) as described in the test for thebaine with the following modifications.

**Injection** Test solution and reference solution (c).

**System suitability** Reference solution (c):

— **repeatability**: maximum relative standard deviation of 1.0 per cent for the area of the peak due to morphine after 6 injections.

Calculate the percentage content of morphine and the percentage content of codeine using the expression given in the test for thebaine, with  $F = 10.417$  for morphine and  $F = 3.125$  for codeine.

To obtain the  $p$  value to be used for the calculation of the morphine content, multiply the percentage content of morphine hydrochloride in *morphine hydrochloride trihydrate* CRS by 0.887.

Ph Eur

**Standardised Opium Dry Extract**

(Ph. Eur. monograph 1839)

Ph Eur

**DEFINITION**

Standardised dry extract produced from *Raw opium* (0777).

**Content**

- *morphine* ( $C_{17}H_{19}NO_3$ ;  $M_r$  285.3): 19.0 per cent to 21.0 per cent (dried extract);
- *codeine* ( $C_{18}H_{21}NO_3$ ;  $M_r$  299.4): minimum 2.0 per cent (dried extract).

Content adjusted if necessary by adding a suitable excipient (e.g. lactose, dextrin).

**PRODUCTION**

The extract is produced from the drug by a suitable procedure using water.

**CHARACTERS****Appearance**

Brown, amorphous powder.

**IDENTIFICATION****A. Thin-layer chromatography (2.2.27).**

**Test solution** Triturate 50 mg of the extract to be examined with 5 mL of *ethanol* (70 per cent V/V) R. Transfer to a 25 mL conical flask. Rinse with 3 mL of *ethanol* (70 per cent V/V) R and transfer the rinsings to the same 25 mL conical flask. Heat in a water-bath at 50-60 °C, while stirring, for 30 min. Cool, filter, wash the filter with *ethanol* (70 per cent V/V) R and dilute the combined filtrates to 10 mL with the same solvent.

**Reference solution** Dissolve 5 mg of *morphine hydrochloride* R in a solution prepared as follows and dilute to 5 mL with the same solution: dissolve 2 mg of *papaverine hydrochloride* R, 12 mg of *codeine phosphate* R and 12 mg of *noscipine hydrochloride* R in *ethanol* (70 per cent V/V) R and dilute to 25 mL with the same solvent.

**Plate** TLC silica gel plate R (5-40 µm) [or TLC silica gel plate R (2-10 µm)].

**Mobile phase** concentrated ammonia R, ethanol (96 per cent) R, acetone R, toluene R (2:6:40:40 V/V/V/V); use a freshly prepared mixture.

**Application** 20 µL [or 6 µL] as bands of 10 mm [or 8 mm].

**Development** Over a path of 15 cm [or 8 cm].

**Drying** At 100-105 °C for 15 min.

**Detection** Allow to cool and treat with *potassium iodobismuthate* solution R2 and then with a 4 g/L solution of *sulfuric acid* R; examine in daylight.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. A dark red zone (thebaine) situated between the zone due to codeine and the zone due to papaverine may be present in the chromatogram obtained with the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Morphine: an orange-red or red zone	An orange-red or red zone (morphine)
Reference solution	Test solution

**B.** To 0.5 g of the extract to be examined add 5 mL of *water* R, shake for 5 min and filter. To the filtrate add 0.25 mL of *ferric chloride* solution R2. A red colour develops which does not disappear upon the addition of 0.5 mL of *dilute hydrochloric acid* R.

**TESTS****Thebaine**

Liquid chromatography (2.2.29).

**Test solution** Suspend 0.500 g of the extract to be examined in 50 mL of *ethanol* (50 per cent V/V) R, mix using sonication for 1 h, allow to cool and dilute to 100.0 mL with the same solvent. Allow to stand. To 10.0 mL of the supernatant add 5 mL of *ammonium chloride buffer solution* pH 9.5 R, dilute to 25.0 mL with *water* R and mix. Transfer 20.0 mL of this solution to a chromatography column about 0.15 m long and about 30 mm in internal diameter containing 15 g of *kieselguhr for chromatography* R. Allow to stand for 15 min. Elute with 2 quantities, each of 40 mL, of a mixture of 15 volumes of *2-propanol* R and 85 volumes of *methylene chloride* R. Evaporate the combined eluates to dryness *in vacuo* at 40 °C. Transfer the residue to a volumetric flask using the mobile phase and dilute to 25.0 mL with the mobile phase.

**Reference solution (a)** Dissolve 5.0 mg of *thebaine* CRS in the mobile phase and dilute to 50.0 mL with the mobile phase.

**Reference solution (b)** Dissolve 12.0 mg of *morphine hydrochloride trihydrate* CRS in the mobile phase and dilute to 15.0 mL with the mobile phase.

**Reference solution (c)** Dissolve 10.0 mg of *codeine CRS* in the mobile phase and dilute to 50.0 mL with the mobile phase. To 10.0 mL of the solution add 10.0 mL of reference solution (b).

**Precolumn:**

- size:  $l = 4$  mm,  $\varnothing = 4.0$  mm;
- stationary phase: *octylsilyl silica gel for chromatography R* (5  $\mu$ m).

**Column:**

- size:  $l = 0.25$  m,  $\varnothing = 4.0$  mm;
- stationary phase: *end-capped octylsilyl silica gel for chromatography R* (5  $\mu$ m).

**Mobile phase** Dissolve 1.0 g of *sodium heptanesulfonate monohydrate R* in 420 mL of *water for chromatography R*, adjust to pH 3.2 with a 4.9 g/L solution of *phosphoric acid R* and add 180 mL of *acetonitrile R*.

**Flow rate** 1.5 mL/min.

**Detection** Spectrophotometer at 280 nm.

**Injection** 20  $\mu$ L of the test solution and reference solutions (a) and (c).

**Run time** Twice the retention time of thebaine.

**System suitability** Reference solution (c):

- resolution: minimum 2.5 between the peaks due to morphine and codeine.

Calculate the percentage content of the relevant alkaloid using the following expression:

$$\frac{A_1 \times m_2 \times F \times p}{A_2 \times m_1}$$

- $A_1$  = area of the peak due to the relevant alkaloid in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to the relevant alkaloid in the chromatogram obtained with reference solution (a) for thebaine or reference solution (c) for morphine and codeine;
- $m_1$  = mass of the extract to be examined used to prepare the test solution, in grams;
- $m_2$  = mass of the relevant alkaloid used to prepare reference solution (a) for thebaine, reference solution (b) for morphine or reference solution (c) for codeine, in grams;
- $F$  = 6.250 for the determination of thebaine;
- $p$  = percentage content of the relevant alkaloid in the corresponding CRS.

**Limit:**

- *thebaine*: maximum 6.0 per cent (dried extract).

**Loss on drying (2.2.32)**

Maximum 5.0 per cent, determined on 1.000 g of the extract to be examined by drying in an oven at 105 °C for 4 h.

**ASSAY**

Liquid chromatography (2.2.29) as described in the test for thebaine with the following modifications.

**Injection** Test solution and reference solution (c).

**System suitability** Reference solution (c):

- repeatability: maximum relative standard deviation of 1.0 per cent for the area of the peak due to morphine after 6 injections.

Calculate the percentage content of morphine and the percentage content of codeine using the expression given in the test for thebaine, with  $F = 10.417$  for morphine and  $F = 3.125$  for codeine.

To obtain the  $p$  value to be used for the calculation of the morphine content, multiply the percentage content of morphine hydrochloride in *morphine hydrochloride trihydrate CRS* by 0.887.

## Standardised Opium Tincture

(Ph. Eur. monograph 1841)

Ph Eur

**DEFINITION**

Standardised tincture produced from *Raw opium (0777)*.

**Content**

- *morphine* ( $C_{17}H_{19}NO_3$ ;  $M_r$  285.3): 0.95 per cent to 1.05 per cent;
- *codeine* ( $C_{18}H_{21}NO_3$ ;  $M_r$  299.4): minimum 0.1 per cent.

**PRODUCTION**

The tincture is produced from the drug by an appropriate procedure using equal volumes of ethanol (70 per cent V/V) and water.

**CHARACTERS**

**Appearance**

Reddish-brown liquid.

**IDENTIFICATION**

Thin-layer chromatography (2.2.27).

**Test solution** Dilute 1.0 mL of the tincture to be examined to 10 mL with *ethanol (70 per cent V/V) R*.

**Reference solution** Dissolve 5 mg of *morphine hydrochloride R* in a solution prepared as follows and dilute to 5 mL with the same solution: dissolve 2 mg of *papaverine hydrochloride R*, 12 mg of *codeine phosphate R* and 12 mg of *noscipine hydrochloride R* in *ethanol (70 per cent V/V) R* and dilute to 25 mL with the same solvent.

**Plate** *TLC silica gel plate R* (5-40  $\mu$ m) [or *TLC silica gel plate R* (2-10  $\mu$ m)].

**Mobile phase** *concentrated ammonia R*, *ethanol (96 per cent) R*, *acetone R*, *toluene R* (2:6:40:40 V/V/V/V); use a freshly prepared mixture.

**Application** 20  $\mu$ L [or 6  $\mu$ L] as bands of 10 mm [or 8 mm].

**Development** Over a path of 15 cm [or 8 cm].

**Drying** At 100-105 °C for 15 min.

**Detection** Allow to cool and treat with *potassium iodobismuthate solution R2* and then with a 4 g/L solution of *sulfuric acid R*; examine in daylight.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. A dark red zone (thebaine) situated between the zone due to codeine and the zone due to papaverine may be present in the chromatogram obtained with the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Morphine: an orange-red or red zone	An orange-red or red zone (morphine)
Reference solution	Test solution

**TESTS****Ethanol (2.9.10)**

31 per cent *V/V* to 34 per cent *V/V*.

**Thebaine**

Liquid chromatography (2.2.29).

**Test solution** Dilute 2.000 g of the tincture to be examined to 25.0 mL with ethanol (50 per cent *V/V*) *R*. To 10.0 mL of the solution add 5 mL of ammonium chloride buffer solution pH 9.5 *R*, dilute to 25.0 mL with water *R* and mix. Transfer 20.0 mL of this solution to a chromatography column about 0.15 m long and about 30 mm in internal diameter containing 15 g of kieselguhr for chromatography *R*. Allow to stand for 15 min. Elute with 2 quantities, each of 40 mL, of a mixture of 15 volumes of 2-propanol *R* and 85 volumes of methylene chloride *R*. Evaporate the combined eluates to dryness in vacuo at 40 °C. Transfer the residue to a volumetric flask using the mobile phase and dilute to 25.0 mL with the mobile phase.

**Reference solution (a)** Dissolve 5.0 mg of thebaine CRS in the mobile phase and dilute to 50.0 mL with the mobile phase.

**Reference solution (b)** Dissolve 12.0 mg of morphine hydrochloride trihydrate CRS in the mobile phase and dilute to 15.0 mL with the mobile phase.

**Reference solution (c)** Dissolve 10.0 mg of codeine CRS in the mobile phase and dilute to 50.0 mL with the mobile phase. To 10.0 mL of the solution add 10.0 mL of reference solution (b).

**Precolumn:**

— size:  $l = 4$  mm,  $\varnothing = 4.0$  mm;

— stationary phase: octylsilyl silica gel for chromatography *R* (5  $\mu$ m).

**Column:**

— size:  $l = 0.25$  m,  $\varnothing = 4.0$  mm;

— stationary phase: end-capped octylsilyl silica gel for chromatography *R* (5  $\mu$ m).

**Mobile phase** Dissolve 1.0 g of sodium heptanesulfonate monohydrate *R* in 420 mL of water *R*, adjust to pH 3.2 with a 4.9 g/L solution of phosphoric acid *R* and add 180 mL of acetonitrile *R*.

**Flow rate** 1.5 mL/min.

**Detection** Spectrophotometer at 280 nm.

**Injection** 20  $\mu$ L of the test solution and reference solutions (a) and (c).

**Run time** Twice the retention time of thebaine.

**System suitability** Reference solution (c):

— resolution: minimum 2.5 between the peaks due to morphine and codeine.

Calculate the percentage content of the relevant alkaloid using the following expression:

$$\frac{A_1 \times m_2 \times F \times p}{A_2 \times m_1}$$

- $A_1$  = area of the peak due to the relevant alkaloid in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to the relevant alkaloid in the chromatogram obtained with reference solution (a) for thebaine or reference solution (c) for morphine and codeine;
- $m_1$  = mass of the tincture to be examined used to prepare the test solution, in grams;
- $m_2$  = mass of the relevant alkaloid used to prepare reference solution (a) for thebaine, reference solution (b) for morphine or reference solution (c) for codeine, in grams;
- $F$  = 1.563 for the determination of thebaine;
- $p$  = percentage content of the relevant alkaloid in the corresponding CRS.

**Limit:**

— thebaine: maximum 0.3 per cent.

**Dry residue (2.8.16)**

Minimum 4.0 per cent, determined on 3.00 g.

**ASSAY**

Liquid chromatography (2.2.29) as described in the test for thebaine with the following modifications.

**Injection** Test solution and reference solution (c).

**System suitability** Reference solution (c):

— repeatability: maximum relative standard deviation of 1.0 per cent for the area of the peak due to morphine after 6 injections.

Calculate the percentage content of morphine and the percentage content of codeine using the expression given in the test for thebaine, with  $F = 2.604$  for morphine and  $F = 0.781$  for codeine.

To obtain the  $p$  value to be used for the calculation of the morphine content, multiply the percentage content of morphine hydrochloride in morphine hydrochloride trihydrate CRS by 0.887.

Ph Eur

**Opium Tincture****DEFINITION**

Opium, sliced

Ethanol (90 per cent)

Purified Water

200 g

A sufficient quantity

A sufficient quantity

**Extemporaneous preparation**

The following directions apply.

Pour 500 mL of boiling Purified Water on to the Opium and allow to stand for 6 hours; add 500 mL of Ethanol (90 per cent), mix thoroughly and allow to stand in a covered vessel for 24 hours; strain, press the marc, mix the liquids and allow to stand for not less than 24 hours; filter.

Determine the concentration of morphine, calculated as anhydrous morphine, in the tincture so prepared by the Assay. To the remainder of the liquid add sufficient of a mixture of equal volumes of Ethanol (90 per cent) and Purified Water to produce an Opium Tincture containing 1% w/v of anhydrous morphine.

The tincture complies with the requirements for Tinctures stated under Extracts and with the following requirements.

Content of anhydrous morphine,  $C_{17}H_{19}NO_3$   
0.925 to 1.075% w/v.

**TESTS****Ethanol content**

41 to 46% v/v, Appendix VIII F, Method III.

**Relative density**

0.898 to 0.969, Appendix V G.

**ASSAY**

Dilute 5 mL to 100 mL with ethanol (45%). To 10 mL of the resulting solution add 5 mL of water and 1 mL of 5M ammonia and extract with 30 mL of a mixture of equal volumes of ethanol (96%) and chloroform and then with two 22.5 mL quantities of a mixture of 2 volumes of chloroform and 1 volume of ethanol (96%), washing each extract with the same 20 mL of a mixture of equal volumes of ethanol (96%) and water. Evaporate the combined extracts just to dryness, extract the residue with two 5 mL quantities of calcium

hydroxide solution, filter and wash the filter with 10 mL of calcium hydroxide solution. To the combined filtrate and washings add 0.1 g of ammonium sulfate, extract with two 10 mL quantities of ethanol-free chloroform, wash the combined extracts with 10 mL of water and discard the chloroform solution. To the combined alkaline liquid and aqueous washings add 10 mL of 1M hydrochloric acid, heat on a water bath to remove any chloroform, cool and dilute to 100 mL with water. To 10 mL of this solution add 10 mL of 0.1M hydrochloric acid and 8 mL of a freshly prepared 1.0% w/v solution of sodium nitrite, allow to stand for 15 minutes, add 12 mL of 5M ammonia, dilute to 50 mL with water and measure the absorbance of a 4-cm layer of the resulting solution at the maximum at 442 nm, Appendix II B, using in the reference cell a solution prepared at the same time and in the same manner but using 8 mL of water in place of the solution of sodium nitrite. Calculate the content of  $C_{17}H_{19}NO_3$  taking 124 as the value of A(1%, 1 cm) at the maximum at 442 nm.

## Concentrated Camphorated Opium Tincture

### DEFINITION

Opium Tincture	400 mL
Benzoic Acid	40 g
Racemic Camphor	24 g
Anise Oil or Star Anise Oil	24 mL
Ethanol (96 per cent)	400 mL
Water	Sufficient to produce 1000 mL

### Extemporaneous preparation

The following directions apply.

Dissolve the Benzoic Acid, the Racemic Camphor and the Anise Oil or Star Anise Oil in the Ethanol (96 per cent), add the Opium Tincture and sufficient Water to produce 1000 mL, mix and filter if necessary.

*The tincture complies with the requirements for Tinctures stated under Extracts and with the following requirements.*

Content of anhydrous morphine,  $C_{17}H_{19}NO_3$  0.36 to 0.44% w/w.

### TESTS

#### Ethanol content

54 to 59% v/v, Appendix VIII F, Method III.

#### Relative density

0.912 to 0.930, Appendix V G.

### ASSAY

Dilute 10 mL to 100 mL with ethanol (50%) and carry out the Assay described under Camphorated Opium Tincture using 10 mL of the diluted solution.

## Camphorated Opium Tincture

### DEFINITION

Opium Tincture	50 mL
Benzoic Acid	5 g
Racemic Camphor	3 g
Anise Oil or Star Anise Oil	3 mL
Ethanol (60 per cent)	Sufficient to produce 1000 mL

### Extemporaneous preparation

The following directions apply.

Dissolve the Benzoic Acid, the Racemic Camphor and the Anise Oil or Star Anise Oil in 900 mL of Ethanol

(60 per cent), add the Opium Tincture and sufficient Ethanol (60 per cent) to produce 1000 mL and mix. Filter, if necessary.

*The tincture complies with the requirements for Tinctures stated under Extracts and with the following requirements.*

Content of anhydrous morphine,  $C_{17}H_{19}NO_3$  0.045 to 0.055% w/v.

### TESTS

#### Ethanol content

56 to 60% v/v, Appendix VIII F, Method III.

#### Relative density

0.90 to 0.92, Appendix V G.

### ASSAY

To 10 mL add 5 mL of water and 1 mL of 5M ammonia and extract with 30 mL of a mixture of equal volumes of ethanol (96%) and chloroform and then with two 22.5 mL quantities of a mixture of 2 volumes of chloroform and 1 volume of ethanol (96%), washing each extract with the same 20 mL of a mixture of equal volumes of ethanol (96%) and water. Evaporate the combined extracts almost to dryness, extract the residue with 10 mL of calcium hydroxide solution, filter and wash the filter with 10 mL of calcium hydroxide solution. To the combined filtrate and washings add 0.1 g of ammonium sulfate, extract with two 10 mL quantities of ethanol-free chloroform, wash the combined extracts with 10 mL of water and discard the chloroform solution. To the combined alkaline liquid and aqueous washings add 10 mL of 1M hydrochloric acid, heat on a water bath to remove any chloroform, cool and dilute to 100 mL with water. To 10 mL of this solution add 10 mL of 0.1M hydrochloric acid and 8 mL of a freshly prepared 1.0% w/v solution of sodium nitrite, allow to stand for 15 minutes, add 12 mL of 5M ammonia, dilute to 50 mL with water and measure the absorbance of a 4-cm layer of the resulting solution at the maximum at 442 nm, Appendix II B, using in the reference cell a solution prepared at the same time and in the same manner but using 8 mL of water in place of the solution of sodium nitrite. Calculate the content of  $C_{17}H_{19}NO_3$  taking 124 as the value of A(1%, 1 cm) at the maximum at 442 nm.

## Bitter-Orange Flower

(Ph. Eur. monograph 1810)

Ph Eur

### DEFINITION

Whole, dried, unopened flower of *Citrus aurantium* L. ssp. *aurantium* (*C. aurantium* L. ssp. *amara* Engl.).

### Content

Minimum 8.0 per cent of total flavonoids, expressed as naringin ( $C_{27}H_{32}O_{14}$ ;  $M_r$  580.5) (dried drug).

### IDENTIFICATION

A. The flower buds are white or yellowish-white and may reach up to 25 mm in length. The dialypetalous corolla is composed of 5 thick, oblong and concave petals dotted with oil glands visible under a hand lens; the short, yellowish-green persistent gamosepalous calyx has 5 spreading sepals, connate at the base and forming a star-shaped structure attached to the yellowish-green peduncle, which is about 5-10 mm long. The flower buds contain at least 20 stamens with yellow anthers and with filaments fused at the base into

groups of 4 or 5; the ovary is superior, brownish-black and spherical, consists of 8-10 multi-ovular loculi and is surrounded at the base by an annular granular hypogynous disc; the thick, cylindrical style ends in a capitate stigma.

**B. Microscopic examination (2.8.23).** The powder is brownish-yellow. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 1810.-1): very numerous spherical pollen grains, with a finely pitted exine and 3-5 germinal pores [H, K]; fragments of the epidermis of the sepals (surface view [D], transverse section [A, C]) accompanied by underlying mesophyll [B], some cells of which contain prisms of calcium oxalate [Aa, Ba, Db], unicellular covering trichomes [Ca] and numerous anomocytic stomata (2.8.3) [Da]; fragments of the epidermis of the petals (surface view [F, G, J]), with a distinctly striated cuticle; fragments of large schizolysigenous oil glands in transverse section [E], which measure up to 100  $\mu\text{m}$  in diameter. Examine under a microscope using a 20 g/L solution of *potassium hydroxide R*. The mounting medium becomes yellow because of the presence of hesperidin in the drug.

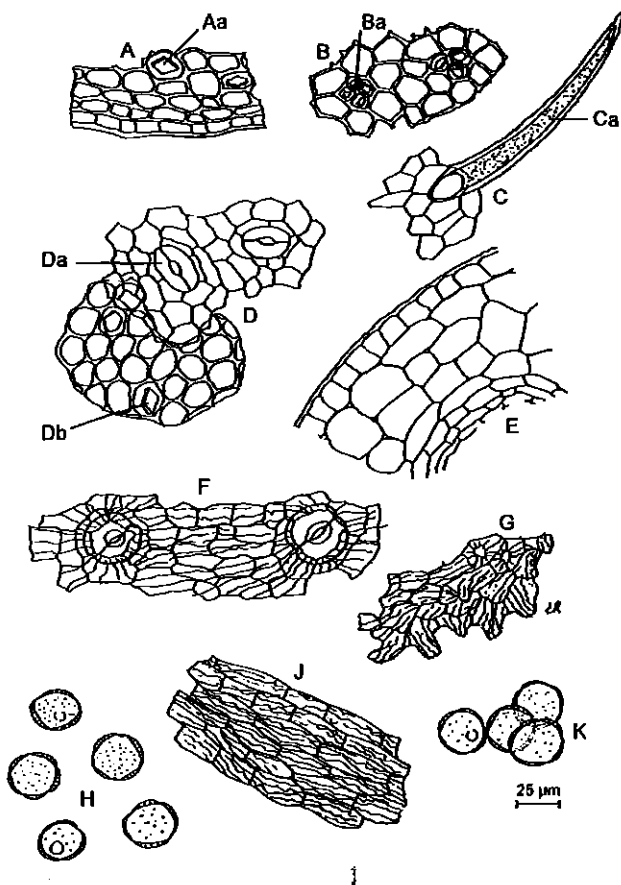

Figure 1810.-1. – Illustration for identification test B of powdered herbal drug of bitter-orange flower

C. Examine the chromatograms obtained in the test for sweet-orange flower.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution.

Top of the plate	
	A weak yellow fluorescent zone
	A weak yellow fluorescent zone
Hesperidin: a greenish-yellow fluorescent zone	A greenish-yellow fluorescent zone (hesperidin)
Naringin: a yellow fluorescent zone	A yellow fluorescent zone (naringin)
	A red fluorescent zone (neoericiotrin)
	A yellow fluorescent zone (diosmin and neodiosmin)
Reference solution	Test solution

## TESTS

### Sweet-orange flower

Thin-layer chromatography (2.2.27).

**Test solution** To 0.5 g of the powdered herbal drug (355) (2.9.12) add 5 mL of *methanol R*. Heat with stirring at 40 °C for 10 min. Filter.

**Reference solution** Dissolve 3.0 mg of *naringin R* and 3.0 mg of *hesperidin R* in 10 mL of *methanol R*.

**Plate** TLC silica gel plate R.

**Mobile phase** *water R*, *anhydrous formic acid R*, *ethyl acetate R* (10:15:75 V/V/V).

**Application** 10  $\mu\text{L}$  as bands.

**Development** Over a path of 10 cm.

**Drying** In air; heat in an oven at 110-120 °C for 5 min.

**Detection** Spray the hot plate with a 10 g/L solution of *diphenylboric acid aminoethyl ester R* in *methanol R* and then with a 50 g/L solution of *macrogol 400 R* in *methanol R*; after at least 1 h, examine in ultraviolet light at 365 nm.

**Results** The chromatogram obtained with the test solution shows a yellow zone similar in position to the zone of naringin in the chromatogram obtained with the reference solution, and immediately below it a red zone (neoericiotrin).

### Loss on drying (2.2.32)

Maximum 11.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C.

### Total ash (2.4.16)

Maximum 10.0 per cent.

## ASSAY

**Stock solution** To 0.175 g of the powdered herbal drug (355) (2.9.12) add 95 mL of *ethanol (50 per cent V/V) R*. Heat on a water-bath under a reflux condenser for 30 min. Allow to cool and filter through a sintered-glass filter (2.1.2). Rinse the filter with 5 mL of *ethanol (50 per cent V/V) R*. Combine the filtrate and the rinsings in a volumetric flask and dilute to 100.0 mL with *ethanol (50 per cent V/V) R*.

**Test solution** Into a test tube (10 mm  $\times$  180 mm) introduce 0.150 g of powdered *magnesium R* (250) (2.9.12), a magnetic stirring bar 25 mm long and 2.00 mL of the stock solution. Maintain the test tube upright, centrifuge at 125 g and carefully add dropwise, especially at the beginning, 2.0 mL of *hydrochloric acid R*, and then 6.0 mL of *ethanol (50 per cent V/V) R*. Stopper the tube and mix by inverting.

**Compensation solution** Into a 2<sup>nd</sup> test tube, introduce 2.00 mL of the stock solution and carefully add dropwise, especially at the beginning, 2.0 mL of *hydrochloric acid R* and then 6.0 mL of *ethanol (50 per cent V/V) R*.

After 10 min, measure the absorbance (2.2.25) of the test solution at 530 nm.

Calculate the percentage content of total flavonoids, expressed as naringin, using the following expression:

$$\frac{A \times 9.62}{m}$$

i.e. taking the specific absorbance of the reaction product of naringin to be 52.

*A* = absorbance at 530 nm;  
*m* = mass of the substance to be examined, in grams.

Ph Eur

## Orange Oil

### DEFINITION

Orange Oil is obtained by mechanical means from the fresh peel of the sweet orange, *Citrus sinensis* (L.) Osbeck.

### CHARACTERISTICS

A yellow to yellowish brown liquid, visibly free from water; odour, that of orange.

### TESTS

#### Optical rotation

+94° to +99°, Appendix V F. On distillation, the first 10% of the distillate has an optical rotation the same as, or only slightly lower than, the original oil.

#### Refractive index

1.472 to 1.476, Appendix V E.

#### Residue on evaporation

1.0 to 5.0% when determined by the method for *residue on evaporation of volatile oils*, Appendix X M. Use 2 g and heat for 4 hours.

#### Solubility in ethanol

Soluble at 20°, in 7 parts of *ethanol (90%)*, Appendix X M. A bright solution is rarely obtained due to the presence of waxy non-volatile substances.

#### Weight per mL

0.842 to 0.848 g, Appendix V G.

#### Content of aldehydes

Not less than 1.0% w/w, calculated as decanal, C<sub>10</sub>H<sub>20</sub>O. Carry out the method for the *determination of aldehydes*, Appendix X K, using 10 g, omitting the *toluene* and using a volume, not less than 7 mL, of *alcoholic hydroxylamine solution* that exceeds by 1 to 2 mL the volume of 0.5M *potassium hydroxide in ethanol (60%) VS* required. Each mL of 0.5M *potassium hydroxide in ethanol (60%) VS* is equivalent to 78.76 mg of C<sub>10</sub>H<sub>20</sub>O.

### STORAGE

Orange Oil should be kept in a well-filled container and protected from light.

## Sweet Orange Oil

(Ph. Eur. monograph 1811)

Ph Eur

### DEFINITION

Essential oil obtained without heating, by suitable mechanical treatment from the fresh peel of the fruit of *Citrus × sinensis* (L.) Osbeck. A suitable antioxidant may be added.

### CHARACTERS

#### Appearance

Clear, pale yellow or orange, mobile liquid, which may become cloudy when chilled.

### IDENTIFICATION

*First identification: B.*

*Second identification: A.*

A. Thin-layer chromatography (2.2.27).

Examine the chromatograms obtained in the test for bergapten.

*Results A* See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution.

Top of the plate	
Bergapten: a greenish-yellow fluorescent zone	
	Many blue fluorescent zones
Reference solution	Test solution

*Results B* See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution.

Top of the plate	
Linalyl acetate: a brownish-orange fluorescent zone	A brown fluorescent zone A faint brownish-orange fluorescent zone (linalyl acetate)
	Many orange fluorescent zones
Linalol: a brownish-orange fluorescent zone	A brownish-orange fluorescent zone (linalol)
Bergapten: a faint greenish-yellow fluorescent zone	Many brownish-orange fluorescent zones
	Many blue fluorescent zones
Reference solution	Test solution

B. It complies with the limits of the test for chromatographic profile.

**TESTS**

**Relative density (2.2.5)**  
0.842 to 0.850.

**Refractive index (2.2.6)**  
1.470 to 1.476.

**Optical rotation (2.2.7)**  
+ 94° to + 99°.

**Peroxide value (2.5.5, Method B)**  
Maximum 20.

**Fatty oils and resinified essential oils (2.8.7)**  
It complies with the test.

**Bergapten**

**Thin-layer chromatography (2.2.27).**

**Test solution** Dilute 0.2 mL of the substance to be examined in 1 mL of *ethanol (96 per cent) R*.

**Reference solution** Dissolve 2 mg of *bergapten R*, 10 µL of *linalol R* and 20 µL of *linalyl acetate R* in 10 mL of *ethanol (96 per cent) R*.

**Plate** TLC silica gel plate *R*.

**Mobile phase** *ethyl acetate R*, *toluene R* (15:85 *V/V*).

**Application** 10 µL as bands.

**Development** Over a path of 15 cm.

**Drying** In air.

**Detection A** Examine in ultraviolet light at 365 nm.

**Results A** The chromatogram obtained with the test solution shows no greenish-yellow fluorescent zone corresponding to that of *bergapten* in the chromatogram obtained with the reference solution.

**Detection B** Spray with *anisaldehyde solution R* and heat at 100-105 °C for 10 min; examine the plate in ultraviolet light at 365 nm.

**Chromatographic profile**

Gas chromatography (2.2.28): use the normalisation procedure.

**Test solution** Dilute 200 µL of the substance to be examined to 10.0 mL with *heptane R*.

**Reference solution (a)** Dilute 5 µL of *α-pinene R*, 5 µL of *sabinene R*, 5 µL of *β-pinene R*, 5 µL of *β-myrcene R*, 5 µL of *octanal R*, 70 µL of *limonene R*, 5 µL of *linalol R*, 5 µL of *decanal R*, 10 µL of *citral R* (composed of *neral* and *geranial*) and 5 µL of *valencene R* to 5.0 mL with *heptane R*.

**Reference solution (b)** Dilute 5 µL of *limonene R* to 50.0 mL with *heptane R*. Dilute 0.1 mL of the solution to 5.0 mL with *heptane R*.

**Column:**

- **material:** fused silica;
- **size:** *l* = 60 m,  $\varnothing$  = 0.25 mm;
- **stationary phase:** *phenyl(5)methyl(95)polysiloxane R* (film thickness 0.25 µm).

**Carrier gas** *helium for chromatography R*.

**Flow rate** 1.4 mL/min.

**Split ratio** 1:70.

**Temperature:**

	Time (min)	Temperature (°C)
Column	0 - 90	50 → 230
Injection port		250
Detector		250

**Detection** Flame ionisation.

**Injection** 1 µL.

**Elution order** Order indicated in the composition of reference solution (a); record the retention times of these substances.

**Identification of peaks** Using the retention times determined from the chromatogram obtained with reference solution (a), locate the components of reference solution (a) in the chromatogram obtained with the test solution.

**System suitability** Reference solution (a):

- **resolution:** minimum 1.5 between the peaks due to *sabinene* and *β-pinene*.

Determine the percentage content of each of these components. The percentages are within the following ranges:

- *α-pinene*: 0.4 per cent to 0.6 per cent;
- *sabinene*: 0.2 per cent to 1.1 per cent;
- *β-pinene*: 0.02 per cent to 0.3 per cent;
- *β-myrcene*: 1.5 per cent to 2.5 per cent;
- *octanal*: 0.1 per cent to 0.4 per cent;
- *limonene*: 92.0 per cent to 97.0 per cent;
- *linalol*: 0.2 per cent to 0.7 per cent;
- *decanal*: 0.1 per cent to 0.4 per cent;
- *neral*: 0.02 per cent to 0.10 per cent;
- *geranial*: 0.03 per cent to 0.20 per cent;
- *valencene*: 0.02 per cent to 0.5 per cent.

**Reporting threshold** 0.01 per cent (reference solution (b)).

**Residue on evaporation**

1.0 per cent to 5.0 per cent.

Evaporate 5.0 g to dryness on a water-bath and dry at 100-105 °C for 4 h.

**STORAGE**

At a temperature not exceeding 25 °C.

Ph Eur

**Terpeneless Orange Oil****Preparation**

Compound Orange Spirit

**DEFINITION**

Terpeneless Orange Oil may be prepared by concentrating orange oil under reduced pressure until most of the terpenes have been removed or by solvent partition.

**CHARACTERISTICS**

A clear, yellow or orange-yellow liquid, visibly free from water.

**TESTS****Optical rotation**

Not more than +60°, Appendix V F.

**Refractive index**

1.461 to 1.473, Appendix V E.

**Solubility in ethanol**

Soluble, at 20°, in 1 part of *ethanol (90%)*, Appendix X M.

**Weight per mL**

0.855 to 0.880 g, Appendix V G.

**Content of aldehydes**

Not less than 18% w/w, calculated as *decanal*, C<sub>10</sub>H<sub>20</sub>O.

Carry out the method for the *determination of aldehydes*,

Appendix X K, using 1.5 g, omitting the *toluene* and using a volume, not less than 7 mL, of *alcoholic hydroxylamine solution* that exceeds by 1 to 2 mL the volume of 0.5M *potassium hydroxide in ethanol (60%) VS* required. Each mL of 0.5M *potassium hydroxide in ethanol (60%) VS* is equivalent to 78.76 mg of  $C_{10}H_{20}O$ .

#### STORAGE

Terpeneless Orange Oil should be kept in a well-filled container and protected from light.

## Compound Orange Spirit

#### DEFINITION

Terpeneless Orange Oil	2.5 mL
Terpeneless Lemon Oil	1.3 mL
Anise Oil or Star Anise Oil	4.25 mL
Coriander Oil	6.25 mL
Ethanol (90 per cent)	Sufficient to produce 1000 mL

The spirit complies with the requirements stated under *Spirits* and with the following requirements.

#### TESTS

##### Ethanol content

86 to 90% v/v, Appendix VIII F.

##### Weight per mL

0.828 to 0.841 g, Appendix V G.

## Dried Bitter-Orange Peel

(*Bitter-Orange Epicarp and Mesocarp, Ph. Eur. monograph 1603*)

#### Preparations

Orange Peel Infusion

Orange Tincture

*Ph Eur*

#### DEFINITION

Dried epicarp and mesocarp of the ripe fruit of *Citrus aurantium* L. ssp. *aurantium* (*C. aurantium* L. ssp. *amara* Engl.) partly freed from the white spongy tissue of the mesocarp and endocarp.

#### Content

Minimum 20 mL/kg of essential oil (anhydrous drug).

#### IDENTIFICATION

A. The herbal drug consists of elliptical or irregular pieces 5-8 cm long, 3-5 cm broad and about 3 mm thick. The outer surface is yellowish or reddish-brown and distinctly punctate, the inner surface is yellowish or brownish-white.

Figure 1603.-1. – Illustration for identification test B of powdered herbal drug of bitter-orange epicarp and mesocarp

B. Microscopic examination (2.8.23). The powder is light brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 1603.-1): fragments of epicarp (surface view [B]) composed of small polygonal cells with slightly thickened anticlinal walls, filled with chromatophores and some anomocytic stomata (2.8.3); fragments of epicarp showing the thickened cuticle (side view [N]); fragments of pericarp (transverse section [A]) showing the cuticularised epicarp [Aa], the sub-epicarpal layers with cells with collenchymatous thickening [Ab], some of which contain a prism of calcium oxalate [Ac], and fragments of schizolysigenous oil glands [Ad]; fragments of the collenchymatous sub-epicarpal layers (surface view [G]); groups of parenchyma cells [L], some of which contain a prism of calcium oxalate [C]; numerous fragments of mesocarp [D, E, F, H, K, M]; free prisms of calcium oxalate [J]. Examine under a microscope using a 20 g/L solution of *potassium hydroxide R*. The mounting medium becomes yellow due to the presence of hesperidin in the herbal drug.

C. Thin-layer chromatography (2.2.27).

**Test solution** To 1.0 g of the powdered herbal drug (710) (2.9.12) add 10 mL of *methanol R* and heat in a water-bath at 65 °C for 5 min with shaking. Allow to cool and filter.

**Reference solution** Dissolve 1.0 mg of *naringin R* and 1.0 mg of *caffeic acid R* in 1 mL of *methanol R*.

**Plate** TLC silica gel plate *R*.

**Mobile phase** *water R*, *anhydrous formic acid R*, *ethyl acetate R* (10:15:75 V/V/V).

**Application** 20 µL as bands.

**Development** Over a path of 10 cm.

**Drying** In air, then in an oven at 110-120 °C for 5 min.

**Detection** Spray the warm plate with a 10 g/L solution of *diphenylboric acid aminoethyl ester R* in *methanol R* and then with a 50 g/L solution of *macrogol 400 R* in *methanol R*. After at least 1 h, examine in ultraviolet light at 365 nm.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other fluorescent zones are present in the chromatogram obtained with the test solution.

Top of the plate	
Caffeic acid: a light blue fluorescent zone	A light blue fluorescent zone
	A light blue fluorescent zone
	A light blue fluorescent zone
	A light blue fluorescent zone
Naringin: a dark green fluorescent zone	A dark green fluorescent zone (naringin)
	A red fluorescent zone (neohesperidin)
	An orange fluorescent zone
Reference solution	Test solution

#### TESTS

##### Water (2.2.13)

Maximum 10.0 per cent, determined by distillation on 20.0 g of the powdered herbal drug (355) (2.9.12).

##### Total ash (2.4.16)

Maximum 7.0 per cent.

##### Extractable matter

Minimum 25.0 per cent.

To 2.000 g of the powdered herbal drug (250) (2.9.12) add 10.0 mL of a mixture of 30 volumes of *water R* and 70 volumes of *ethanol (96 per cent) R* and extract for 2 h, shaking frequently. Filter, evaporate 2.000 mL of the filtrate to dryness on a water-bath and dry in an oven at 100-105 °C for 3 h. Allow to cool in a desiccator over *diphosphorus pentoxide R* and weigh. The residue weighs a minimum of 0.100 g.

#### ASSAY

##### Essential oil (2.8.12)

Use a 500 mL round-bottomed flask, 200 mL of *water R* as the distillation liquid and 0.50 mL of *xylene R* in the graduated tube. Reduce the drug to a powder (710) (2.9.12) and immediately use 15.0 g for the determination. Distil at a rate of 2-3 mL/min for 90 min.

Ph Eur

## Orange Peel Infusion

#### DEFINITION

Concentrated Orange Peel Infusion  
Water

100 mL  
Sufficient to produce  
1000 mL

*The infusion complies with the requirements stated under Infusions.*

## CONCENTRATED ORANGE PEEL INFUSION

#### DEFINITION

Dried Bitter-Orange Peel, cut small  
Ethanol (25 per cent)

500 g  
1350 mL

#### Extemporaneous preparation

The following directions apply.

Macerate the Dried Bitter-Orange Peel in a covered vessel for 48 hours with 1000 mL of the Ethanol (25 per cent) and press out the liquid. To the pressed marc add 350 mL of the Ethanol (25 per cent), macerate for 24 hours, press and add the liquid to the product of the first pressing. Allow to stand for not less than 14 days and filter.

#### TESTS

##### Ethanol content

18 to 23% v/v, Appendix VIII F.

##### Total solids

10 to 15% w/v, Appendix XI A. Use 1 mL.

##### Weight per mL

1.01 to 1.04 g, Appendix V G.

## Orange Tincture

*(Bitter-Orange Epicarp and Mesocarp Tincture, Ph. Eur. monograph 1604)*

Ph Eur

#### DEFINITION

Tincture produced from *Bitter-orange epicarp and mesocarp (1603)*.

#### PRODUCTION

The tincture is produced from 1 part of the freshly powdered herbal drug (2000) (2.9.12) and 5 parts of alcohol (70 per cent V/V) by an appropriate procedure.

#### CHARACTERS

Liquid with a bitter taste.

#### IDENTIFICATION

Examine by thin-layer chromatography (2.2.27).

**Test solution** The tincture to be examined.

**Reference solution** Dissolve 1.0 mg of *naringin R* and 1.0 mg of *caffeic acid R* in 1 mL of *methanol R*.

**Plate** TLC silica gel plate R.

**Mobile phase** *water R*, *anhydrous formic acid R*, *ethyl acetate R* (10:15:75 V/V/V).

**Application** 20 µL, as bands.

**Development** Over a path of 10 cm.

**Drying** In air, and heat in an oven at 110-120 °C for 5 min.

**Detection** Spray the warm plate with a 10 g/L solution of *diphenylboric acid aminoethyl ester R* in *methanol R* and then with a 50 g/L solution of *macrogol 400 R* in *methanol R*. After 1 h, examine in ultraviolet light at 365 nm.

**Results** See below the sequence of the zones present in the chromatograms obtained with the reference and test solutions. Furthermore, other zones are present in the chromatogram obtained with the test solution.

### TESTS

**Ethanol content (2.9.10)**

63 per cent to 67 per cent *V/V*.

**Methanol and 2-propanol (2.9.11)**

Maximum 0.05 per cent *V/V* of methanol and maximum 0.05 per cent *V/V* of 2-propanol.

**Dry residue**

Minimum 6.0 per cent *m/m*, determined on 2.00 g of tincture to be examined.

*Ph Eur*

## Orange Syrup

### DEFINITION

Orange Tincture 60 mL  
Syrup Sufficient to produce 1000 mL

The syrup complies with the requirements stated under Oral Liquids and with the following requirement.

### TESTS

**Weight per mL**

1.29 to 1.31 g, Appendix V G.

## Oregano

(*Ph. Eur. monograph 1880*)

*Ph Eur*

### DEFINITION

Dried leaves and flowers separated from the stems of *Origanum onites* L. or *Origanum vulgare* L. subsp. *hirtum* (Link) Ietsw., or a mixture of both species.

### Content

— *essential oil*: minimum 25 mL/kg (anhydrous drug);  
— *sum of the contents of carvacrol and thymol* (both  $C_{10}H_{14}O$ ;  $M_r$  150.2): minimum 60 per cent in the essential oil.

### IDENTIFICATION

A. *O. onites*. The leaf is yellowish-green, usually 4-22 mm long and 3-14 mm wide. It has a long or short petiole or is sessile. The lamina is ovate, elliptic or ovate-lanceolate.

Margins are entire or serrate, the apex is acute or obtuse. The veins are yellowish and conspicuous on the adaxial surface. Flowers are solitary or seen as broken parts of the corymb. The calyx is bract-like and inconspicuous. The corolla is white, on top of inflorescences or single flowers, or inconspicuous. The bracts are imbricate and green like the leaves. The drug contains yellowish or yellowish-brown stem parts.

*O. vulgare* (subsp. *hirtum*). The leaf is green and usually 3-28 mm long and 2.5-19 mm wide. It is petiolate or sessile. The lamina is ovate or ovate-elliptic. The margins are entire or serrate, the apex is acute or obtuse. Flowers are rare, found as broken parts of the corymbs. Bracts are greenish-yellow and imbricate. The calyx is corolla-like and inconspicuous. The corolla is white, on top of inflorescences, slightly conspicuous or inconspicuous.

B. Microscopic examination (2.8.23). Reduce to a powder (710) (2.9.12). The powder is green (*O. vulgare*) or yellowish-green (*O. onites*). Examine under a microscope using *chloral hydrate solution R* (Figure 1880.-1).

*O. onites* Powder shows fragments of leaf epidermis [A, D, G] composed of cells with sinuous walls, diacytic stomata (2.8.3) [Ga], covering trichomes and glandular trichomes; there are 2 types of glandular trichomes: some of lamiaaceous type with 8-16 cells (surface view [Da]) and a very common type with a unicellular head and uni- [Gc], bi- [H] or tricellular stalk; the covering trichomes have smooth, thick walls; some are multicellular [B, Gb], often broken [Aa], and contain prisms of calcium oxalate, while others, which are rare, are unicellular and conical [C]; scars from covering and glandular trichomes are visible on the epidermises [Gd, Ge]; pollen grains, with smooth exine, are frequent [E, F].

*O. vulgare* Subsp. *hirtum* powder shows fragments of the upper epidermis with cells with sinuous, beaded walls, accompanied by palisade parenchyma [J]; fragments of the lower epidermis [N] composed of cells with finely and irregularly thickened walls, diacytic stomata (2.8.3) [Na], covering trichomes and glandular trichomes; there are 2 types of glandular trichomes: some of lamiaaceous type with 12 cells, in surface view [Nb], and a rare type with a unicellular head [Nc] and bi- or tricellular stalk; the covering trichomes have thick, warty walls and contain fine needles of calcium oxalate; some are conical, multicellular and serrate [L, M], while others, which are rare, are unicellular [K]; there are occasional pollen grains, with smooth exine [E, F].

C. Thin-layer chromatography (2.2.27).

**Test solution** To 1.0 g of the powdered herbal drug (355) (2.9.12) add 5 mL of *methylene chloride R* and shake for 3 min, then filter through about 2 g of *anhydrous sodium sulfate R*.

**Reference solution** Dissolve 1 mg of *thymol R* and 10  $\mu$ L of *carvacrol R* in 10 mL of *methylene chloride R*.

**Plate** TLC silica gel plate R.

**Mobile phase** *methylene chloride R*.

**Application** 20  $\mu$ L as bands.

**Development** Over a path of 15 cm.

**Drying** In air.

**Detection** Spray with *anisaldehyde solution R* using 10 mL for a plate 200 mm square and heat at 100-105 °C for 10 min.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones are present in the lower third and upper part of the chromatogram obtained with the test solution.

Figure 1880.-1. – Illustration for identification test B of powdered herbal drug of oregano

#### ASSAY

##### Essential oil (2.8.12)

Use 30.0 g of the drug to be examined, a 1000 mL round-bottomed flask and 400 mL of *water R* as the distillation liquid. Distil at a rate of 2-3 mL/min for 2 h without *xylene R* in the graduated tube.

##### Carvacrol and thymol

Gas chromatography (2.2.28): use the normalisation procedure.

**Test solution** Filter the essential oil obtained in the assay of essential oil over a small amount of *anhydrous sodium sulfate R* and dilute to 5.0 mL with *heptane R* by rinsing the apparatus and the anhydrous sodium sulfate.

**Reference solution** Dissolve 0.20 g of *thymol R* and 50 mg of *carvacrol R* in *heptane R* and dilute to 5.0 mL with the same solvent.

##### Column:

- *material*: fused silica;
- *size*:  $l = 60\text{ m}$ ,  $\varnothing = 0.25\text{ mm}$ ;
- *stationary phase*: *macrogol 20 000 R* (film thickness 0.25  $\mu\text{m}$ ).

**Carrier gas** *nitrogen for chromatography R* or *helium for chromatography R*.

**Flow rate** 1.5 mL/min.

**Split ratio** 1:100.

**Temperature:**

	Time (min)	Temperature (°C)
Column	0 - 45	40 → 250
Injection port		190
Detector		210

**Detection** Flame ionisation.

**Injection** 0.2  $\mu\text{L}$ .

**Elution order** Order indicated in the composition of the reference solution; record the retention times of these substances.

**System suitability** Reference solution:

— *resolution*: minimum 1.5 between the peaks due to thymol and carvacrol.

Using the retention times determined from the chromatogram obtained with the reference solution, locate the components of the reference solution in the chromatogram obtained with the test solution.

Determine the percentage content of the sum of carvacrol and thymol.

#### TESTS

##### Water (2.2.13)

Maximum 120 mL/kg, determined on 20.0 g of the powdered herbal drug (355) (2.9.12).

##### Total ash (2.4.16)

Maximum 15.0 per cent.

##### Ash insoluble in hydrochloric acid (2.8.1)

Maximum 4.0 per cent.

## Orientvine Stem

(Ph. Eur. monograph 2450)

Ph Eur

#### DEFINITION

Dried, whole or fragmented stem of *Sinomenium acutum* (Thunb.) Rehder & E.H.Wilson, collected in late autumn and early winter.

#### Content

Minimum 0.5 per cent of sinomenine ( $\text{C}_{19}\text{H}_{23}\text{NO}_4$ ;  $M_r$  329.4) (dried drug).

**IDENTIFICATION**

**A. Whole drug.** Long cylindrical stem, somewhat curved, 60 cm long or more, 0.5-2 cm in diameter. The outer bark is greenish-brown or brown, sometimes greyish-brown, with relatively wide longitudinal striations and prominent verrucose lenticels; the nodes are slightly swollen and branched. The texture is light, hard and difficult to break; the fracture is uneven, greyish-yellow or pale greyish-brown; the bark is thin (about 1/10 of the diameter); the medullary rays are very conspicuous; the pith is yellowish-white or pale yellowish-brown.

**Fragmented drug** Fragments of stems, in discs, about 1.5 cm in diameter and 0.3 cm thick, with greenish-brown, brown or greyish-brown outer surface; a transverse section shows a narrow, pale yellow cortical zone, it is mainly occupied by the vascular system (about 3/4 of the section) consisting of very numerous vascular bundles (about 15-20) in a circle around the yellowish-white or pale yellowish-brown, small, circular pith; each bundle is delimited on the outside by a narrow and continuous, wavy, light brown zone and is separated from the next bundle by a narrow, light brown medullary ray; the xylem vessels with a relatively wide interior lumen are clearly visible.

**B. Microscopic examination (2.8.23).** The powder is yellowish-brown or greyish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: rare fragments of epidermis with polyhedral cells, in surface view, covered with a thick, pale yellow cuticle [J]; sclereids, isolated or in groups, of various sizes and shapes (cubical [H], fusiform [F], elliptical or irregular [B, E]), with more or less thick walls, pitted and distinctly channelled, free or included in fragments of parenchyma; pale yellow or yellow fibres, 30-70 µm in diameter with thick, channelled walls and a very narrow lumen [G]; fragments of parenchyma with thin-walled cells containing fine, needle-shaped crystals of calcium oxalate [C]; fragments of xylem consisting of reticulate or bordered-pitted vessels [L], up to 200 µm in diameter, accompanied by cells of xylem parenchyma [A, D] with slightly and regularly thickened and pitted walls. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows spherical starch granules, about 10 µm in diameter, simple or 2- to 3-compound, free or included in parenchymatous cells [K].

**C. Thin-layer chromatography (2.2.27).**

**Test solution** To 2 g of the powdered herbal drug (355) (2.9.12) add 25 mL of *ethanol (96 per cent) R* and heat under reflux for 1 h. Filter and evaporate the filtrate to dryness. Dissolve the residue in 2 mL of *ethanol (96 per cent) R*.

**Reference solution** Dissolve 5 mg of *sinomenine R* and 5 mg of *papaverine hydrochloride R* in 5 mL of *ethanol (96 per cent) R*.

**Plate** TLC silica gel *F<sub>254</sub>* plate *R* (2-10 µm).

**Mobile phase** concentrated ammonia *R*, water *R*, toluene *R*, methanol *R*, ethyl acetate *R* (2:10:20:30:40 *V/V/V/V/V*).

**Application** 8 µL as bands of 8 mm.

**Development** Over a path of 6 cm.

**Drying** In air.

**Detection A** Examine in ultraviolet light at 254 nm.

**Results A** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint fluorescent zones may be present in the chromatogram obtained with the test solution.

### TESTS

#### Loss on drying (2.2.32)

Maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 3 h.

#### Total ash (2.4.16)

Maximum 6.0 per cent.

#### Aristolochic acids (2.8.21, Method A)

It complies with the test.

### ASSAY

#### Liquid chromatography (2.2.29).

**Test solution** Disperse 0.500 g of the powdered herbal drug (355) (2.9.12) in 20.0 mL of ethanol (70 per cent V/V) R in a conical flask and weigh. Sonicate for 20 min. Cool and weigh again. Compensate the loss of solvent with ethanol (70 per cent V/V) R and stopper the flask. Shake thoroughly and filter through a membrane filter (nominal pore size 0.45 µm).

**Reference solution (a)** Dissolve 3.0 mg of sinomenine CRS in methanol R and dilute to 10.0 mL with the same solvent.

**Reference solution (b)** Disperse 0.250 g of orientvine stem HRS in 10.0 mL of ethanol (70 per cent V/V) R in a conical flask and weigh. Sonicate for 20 min. Cool and weigh again. Compensate the loss of solvent with ethanol (70 per cent V/V) R and stopper the flask. Shake thoroughly and filter through a membrane filter (nominal pore size 0.45 µm).

#### Column:

- size:  $l = 0.15$  m,  $\varnothing = 4.6$  mm;
- stationary phase: end-capped octadecylsilyl silica gel for chromatography R (5 µm).

**Mobile phase** Adjust a 1.8 g/L solution of disodium hydrogen phosphate dodecahydrate R to pH 8.0 with a 0.8 g/L solution of sodium dihydrogen phosphate R, then adjust to pH 9.0 with a 10 g/L solution of triethylamine R. Mix 60 volumes of this solution with 40 volumes of acetonitrile R.

**Flow rate** 1.0 mL/min.

**Detection** Spectrophotometer at 262 nm.

**Injection** 20 µL.

**Retention time** Sinomenine = about 3 min.

**System suitability** Reference solution (b):

- resolution: minimum 1.5 between peak 1 and the peak due to sinomenine; identify peak 1 using the chromatogram supplied with orientvine stem HRS.

Calculate the percentage content of sinomenine using the following expression:

$$\frac{A_1 \times m_2 \times 2 \times p}{A_2 \times m_1}$$

- $A_1$  = area of the peak due to sinomenine in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to sinomenine in the chromatogram obtained with reference solution (a);
- $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;
- $m_2$  = mass of sinomenine CRS used to prepare reference solution (a), in grams;
- $p$  = assigned percentage content of sinomenine in sinomenine CRS.

Ph Eur

## Wild Pansy

(Wild Pansy (Flowering Aerial Parts), Ph. Eur. monograph 1855)

Ph Eur

### DEFINITION

Dried flowering aerial parts of *Viola arvensis* Murray and/or *Viola tricolor* L.

### Content

Minimum 1.5 per cent of flavonoids, expressed as violanthin ( $C_{27}H_{30}O_{14}$ ;  $M_r$  578.5) (dried drug).

### IDENTIFICATION

A. The stem is angular and hollow. The leaves are oval, petiolate, with a cordate base or elongated and obtuse, with lyrate stipules, divided in the middle. The flowers, with a long peduncle, are zygomorphic, with 5 oval, lanceolate sepals, an appendage pointed outwards and 5 petals of which the lower one bears a spur; in *Viola arvensis*, the petals are shorter than the calyx, the lower petal is cream coloured, with black lines, the 4 upper petals may be cream coloured or violet blue; in *Viola tricolor*, the petals are longer than the calyx and violet coloured, more or less tinged with yellow. The androecium consisting of 5 stamens bears at the apex a membranous connective appendage with 2 spurs. The trilobular ovary shows a short style and globular stigmata. The fruit are navicular capsules, three-lobed, yellowish brown, 5 mm to 10 mm long. The pale yellow, pyriform seeds are about 1 mm long, bearing a caruncle.

B. Microscopic examination (2.8.23). The powder is greenish. Examine under a microscope using chloral hydrate solution R. The powder shows the following diagnostic characters: fragments of the epidermis of the leaves in surface view with wavy-walled cells and anomocytic stomata (2.8.3); conical unicellular covering trichomes, widened at the base and sharply pointed at the apex, with a striated cuticle; glandular trichomes with a multicellular head, and a short, multicellular stalk in the indentations of the leaf margins; cluster crystals of calcium oxalate, sometimes included in parenchyma; fragments of the corolla with wavy-walled epidermal cells, those from the mid-region papillose and with some extended to form flask or bottle-shaped projections, those from the base of the petals with covering trichomes up to about 300 µm long with characteristic hump-like swellings along their length; spherical or polyhedral pollen grains, 60 µm to 80 µm in diameter, with finely pitted exines and 5 pores (*Viola arvensis*) or 4 pores (*Viola tricolor*); occasional fragments of spiral and reticulate vessels and groups of fibres from the stem.

C. Thin-layer chromatography (2.2.27).

**Test solution** Heat in a water-bath at 65 °C for 5 min, with frequent stirring, 2.0 g of the powdered herbal drug (355) (2.9.12) in 10 mL of *alcohol (70 per cent V/V) R*. Cool and filter.

**Reference solution** Dissolve 2.5 mg of *rutoside trihydrate R*, 2.5 mg of *hyperoside R* and 1.0 mg of *caffeic acid R* in *methanol R* and dilute to 10 mL with the same solvent.

**Plate** TLC silica gel plate R.

**Mobile phase** *anhydrous formic acid R*, *acetic acid R*, *water R*, *ethyl acetate R* (11:11:27:100 V/V/V/V).

**Application** 10 µL, as bands.

**Development** Over a path of 12 cm.

**Drying** At 100-105 °C.

**Detection** Spray with a solution containing 10 g/L of *diphenylboric acid aminoethyl ester R* and 50 g/L of *macrogol 400 R* in *methanol R*. Allow the plate to dry in air for 30 min. Examine in ultraviolet light at 365 nm.

**Results** See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.

	A yellowish-green fluorescent zone
	A yellowish-green fluorescent zone
Reference solution	Test solution

## TESTS

### Foreign matter (2.8.2)

Maximum 3 per cent.

### Swelling index (2.8.4)

Minimum 9, determined on the powdered herbal drug (355) (2.9.12).

### Loss on drying (2.2.32)

Maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

### Total ash (2.4.16)

Maximum 15.0 per cent.

## ASSAY

**Stock solution** In a 200 mL flask, introduce 0.300 g of the powdered herbal drug (250) (2.9.12) and 40 mL of *alcohol (60 per cent V/V) R*. Heat in a water-bath at 60 °C for 10 min, shaking frequently. Allow to cool and filter through a plug of absorbent cotton into a 100 mL volumetric flask. Transfer the absorbent cotton with the drug residue back into the 200 mL flask, add 40 mL of *alcohol (60 per cent V/V) R* and heat again in a water-bath at 60 °C for 10 min, shaking frequently. Allow to cool and filter into the same 100 mL volumetric flask as used previously. Rinse the 200 mL flask with a further quantity of *alcohol (60 per cent V/V) R*, filter and transfer to the same 100 mL volumetric flask. Dilute to volume with *alcohol (60 per cent V/V) R* and filter.

**Test solution** Introduce 5.0 mL of the stock solution into a round-bottomed flask and evaporate to dryness under reduced pressure. Take up the residue with 8 mL of a mixture of 10 volumes of *methanol R* and 100 volumes of *glacial acetic acid R* and transfer into a 25 mL volumetric flask. Rinse the round-bottomed flask with 3 mL of a mixture of 10 volumes of *methanol R* and 100 volumes of *glacial acetic acid R* and transfer into the same 25 mL volumetric flask as used previously. Add 10.0 mL of a solution containing 25.0 g/L of *boric acid R* and 20.0 g/L of *oxalic acid R* in *anhydrous formic acid R* and dilute to 25.0 mL with *anhydrous acetic acid R*.

**Compensation liquid** Introduce 5.0 mL of the stock solution into a round-bottomed flask and evaporate to dryness under reduced pressure. Take up the residue with 8 mL of a mixture of 10 volumes of *methanol R* and 100 volumes of *glacial acetic acid R* and transfer into a 25 mL volumetric flask. Rinse the round-bottomed flask with 3 mL of a mixture of 10 volumes of *methanol R* and 100 volumes of *glacial acetic acid R* and transfer into the same 25 mL volumetric flask as used previously. Add 10.0 mL of *anhydrous formic acid R* and dilute to 25.0 mL with *anhydrous acetic acid R*.

Measure the absorbance (2.2.25) of the test solution at 405 nm after 30 min.

Calculate the percentage content of total flavonoids, expressed as violanthin from the expression:

$$\frac{A \times 1.25}{m}$$

taking the specific absorbance of violanthin to be 400.

$A$  = measured absorbance at 405 nm,  
 $m$  = mass of the herbal drug to be examined, in grams.

Ph Eur

## Passionflower Herb

*Passiflora*

(*Passion Flower*, Ph. Eur. monograph 1459)

### Preparation

Passionflower Herb Dry Extract

Ph Eur

### DEFINITION

Fragmented or cut, dried aerial parts of *Passiflora incarnata* L. of the swertisin chemotype or the isovitexin

chemotype or a mixture of the two. It may also contain flowers and/or fruits.

#### Content

Minimum 1.0 per cent of total flavonoids, expressed as isovitexin ( $C_{21}H_{20}O_{10}$ ;  $M_r$  432.4) (dried drug).

#### IDENTIFICATION

**A.** The green or greenish-grey or brownish stem is ligneous, hollow, longitudinally striated, glabrous or very slightly pubescent, with a diameter that is generally less than 8 mm. The green or greenish-brown leaves are alternate, finely dentate and pubescent, deeply divided into 3 acute lobes of which the central lobe is the largest. The midrib is much more prominent on the lower surface. The petiole is pubescent and bears 2 dark nectaries near the lamina. The tendrils are very numerous and grow from the axils of the leaves; they are fine, smooth, round and terminated in cylindrical spirals. The radiate flowers, if present, have 3 small bracts and a corolla consisting of 5 white, elongated petals with several rows of filiform, petaloid appendices. If present, the greenish or brownish fruit is flattened and oval; it contains several flattened, brownish-yellow, pitted seeds.

**B.** Microscopic examination (2.8.23). The powder is light green. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 1459.-1): fragments of the upper epidermis of the leaf (surface view [A]) consisting of cells with sinuous, almost angular walls, accompanied by underlying palisade parenchyma [Aa]; fragments of the lower epidermis of the leaf (surface view [B]) consisting of cells with sinuous walls and anomocytic [Ba] or anisocytic [Bb] stomata (2.8.3); fragments of the veins of the leaf [C, F] with annular or spiral vessels [Ca, Fb], and sheaths containing cluster crystals of calcium oxalate [Cb, Fa]; fragments of the stem (longitudinal section [D]) with numerous fibres [Db] accompanied by pitted or reticulate vessels [Da] and medullary rays [Dc]; fragments of the central stem parenchyma [K] with cells with slightly thickened and pitted walls; uniseriate trichomes [J], with 1 to 3 thin-walled cells, straight or slightly curved, ending in a point. In addition, if flowers are present, the powder shows fragments of the epidermis of the petals and appendages with papillose cells [G] and pollen grains with a reticulate exine [E]; if mature fruits are present, the powder may also show scattered brown tannin cells and fragments of brownish-yellow testa comprising cells with regularly thickened and strongly channelled walls [H].

**C.** High-performance thin-layer chromatography (2.8.25).

**Test solution** To 0.5 g of the powdered herbal drug (355) (2.9.12) add 5.0 mL of *methanol R*. Sonicate for 15 min, then filter or centrifuge; use the filtrate or the supernatant.

**Reference solution (a)** Dissolve 1.5 mg of *homoorientin R* and 1.5 mg of *isovitexin R* in *methanol R* and dilute to 10.0 mL with the same solvent.

**Reference solution (b)** Dilute 2.5 mL of reference solution (a) to 10.0 mL with *methanol R*.

**Reference solution (c)** Dissolve 1.5 mg of *isovitexin R* and 1.5 mg of *orientin R* in *methanol R* and dilute to 10 mL with the same solvent.

**Intensity markers** Homoorientin for the yellow fluorescent zones and isovitexin for the green or greenish-blue fluorescent zones.

**Plate** TLC silica gel  $F_{254}$  plate R (2-10  $\mu$ m).

Figure 1459.-1. – Illustration for identification test B of powdered herbal drug of passionflower herb

**Mobile phase** anhydrous formic acid R, water R, methyl ethyl ketone R, ethyl acetate R (10:10:30:50 V/V/V/V).

**Application** 4  $\mu$ L as bands of 8 mm.

**Development** 70 mm from the lower edge of the plate.

**Drying** In a current of air at room temperature for 5 min.

**Detection** Heat at 100-105 °C for 5 min; spray the warm plate with a 10 g/L solution of *diphenylboric acid aminoethyl ester R* in *methanol R*, then with a 50 g/L solution of *macrogol 400 R* in *methanol R* or, alternatively, dip the warm plate in a 5 g/L solution of *diphenylboric acid aminoethyl ester R* in *ethyl acetate R*, then in a 50 g/L solution of *macrogol 400 R* in *methylene chloride R*; allow to dry in air for about 1 min. Examine in ultraviolet light at 366 nm.

**System suitability** Reference solution (c):

- the chromatogram shows in the middle third 2 distinct zones which may be touching. The lower zone (isovitexin) shows a green or greenish-blue fluorescence and the upper zone (orientin) shows a light yellow fluorescence.

**Results** See below the sequence of fluorescent zones present in the chromatograms obtained with reference solution (a) and the test solution. Furthermore, in the chromatogram obtained with the test solution, the faint to very faint green or greenish-blue fluorescent zone in the lower third of the chromatogram may overlap with a faint yellow fluorescent zone just below it, and other faint to very faint, yellow, greenish-yellow or brownish-yellow and green or greenish-blue fluorescent zones may be present, especially in the lower third of the chromatogram.

		A green or greenish-blue zone, very faint to faint
Reference solution (a)	Test solution (isovitexin-type)	Test solution (swertisin-type)

**TESTS****Total ash (2.4.16)**

Maximum 13.0 per cent.

**Loss on drying (2.2.32)**

Maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

**ASSAY**

Liquid chromatography (2.2.29).

**Solvent mixture** water R, methanol R (20:80 V/V).**Test solution** Introduce 0.800 g of the powdered herbal drug (355) (2.9.12) into a screw-cap bottle and add 25.0 mL of the solvent mixture. Sonicate for 40 min. Shake the tube every 10 min and at the end of the process. Subsequently centrifuge for 5 min at about 9000-10 000 g and transfer the supernatant to a vial.**Reference solution (a)** Dissolve 5.0 mg of *isovitexin* CRS in the solvent mixture and dilute to 50.0 mL with the solvent mixture. Sonicate for about 10 min.**Reference solution (b)** Dissolve 0.5 mg of *homoorientin* R and 0.5 mg of *orientin* R in the solvent mixture and dilute to 10.0 mL with the solvent mixture.**Reference solution (c)** Dilute 1.0 mL of reference solution (a) to 50.0 mL with the solvent mixture.**Column:**

- size:  $l = 0.10$  m,  $\varnothing = 2.1$  mm;
- stationary phase: end-capped octadecylsilyl silica gel for chromatography R (1.8  $\mu$ m);
- temperature: 50 °C.

**Mobile phase:**

- mobile phase B: acetone R;
- mobile phase C: methanol R;

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)	Mobile phase C (per cent V/V)
0 - 0.5	95	0	5
0.5 - 26.5	95 → 84	0 → 11	5

**Flow rate** 0.7 mL/min.**Detection** Spectrophotometer at 338 nm.**Injection** 2  $\mu$ L.**Identification of peaks** Use the chromatogram obtained with reference solution (a) to identify the peak due to isovitexin; identify the peaks due to flavonoids with relative retentions between 0.64 and 1.12 with reference to isovitexin.**System suitability** Reference solution (b):— **resolution:** minimum 3.0 between the peaks due to orientin and homoorientin.**Reporting threshold** 0.006 per cent (reference solution (c)).

Calculate the percentage content of the sum of flavonoids, expressed as isovitexin, using the following expression:

$$\frac{A_1 \times m_2 \times p}{A_2 \times m_1 \times 2}$$

- $A_1$  = sum of the peak areas due to flavonoids which elute with relative retentions between 0.64 and 1.12 with reference to isovitexin in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to isovitexin in the chromatogram obtained with reference solution (a);
- $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;
- $m_2$  = mass of *isovitexin* CRS used to prepare reference solution (a), in grams;
- $p$  = percentage content of isovitexin in *isovitexin* CRS.

Ph Eur

**Passionflower Herb Dry Extract****Passion Flower Dry Extract**

(Ph. Eur. monograph 1882)

Ph Eur

**DEFINITION**Dry extract produced from *Passionflower herb* (1459).**Content**Minimum 1.5 per cent of total flavonoids, expressed as isovitexin ( $C_{21}H_{20}O_{16}$ ;  $M_r$  432.4) (anhydrous extract).**PRODUCTION**

The extract is produced from the herbal drug by a suitable procedure using ethanol (40-90 per cent V/V), methanol (60 per cent V/V) or acetone (40 per cent V/V).

**CHARACTERS****Appearance**

Greenish-brown amorphous powder.

**IDENTIFICATION**

High-performance thin-layer chromatography (2.8.25).

**Test solution** To 0.1 g of the extract to be examined add 5.0 mL of *methanol* R. Sonicate for 15 min, then filter or centrifuge; use the filtrate or supernatant.**Reference solution (a)** Dissolve 1.5 mg of *homoorientin* R and 1.5 mg of *isovitexin* R in *methanol* R and dilute to 10.0 mL with the same solvent.**Reference solution (b)** Dilute 2.5 mL of reference solution (a) to 10.0 mL with *methanol* R.

**Reference solution (c)** Dissolve 1.5 mg of *isovitexin R* and 1.5 mg of *orientin R* in *methanol R* and dilute to 10 mL with the same solvent.

**Intensity markers** Homoorientin for the yellow fluorescent zones and isovitexin for the green or greenish-blue fluorescent zones.

**Plate** TLC silica gel  $F_{254}$  plate R (2-10  $\mu\text{m}$ ).

**Mobile phase** anhydrous formic acid R, water R, methyl ethyl ketone R, ethyl acetate R (10:10:30:50 V/V/V/V).

**Application** 4  $\mu\text{L}$  as bands of 8 mm.

**Development** 70 mm from the lower edge of the plate.

**Drying** In a current of air at room temperature for 5 min.

**Detection** Heat at 100-105 °C for 5 min; spray the warm plate with a 10 g/L solution of *diphenylboric acid aminoethyl ester R* in *methanol R*, then with a 50 g/L solution of *macrogol 400 R* in *methanol R* or, alternatively, dip the warm plate in a 5 g/L solution of *diphenylboric acid aminoethyl ester R* in *ethyl acetate R*, then in a 50 g/L solution of *macrogol 400 R* in *methylene chloride R*; allow to dry in air for about 1 min. Examine in ultraviolet light at 366 nm.

**System suitability** Reference solution (c):

- the chromatogram shows in the middle third 2 distinct zones which may be touching. The lower zone (isovitexin) shows a green or greenish-blue fluorescence and the upper zone (orientin) shows a light yellow fluorescence.

**Results** See below the sequence of fluorescent zones present in the chromatograms obtained with reference solution (a) and the test solution. Furthermore, in the chromatogram obtained with the test solution, the very faint to faint green or greenish-blue fluorescent zone in the lower third of the chromatogram may overlap with a faint yellow fluorescent zone below it, and other very faint to faint, yellow, greenish-yellow or brownish-yellow and green or greenish-blue fluorescent zones may be present, especially in the lower third of the chromatogram.

## TESTS

### Water

(2.5.12): maximum 5.0 per cent, determined on 0.500 g.

### ASSAY

Liquid chromatography (2.2.29).

**Solvent mixture** water R, *methanol R* (20:80 V/V).

**Test solution** Introduce 0.450 g of the extract to be examined into a screw-cap bottle and add 25.0 mL of the solvent mixture. Sonicate for 40 min. Shake the tube every 10 min and at the end of the process. Subsequently centrifuge for 5 min at about 9000-10 000  $g$  and transfer the supernatant to a vial.

**Reference solution (a)** Dissolve 5.0 mg of *isovitexin CRS* in the solvent mixture and dilute to 50.0 mL with the solvent mixture. Sonicate for about 10 min.

**Reference solution (b)** Dissolve 0.5 mg of *homoorientin R* and 0.5 mg of *orientin R* in the solvent mixture and dilute to 10.0 mL with the solvent mixture.

**Reference solution (c)** Dilute 1.0 mL of reference solution (a) to 50.0 mL with the solvent mixture.

### Column:

- size:  $l = 0.10$  m,  $\varnothing = 2.1$  mm;
- stationary phase: end-capped octadecylsilyl silica gel for chromatography R (1.8  $\mu\text{m}$ );
- temperature: 50 °C.

### Mobile phase:

- mobile phase A: anhydrous formic acid R, water for chromatography R (0.1:100 V/V);
- mobile phase B: acetonitrile R;
- mobile phase C: *methanol R*;

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)	Mobile phase C (per cent V/V)
0-0.5	95	0	5
0.5-26.5	95 → 84	0 → 11	5

**Flow rate** 0.7 mL/min.

**Detection** Spectrophotometer at 338 nm.

**Injection** 2  $\mu\text{L}$ .

**Identification of peaks** Use the chromatogram obtained with reference solution (a) to identify the peak due to isovitexin; identify the peaks due to flavonoids with relative retentions between 0.64 and 1.12 with reference to isovitexin.

**System suitability** Reference solution (b):

- resolution: minimum 3.0 between the peaks due to orientin and homoorientin.

**Reporting threshold** 0.01 per cent (reference solution (c)).

Calculate the percentage content of total flavonoids, expressed as isovitexin, using the following expression:

$$\frac{A_1 \times m_2 \times p}{A_2 \times m_1 \times 2}$$

- $A_1$  = sum of the peak areas due to flavonoids with relative retentions between 0.64 and 1.12 with reference to isovitexin in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to isovitexin in the chromatogram obtained with reference solution (a);
- $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;
- $m_2$  = mass of *isovitexin CRS* used to prepare reference solution (a), in grams;
- $p$  = percentage content of isovitexin in *isovitexin CRS*.

## Pelargonium Root

(Ph. Eur. monograph 2264)

Ph Eur

### DEFINITION

Dried, usually fragmented, underground organs of *Pelargonium sidoides* DC and/or *Pelargonium reniforme* Curt.

### Content

Minimum 2.0 per cent of tannins, expressed as pyrogallol ( $C_6H_6O_3$ ;  $M_r$  126.1) (dried drug).

### IDENTIFICATION

A. The root is covered with dark, partly reddish-brown, longitudinally fissured bark. The transverse section shows, underneath the cork layer, yellow or white wood, which clearly shows partly brownish medullary rays.

B. Microscopic examination (2.8.23). The powder is brownish-red. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: multilayer cork cells consisting of almost uniform, rectangular cells; fragments of parenchyma underneath the cork containing sclereids with a wide lumen; numerous calcium oxalate cluster crystals. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows simple starch granules without striations or cracks.

C. Thin-layer chromatography (2.2.27).

**Test solution** To 0.5 g of the powdered herbal drug (355) (2.9.12) add 10 mL of *methanol R*, shake for 15 min and filter.

**Reference solution** Dissolve 1 mg of *scopoletin R* and 2 mg of *esculin R* in 20 mL of *methanol R*.

**Plate** TLC silica gel  $F_{254}$  plate R (5-40  $\mu$ m) [or TLC silica gel  $F_{254}$  plate R (2-10  $\mu$ m)].

**Mobile phase** *water R*, *methanol R*, *ethyl acetate R* (10:14:76 *V/V/V*).

**Application** 10  $\mu$ L [or 5  $\mu$ L] as bands.

**Development** Over a path of 10 cm [or 6 cm].

**Drying** In air.

**Detection** Spray with *alcoholic potassium hydroxide solution R*. Examine in ultraviolet light at 365 nm.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other blue fluorescent zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Scopoletin: a very bright blue fluorescent zone	A blue fluorescent zone
	A weak blue fluorescent zone (scopoletin)
Esculin: a very bright blue fluorescent zone	One or two bright blue fluorescent zones
	A blue fluorescent zone
	A weak blue fluorescent zone
Reference solution	Test solution

### TESTS

**Loss on drying** (2.2.32)

Maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C.

**Total ash** (2.4.16)

Maximum 12.0 per cent.

**Ash insoluble in hydrochloric acid** (2.8.1)

Maximum 3.0 per cent.

### ASSAY

**Tannins** (2.8.14)

Use 0.750 g of the powdered herbal drug (180) (2.9.12).

Ph Eur

## Red Peony Root

(Ph. Eur. monograph 2425)

Ph Eur

### DEFINITION

Dried, whole or fragmented root of *Paeonia lactiflora* Pall. or *Paeonia veitchii* Lynch or a mixture of the two, with rhizome and rootlets removed.

### Content

Minimum 1.8 per cent of paeoniflorin ( $C_{23}H_{28}O_{11}$ ;  $M_r$  480.5) (dried drug).

### IDENTIFICATION

A. **Whole drug.** The whole root is cylindrical, slightly curved. Truncated at both ends, 4-40 cm long, 0.5-3 cm in diameter, externally brown or reddish-brown, rough, longitudinally furrowed and wrinkled, showing rootlet scars and transversely prominent lenticels. The outer bark is sometimes easily exfoliated. The texture is hard and fragile, easily broken.

**Fragmented drug** The fragmented root usually occurs as longitudinal slices, 2-8 cm long, about 1-5 mm thick and 0.5-3 cm in diameter, or as transversal slices, about 2-4 mm thick and 0.5-3 cm in diameter. The edges are brown, the cut surface is chalk-white or pinkish, the bark is narrow and the wood shows distinct radial striations, sometimes with clefts.

B. Microscopic examination (2.8.23). The powder is greyish-white or pale brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2425.-1): reticulate or bordered pitted vessels [G] up to 65  $\mu$ m in diameter; cluster crystals of calcium oxalate, 10-35  $\mu$ m in diameter, isolated [C] or included in parenchymatous cells [B], sometimes several in the same cell [Ba], sometimes arranged in rows [Ga]; long, fusiform, ligneous fibres, with thickened and slightly lignified walls with large oblique or cross pits [E]; brown cork fragments (surface view [A], transverse section [D]). Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows simple, spheroidal starch granules up to 50  $\mu$ m in diameter [F].

C. Thin-layer chromatography (2.2.27).

**Test solution** To 0.5 g of the powdered herbal drug (355) (2.9.12) add 5 mL of *methanol R* and heat in a water-bath at 60 °C for 1 min. Centrifuge and use the supernatant.

**Reference solution** Dissolve 1 mg of *paeoniflorin R* and 1 mg of *paeonol R* in 1 mL of *methanol R*.

**Plate** TLC silica gel  $F_{254}$  plate R (2-10  $\mu$ m).

Figure 2425.-1. – Illustration for identification test B of powdered herbal drug of peony root, red

**Mobile phase** anhydrous formic acid R, ethyl acetate R, methanol R, methylene chloride R (3:5:5:35 V/V/V/V).

**Application** 8 µL as bands of 8 mm.

**Development** Over a path of 6 cm.

**Drying** In air.

**Detection A** Examine in ultraviolet light at 254 nm.

**Results A** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

#### TESTS

##### Loss on drying (2.2.32)

Maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

##### Total ash (2.4.16)

Maximum 8.0 per cent.

##### Ash insoluble in hydrochloric acid (2.8.1)

Maximum 1.0 per cent.

#### ASSAY

Liquid chromatography (2.2.29).

**Test solution** To 30.0 mg of the powdered herbal drug (355) (2.9.12) add 3.0 mL of methanol R and sonicate for 30 min. Dilute to 10.0 mL with a 6.8 g/L solution of potassium dihydrogen phosphate R. Filter through a membrane filter (nominal pore size 0.45 µm).

**Reference solution (a)** Dissolve 5.0 mg of paeoniflorin CRS in methanol R and dilute to 25.0 mL with the same solvent.

**Reference solution (b)** Dissolve 1.0 mg of 4'-hydroxyacetophenone R in 6.0 mL of reference solution (a). Dilute 3.0 mL of this solution to 10.0 mL with a 6.8 g/L solution of potassium dihydrogen phosphate R.

**Reference solution (c)** Dilute 2.5 mL of reference solution (a) to 10.0 mL with a 6.8 g/L solution of potassium dihydrogen phosphate R.

**Column:**

— size:  $l = 0.15$  m,  $\varnothing = 4.6$  mm;

— stationary phase: end-capped octadecylsilyl silica gel for chromatography R (5 µm).

**Mobile phase** methanol R, 6.8 g/L solution of potassium dihydrogen phosphate R (30:70 V/V).

**Flow rate** 1.0 mL/min.

**Detection** Spectrophotometer at 230 nm.

**Injection** 10 µL of the test solution and reference solutions (b) and (c).

**Run time** 18 min.

**Retention time** Paeoniflorin = about 8 min;  
4'-hydroxyacetophenone = about 9 min.

**System suitability** Reference solution (b):

— **resolution**: minimum 1.5 between the peaks due to paeoniflorin and 4'-hydroxyacetophenone.

Calculate the percentage content of paeoniflorin using the following expression:

$$\frac{A_1 \times m_2 \times p}{A_2 \times m_1 \times 10}$$

- $A_1$  = area of the peak due to paeoniflorin in the chromatogram obtained with the test solution;  
 $A_2$  = area of the peak due to paeoniflorin in the chromatogram obtained with reference solution (c);  
 $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;  
 $m_2$  = mass of paeoniflorin CRS used to prepare reference solution (a), in grams;  
 $p$  = percentage content of paeoniflorin in paeoniflorin CRS.

Ph Eur

## White Peony Root

(Ph. Eur. monograph 2424)

Ph Eur

### DEFINITION

Whole or fragmented, peeled root, of *Paeonia lactiflora* Pall. with rhizome and rootlets removed, treated with boiling water and dried.

### Content

Minimum 1.6 per cent of paeoniflorin ( $C_{23}H_{28}O_{11}$ ;  $M_r$  480.5) (dried drug).

### IDENTIFICATION

**A. Whole drug.** The whole root is cylindrical, straight or slightly curved, truncated at both ends, 5-18 cm long, 1-2.5 cm in diameter, externally whitish or pale reddish-brown, glossy or with longitudinal wrinkles and rootlet scars. Blackish-brown zones due to lesions, especially those around the rootlet scars, and remains of brown cork are occasionally present. The texture is compact, relatively even and not easily broken.

**Fragmented drug** The fragmented root usually occurs as longitudinal slices, 2-8 cm long, about 1-5 mm thick and 1-2.5 cm in diameter, or as transversal slices, about 2-4 mm thick and 1-2.5 cm in diameter. The edges are whitish or pale reddish-brown and the cut surface is whitish, often with a pinkish tone. The cambium ring and radial striations are distinct.

**B. Microscopic examination (2.8.23).** The powder is yellowish-white. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2424.-1): bordered-pitted or reticulate vessels [A, E], 20-65 µm in diameter; cluster crystals of calcium oxalate, 10-35 µm in diameter, isolated [C, D] or included in parenchymatous cells [B, F], sometimes several in the same cell [Fa], often arranged in rows [Ba]; ligenous fibres with thickened walls with large pits [Ea]. Examine under a microscope using a 50 per cent *V/V* solution of

*glycerol R*. The powder shows very numerous masses of gelatinised starch, either isolated [H] or associated with the remains of cells [G].

Figure 2424.-1. – Illustration for identification test B of powdered herbal drug of peony root, white

**C. Thin-layer chromatography (2.2.27).**

**Test solution** To 0.5 g of the powdered herbal drug (355) (2.9.12) add 5 mL of *methanol R* and heat in a water-bath at 60 °C for 1 min. Centrifuge and use the supernatant.

**Reference solution** Dissolve 1 mg of *paeoniflorin R* and 1 mg of *paeonol R* in 1 mL of *methanol R*.

**Plate** TLC silica gel  $F_{254}$  plate *R* (2-10 µm).

**Mobile phase** *anhydrous formic acid R*, *ethyl acetate R*, *methanol R*, *methylene chloride R* (3:5:5:35 *V/V/V/V*).

**Application** 8 µL as bands of 8 mm.

**Development** Over a path of 6 cm.

**Drying** In air.

**Detection A** Examine in ultraviolet light at 254 nm.

**Results A** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Ph Eur

## DEFINITION

Dried, ripe or nearly ripe fruit of *Piper nigrum* L. with an unbroken pericarp (black pepper) or with the outer layers of the pericarp removed (white pepper).

## Content

- essential oil: minimum 25 mL/kg (anhydrous drug);
- piperine ( $C_{17}H_{19}NO_3$ ;  $M_r$  285.3): minimum 3.0 per cent (anhydrous drug).

## IDENTIFICATION

**A. White pepper.** Spheroid berries, 3-5 mm in diameter, slightly flattened at one pole and with a small protuberance at the other, with smooth, externally matt, brownish-grey, greyish-white or pale yellowish-white surface, with numerous pale, linear striations between apex and base.

**Black pepper** Spheroid berries, 3-6 mm in diameter, externally blackish-brown, with raised reticular wrinkles, bearing fine remains of the style at the apex and a scar of the peduncle at the base. The texture is hard, the epicarp can be

stripped, the endocarp is greyish-white or pale yellow. The fracture is greyish-white, starchy, possessing a small space at the centre.

**B. Microscopic examination (2.8.23).**

Figure 2477.-1. – Illustration for identification test B of powdered herbal drug of pepper

**White pepper** The powder is light grey. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2477.-1): fragments of the endocarp in surface view, consisting of more or less polygonal sclereids about 20-30 μm in diameter, which have irregularly thickened walls [Ac, C, Fa] and which may or may not be associated with the testa [A, F], consisting of a layer of indistinct, reddish-brown pigmented cells constituting the 'pigmented layer' [Ab, Fb] and a layer of very thin-walled polygonal cells constituting the 'hyaline layer' [Aa]; fragments of the endocarp, in transverse section [G], showing sclereids with thickened inner walls on the 3 lower sides [Ga], usually associated with the testa (pigmented layer [Gb] and hyaline layer [Gc]); fragments of the parenchyma of the mesocarp [D] containing large oil cells 50-75 μm in diameter [Da]; numerous thin-walled, ovoid or polygonal cells of the parenchyma of the seed [E]; rare, elongated sclereids, with thickened walls, from the fruit peduncle [B]; a few fragments of vascular tissue with narrow spiral vessels [J]. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. Rounded, compound starch granules [H], about 30 μm in diameter, made up of tiny individual granules, ovoid or polyhedral by compression, free [Hb] or included in the parenchymatous cells of the seed [Ha].

**Black pepper** The powder is grey. Examine under a microscope using *chloral hydrate solution R*. In addition to the diagnostic characters described for white pepper, the powdered black pepper shows the following diagnostic characters (Figure 2477.-1): fragments of the epicarp [K] with extremely thin-walled, brownish-red pigmented, polygonal or ovoid cells, which contain small prisms of

calcium oxalate [Ka], and which are associated with the outer layers of the mesocarp consisting of groups of sclereids with strongly thickened walls [Kb].

**C. Thin-layer chromatography (2.2.27).**

**Test solution** To 0.5 g of the powdered herbal drug (355) (2.9.12) add 5 mL of *methanol R*. Sonicate for 10 min, centrifuge and use the supernatant.

**Reference solution** Dissolve 10 mg of *borneol R* and 15 mg of *piperine R* in 10 mL of *methanol R*.

**Plate** TLC silica gel *F<sub>254</sub>* plate *R* (5-40 μm) [or TLC silica gel *F<sub>254</sub>* plate *R* (2-10 μm)].

**Mobile phase** *ethyl acetate R*, *cyclohexane R* (30:50 *V/V*).

**Application** 10 μL [or 5 μL] as bands of 10 mm [or 8 mm].

**Development** Over a path of 15 cm [or 6 cm].

**Drying** In air.

**Detection A** Examine in ultraviolet light at 254 nm.

**Results A** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint quenching zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
	3 quenching zones
	A quenching zone
Piperine: a quenching zone	A strong quenching zone (piperine)
Reference solution	Test solution

**Detection B** Treat with *anisaldehyde solution R* and heat at 100 °C for 5 min; examine in daylight.

**Results B** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
	A strong purple zone
	A purple zone
Borneol: a yellowish-brown zone	A purple-grey zone
	A violet-grey zone
	A grey zone
Piperine: a green or brownish zone	A green or brownish zone (piperine)
	A grey zone
Reference solution	Test solution

## TESTS

## Foreign matter (2.8.2)

Maximum 3 per cent.

## Water (2.2.13)

Maximum 120 mL/kg, determined on 20.0 g of the freshly powdered herbal drug (1400) (2.9.12) reduced using a knife mill.

## Total ash (2.4.16)

Maximum 6.0 per cent.

## ASSAY

## Essential oil (2.8.12)

Use 10.0 g of the freshly powdered herbal drug (1400) (2.9.12), a 1000 mL round-bottomed flask, 400 mL of water R as the distillation liquid and 0.5 mL of xylene R in the graduated tube. Distil at a rate of 2-3 mL/min for 3 h.

## Piperine

Liquid chromatography (2.2.29). Carry out the assay protected from light.

**Test solution** Disperse 0.250 g of the powdered herbal drug (355) (2.9.12) in 40 mL of ethanol (96 per cent) R. Sonicate for 20 min and filter. Rinse the flask and the filter with 5 mL of ethanol (96 per cent) R, combine the filtrate and washings and dilute to 50.0 mL with the same solvent. Filter through a membrane filter (nominal pore size 0.45 µm).

**Reference solution (a)** Dissolve 15.0 mg of piperine CRS in ethanol (96 per cent) R and dilute to 100.0 mL with the same solvent.

**Reference solution (b)** Disperse 0.250 g of long pepper for system suitability HRS (355) (2.9.12) in 40 mL of ethanol (96 per cent) R. Sonicate for 20 min and filter. Rinse the flask and the filter with 5 mL of ethanol (96 per cent) R, combine the filtrate and washings and dilute to 50.0 mL with the same solvent. Filter through a membrane filter (nominal pore size 0.45 µm).

## Column:

— size:  $l = 0.15$  m,  $\varnothing = 4.6$  mm;

— stationary phase: end-capped octadecylsilyl silica gel for chromatography R (5 µm).

## Mobile phase:

— mobile phase A: water R;

— mobile phase B: acetonitrile R;

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 5	50	50
5 - 20	50 → 5	50 → 95
20 - 22	5 → 0	95 → 100

Flow rate 1.0 mL/min.

Detection Spectrophotometer at 343 nm.

Injection 10 µL.

Retention time Piperine = about 10 min.

**Identification of peaks** Use the chromatogram supplied with long pepper for system suitability HRS and the chromatogram obtained with reference solution (b) to identify the peak due to piperine and peak 2.

**System suitability** Reference solution (b):

— peak-to-valley ratio: minimum 4, where  $H_p$  = height above the baseline of peak 2 and  $H_o$  = height above the baseline of the lowest point of the curve separating the peak due to piperine from peak 2.

Calculate the percentage content of piperine using the following expression:

$$\frac{A_1 \times m_2 \times p}{A_2 \times m_1 \times 2}$$

- $A_1$  = area of the peak due to piperine in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to piperine in the chromatogram obtained with reference solution (a);
- $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;
- $m_2$  = mass of piperine CRS used to prepare reference solution (a), in grams;
- $p$  = percentage content of piperine in piperine CRS.

Ph Eur

## Peppermint Leaf

(Ph. Eur. monograph 0406)

## Preparation

Peppermint Leaf Dry Extract

Ph Eur

## DEFINITION

Whole or cut, dried leaf of *Mentha × piperita* L.

## Essential oil content:

— for the whole drug, minimum 12 mL/kg (anhydrous drug);

— for the cut drug, minimum 9 mL/kg (anhydrous drug).

## CHARACTERS

Penetrating odour reminiscent of menthol.

Peppermint leaf is green or brownish-green, with brownish-violet veins in some varieties. The petioles are green or brownish-violet.

## IDENTIFICATION

A. The leaf is entire, broken or cut, thin, fragile and often crumpled; the entire leaf is 3-9 cm long and 1-3 cm wide. The lamina is oval or lanceolate, the apex acuminate, the margin sharply dentate and the base asymmetrical. Venation is pinnate, prominent on the lower surface, with lateral veins leaving the midrib at about 45°. The lower surface is slightly pubescent and secretory trichomes are visible under a lens (6×) as bright yellowish points. The petiole is grooved, usually up to 1 mm in diameter and 0.5-1 cm long.

B. Microscopic examination (2.8.23). The powder is brownish-green. Examine under a microscope using chloral hydrate solution R. The powder shows the following diagnostic characters (Figure 0406.-1): fragments of epidermises bearing covering and glandular trichomes; adaxial epidermis (surface view [B, H]) having cells with sinuous-wavy walls [Ha] and cuticle striated over the veins [B] associated with palisade parenchyma [Hb]; abaxial epidermis [C] with diacytic stomata (2.8.3) [Ca]; covering trichomes are usually fragmented, elongated, uniseriate with 3-8 cells with striated cuticle [A, E]; glandular trichomes of 2 types: a) unicellular stalk with small, rounded unicellular head 15-25 µm in diameter (surface view [Ba, Cb], transverse section [D]), b) unicellular stalk with enlarged oval head 55-70 µm in diameter composed of 8 radiating cells (surface view [Bb], transverse section [Ga]); fragments from near the leaf margin [F] with isodiametric cells whose anticlinal walls are more-or-less straight and beaded [Fa] and short, conical, unicellular or bicellular covering trichomes [Fb]; dorsiventral mesophyll fragments (transverse section [G]), with a single palisade layer [Gc] and 4-6 layers of spongy parenchyma [Gb]. Yellowish crystals of menthol under the cuticle of secretory cells may be present.

Figure 0406.-1. – Illustration for identification test B of powdered herbal drug of peppermint leaf

#### C. Thin-layer chromatography (2.2.27).

**Test solution** To 0.5 g of the powdered herbal drug (355) (2.9.12) add 2.5 mL of methanol R and 2.5 mL of water R, sonicate for 5 min and filter.

**Reference solution** Dissolve 2 mg of luteolin-7-glucoside R, 2 mg of rutoside trihydrate R and 5 mg of rosmarinic acid R in methanol R and dilute to 10 mL with the same solvent.

**Plate** TLC silica gel F<sub>254</sub> plate R (2–10 µm).

**Mobile phase** acetic acid R, anhydrous formic acid R, water R, ethyl acetate R (7:7:18:68 V/V/V/V).

**Application** 4 µL as bands of 8 mm.

**Development** Over a path of 6 cm.

**Drying** In air.

**Detection** Heat at 100–105 °C for 5 min; spray the warm plate with a 10 g/L solution of diphenylboric acid aminoethyl ester R in methanol R, then with a 50 g/L solution of macrogol 400 R in methanol R or, alternatively, dip the warm plate in a 5 g/L solution of diphenylboric acid aminoethyl ester R in ethyl acetate R, then in a 50 g/L solution of macrogol 400 R in methylene chloride R; allow to dry in air for about 1 min and examine in ultraviolet light at 366 nm.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint fluorescent zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Rosmarinic acid: a light blue fluorescent zone	A light blue fluorescent zone (rosmarinic acid)
Luteolin-7-glucoside: an orange fluorescent zone	An orange-yellow fluorescent zone
Rutoside: an orange fluorescent zone	A red fluorescent zone
	An orange-yellow fluorescent zone
Reference solution	Test solution

#### TESTS

##### Foreign matter (2.8.2)

Maximum 5 per cent of stems, whose diameter is not greater than 1.5 mm; maximum 2 per cent of foreign elements; not more than 8 per cent of the leaves show brown stains due to *Puccinia menthae*.

Carry out the determination using 10 g of the drug.

##### Water (2.2.13)

Maximum 110 mL/kg, determined on 20.0 g.

##### Total ash (2.4.16)

Maximum 15.0 per cent.

##### Ash insoluble in hydrochloric acid (2.8.1)

Maximum 1.5 per cent.

#### ASSAY

##### Essential oil (2.8.12)

Use 20.0 g of the crushed herbal drug, a 500 mL flask, 200 mL of water R as the distillation liquid and 0.50 mL of xylene R in the graduated tube. Distil at a rate of 3–4 mL/min for 2 h.

Ph Eur

## Peppermint Oil

(Ph. Eur. monograph 0405)

#### Preparation

Peppermint Oil Gastro-resistant Capsules

Ph Eur

#### DEFINITION

Essential oil obtained by steam distillation from the fresh aerial parts of *Mentha × piperita* L.

#### CHARACTERS

**Appearance** Colourless, pale yellow or pale greenish-yellow liquid.

Characteristic odour and taste followed by a sensation of cold.

**Solubility** Miscible with ethanol (96 per cent) and with methylene chloride.

**IDENTIFICATION***First identification: B.**Second identification: A.***A. Thin-layer chromatography (2.2.27).***Test solution* Mix 0.1 g of the substance to be examined with *toluene R* and dilute to 10 mL with the same solvent.*Reference solution* Dissolve 50 mg of *menthol R*, 20 µL of *cineole R*, 10 mg of *thymol R* and 10 µL of *menthyl acetate R* in *toluene R* and dilute to 10 mL with the same solvent.*Plate* TLC silica gel *F<sub>254</sub>* plate *R* (5-40 µm) [or TLC silica gel *F<sub>254</sub>* plate *R* (2-10 µm)].*Mobile phase* *ethyl acetate R*, *toluene R* (5:95 *V/V*).*Application* 10 µL [or 1 µL] of the reference solution and 20 µL [or 2 µL] of the test solution, as bands of 10 mm [or 8 mm].*Development* Over a path of 15 cm [or 6 cm].*Drying* In air.*Detection A* Examine in ultraviolet light at 254 nm.*Results A* See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution.

Top of the plate	
Thymol: a quenching zone	Quenching zones may be present (carvone, pulegone)
Reference solution	Test solution

*Detection B* Treat with *anisaldehyde solution R* and heat at 100-105 °C for 5-10 min; examine immediately in daylight.*Results B* See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other less intensely coloured zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Menthyl acetate: a violet-blue zone	A violet-blue zone (menthyl acetate) A greenish-blue zone (menthone)
Thymol: a pink zone	Light pink or greyish-blue or greyish-green zones may be present (carvone, pulegone, isomenthone)

- *material:* fused silica;
- *size:* *l* = 60 m, Ø = 0.25 mm;
- *stationary phase:* *macrogol 20 000 R* (film thickness 0.25 µm).

*Carrier gas* *helium for chromatography R*.*Flow rate* 1.5 mL/min.*Split ratio* 1:50.*Temperature:*

	Time (min)	Temperature (°C)
Column	0 - 10	60
	10 - 70	60 → 180
	70 - 75	180
Injection port		200
Detector		220

*Detection* Flame ionisation.*Injection* 1 µL.

**Elution order** Order indicated in the composition of reference solution (a); record the retention times of these substances.

**Identification of peaks** Using the retention times determined from the chromatogram obtained with reference solution (a), locate the components of reference solution (a) in the chromatogram obtained with the test solution.

**System suitability** Reference solution (a):

- **resolution:** minimum 1.5 between the peaks due to limonene and 1,8-cineole; minimum 1.5 between the peaks due to piperitone and carvone.

Determine the percentage content of each of the following components. The limits are within the following ranges:

- **limonene:** 1.0 per cent to 3.5 per cent;
- **1,8-cineole:** 3.5 per cent to 8.0 per cent;
- **menthone:** 14.0 per cent to 32.0 per cent;
- **menthofuran:** 1.0 per cent to 8.0 per cent;
- **isomenthone:** 1.5 per cent to 10.0 per cent;
- **menthyl acetate:** 2.8 per cent to 10.0 per cent;
- **isopulegol:** maximum 0.2 per cent;
- **menthol:** 30.0 per cent to 55.0 per cent;
- **pulegone:** maximum 3.0 per cent;
- **carvone:** maximum 1.0 per cent;
- **disregard limit:** the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

The ratio of 1,8-cineole content to limonene content is a minimum of 2.

#### STORAGE

At a temperature not exceeding 25 °C.

Ph Eur

## Peppermint Oil Gastro-resistant Capsules

Gastro-resistant Peppermint Oil Capsules

#### DEFINITION

Peppermint Oil Gastro-resistant Capsules contain Peppermint Oil. They are covered with a gastro-resistant coating.

The capsules comply with the requirements stated under Capsules and with the following requirements.

#### IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

- (1) Dissolve a quantity of the contents of the capsules containing 0.1 g of Peppermint Oil in sufficient *toluene* to produce 10 mL.
- (2) Dissolve 10 mg of *thymol*, 10 µL of *menthyl acetate*, 20 µL of *cineole* and 50 mg of *menthol* in *toluene* and dilute to 10 mL with the same solvent.

#### CHROMATOGRAPHIC CONDITIONS

- (a) Use a TLC silica gel GF<sub>254</sub> plate.
- (b) Use the mobile phase as described below.
- (c) Apply 20 µL of solution (1) and 10 µL of solution (2) as bands.
- (d) After removal of the plate, dry in air and examine under *ultraviolet light (254 nm)*, spray with *anisaldehyde solution* and examine in daylight for 5 to 10 minutes while heating at 100° to 105°.

#### MOBILE PHASE

5 volumes of ethyl acetate and 95 volumes of *toluene*.

#### CONFIRMATION

When examined under *ultraviolet light (254 nm)* the chromatogram obtained with solution (1) may show quenching zones (*carvone*, *pulegone*) situated just below the level of the zone (*thymol*) in the chromatogram obtained with solution (2).

When examined in daylight the chromatogram obtained with solution (2) shows, in order of increasing R<sub>f</sub> value, an intense blue to violet zone (*menthol*) in the lower third; a violet-blue to brown zone (*cineole*); a pink zone (*thymol*); and a violet-blue zone (*menthyl acetate*). In the chromatogram obtained with solution (1) there is a zone due to *menthol* (the most intense) and a faint zone due to *cineole*; at R<sub>f</sub> values between those of the *cineole* and *thymol* zones in the chromatogram obtained with solution (2), there may be light pink or greyish-blue or greenish-grey zones (*carvone*, *pulegone*, *isomenthone*); in the middle of the chromatogram, there is a violet-blue zone (*menthyl acetate*) and just below it a greenish-blue zone (*menthone*); an intense violet-red zone (*hydrocarbons*) appears near the solvent front and below it there may be a brownish-yellow zone (*menthofuran*); other less intensely coloured zones may also appear.

B. Examine the chromatograms obtained in the test for Chromatographic profile. The retention time of the principal peaks in the chromatogram obtained with solution (1) is similar to that of the principal peaks in the chromatogram obtained with solution (2). *Carvone* and *pulegone* may be absent from the chromatogram obtained with solution (1).

#### TESTS

##### Disintegration test

Complies with the requirements stated under Gastro-resistant Capsules.

##### Refractive index

1.457 to 1.467, determined on the contents of the capsules, Appendix V G.

##### Relative density

0.900 to 0.916, determined on the contents of the capsules, Appendix V E.

##### Composition of peppermint oil

Carry out the method for *gas chromatography*, Appendix III B, using the following freshly prepared solutions.

- (1) Use the contents of the capsules.
- (2) Dissolve 0.1 g of *limonene*, 0.2 g of *cineole*, 0.4 g of *menthone*, 0.1 g of *menthofuran*, 0.1 g of *isomenthone*, 0.4 g of *menthyl acetate*, 0.6 g of *menthol*, 0.2 g of *pulegone* and 0.1 g of *carvone* in 1 mL of *hexane*.

#### CHROMATOGRAPHIC CONDITIONS

- (a) Use a fused-silica capillary column (60 m × 0.25 mm) coated with *macrogol 20,000* as the bonded phase.
- (b) Use *helium* as the carrier gas at 1.5 mL per minute.
- (c) Use the gradient conditions described below.
- (d) Use an inlet temperature of 220°.
- (e) Use a flame ionisation detector at a temperature of 220°.
- (f) Inject 0.2 µL of each solution.
- (g) Use a split ratio of 1:100.

When the chromatograms are recorded in the prescribed conditions, the components elute in the order indicated in the composition of solution (2). Record the retention times of these substances.

Time (minutes)	Temperature	Comments
0 → 10	60°	isothermal
10 → 70	60° → 180°	linear gradient
70 → 75	180°	isothermal

**SYSTEM SUITABILITY**

The test is not valid unless the number of theoretical plates calculated from the limonene peak at 110° is at least 30,000 and the resolution factor between the peaks corresponding to limonene and cineole is at least 1.5 in the chromatogram obtained with solution (2).

**DETERMINATION OF CONTENT**

Using the retention times determined from the chromatogram obtained with solution (2), locate the components of solution (2) on the chromatogram obtained with solution (1) (disregard the peak due to hexane).

Determine the percentage content of the components by the normalisation procedure.

The percentages are within the following ranges:

Limonene	1.0 to 3.5%,
Cineole	3.5 to 8.0%,
Menthone	14.0 to 32.0%,
Menthofuran	1.0 to 8.0%,
Isomenthone	1.5 to 10.0%,
Menthyl acetate	2.8 to 10.0%,
Isopulegol	Maximum 0.2%
Menthol	30.0 to 55.0%
Pulegone	Not more than 3.0%,
Carvone	Not more than 1.0%.

The ratio of cineole content to limonene content is greater than 2.

**STORAGE**

Peppermint Oil Gastro-resistant Capsules should be protected from light.

**Peppermint Leaf Dry Extract**

(Ph. Eur. monograph 2382)

Ph Eur

**DEFINITION**

Dry extract produced from *Peppermint leaf* (0406).

**Content**

Minimum 0.5 per cent of rosmarinic acid (C<sub>18</sub>H<sub>16</sub>O<sub>6</sub>; M<sub>r</sub> 360.3) (dried extract).

**PRODUCTION**

The extract is produced from the herbal drug by a suitable procedure using ethanol (30-50 per cent V/V) or water at minimum 60 °C.

**CHARACTERS****Appearance**

Brown, amorphous powder.

**IDENTIFICATION**

Thin-layer chromatography (2.2.27).

**Test solution** To 0.2 g of the extract to be examined add 2.5 mL of *methanol R* and 2.5 mL of *water R*, sonicate for 5 min and filter.

**Reference solution** Dissolve 2 mg of *luteolin-7-glucoside R*, 2 mg of *rutoside trihydrate R* and 5 mg of *rosmarinic acid R* in *methanol R* and dilute to 10 mL with the same solvent.

**Plate** TLC silica gel F<sub>254</sub> plate R (2-10 µm).

**Mobile phase** *acetic acid R*, *anhydrous formic acid R*, *water R*, *ethyl acetate R* (7:7:18:68 V/V/V/V).

**Application** 4 µL as bands of 8 mm.

**Development** Over a path of 6 cm.

**Drying** In air.

**Detection** Heat at 100-105 °C for 5 min; spray the warm plate with a 10 g/L solution of *diphenylboric acid aminoethyl ester R* in *methanol R*, then with a 50 g/L solution of *macrogol 400 R* in *methanol R* or, alternatively, dip the warm plate in a 5 g/L solution of *diphenylboric acid aminoethyl ester R* in *ethyl acetate R*, then in a 50 g/L solution of *macrogol 400 R* in *methylene chloride R*; allow to dry in air for about 1 min and examine in ultraviolet light at 366 nm.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint fluorescent zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Rosmarinic acid: a light blue fluorescent zone	A light blue fluorescent zone (rosmarinic acid)
Luteolin-7-glucoside: an orange fluorescent zone	A faint orange fluorescent zone
Rutoside: an orange fluorescent zone	An orange-yellow fluorescent zone
	A red fluorescent zone
	An orange-yellow fluorescent zone
	An orange-yellow fluorescent zone
Reference solution	Test solution

**ASSAY**

Liquid chromatography (2.2.29).

**Test solution** Use brown glass flasks. To 0.400 g of the extract to be examined add 15 mL of *ethanol (50 per cent V/V) R*, sonicate for 10 min and filter into a 20 mL volumetric flask. Rinse the flask and the filter with *ethanol (50 per cent V/V) R* and dilute to 20.0 mL with the same solvent.

**Reference solution (a)** Dissolve 10.0 mg of *rosmarinic acid CRS* in *ethanol (50 per cent V/V) R* and dilute to 100.0 mL with the same solvent.

**Reference solution (b)** Dissolve 5 mg of *ferulic acid R* in reference solution (a) and dilute to 50 mL with the same solution.

**Column:**

— size: l = 0.25 m, Ø = 4.6 mm;

— stationary phase: end-capped octadecylsilyl silica gel for chromatography R (5 µm).

**Mobile phase:**

- mobile phase A: phosphoric acid R, acetonitrile R, water for chromatography R (1:19:80 V/V/V);
- mobile phase B: phosphoric acid R, methanol R, acetonitrile R (1:40:59 V/V/V);

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 20	100 → 55	0 → 45
20 - 25	55 → 0	45 → 100
25 - 30	0 → 100	100 → 0

**Flow rate** 1.2 mL/min.

**Detection** Spectrophotometer at 330 nm.

**Injection** 20 µL.

**Identification of peaks** Use the chromatogram obtained with reference solution (a) to identify the peak due to rosmarinic acid.

**Relative retention** With reference to rosmarinic acid (retention time = about 11 min): ferulic acid = about 0.8.

**System suitability** Reference solution (b):

- resolution: minimum 4.0 between the peaks due to ferulic acid and rosmarinic acid.

Calculate the percentage content of rosmarinic acid using the following expression:

$$\frac{A_1 \times m_2 \times p \times 0.2}{A_2 \times m_1}$$

- $A_1$  = area of the peak due to rosmarinic acid in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to rosmarinic acid in the chromatogram obtained with reference solution (a);
- $m_1$  = mass of the extract to be examined used to prepare the test solution, in grams;
- $m_2$  = mass of rosmarinic acid CRS used to prepare reference solution (a), in grams;
- $p$  = percentage content of rosmarinic acid in rosmarinic acid CRS.

Ph Eur

**Peru Balsam**

(Ph. Eur. monograph 0754)

Ph Eur

**DEFINITION**

Balsam obtained from the scorched and wounded trunk of *Myroxylon balsamum* (L.) Harms var. *pereirae* (Royle) Harms.

**Content**

45.0 per cent *m/m* to 70.0 per cent *m/m* of esters, mainly benzyl benzoate and benzyl cinnamate.

**CHARACTERS****Appearance**

Dark brown, viscous liquid which is transparent and yellowish-brown when viewed in a thin layer; it is not sticky, non-drying and does not form threads.

**Solubility**

Practically insoluble in water, freely soluble in anhydrous ethanol, not miscible with fatty oils, except for castor oil.

**IDENTIFICATION**

**A.** Dissolve 0.20 g in 10 mL of ethanol (96 per cent) R. Add 0.2 mL of ferric chloride solution R1. A green or yellowish-green colour develops.

**B.** Thin-layer chromatography (2.2.27).

**Test solution** Dissolve 0.5 g of the substance to be examined in 10 mL of ethyl acetate R.

**Reference solution** Dissolve 4 mg of thymol R, 30 mg of benzyl cinnamate R and 80 µL of benzyl benzoate R in 5 mL of ethyl acetate R.

**Plate** TLC silica gel GF<sub>254</sub> plate R.

**Mobile phase** glacial acetic acid R, ethyl acetate R, hexane R (0.5:10:90 V/V/V).

**Application** 10 µL, as bands of 20 mm by 3 mm.

**Development** Twice over a path of 10 cm.

**Drying** In air.

**Detection A** Examine in ultraviolet light at 254 nm and mark the quenching zones.

**Results A** The chromatogram obtained with the reference solution shows in the upper third 2 quenching zones, the higher one due to benzyl benzoate and the lower one due to benzyl cinnamate. The chromatogram obtained with the test solution shows 2 quenching zones at the same levels and of approximately the same size.

**Detection B** Spray with a freshly prepared 200 g/L solution of phosphomolybdic acid R in ethanol (96 per cent) R, using 10 mL for a plate 200 mm square and examine in daylight while heating at 100-105 °C for 5-10 min.

**Results B** The zones due to benzyl benzoate and benzyl cinnamate are blue against a yellow background. The chromatogram obtained with the reference solution shows at about the middle a violet-grey zone (thymol). In the chromatogram obtained with the test solution, a blue zone (nerolidol) is seen just below the level of the zone due to thymol in the chromatogram obtained with the reference solution. Just below the zone due to nerolidol, no blue zone is seen corresponding to a quenching zone seen when examined in ultraviolet light at 254 nm (colophony). In the upper and lower part of the chromatogram obtained with the test solution, other faint blue zones may be seen.

**TESTS****Relative density (2.2.5)**

1.14 to 1.17.

**Saponification value (2.5.6)**

230 to 255, determined on the residue obtained in the assay.

**Artificial balsams**

Shake 0.20 g with 6 mL of light petroleum R1. The light petroleum solution is clear and colourless and the whole of the insoluble parts of the balsam stick to the wall of the test-tube.

**Fatty oils**

Shake 1 g with 3 mL of a 1000 g/L solution of chloral hydrate R. The resulting solution is as clear as the 1000 g/L solution of chloral hydrate R.

**Turpentine**

Evaporate to dryness 4 mL of the solution obtained in the test for artificial balsams. The residue has no odour of turpentine.

**ASSAY**

To 2.50 g in a separating funnel add 7.5 mL of dilute sodium hydroxide solution R and 40 mL of peroxide-free ether R and shake vigorously for 10 min. Separate the lower layer and

shake it with 3 quantities, each of 15 mL, of *peroxide-free ether R*. Combine the ether layers, dry over 10 g of *anhydrous sodium sulfate R* and filter. Wash the sodium sulfate with 2 quantities, each of 10 mL, of *peroxide-free ether R*. Combine the ether layers and evaporate to dryness. Dry the residue (esters) at 100-105 °C for 30 min and weigh.

**STORAGE**

Protected from light.

Ph Eur

**Phellodendron Amurense Bark****DEFINITION**

Phellodendron Amurense Bark is the dried bark of *Phellodendron amurense* Ruprecht.

It is collected between spring and summer and the rough part of the bark is removed and sundried.

It contains not less than 0.4% w/w of berberine (C<sub>20</sub>H<sub>18</sub>NO<sub>4</sub>) and not less than 0.2% w/w palmatine (C<sub>21</sub>H<sub>22</sub>NO<sub>4</sub>) calculated with reference to the dried material.

**IDENTIFICATION**

A. The bark pieces are usually rectangular or shallowly quilled, of variable length and width; between 2 and 6 mm thick. Prepared, cut slices are transversely sliced into rectangular pieces and occasionally show the remains of the corky outer bark. The outer surface is relatively smooth with yellow, yellowish-green or yellowish-brown inner bark (secondary phloem) interrupted by irregularly shaped remains of brown or greyish-brown outer bark (cork or rhytidoma), the latter fissured or sometimes raised, angular and somewhat spongy. Lenticels are occasionally visible in the outer bark. The inner surface is smooth and yellow or yellowish-brown throughout with fine longitudinal striations. The texture is light and hard. The fracture is fibrous, bright yellow or yellowish-green.

B. Reduce to a powder, Appendix XVII A. The powder is yellow or yellowish-brown. Examine under a microscope using *chloral hydrate solution*. The powder shows the following diagnostic characters: abundant fragments of fibres, yellow or pale yellow, mainly in bundles or sheets, with thickened walls and a long, narrow lumen, surrounded by a crystal sheath of parenchyma cells containing prisms of calcium oxalate. Scattered calcium oxalate prism crystals, up to about 24 µm, are also seen in the powder. The fibre sheets are interspersed with medullary rays composed of polygonal cells two to three cells wide. Numerous large stone cells, bright yellow, sub-orbicular, fusiform or irregular in shape, some branched or with a pointed apex, with thickened, distinctly striated walls, are present, commonly arranged in groups. Groups of tabular, colourless, cork cells in layers are present.

C. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) To 0.25 g of the finely powdered drug, Appendix XVII A, add 4 mL of a mixture of 20 mL of *water* and 80 mL of *methanol*. Mix with the aid of ultrasound for 10 minutes and filter. Extract the remaining residue in the filter with two 2-mL quantities of *methanol*. Combine the solutions and dilute to 20 mL with *methanol*.

(2) 0.04% w/v each of *palmatine chloride BPCRS* and *berberine chloride BPCRS* in *methanol*.

**CHROMATOGRAPHIC CONDITIONS**

- Use as the coating *octadecylsilyl silica gel for HPTLC* (Merck silica gel HPTLC plates are suitable)
- Use the mobile phase as described below.
- Apply 20 µL of each solution, as 8 mm bands.
- Develop the plate to 6 cm from the point of application.
- After removal of the plate, dry in air for 5 minutes, dip the plate in *ethanolic sulfuric acid (20%)* and then heat at 105° until coloured bands appear. Examine under *ultraviolet light (366 nm)*.

**MOBILE PHASE**

10 volumes of *anhydrous formic acid*, 10 volumes of *water* and 80 volumes of *ethyl acetate*.

**SYSTEM SUITABILITY**

The test is not valid unless the chromatogram obtained with solution (2) shows two clearly separated bands.

**RESULTS**

See the sequence of zones present in the chromatograms obtained with the solution (1) and solution (2). Other faint zones may be present.

Top of the plate	
A green band (berberine)	A green band (berberine)
An orange band	
A green band (palmatine)	A green band (palmatine)
An orange band	
A blue band	
A blue band	
<i>Solution (1)</i>	<i>Solution (2)</i>

**TESTS****Loss on drying**

When dried at 100° to 105° for 2 hours, loses not more than 10.0% of its weight, Appendix IX D. Use 1 g.

**Total ash**

Not more than 8.0%, Appendix XI J, Method II.

**ASSAY**

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) To 0.1 g of powdered sample, add 80 mL of a mixture of equal volumes of *acetonitrile* and 0.1% v/v solution of *orthophosphoric acid*. Mix with the aid of ultrasound for 40 minutes and allow to cool. Dilute to 100 mL with mobile phase and filter (Whatman GF/C is suitable).

(2) 0.01% w/v of *palmatine chloride BPCRS* and 0.01% w/v *berberine chloride BPCRS* in mobile phase.

**CHROMATOGRAPHIC CONDITIONS**

- Use a stainless steel column (15 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography (5 µm)* (Phenomenex Luna C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 235 nm.

(f) Inject 50 µl of each solution.

#### MOBILE PHASE

27 volumes of *acetonitrile* and 73 volumes of a 1.36% w/v solution of *potassium dihydrogen orthophosphate* in *water*.

#### SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the *resolution* between the peaks due to *palmatine* (retention time approximately 8 minutes) and *berberine* (retention time approximately 9 minutes) is at least 2.0.

#### DETERMINATION OF CONTENT

Using the retention times and the peak areas from the chromatograms obtained with solution (2), locate and integrate the peaks due to *berberine* and *palmatine* in the chromatogram obtained with solution (1). Calculate the content of *berberine* and of *palmatine* in the sample using the declared content of *berberine* in *berberine chloride BPCRS* and *palmatine* in *palmatine chloride BPCRS* and the following expression:

$$\frac{A_1 \times m_2 \times p}{A_2 \times m_1} \times 12.5$$

- $A_1$  = Area of the peak due to *berberine/palmatine* in the chromatogram obtained with solution (1).  
 $A_2$  = Area of the peak due to *berberine/palmatine* in the chromatogram obtained with solution (2).  
 $m_1$  = Weight of the drug being examined in g.  
 $m_2$  = Weight of *berberine chloride/palmatine chloride* in the reference solution in g.  
 $p$  = Percentage content of *berberine/palmatine* in *berberine chloride/palmatine chloride*.

#### STORAGE

*Phellodendron Amurense* Bark should be protected from moisture.

#### ANNEX

This section is non-mandatory.

#### DNA reference sequence

A DNA reference sequence for the identity of *Phellodendron Amurense* Bark is published in *Supplementary Chapter VII D*.

## Phellodendron Chinense Bark

#### DEFINITION

*Phellodendron Chinense* Bark is the dried bark of *Phellodendron chinense* Schneid.

It is collected between spring and summer and the rough outer bark is removed and discarded. The remainder is sundried.

It contains not less than 3.0% w/w of *berberine* ( $C_{20}H_{18}NO_4$ ), calculated with reference to the dried material.

#### IDENTIFICATION

A. The bark pieces are usually rectangular or shallowly quilled of widely varying length and width; up to 6 mm

thick. Prepared, cut, slices are sliced transversely into rectangular pieces. The outer surface is greyish or yellowish (depending on the amount of thin outer cork bark removed), with irregularly scattered raised transverse lenticels. The inner surface is smooth and yellow to yellowish-brown throughout with fine longitudinal striations. The texture is light and hard. The fracture is fibrous, yellow or yellowish green; older barks are thicker and include a hard sponge-like zone on the innermost side.

B. Reduce to a powder, Appendix XVII A. The powder is yellow or yellowish-brown. Examine under a microscope using *chloral hydrate solution*. The powder shows the following diagnostic characters: abundant fragments of short fibres, yellow or pale yellow, mainly in bundles or sheets, with thickened walls and a long, narrow lumen, surrounded by a crystal sheath of parenchyma cells containing prisms of calcium oxalate. Scattered calcium oxalate prism crystals, up to about 40 µm, are also seen in the powder. The fibre sheets are interspersed with conspicuous medullary rays composed of polygonal cells two to three cells wide. Numerous large stone cells, bright yellow, sub-orbicular, fusiform or irregular in shape, some branched or with a pointed apex, with thickened, distinctly striated walls, are present, commonly arranged in groups.

C. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) To 0.25 g of the finely powdered drug, Appendix XVII A, add 4 mL of a mixture of 20 mL of *water* and 80 mL of *methanol*. Mix with the aid of ultrasound for 10 minutes and filter. Extract the remaining residue in the filter with two 2-mL quantities of *methanol*. Combine the solutions and dilute to 20 mL with *methanol*.

(2) 0.04% w/v each of *palmatine chloride BPCRS* and *berberine chloride BPCRS* in *methanol*.

#### CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *octadecylsilyl silica gel for HPTLC* (Merck silica gel HPTLC plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 20 µL of each solution, as 8 mm bands.

(d) Develop the plate to 6 cm from the point of application.

(e) After removal of the plate, dry in air for 5 minutes, dip the plate in *ethanolic sulfuric acid (20%)* and then heat at 105° until coloured bands appear. Examine under *ultraviolet light (366 nm)*.

#### MOBILE PHASE

10 volumes of *anhydrous formic acid*, 10 volumes of *water* and 80 volumes of *ethyl acetate*.

#### SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (2) shows two clearly separated bands.

#### RESULTS

See the diagram for the sequence of zones present in the chromatograms obtained with solution (1) and solution (2). Furthermore, in the chromatogram obtained with solution (1) a faint or more intense green band corresponding to *palmatine* may be present. Other faint zones may be present.

Top of the plate	
A green band (berberine) A yellow band	A green band (berberine)  A green band (palmatine)
Solution (1)	Solution (2)

**TESTS*****Phellodendron amurense***

In identification test C, the chromatogram obtained with solution (1) shows no orange band between the bands for berberine and palmatine and no orange or blue bands below the band for palmatine given in the chromatogram obtained with solution (2).

**Loss on drying**

When dried at 100° to 105° for 2 hours, loses not more than 10.0% of its weight, Appendix IX D. Use 1 g.

**Total ash**

Not more than 8.0%, Appendix XI J, Method II.

**ASSAY**

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) To 0.1 g of powdered sample, add 80 mL of a mixture of equal volumes of *acetonitrile* and 0.1% *v/v* solution of *orthophosphoric acid*. Mix with the aid of ultrasound for 40 minutes and allow to cool. Dilute to 100 mL with mobile phase and filter (Whatman GF/C is suitable).

(2) 0.01% *w/v* of *palmatine chloride* BPCRS and 0.01% *w/v* *berberine chloride* BPCRS in mobile phase.

**CHROMATOGRAPHIC CONDITIONS**

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 μm) (Phenomenex Luna C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 235 nm.

(f) Inject 50 μL of each solution.

**MOBILE PHASE**

27 volumes of *acetonitrile* and 73 volumes of a 1.36% *w/v* solution of *potassium dihydrogen orthophosphate* in *water*.

**SYSTEM SUITABILITY**

The test is not valid unless, in the chromatogram obtained with solution (2), the *resolution* between the peaks due to palmatine (retention time of approximately 8 minutes) and berberine (retention time of approximately 9 minutes) is at least 2.0.

**DETERMINATION OF CONTENT**

Using the retention time and the peak area from the chromatograms obtained with solution (2), locate and

integrate the peak due to berberine in the chromatogram obtained with solution (1). Calculate the content of berberine in the sample using the declared content of berberine in *berberine chloride* BPCRS and the following expression:

$$\frac{A_1 \times m_2 \times p}{A_2 \times m_1} \times 12.5$$

- $A_1$  = Area of the peak due to berberine in the chromatogram obtained with solution (1).  
 $A_2$  = Area of the peak due to berberine in the chromatogram obtained with solution (2).  
 $m_1$  = Weight of the drug being examined in g.  
 $m_2$  = Weight of *berberine chloride* in the reference solution in g.  
 $p$  = Percentage content of berberine in *berberine chloride*.

**STORAGE**

*Phellodendron* Chinese Bark should be protected from moisture.

**ANNEX**

*This section is non-mandatory.*

**DNA reference sequence**

A DNA reference sequence for the identity of *Phellodendron* Chinese Bark is published in *Supplementary Chapter VII D*.

***Phyllanthus Emblica* Pericarp****DEFINITION**

*Phyllanthus Emblica* Pericarp is the pericarp of dried mature fruits of *Phyllanthus emblica* L. (syn. *Emblica officinalis* Gaertn.)

It contains not less than 6.0% tannins, expressed as pyrogallol (C<sub>6</sub>H<sub>6</sub>O<sub>3</sub>, *M<sub>r</sub>* 126.1), calculated with reference to the dried drug.

**IDENTIFICATION**

A. Irregular pieces of the pericarp showing a dark brownish to black outer surface, much wrinkled and grooved with occasional greyish-white patches; the underlying brown mesocarp is about 2 to 3 mm wide surrounding a thin, paler brown endocarp. Infrequently whole seeds, or portions of the creamish white testa may be present, attached to the endocarp; whole seeds are subspherical, about 1 cm in diameter and the testa is marked with 6 equidistant longitudinal ridges. Occasional whole fruits may also be present; they are spherical to ovoid or irregular, about 2 cm in diameter and show a depression at one end.

B. The powder is yellow-green or pale brown. It shows small polygonal cells from the exocarp covered with a thick cuticle, numerous mesocarp, some filled with amorphous grey birefractive masses, some with mucilage, and some with calcium oxalate crystals in the form of needles, large prism or microsphenoids; thick-walled, pitted sclereids from the mesocarp found singly and usually surrounded by parenchyma, and fragments of the endocarp consisting of a thick layer of pitted fibres and sclereids.

C. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Add 25 mL of *ethanol* to 1.0 g of the powdered herbal drug, sonicate for 30 minutes and filter.

(2) 0.1% *w/v* of *ellagic acid* and 0.1% *w/v* of *gallic acid* in *methanol*.

## CHROMATOGRAPHIC CONDITIONS

- (a) Use as the coating *silica gel 60 F<sub>254</sub>* or high-performance *silica gel 60 F<sub>254</sub>* (Merck silica gel 60 F<sub>254</sub> HPTLC plates are suitable).
- (b) Use the mobile phase as described below.
- (c) Apply 10 µL [or 2 µL] of each solution, as bands.
- (d) Develop the plate to 15 cm [or 7 cm].
- (e) After removal of the plate, dry in air, spray with a 5% w/v solution of *iron(III) chloride* in *ethanol* and examine in daylight.

## MOBILE PHASE

1.5 volumes of *toluene*, 3 volumes of *acetic acid*, 4 volumes of *formic acid* and 30 volumes of *ethyl acetate*.

## SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (2) shows two clearly separated bands.

## CONFIRMATION

The chromatogram obtained with solution (1) shows a dark blue band with an *R<sub>f</sub>* value of 0.6 corresponding in colour and position to the band obtained with *ellagic acid* in solution (2) and a dark blue band with an *R<sub>f</sub>* value of approximately 0.9 corresponding in position to the dark blue band obtained with *gallic acid* in solution (2). Two or three separated blue or faint blue bands with *R<sub>f</sub>* values of between 0.2 and 0.3 are also present. Other bands may be present in solution (1).

Top of the plate	
Dark blue band	Gallic acid: a dark blue band
Dark blue band	Ellagic acid: a dark blue band
Blue/faint blue band Blue/faint blue band

## TESTS

## Ethanol-soluble extractive

Not less than 15.0%, Appendix XI B1

## Foreign matter

Not more than 5% of foreign matter including seed material, Appendix XI D.

## Water-soluble extractive

Not less than 50%, Appendix XI B2.

## Ash

Not more than 7.0%, Appendix XI J, method II.

## Loss on drying

Not more than 10.0%, Appendix IX D. Use 1 g.

## ASSAY

Carry out the determination of *tanmins* in *herbal drugs*, Appendix XI M. Use 1.0 g of powdered drug.

## Dwarf Pine Oil

(Ph. Eur. monograph 2377)

Ph Eur

## DEFINITION

Essential oil obtained by steam distillation of the fresh leaves and twigs of *Pinus mugo* Turra. A suitable antioxidant may be added.

## CHARACTERS

## Appearance

Clear, colourless or pale yellow liquid.

## IDENTIFICATION

First identification: B.

Second identification: A.

A. Thin-layer chromatography (2.2.27).

Test solution Dilute 1 mL of the substance to be examined to 10 mL with *toluene R*.

Reference solution Dissolve 10 mg of *borneol R* and 10 µL of *bornyl acetate R* in *toluene R* and dilute to 10 mL with the same solvent.

Plate TLC silica gel plate R (5-40 µm) [or TLC silica gel plate R (2-10 µm)].

Mobile phase *ethyl acetate R*, *toluene R* (5:95 V/V).

Application 10 µL [or 2 µL], as bands.

Development Over a path of 15 cm [or 6 cm].

Drying In air.

Detection Spray with *anisaldehyde solution R* and heat at 100-105 °C for 5-10 min; examine in daylight.

Results See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
	A pink zone
Bornyl acetate: a brown or greyish-brown zone	A brown or greyish-brown zone (bornyl acetate)
	A pink zone
Borneol: a brown or greyish-brown zone	A cluster of violet zones
<b>Reference solution</b>	<b>Test solution</b>

B. Examine the chromatograms obtained in the test for chromatographic profile.

Results The characteristic peaks in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with reference solution (a).

## TESTS

Relative density (2.2.5)  
0.857 to 0.870.

Refractive index (2.2.6)  
1.474 to 1.480.

Optical rotation (2.2.7)  
-15° to -6°.

**Acid value (2.5.1)**

Maximum 1.0.

**Peroxide value (2.5.5)**

Maximum 20.

**Fatty oils and resinified oils (2.8.7)**

It complies with the test.

**Chromatographic profile**

Gas chromatography (2.2.28): use the normalisation procedure.

**Test solution** Dilute 200 µL of the substance to be examined to 10.0 mL with *heptane R*.**Reference solution (a)** Dilute 30 µL of *α-pinene R*, 5 mg of *camphene R*, 10 µL of *β-pinene R*, 20 µL of *car-3-ene R*, 5 µL of *β-myrcene R*, 10 µL of *limonene R*, 5 µL of *p-cymene R*, 10 µL of *terpinolene R*, 5 µL of *bornyl acetate R* and 5 µL of *β-caryophyllene R* in *heptane R* and dilute to 5 mL with the same solvent.**Reference solution (b)** Dissolve 5 mg of *camphene R* in *heptane R* and dilute to 50.0 mL with the same solvent. Dilute 1.0 mL of this solution to 10.0 mL with *heptane R*.**Column:**

- **material:** fused silica;
- **size:**  $l = 60$  m,  $\varnothing = 0.25$  mm;
- **stationary phase:** *macrogol 20 000 R* (film thickness 0.25 µm).

**Carrier gas** *helium for chromatography R*.**Flow rate** 1.5 mL/min.**Split ratio** 1:50.**Temperature:**

	Time (min)	Temperature (°C)
Column	0 - 10	65
	10 - 41	65 → 220
	41 - 50	220
Injection port		220
Detector		250

**Detection** Flame ionisation.**Injection** 1 µL.**Elution order** Order indicated in the composition of reference solution (a); record the retention times of these substances.**System suitability** Reference solution (a):

- **resolution:** minimum 1.5 between the peaks due to *car-3-ene* and *β-myrcene*.

**Identification of components** Using the retention times determined from the chromatogram obtained with reference solution (a), locate the components of reference solution (a) in the chromatogram obtained with the test solution; the peak due to *β-phellandrene* is eluted after the peak due to *limonene* with a relative retention of about 1.03 with reference to *limonene*.

Determine the percentage content of each of these components. The limits are within the following ranges:

- *α-pinene*: 10.0 per cent to 30.0 per cent;
- *camphene*: maximum 2.0 per cent;
- *β-pinene*: 3.0 per cent to 14.0 per cent;
- *car-3-ene*: 10.0 per cent to 40.0 per cent;
- *β-myrcene*: 3.0 per cent to 12.0 per cent;
- *limonene*: 5.0 per cent to 14.0 per cent;
- *β-phellandrene*: 9.0 per cent to 19.0 per cent;
- *p-cymene*: maximum 2.5 per cent;

- *terpinolene*: maximum 8.0 per cent;
- *bornyl acetate*: 0.5 per cent to 5.0 per cent;
- *β-caryophyllene*: 0.5 per cent to 5.0 per cent;
- **reporting threshold:** 0.05 per cent (principal peak in the chromatogram obtained with reference solution (b)).

**STORAGE**

In an inert container and at a temperature not exceeding 25 °C.

Ph Eur

**DEFINITION**Essential oil obtained by steam distillation of the fresh leaves and branches of *Pinus sylvestris* L. A suitable antioxidant may be added.**CHARACTERS****Appearance**

Clear, colourless or pale yellow liquid.

Characteristic odour.

**IDENTIFICATION****First identification:** B.**Second identification:** A.

A. Thin-layer chromatography (2.2.27).

**Test solution** Dilute 1 mL of the substance to be examined to 10 mL with *toluene R*.**Reference solution** Dissolve 10 mg of *borneol R* and 10 µL of *bornyl acetate R* in *toluene R* and dilute to 10 mL with the same solvent.**Plate** *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].**Mobile phase** *ethyl acetate R*, *toluene R* (5:95 V/V).**Application** 10 µL [or 2 µL] as bands.**Development** Over a path of 15 cm [or 6 cm].**Drying** In air.**Detection** Treat with *anisaldehyde solution R*, heat at 100-105 °C for 5-10 min and examine in daylight.**Results** See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore other faint zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
	A pink zone (hydrocarbons)
Bornyl acetate: a brown or grey-brown zone	A brown or grey-brown zone (bornyl acetate)
	A pink zone
Borneol: a brown or grey-brown zone	A cluster of violet zones
Reference solution	Test solution

B. Examine the chromatograms obtained in the test for chromatographic profile.

**Results** The characteristic peaks in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with reference solution (a).

#### TESTS

**Relative density (2.2.5)**  
0.855 to 0.875.

**Refractive index (2.2.6)**  
1.465 to 1.480.

**Optical rotation (2.2.7)**  
-9° to -30°.

**Acid value (2.5.1)**  
Maximum 1.0.

**Peroxide value (2.5.5)**  
Maximum 20.

**Fatty oils and resinified oils (2.8.7)**  
It complies with the test.

#### Chromatographic profile

Gas chromatography (2.2.28): use the normalisation procedure.

**Test solution** The substance to be examined.

**Reference solution (a)** Dissolve 30 µL of  $\alpha$ -pinene R, 10 mg of camphene R, 20 µL of  $\beta$ -pinene R, 10 µL of car-3-ene R, 10 µL of  $\beta$ -myrcene R, 20 µL of limonene R, 10 µL of p-cymene R, 10 µL of terpinolene R, 10 µL of bornyl acetate R and 10 µL of  $\beta$ -caryophyllene R in 1 mL of heptane R.

**Reference solution (b)** Dissolve 10 mg of camphene R in heptane R and dilute to 2 mL with the same solvent. Dilute 0.1 mL of the solution to 1 mL with heptane R.

#### Column:

- material: fused silica,
- size:  $l = 60$  m,  $\varnothing = 0.22$  mm,
- stationary phase: macrogol 20 000 R (0.2 µm).

**Carrier gas** helium for chromatography R.

**Flow rate** 1.5 mL/min.

**Split ratio** 1:100.

**Temperature:**

	Time (min)	Temperature (°C)
Column	0 - 10	65
	10 - 41	65 → 220
	41 - 50	220
Injection port		220
Detector		250

**Detection** Flame ionisation.

**Injection** 0.2 µL.

**Elution order** Order indicated in the preparation of reference solution (a). Record the retention times of these substances.

**System suitability** Reference solution (a):

- resolution: minimum 1.5 between the peaks due to car-3-ene and  $\beta$ -myrcene.

**Identification of components** Using the retention times determined from the chromatogram obtained with reference solution (a), locate the components of reference solution (a) in the chromatogram obtained with the test solution. The peak due to  $\beta$ -phellandrene is eluted after the peak due

to limonene with a relative retention of about 1.03 with reference to limonene.

Determine the percentage content of these components.

The limits are within the following ranges:

- $\alpha$ -pinene: 32.0 per cent to 60.0 per cent,
- camphene: 0.5 per cent to 2.0 per cent,
- $\beta$ -pinene: 5.0 per cent to 22.0 per cent,
- car-3-ene: 6.0 per cent to 18.0 per cent,
- $\beta$ -myrcene: 1.5 per cent to 10.0 per cent,
- limonene: 7.0 per cent to 12.0 per cent,
- $\beta$ -phellandrene: maximum 2.5 per cent,
- p-cymene: maximum 2.0 per cent,
- terpinolene: maximum 4.0 per cent,
- bornyl acetate: 1.0 per cent to 4.0 per cent,
- $\beta$ -caryophyllene: 1.0 per cent to 6.0 per cent,
- disregard limit: the area of the principal peak in the chromatogram obtained with reference solution (b).

#### STORAGE

At a temperature not exceeding 25 °C.

Ph Eur

## Plantain

(Ribwort Plantain, Ph. Eur. monograph 1884)

Ph Eur

#### DEFINITION

Whole or fragmented, dried leaf and scape of *Plantago lanceolata* L. s.l.

#### Content

Minimum 1.5 per cent of total *ortho*-dihydroxycinnamic acid derivatives expressed as acetoate ( $C_{29}H_{36}O_{15}$ ;  $M_r$  624.6) (dried drug).

#### IDENTIFICATION

A. The leaf is up to 30 cm long and 4 cm wide, yellowish-green to brownish-green, with a prominent, whitish-green, almost parallel venation on the abaxial surface. It consists of a lanceolate lamina narrowing at the base into a channelled petiole. The margin is indistinctly dentate and often undulate. It has 3, 5 or 7 primary veins, nearly equal in length and running almost parallel. Hairs may be almost absent, sparsely scattered or sometimes abundant, especially on the lower surface and over the veins. The scape is brownish-green, longer than the leaves, 3-4 mm in diameter and is deeply grooved longitudinally, with 5-7 conspicuous ribs. The surface is usually covered with fine hairs.

B. Microscopic examination (2.8.23). The powder is yellowish-green. Examine under a microscope using *chloral hydrate solution* R. The powder shows the following diagnostic characters (Figure 1884.-1b): fragments of epidermis, composed of cells with irregularly sinuous anticlinal walls, the fragments of the upper epidermis of the lamina (surface view [H], transverse section [D]) are accompanied by palisade parenchyma [Da, Ha], and those of the lower epidermis (surface view [G]) show stomata (2.8.3) mostly of the diacytic type [Ga] and sometimes of the anomocytic type [Gb]; the multicellular, uniseriate, conical covering trichomes are highly characteristic, whole [C] or mostly fragmented [A], with a basal cell larger than the other epidermal cells followed by a short cell supporting 2 or more elongated cells with the lumen narrow and variable, occluded at intervals corresponding to slight swellings in the trichome and giving a jointed appearance, the terminal cell has an

acute apex and a filiform lumen; the glandular trichomes have a unicellular, cylindrical stalk and a multicellular, elongated, conical head consisting of several rows of small cells and a single terminal cell [B, Gc]; dense groups of lignified fibro-vascular tissue with narrow, spirally and annularly thickened vessels and slender, moderately thickened fibres [F]; fragments of the scape [E] with cells with thickened walls and a coarsely ridged cuticle, stomata [Ec], multicellular, uniseriate covering trichomes [Eb] and glandular trichomes [Ea] of the type previously described.

Figure 1884.-1. – Illustration for identification test B of powdered herbal drug of ribwort plantain

C. Examine the chromatograms obtained in the test for *Digitalis lanata* leaves.

**Results A** See below the sequence of zones present in the chromatogram obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Acteoside: a yellow zone	A yellow zone (acteoside)
Aucubin: a blue zone	A blue zone (aucubin)
Reference solution	Test solution

## TESTS

### *Digitalis lanata* leaves

Thin-layer chromatography (2.2.27).

**Solvent mixture** water R, methanol R (30:70 V/V).

**Test solution** Use a freshly prepared solution. To 1 g of the powdered herbal drug (355) (2.9.12) in a 25 mL flask, add 10 mL of the solvent mixture and shake for 30 min. Filter, rinse the flask and the filter with 2 quantities, each of 5 mL, of the solvent mixture. Dilute to 25 mL with the solvent mixture.

**Reference solution** Dissolve 1 mg of acteoside R and 1 mg of aucubin R in 1 mL of the solvent mixture.

**Plate** TLC silica gel F<sub>254</sub> plate R.

**Mobile phase** anhydrous formic acid R, glacial acetic acid R, water R, ethyl acetate R (11:11:27:100 V/V/V/V).

**Application** 10 μL as bands.

**Development** Over a path of 8 cm; heat immediately after development at about 120 °C for 5-10 min.

**Detection A** Examine in daylight.

**Detection B** Examine in ultraviolet light at 365 nm.

**Results B** The chromatogram obtained with the test solution shows no bright blue fluorescent zone just below the reddish-brown fluorescent zone corresponding to aucubin in the chromatogram obtained with the reference solution.

### Foreign matter (2.8.2)

Maximum 5 per cent of leaves of different colour and maximum 2 per cent of other foreign matter.

### Loss on drying (2.2.32)

Maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

### Total ash (2.4.16)

Maximum 14.0 per cent.

## ASSAY

**Stock solution** In a flask, place 1.000 g of the powdered herbal drug (355) (2.9.12) and add 90 mL of ethanol (50 per cent V/V) R. Boil in a water-bath under a reflux condenser for 30 min. Allow to cool and filter into a 100 mL volumetric flask. Rinse the flask and the filter with 10 mL of ethanol (50 per cent V/V) R. Combine the filtrate and the rinsings and dilute to 100.0 mL with ethanol (50 per cent V/V) R.

**Test solution** To a 10 mL volumetric flask add, mixing after each addition, 1.0 mL of the stock solution, 2 mL of 0.5 M hydrochloric acid, 2 mL of a solution prepared by dissolving 10 g of sodium nitrite R and 10 g of sodium molybdate R in 100 mL of water R, and 2 mL of dilute sodium hydroxide solution R. Dilute to 10.0 mL with water R.

Immediately measure the absorbance (2.2.25) of the test solution at 525 nm using as compensation liquid a solution prepared as follows: to a 10 mL volumetric flask add 1.0 mL of the stock solution, 2 mL of 0.5 M hydrochloric acid and 2 mL of dilute sodium hydroxide solution R, and dilute to 10.0 mL with water R.

Calculate the percentage content of total ortho-dihydroxycinnamic acid derivatives, expressed as acteoside, using the following expression:

$$\frac{A \times 1000}{185 \times m}$$

i.e. taking the specific absorbance to be 185 for acteoside at 525 nm.

*A* = absorbance of the test solution at 525 nm;  
*m* = mass of the substance to be examined, in grams.

## Platycodon Root

(Ph. Eur. monograph 2660)

Ph Eur

### DEFINITION

Dried whole or fragmented root of *Platycodon grandiflorus* (Jacq.) A.DC., peeled or unpeeled, with rootlets removed, collected in spring or autumn.

### Content

Minimum 0.3 per cent of total saponins, expressed as platycodin D ( $C_{57}H_{92}O_{28}$ ;  $M_r$  1225) (dried drug).

### IDENTIFICATION

**A. Whole drug.** The whole root is cylindrical or slightly fusiform, gradually tapering downwards, sometimes branched, slightly twisted, about 5-20 cm long and 0.3-2 cm in diameter. It shows deep, longitudinally twisted furrows and rootlet scars or transverse lenticel-like scars; the margins of the rootlet scars may appear shiny and slightly translucent; the upper part of the root also shows transverse striations. The outer surface of the peeled root is white or brownish-yellow, whilst the outer surface of the unpeeled root is brownish-yellow or brownish-grey. Sometimes the upper part shows a relatively short or inconspicuous rhizome, marked by several crescent-shaped or irregularly round stem scars. The texture is fragile and the fracture uneven.

**Fragmented drug** The fragmented root occurs as thin discs, about 1.5-4 mm thick, sometimes oblique or irregular; most come from peeled roots, but sometimes showing patches of bark still adhering. The outer surface may sometimes also be cracked. A transverse section shows a distinctly crenate outline, a yellow or pale brown cortex, a distinct, more or less dark brown cambium ring and a well-developed yellow or pale brown xylem showing radial striations and occasional clefts.

**B. Microscopic examination (2.8.23).** The powder is yellowish-white or light brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2660.-1): reticulate or pitted xylem vessels (longitudinal section [B]) up to 56  $\mu$ m in diameter, free or in groups of 2, 3 or more, accompanied by thin-walled parenchyma cells [Ba]; the sieve plates of the vessels have a thickened outline giving the appearance of a hole; numerous fragments of parenchyma consisting of ovoid cells [A] with slightly thickened and lignified walls; fragments of phloem containing articulated laticiferous tubes, with thick non-lignified walls and granular yellowish-grey or brown contents (longitudinal section [F], transverse section [D]); fragments of orange cork, consisting of several layers of superimposed cells (surface view [C], transverse section [E]), frequent in unpeeled roots and relatively rare in peeled roots; small calcium oxalate prism crystals may be present in the parenchymatous cells. Examine under a microscope using *glycerol R*. The powder shows numerous pieces of inulin, angular, irregular [H] or crystallised in a fan shape, free or included in parenchyma cells [G].

**C. Thin-layer chromatography (2.2.27).**

Ph Eur

Figure 2660.-1. – Illustration for identification test B of powdered herbal drug of platycodon root

**Test solution** To 0.500 g of the powdered herbal drug (355) (2.9.12) add 5.0 mL of *ethanol (70 per cent V/V) R*. Sonicate for 10 min and centrifuge or filter. Evaporate the supernatant or filtrate to dryness under reduced pressure. Dissolve the residue in 1.0 mL of *water R*. Prepare a ready-to-use sample preparation cartridge containing 50 mg of octadecylsilyl silica gel (55  $\mu$ m), using 3 mL of *methanol R* followed by 3 mL of *water R*. Apply 1.0 mL of the solution to be analysed to the top of the cartridge. Elute the cartridge with 3 mL of *water R* and collect the eluate. Evaporate the eluate to dryness under reduced pressure. Dissolve the residue in 1.0 mL of *methanol R*.

**Reference solution** Dissolve 1.0 mg of *glucose R* and 1.0 mg of *xylose R* in 2.0 mL of *methanol R*.

**Plate** TLC silica gel F<sub>254</sub> plate R (2-10  $\mu$ m).

**Mobile phase** *water R*, *methanol R*, *glacial acetic acid R*, *methylene chloride R* (2:3:8:15 V/V/V/V).

**Application** 10  $\mu$ L as bands of 8 mm.

**Development** Over a path of 6 cm.

**Drying** In air.

**Detection** Treat with *anisaldehyde solution R* and heat at 100 °C for 3 min; examine in daylight.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Xylose: a yellowish-brown zone	A yellowish-brown zone A yellowish-brown zone
Glucose: a yellowish-brown zone	2 yellowish-brown zones
Reference solution	Test solution

**TESTS****Codonopsis pilosula (Franch.) Nannf**

Examine the herbal drug as described in identification test B. The presence of sclereids, isolated or in groups, and starch granules indicates adulteration by *Codonopsis pilosula* (Franch.) Nannf.

**Loss on drying (2.2.32)**

Maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

**Total ash (2.4.16)**

Maximum 6.0 per cent.

**Ash insoluble in hydrochloric acid (2.8.1)**

Maximum 1.0 per cent.

**ASSAY**

Liquid chromatography (2.2.29).

**Solvent mixture** water R, anhydrous ethanol R (30:70 V/V).

**Test solution** To 2.00 g of the powdered herbal drug (355) (2.9.12) add 50.0 mL of the solvent mixture and sonicate for 45 min. Allow to cool and filter. Rinse the filter with 10 mL of solvent mixture. Combine the filtrate and washings, and evaporate to dryness under reduced pressure. Take up the residue with the solvent mixture, transfer to a volumetric flask and dilute to 10.0 mL with the solvent mixture. Shake well and filter through a membrane filter (nominal pore size 0.45 µm).

**Reference solution (a)** Dissolve 8.0 mg of platycodin D CRS in the solvent mixture and dilute to 10.0 mL with the solvent mixture.

**Reference solutions (b), (c), (d), (e), (f), (g)** Dilute reference solution (a) to obtain 6 reference solutions of platycodin D, the concentrations of which span the expected value in the test solution.

**Reference solution (h)** Dissolve 5.0 mg of platycodon root dry extract for system suitability HRS in 1.0 mL of methanol R.

**Column:**

- size:  $l = 0.15$  m,  $\varnothing = 4.6$  mm;
- stationary phase: end-capped solid core octadecylsilyl silica gel for chromatography R (2.7 µm);
- temperature: 30 °C.

**Mobile phase:**

- mobile phase A: water for chromatography R;
- mobile phase B: acetonitrile R1;

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 10	85 → 75	15 → 25
10 - 30	75	25

Flow rate 1.0 mL/min.

**Detection** Evaporative light-scattering detector; the following settings have been found to be suitable; if the detector has different setting parameters, adjust the detector settings so as to comply with the system suitability criteria:

- carrier gas: nitrogen R;
- pressure: 350 kPa;
- evaporator temperature: 45 °C.

**Injection** 10 µL.

**Identification of peaks** Use the chromatogram supplied with platycodon root dry extract for system suitability HRS and the chromatogram obtained with reference solution (h) to identify the peaks due to saponins 1, 2 (platycodin D), 3, 4 and 5; use the chromatogram obtained with reference solution (a) to identify the peak due to platycodin D.

**Relative retention** With reference to platycodin D (retention time = about 21 min): saponin 1 = about 0.98; saponin 3 = about 1.03; saponin 4 = about 1.06; saponin 5 = about 1.08. Additional peaks may be present.

**System suitability:**

- resolution: minimum 1.5 between the peaks due to saponin 1 and platycodin D in the chromatogram obtained with reference solution (h);
- signal-to-noise ratio: minimum 50 for the principal peak in the chromatogram obtained with reference solution (a).

Establish a calibration curve with the common logarithm of the concentration (in milligrams per millilitre) of reference solutions (a), (b), (c), (d), (e), (f) and (g) (corrected by the assigned percentage content of platycodin D CRS) as the abscissa and the common logarithm of the corresponding peak area as the ordinate.

Calculate the percentage content of saponins 1, 2, 3, 4 and 5 using the following expression:

$$\frac{10^A}{m}$$

- $A$  = common logarithm of the concentration of the peak due to each saponin in the chromatogram obtained with the test solution, determined from the calibration curve;
- $m$  = mass of the herbal drug to be examined used to prepare the test solution, in grams.

Calculate the percentage content of total saponins, expressed as platycodin D, by taking the sum of the percentage contents of saponins 1, 2, 3, 4 and 5.

Ph Eur

**Podophyllum Resin**

Podophyllin

**Action and use**

Used in treatment of warts.

**Preparation**

Compound Podophyllin Paint

**DEFINITION**

Podophyllum Resin is the resin obtained from rhizomes and roots of *Podophyllum hexandrum* Royle (*P. emodi* Wall.). It contains not less than 50.0% of total aryltetralin lignans, calculated as podophyllotoxin.

**CHARACTERISTICS**

An amorphous powder varying in colour from light brown to greenish yellow, or brownish grey masses; odour, characteristic; caustic.

Partly soluble in hot *water*, from which it is precipitated on cooling, in *chloroform*, in *ether* and in 5M *ammonia*.

#### IDENTIFICATION

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions in *methanol*.

- (1) 1% w/v of the substance being examined.
- (2) 0.5% w/v of *podophyllotoxin*.
- (3) 0.1% w/v of *phenazone*.

#### CHROMATOGRAPHIC CONDITIONS

- (a) Use as the coating *silica gel GF<sub>254</sub>*.
- (b) Use the mobile phase as described below.
- (c) Apply as bands 10 µL of each solution.
- (d) Develop the plate to 10 cm.
- (e) After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*. Spray the plate with *methanolic sulfuric acid (50%)* and heat at 130° for 10 minutes.

#### MOBILE PHASE

1 volume of *methanol* and 25 volumes of *chloroform*.

#### CONFIRMATION

When viewed under *ultraviolet light (254 nm)*, the chromatogram obtained with solution (1) exhibits quenching zones corresponding in position to the principal quenching zones in the chromatograms obtained with solutions (2) and (3). Other quenching zones may be present.

When viewed after spraying, the chromatogram obtained with solution (1) exhibits a purplish zone (*podophyllotoxin*) corresponding in position and colour to the principal zone in solution (2) and a purplish zone (4'-demethylpodophyllotoxin) corresponding in position to the quenching zone found in solution (3). Other coloured zones may be present.

#### TESTS

##### Matter insoluble in ethanol (96%)

Shake 1 g, finely powdered, with 20 mL of *ethanol (96%)* for 5 minutes, filter through a sintered-glass crucible (ISO 4793, porosity grade 2, is suitable), wash the filter with *ethanol (96%)* and dry at 105°. The residue weighs not more than 25 mg.

##### Matter insoluble in 5M ammonia

Shake 0.5 g, finely powdered, with 30 mL of 5M *ammonia* for 30 minutes at about 20°; filter through a sintered-glass crucible (ISO 4793, porosity grade 2, is suitable) and wash the flask and filter with 30 mL of *water*, the time taken for filtering and washing being not more than 10 minutes. Dry the filter and residue to constant weight at 105°. The residue weighs not less than 0.18 g and not more than 0.30 g.

##### Loss on drying

When dried to constant weight at 105°, loses not more than 5.0% of its weight. Use 1 g.

##### Sulfated ash

Not more than 1.0%, Appendix IX A.

#### ASSAY

Dissolve 0.5 g in sufficient *ethanol (96%)* to produce 100 mL. To 10 mL of this solution in a separating funnel add 190 mL of *water* and extract with six 30-mL quantities of *dichloromethane*. Combine the dichloromethane layers, extract with 10 mL of 0.2M *sodium hydroxide* followed by five 10-mL quantities of *water* and wash each of the six aqueous layers separately with the same 20-mL quantity of

*dichloromethane*. Combine the dichloromethane solutions, filter through absorbent cotton and evaporate the filtrate to dryness. Dissolve the residue in sufficient *ethanol (96%)* to produce 100 mL, dilute 10 mL of this solution to 50 mL with *ethanol (96%)* and measure the absorbance of the resulting solution at the maximum at 292 nm, Appendix II B. Calculate the content of total aryltetralin lignans expressed as *podophyllotoxin*, taking 105.4 as the value of A(1%, 1 cm) at the maximum at 292 nm.

#### STORAGE

*Podophyllum Resin* should be protected from light. On exposure to light, or to temperatures above 25°, it becomes darker in colour.

#### LABELLING

The label states the botanical source.

## Compound Podophyllin Paint

Compound Podophyllin Cutaneous Solution

#### DEFINITION

Compound Podophyllin Paint is a *cutaneous solution*.

<i>Podophyllum Resin</i>	150 g
Compound Benzoin Tincture	Sufficient to produce 1000 mL

In making the Compound Benzoin Tincture used to prepare Compound Podophyllin Paint, the Ethanol (90 per cent) may be replaced by Industrial Methylated Spirit<sup>1</sup> diluted so as to be of equivalent ethanolic strength.

*The paint complies with the requirements stated under Liquids for Cutaneous Application and with the following requirements.*

#### IDENTIFICATION

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions in *methanol*.

- (1) 7% v/v of the paint.
- (2) 0.5% w/v of *podophyllotoxin*.
- (3) 0.1% w/v of *phenazone*.

#### CHROMATOGRAPHIC CONDITIONS

- (a) Use as the coating *silica gel GF<sub>254</sub>*.
- (b) Use the mobile phase as described below.
- (c) Apply 10 µL of each solution.
- (d) Develop the plate to 10 cm.
- (e) After removal of the plate, dry in air and examine under *ultraviolet light (254 nm)* to locate the quenching zone due to *phenazone* in solution (3). Spray the plate with *methanolic sulfuric acid (50%)* and heat at 130° for 10 minutes.

#### MOBILE PHASE

1 volume of *methanol* and 25 volumes of *chloroform*.

#### CONFIRMATION

The chromatogram obtained with solution (1) exhibits a purplish zone (*podophyllotoxin*) corresponding in position and colour to the principal zone in solution (2) and a purplish zone (4'-demethylpodophyllotoxin) corresponding in position to the quenching zone found in solution (3). Other coloured zones are present in the chromatogram obtained with solution (1).

<sup>1</sup> The law and the statutory regulations governing the use of Industrial Methylated Spirit must be observed.

**TESTS****Weight per mL**

0.925 to 0.975 g, Appendix V G.

**Total solids**

27.0 to 33.0% w/v when determined by evaporating 1 mL to dryness on a water bath and drying the residue at 105° for 4 hours.

**Polygonum Cuspidatum Rhizome and Root**

(Ph. Eur. monograph 2724)

Ph Eur

**DEFINITION**

Dried, fragmented rhizome and root, with rootlets removed, of *Reynoutria japonica* Houtt. (syn. *Polygonum cuspidatum* Sieb. et Zucc.) collected in spring or autumn.

**Content**

- *emodin* (C<sub>15</sub>H<sub>10</sub>O<sub>5</sub>; M<sub>r</sub> 270.2): minimum 1.0 per cent (dried drug),
- *polydatin* (C<sub>20</sub>H<sub>22</sub>O<sub>8</sub>; M<sub>r</sub> 390.4): minimum 1.5 per cent (dried drug).

**IDENTIFICATION**

A. Irregular thick slices or sections, about 2-9 cm long and 5-27 mm in diameter or sometimes cylindrical pieces.

The outer surface is yellowish-brown, with longitudinal striations and rootlet scars. In transverse section, the brown or reddish-brown bark is relatively thin, separating easily from the wood. The wood is thick, yellowish-brown, with numerous radial striations. The pith of the rhizome is large, hollowed and transversally septate.

B. Microscopic examination (2.8.23). The powder is yellowish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2724.-1): very numerous cluster crystals of calcium oxalate, up to 100 µm in diameter, usually free [H], or sometimes inside parenchyma cells [Ca]; brownish-yellow fragments of cork (surface view [A]), with wavy striations in the cells; sclereids, elongated and ramified at one end, with clearly channelled walls, isolated or in small groups [G]; bundles of phloem fibres [E], thick-walled and channelled; fragments of the medullary rays [B], with rectangular or sub-rectangular cells with slightly thickened, beaded and pitted walls; fragments of large vessels, usually with bordered pits [D, F]; fragments of parenchyma with large ovoid cells having slightly thickened and pitted walls [C]. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows numerous starch granules, rounded or elliptical, on average 10 µm in diameter and with a punctiform or slightly eccentric slit-shaped hilum, simple or 2-10 compound [J].

C. Thin-layer chromatography (2.2.27).

**Test solution** To 0.5 g of the powdered herbal drug (355) (2.9.12) add 5 mL of *methanol R* and sonicate for 10 min. Centrifuge or filter, and use the supernatant or the filtrate as the test solution.

**Reference solution** Dissolve 1 mg of *polydatin R* and 1 mg of *resveratrol R* in 1 mL of *methanol R*.

**Plate** TLC silica gel plate R (2-10 µm).

**Mobile phase** *methanol R*, *methylene chloride R* (20:80 *V/V*).

**Application** 8 µL as bands of 8 mm.

Figure 2724.-1. – Illustration for identification test B of powdered herbal drug of *Polygonum cuspidatum* rhizome and root

**Development** Over a path of 6 cm.

**Drying** In air.

**Detection** Examine in ultraviolet light at 365 nm.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
	2 yellow fluorescent zones

## TESTS

## Loss on drying (2.2.32)

Maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 4 h.

## Total ash (2.4.16)

Maximum 5.0 per cent.

## Ash insoluble in hydrochloric acid (2.8.1)

Maximum 1.0 per cent.

## ASSAY

## Emodin

Liquid chromatography (2.2.29).

**Test solution** To 0.150 g of the powdered herbal drug (355) (2.9.12) in a round-bottomed flask add 150.0 mL of a 14 per cent *V/V* solution of sulfuric acid *R* and 150.0 mL of methylene chloride *R*. Heat under a reflux condenser in a water-bath at 60 °C for 2 h. Allow to cool and transfer the contents to a separating funnel. Separate the organic layer and shake the acid layer with 3 quantities, each of 15 mL, of methylene chloride *R*. Combine the organic extracts and evaporate to dryness. Dissolve the residue in methanol *R* and dilute to 100.0 mL with the same solvent. Filter the solution through a membrane filter (nominal pore size 0.45 µm).

**Reference solution (a)** Dissolve 5.0 mg of emodin *CRS* in methanol *R* and dilute to 50.0 mL with the same solvent. Dilute 5.0 mL of the solution to 20.0 mL with methanol *R*.

**Reference solution (b)** Dissolve 2.5 mg of rhein *R* in methanol *R* and dilute to 25.0 mL with the same solvent. Dilute 1.0 mL of the solution to 10.0 mL with reference solution (a).

## Column:

— size:  $l = 0.25$  m,  $\varnothing = 4.0$  mm;

— stationary phase: octadecylsilyl silica gel for chromatography *R* (5 µm);

— temperature: 30 °C.

## Mobile phase:

— mobile phase A: phosphoric acid *R*, water for chromatography *R* (0.1:99.9 *V/V*);

— mobile phase B: methanol *R*;

Time (min)	Mobile phase A (per cent <i>V/V</i> )	Mobile phase B (per cent <i>V/V</i> )
0 - 11	15	85
11 - 11.1	15 → 5	85 → 95
11.1 - 22	5	95

**Flow rate** 1.0 mL/min.

**Detection** Spectrophotometer at 254 nm.

**Injection** 20 µL.

**Retention time** Rhein = about 4 min; emodin = about 6 min.

**System suitability** Reference solution (b):

— resolution: minimum 5 between the peaks due to rhein and emodin.

Calculate the percentage content of emodin using the following expression:

$$\frac{A_1 \times m_2 \times p}{A_2 \times m_1 \times 2}$$

$A_1$  = area of the peak due to emodin in the chromatogram obtained with the test solution;

$A_2$  = area of the peak due to emodin in the chromatogram obtained with reference solution (a);

$m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;

$m_2$  = mass of emodin *CRS* used to prepare reference solution (a), in grams;

$p$  = percentage content of emodin in emodin *CRS*.

## Polydatin

Liquid chromatography (2.2.29). Carry out the assay protected from bright light.

**Test solution** To 0.200 g of the powdered herbal drug (355) (2.9.12) in a round-bottomed flask add 50.0 mL of ethanol (50 per cent *V/V*) *R* and weigh. Heat under a reflux condenser in a water-bath at 95 °C for 30 min. Allow to cool, weigh and adjust to the original mass with ethanol (50 per cent *V/V*) *R* and shake well. Filter and dilute 3.0 mL of the filtrate to 25.0 mL with a 60 per cent *V/V* solution of methanol *R*.

**Reference solution (a)** Dissolve 5.0 mg of polydatin *CRS* in methanol *R* and dilute to 50.0 mL with the same solvent. Dilute 10.0 mL of the solution to 50.0 mL with a 60 per cent *V/V* solution of methanol *R*.

**Reference solution (b)** Dissolve 5.0 mg of resveratrol *R* in a 60 per cent *V/V* solution of methanol *R* and dilute to 50.0 mL with the same solution. Dilute 3.0 mL of the solution to 25.0 mL with reference solution (a).

## Column:

— size:  $l = 0.25$  m,  $\varnothing = 4.0$  mm;

— stationary phase: octadecylsilyl silica gel for chromatography *R* (5 µm);

— temperature: 35 °C.

## Mobile phase:

— mobile phase A: water for chromatography *R*;

— mobile phase B: acetonitrile for chromatography *R*;

Time (min)	Mobile phase A (per cent <i>V/V</i> )	Mobile phase B (per cent <i>V/V</i> )
0 - 12	82	18
12 - 18	82 → 5	18 → 95
18 - 25	5	95

**Flow rate** 1.0 mL/min.

**Detection** Spectrophotometer at 306 nm.

**Injection** 20 µL.

**Retention time** Polydatin = about 10 min; resveratrol = about 17 min.

**System suitability** Reference solution (b):

— resolution: minimum 5 between the peaks due to polydatin and resveratrol.

Calculate the percentage content of polydatin using the following expression:

$$\frac{A_1 \times m_2 \times p \times 1.67}{A_2 \times m_1}$$

$A_1$  = area of the peak due to polydatin in the chromatogram obtained with the test solution;

$A_2$  = area of the peak due to polydatin in the chromatogram obtained with reference solution (a);

$m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;

$m_2$  = mass of polydatin *CRS* used to prepare reference solution (a), in grams;

$p$  = percentage content of polydatin in polydatin *CRS*.

Ph Eur

## Polygonum Orientale Fruit

(Ph. Eur. monograph 2726)

Ph Eur

### DEFINITION

Dried ripe fruit of *Persicaria orientalis* (L.) Spach (syn. *Polygonum orientale* L.).

### Content

Minimum 0.15 per cent of taxifolin ( $C_{15}H_{12}O_7$ ;  $M_r$  304.3) (dried drug).

### IDENTIFICATION

A. The fruit is roundish and oblate, the flattened sides slightly concave, about 2-3.5 mm in diameter and about 1-1.5 mm thick. The glossy surface is brownish-black or reddish-brown. There is a light brown and slightly protruding pedicel at the base with the remains of the membranous perianth. The texture is hard.

Figure 2726.-1. – Illustration for identification test B of powdered herbal drug of *Polygonum orientale* fruit

B. Microscopic examination (2.8.23). The powder is greyish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2726.-1): fragments of the pericarp consisting of groups of yellowish-brown or reddish-brown palisade cells, 100-190  $\mu\text{m}$  long and 15-30  $\mu\text{m}$  wide, with thickened walls [Da], arranged as a single layer (side view [D]), which exhibit, on the outer surface, a polygonal or near-circular shape, narrow lumina and pitted walls (surface view [B]), and on the inner surface, a sinuous, anticlinal shape and circular lumina (surface view [C]); fragments of the inner part of the pericarp composed of brown rectangular cells [Db]; fragments of the parenchyma of the mesocarp, with colourless thin-walled cells [E], sometimes accompanied by fine annular or spiral vessels [Ea]; fragments of the testa consisting of a layer of cells with a barely visible zigzag [H] or polygonal [J] pattern mostly attached to a layer with a sinuous wall structure [Ja, F]; fragments of the cotyledons with thin-walled, small parenchyma cells (transverse section [G]); fragments of the endosperm with thin-walled cells [A]; possibly fragments of the perianth with cluster crystals of

calcium oxalate up to 50  $\mu\text{m}$  in diameter, small vascular bundles and a partly papillous epidermis. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows numerous simple starch granules 2-9  $\mu\text{m}$  in diameter, sometimes with a cleft hilum [K].

C. Thin-layer chromatography (2.2.27).

**Test solution** To 0.5 g of the powdered herbal drug (355) (2.9.12) add 5 mL of *methanol R*. Sonicate at 60 °C for 10 min. Allow to cool and filter; use the filtrate.

**Reference solution** Dissolve 2.0 mg of *taxifolin R* and 3.0 mg of *kaempferol R* in 6 mL of *methanol R*.

**Plate** TLC silica gel plate R (2-10  $\mu\text{m}$ ).

**Mobile phase** *acetone R*, *glacial acetic acid R*, *anhydrous formic acid R*, *methylene chloride R* (4:5:5:50 *V/V/V/V*).

**Application** 7  $\mu\text{L}$  as bands of 8 mm.

**Development** Over a path of 6 cm.

**Drying** In air.

**Detection** Heat at 100 °C for 3 min; treat the still-warm plate with a 5 g/L solution of *diphenylboric acid aminoethyl ester R* in *ethyl acetate R*, and then with a 50 g/L solution of *macrogol 400 R* in *methylene chloride R*; allow to dry in air for 60 min. Examine in ultraviolet light at 365 nm.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
	A red fluorescent zone
	A pale blue zone
Kaempferol: a pale blue zone	A pale blue zone
	3 bluish-green zones
Taxifolin: an orangish-brown zone	An orangish-brown zone (taxifolin)
	A blue zone
	An orangish-brown zone
Reference solution	Test solution

### TESTS

**Loss on drying** (2.2.32)

Maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

**Total ash** (2.4.16)

Maximum 3.0 per cent.

### ASSAY

Liquid chromatography (2.2.29).

**Test solution** 0.500 g of the powdered herbal drug (355) (2.9.12) in a round-bottomed flask, add 25 mL of a 55 per cent *V/V* solution of *methanol R*. Heat under a reflux condenser in a water-bath at 90 °C for 1 h. Allow to cool and filter. Rinse the filter with 5.0 mL of *hydrochloric acid R1*.

Combine the filtrate and the rinsings in a volumetric flask and dilute to 50.0 mL with a 55 per cent *V/V* solution of *methanol R*. Filter through a membrane filter (nominal pore size 0.45 µm).

**Reference solution (a)** Dissolve 5.0 mg of *taxifolin CRS* in a 55 per cent *V/V* solution of *methanol R*. Add 2.5 mL of *hydrochloric acid R1* and dilute to 25.0 mL with a 55 per cent *V/V* solution of *methanol R*. To 10.0 mL of this solution add 4.0 mL of *hydrochloric acid R1* and dilute to 50.0 mL with a 55 per cent *V/V* solution of *methanol R*.

**Reference solution (b)** 0.500 g of *polygonum orientale fruit for system suitability HRS* in a round-bottomed flask, add 25.0 mL of a 55 per cent *V/V* solution of *methanol R*. Heat under a reflux condenser in a water-bath at 90 °C for 1 h. Allow to cool and filter. Rinse the filter with 5.0 mL of *hydrochloric acid R1*. Combine the filtrate and the rinsings in a volumetric flask and dilute to 50.0 mL with a 55 per cent *V/V* solution of *methanol R*. Filter through a membrane filter (nominal pore size 0.45 µm).

**Column:**

- size:  $l = 0.150$  m,  $\varnothing = 4.0$  mm;
- stationary phase: octadecylsilyl silica gel for chromatography R (5 µm).

**Mobile phase:**

- mobile phase A: phosphoric acid R, water for chromatography R (0.1:99.9 *V/V*);
- mobile phase B: acetonitrile for chromatography R;

Time (min)	Mobile phase A (per cent <i>V/V</i> )	Mobile phase B (per cent <i>V/V</i> )
0 - 20	85	15
20 - 21	85 → 0	15 → 100
21 - 30	0	100

**Flow rate** 1.0 mL/min.

**Detection** Spectrophotometer at 290 nm.

**Injection** 10 µL.

**Identification of peaks** Use the chromatogram supplied with *polygonum orientale fruit for system suitability HRS* and the chromatogram obtained with reference solution (b) to identify the peak due to epitaxifolin.

**Retention time** Taxifolin = about 14 min;  
epitaxifolin = about 16 min.

**System suitability** Reference solution (b):

- resolution: minimum 2.0 between the peaks due to taxifolin and epitaxifolin.

Calculate the percentage content of taxifolin using the following expression:

$$\frac{A_1 \times m_2 \times 0.4 \times p}{A_2 \times m_1}$$

- $A_1$  = area of the peak due to taxifolin in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to taxifolin in the chromatogram obtained with reference solution (a);
- $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;
- $m_2$  = mass of *taxifolin CRS* used to prepare reference solution (a), in grams;
- $p$  = percentage content of taxifolin in *taxifolin CRS*.

Ph Eur

## Red Poppy Petals

(Ph. Eur. monograph 1881)

Ph Eur

### DEFINITION

Dried, whole or fragmented petals of *Papaver rhoeas L.*

### IDENTIFICATION

**A.** The petal is dark red or dark violet-brown, very thin, floppy, wrinkled, often crumpled into a ball and velvety to the touch. It is broadly ovate with an entire margin, about 6 cm long and 4–6 cm wide, narrowing at the base where there is a black spot. The vascular bundles radiate from the base and they anastomose in a continuous arc, all at the same short distance from the margin.

**B.** Microscopic examination (2.8.23). Examine under a microscope using *chloral hydrate solution R*. The powder has an intense reddish-pink colour and shows the following diagnostic characters (Figure 1881.-1): fragments of epidermis composed of elongated, sinuous-walled cells [B, D, G] with small, rounded, anomocytic stomata (2.8.3) [Ba]; numerous vascular bundles with spiral vessels [E] embedded in the parenchyma; occasional fragments of the fibrous layer of the anthers [F]; rounded pollen grains, about 30 µm in diameter, with 3 pores and a finely verrucose exine [A, C, H].

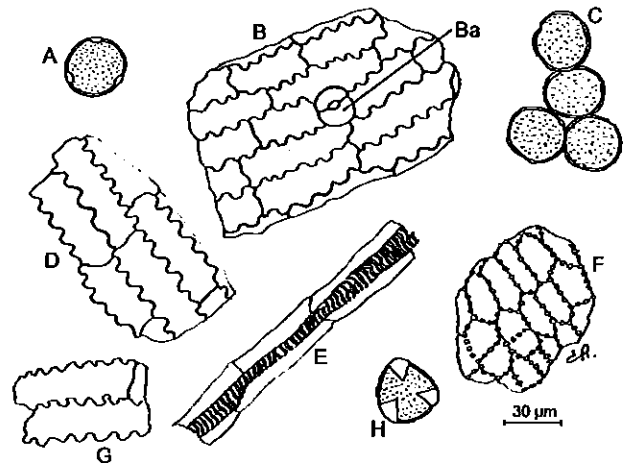

Figure 1881.-1. – Illustration for identification test B of powdered herbal drug of red poppy petals

**C.** Thin-layer chromatography (2.2.27).

**Test solution** To 1.0 g of the powdered herbal drug (355) (2.9.12) add 10 mL of *ethanol (60 per cent V/V) R*. Stir for 15 min. Filter through a filter paper.

**Reference solution** Dissolve 1 mg of *quinaldine red R* and 1 mg of *sulfan blue R* in 2 mL of *methanol R*.

**Plate** TLC silica gel plate R.

**Mobile phase** anhydrous formic acid R, water R, butanol R (10:12:40 *V/V/V*).

**Application** 10 µL as bands.

**Development** Over a path of 10 cm.

**Drying** In air.

**Detection** Examine in daylight.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Quinaldine red: an orange-red zone	2 yellow zones
Sulfan blue: a blue zone	A violet principal zone A violet zone A yellow zone
Reference solution	Test solution

**TESTS****Foreign matter (2.8.2)**

Maximum 2.0 per cent of capsules and maximum 1.0 per cent of other foreign matter.

**Loss on drying (2.2.32)**

Maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

**Total ash (2.4.16)**

Maximum 11.0 per cent.

**Colouring intensity**

Place 1.0 g of the powdered herbal drug (355) (2.9.12) in a 250 mL flask and add 100 mL of *ethanol (30 per cent V/V) R*. Allow to macerate for 4 h with frequent stirring. Filter and discard the first 10 mL. To 10.0 mL of the filtrate add 2 mL of *hydrochloric acid R* and dilute to 100.0 mL with *ethanol (30 per cent V/V) R*. Allow to stand for 10 min.

The absorbance (2.2.25) measured at 523 nm using *ethanol (30 per cent V/V) R* as the compensation liquid is not less than 0.6.

Ph Eur

**Poria**

(Ph. Eur. monograph 2475)

Ph Eur

**DEFINITION**

Dried sclerotium without skin of *Wolfiporia extensa* (Peck) Ginns (syn. *Poria cocos* (Schw.) Wolf; *Wolfiporia cocos* (F.A. Wolf) Ryvardeen & Gilb.).

**IDENTIFICATION**

A. Square, rectangular or polyhedral pieces, or slices, varying in length and thickness; whitish with a pale brown hue, flat and smooth, square, rectangular or polyhedral pieces, with no brown skin, difficult to break; slices easily broken, rough fracture with granular or farinaceous texture.

B. Microscopic examination (2.8.23). The powder is whitish with a pale brown hue. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: irregularly shaped and occasionally branched colourless particles, which dissolve gradually in *chloral hydrate solution R*. Examine under a microscope using a 50 g/L solution of *potassium hydroxide R*. The powder shows the following diagnostic characters: fragments of hyphae, colourless, slender, slightly curved, sometimes with septa, branched, 3-16 µm in diameter.

C. Thin-layer chromatography (2.2.27).

**Test solution** To 1 g of the powdered herbal drug (250) (2.9.12) add a mixture of 2 mL of *ethyl acetate R* and 3 mL of *methanol R*. Sonicate for 10 min, centrifuge and use the supernatant.

**Reference solution** Dissolve 10 mg of *4-aminobenzoic acid R*, 10 mg of *coumarin R* and 10 mg of *thymol R* in 10 mL of *methanol R*.

**Plate** TLC silica gel  $F_{254}$  plate R (2-10 µm).

**Mobile phase** *glacial acetic acid R*, *2-propanol R*, *cyclohexane R* (10:10:80 V/V/V).

**Application** 5 µL as bands of 8 mm.

**Development** Over a path of 6 cm.

**Drying** In air.

**Detection** Examine in ultraviolet light at 254 nm.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint quenching zones may be present in the chromatogram obtained with the test solution between the zones due to 4-aminobenzoic acid and coumarin in the chromatogram obtained with the reference solution.

Top of the plate	
Thymol: a quenching zone	2 quenching zones
Coumarin: a quenching zone	
4-Aminobenzoic acid: a quenching zone	
Reference solution	Test solution

D. The herbal drug sticks to the pestle when moistened with *water R* and pressed into a mortar.

E. To a small piece of the herbal drug add 1 drop of *iodinated potassium iodide solution R1*. A deep red colour is produced.

**TESTS****Foreign matter (2.8.2)**

Maximum 0.1 per cent of brown skins and roots of conifer and maximum 2 per cent of other foreign matter.

**Loss on drying (2.2.32)**

Maximum 13.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

**Total ash (2.4.16)**

Maximum 1.0 per cent.

**Water-soluble extractive**

Minimum 1.5 per cent.

To 5.00 g of the powdered herbal drug (355) (2.9.12) add 100 mL of boiling *water R*. Allow to stand for 10 min, shaking occasionally. Allow to cool, dilute to 100.0 mL with *water R* and filter. Evaporate 25.0 mL of the filtrate to dryness on a water-bath. Dry the residue in an oven at 100-105 °C. The residue weighs a minimum of 18.75 mg.

Ph Eur

## Primula Root

(Ph. Eur. monograph 1364)

Ph Eur

### DEFINITION

Whole or cut, dried rhizome and root of *Primula veris* L. or *Primula elatior* Hill.

### IDENTIFICATION

**A.** The coarsely torose, greyish-brown rhizome is straight or slightly curved, about 1-5 cm long and about 2-4 mm thick. The rhizome crown often bears the remains of stems and leaves. Attached to the rhizome are numerous brittle roots, about 1 mm thick and usually 6-8 cm long. The root of *P. elatior* is light brown or reddish-brown, that of *P. veris* light yellow or yellowish-white. The fracture is smooth.

**B.** Microscopic examination (2.8.23). The powder is greyish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 1364.-1): fragments of parenchyma from the bark of the root or the rhizome and from the medulla of the rhizome [G, H], consisting of rounded or ovoid cells with irregularly thickened and pitted walls; brownish fragments from the dermal tissue of the root showing absorbent hairs [C]; yellow or brownish fragments of the epidermis of the rhizome covered by a striated cuticle (surface view [A], transverse section [F]) accompanied by parenchyma from the bark [Fa]; reticulate vessels [B] sometimes accompanied by spiral vessels [J]; groups of large, strongly pitted, yellowish-green sclereids from the medullary parenchyma of the rhizome [E], which are characteristic of *P. elatior*. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows simple or compound starch granules of various shapes and sizes [D].

**C.** Thin-layer chromatography (2.2.27) as described in the test for *Vincetoxicum hirundinaria* Medik. root with the following modifications.

**Detection** Treat with *anisaldehyde solution R*, heat at 100-105 °C for 5-10 min and examine in daylight.

**Results** The main zone (aescin) in the chromatogram obtained with the reference solution is bluish-violet and is situated near the boundary between the lower and middle thirds. The chromatogram obtained with the test solution shows 1-2 strong dark violet zones a little below the zone due to aescin in the chromatogram obtained with the reference solution; further pale violet, yellowish or brownish-green zones may be visible.

### TESTS

*Vincetoxicum hirundinaria* Medik. root

Thin-layer chromatography (2.2.27).

**Test solution** To 1.0 g of the powdered herbal drug (500) (2.9.12) add 10 mL of *ethanol (70 per cent V/V) R* and heat under a reflux condenser for 15 min. Cool and filter.

**Reference solution** Dissolve 10 mg of *aescin R* in 1.0 mL of *ethanol (70 per cent V/V) R*.

**Plate** TLC silica gel *F<sub>254</sub>* plate *R*.

**Mobile phase** *glacial acetic acid R*, *water R*, *butanol R* (10:40:50 *V/V/V*); use the upper layer.

**Application** 20 µL as bands.

**Development** Over a path of 12 cm.

**Drying** In an oven at 100-105 °C.

**Detection A** Examine in ultraviolet light at 254 nm.

Figure 1364.-1. – Illustration for identification test B of powdered herbal drug of primula root

**Results A** The chromatograms obtained with the reference solution and the test solution show a quenching zone (aescin) near the boundary between the lower and the middle thirds. Mark this zone.

**Detection B** Examine in ultraviolet light at 365 nm.

**Results B** In the chromatogram obtained with the test solution no zones of light-blue or greenish fluorescence occur below the main zone due to aescin in the chromatogram obtained with the reference solution.

### Loss on drying (2.2.32)

Maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

### Total ash (2.4.16)

Maximum 9.0 per cent.

### Ash insoluble in hydrochloric acid (2.8.1)

Maximum 3.0 per cent.

Ph Eur

## Psyllium Seed

(Ph. Eur. monograph 0858)

Ph Eur

### DEFINITION

Ripe, whole, dry seeds of *Plantago afra* L. (*Plantago psyllium* L.) or *Plantago indica* L. (*Plantago arenaria* Waldstein and Kitaibel).

### CHARACTERS

Sweet taste.

**IDENTIFICATION**

*P. afra* Seeds are light brown to very dark brown but never black, smooth and shiny having an elliptical oblong shape. They are 2-3 mm long and 0.8-1.0 mm wide, one end being wider than the other. Towards the middle of the dorsal surface there is a fairly marked transverse constriction of light colour. On the ventral surface, there is a linear lighter-coloured groove in the middle of which is a clear spot corresponding to the hilum and bounded by swollen edges.

*P. indica* Seeds are almost identical to the seeds of *P. afra*, but a little less shiny; they are 2-3 mm long and have a maximum diameter of 1.5 mm.

**TESTS**

**Swelling index (2.8.4)**

Minimum 10.

**Foreign matter (2.8.2)**

Maximum 1.0 per cent, determined on 10.0 g of the drug, including greenish unripe seeds. Psyllium seed does not contain seeds having a dark central spot on the groove (*Plantago lanceolata* L. and *P. major* L.) or seeds with brownish-grey or pinkish outer coats (*P. ovata* Forssk. and *P. sempervirens* Crantz).

**Loss on drying (2.2.32)**

Maximum 14.0 per cent, determined on 1.000 g of drug by drying in an oven at 105 °C for 2 h.

**Total ash (2.4.16)**

Maximum 4.0 per cent.

**STORAGE**

Store protected from moisture.

Ph Eur

**Pygeum Bark**

(*Pygeum Africanum* Bark, Ph. Eur. monograph 1886)

Ph Eur

**DEFINITION**

Whole or fragmented, dried bark of the stems and branches of *Prunus africana* (Hook.f.) Kalkman (syn. *Pygeum africanum* Hook.f.).

**IDENTIFICATION**

A. The dark brown or reddish-brown bark occurs in curved, hard, irregular pieces. The outer surface has a wrinkled dark reddish-brown cork with areas of adhering lichen. The reddish-brown or dark brown inner surface bears longitudinal striations. It may also occur in rolled fragments with a fibrous fracture.

B. Microscopic examination (2.8.23). The powder is reddish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 1886.-1): numerous sclereids, varying greatly in size, up to more than 500 µm in diameter, with very thick walls showing concentric striations and a reduced lumen, isolated [A] or in groups [B] sometimes accompanied by sclereids about 50 µm in diameter [Ba], some with granular reddish-brown contents [Bb]; isolated cluster crystals of calcium oxalate of various sizes [C] and a few calcium oxalate prisms [F]; numerous lignified fibres, usually broken, thick-walled and channelled with a narrow lumen, sometimes isolated [L], but usually in groups [G] accompanied by rectangular cells of the medullary rays [Ga];

fragments of parenchyma with reddish-brown, polygonal or ovoid cells [D], including some with reticulate walls [J, M]; fragments of cork (surface view [H], side view [E]). Examine under a microscope using *lactic reagent R*. The powder shows a few simple starch granules that stain violet-blue, rounded, 10-20 µm in diameter, with a punctiform or Y-shaped hilum [K].

Figure 1886.-1. – Illustration for identification test B of powdered herbal drug of *pygeum africanum* bark

C. Thin-layer chromatography (2.2.27).

**Test solution** Extract 15.0 g of the powdered herbal drug (250) (2.9.12) with *methylene chloride R* for 30 min in a continuous extraction apparatus (Soxhlet type). Filter. Evaporate the solvent to dryness under reduced pressure. Dissolve the residue in 1 mL of *methylene chloride R*.

**Reference solution** Dissolve 20 mg of  $\beta$ -sitosterol *R* and 20 mg of *ursolic acid R* in 10 mL of a mixture of equal volumes of *methanol R* and *methylene chloride R*.

**Plate** TLC silica gel plate *R*.

**Mobile phase** *methanol R*, *methylene chloride R* (10:90 *V/V*).

**Application** 10 µL as bands of 10 mm.

**Development** Over a path of 15 cm.

**Drying** In air.

**Detection** Treat with *vanillin reagent R*, heat at 100-105 °C for 10 min and allow to cool; examine in daylight.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
	A violet zone Several weak violet, blue or grey zones
$\beta$ -Sitosterol: a violet zone Ursolic acid: a blue zone	A violet zone ( $\beta$ -sitosterol) A blue zone (ursolic acid) Several weak violet, blue or grey zones
	A violet zone ( $\beta$ -sitosterol glucoside)
Reference solution	Test solution

**TESTS****Foreign matter (2.8.2)**

Maximum 3.0 per cent.

**Loss on drying (2.2.32)**

Maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

**Total ash (2.4.16)**

Maximum 10.0 per cent.

**Extractable matter**

Minimum 0.5 per cent.

Extract 20.0 g of the powdered herbal drug (250) (2.9.12) with *methylene chloride R* for 4 h in a continuous extraction apparatus (Soxhlet type). Evaporate the solution to dryness on a water-bath *in vacuo* and then dry the residue at 80 °C for 2 h. The residue weighs a minimum of 0.10 g.

Ph Eur

three to four, but sometimes up to six cells wide, with occasional pitted, subrectangular sclereids adjacent to the bundles of phloem fibres. Starch granules 5 to 20  $\mu\text{m}$ , usually about 10  $\mu\text{m}$ , in diameter and prisms of calcium oxalate usually 50 to 170  $\mu\text{m}$  long and up to 30  $\mu\text{m}$  wide present in the parenchymatous cells.

**TESTS****Extractive soluble in ethanol (45%)**

Not less than 22.0%, Appendix XI B1.

**Acid-insoluble ash**

Not more than 1.0%, Appendix XI K.

**Foreign matter**Complies with the test for *foreign matter*, Appendix XI D.**Quillaia Bark**

(Ph. Eur. monograph 1843)

Ph Eur

**DEFINITION**

Whole or fragmented, dried bark, with the cork and underlying parenchyma removed, of *Quillaja saponaria* Molina s.l.

**Content**

Minimum 6.5 per cent of triterpene glycosides, expressed as quillaia saponin III ( $\text{C}_{104}\text{H}_{168}\text{O}_{55}$ ;  $M_r$  2298) (dried drug).

**IDENTIFICATION**

A. Large, flat pieces of variable length and width, 3-10 mm thick, or smaller, splintered pieces. The outer surface is brownish-white or pale reddish-brown, longitudinally striated or coarsely reticulated, with occasional blackish-brown patches of incompletely removed outer bark. The inner surface is yellowish-white and smooth. The fracture is splintery and laminated, the surface often glistening due to the presence of numerous large prisms of calcium oxalate.

B. Microscopic examination (2.8.23). The powder is pale pinkish-yellow. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 1843.-1): abundant phloem fibres [E, F], up to 1 mm long, isolated or, more usually, in groups, each fibre irregular in outline with lignified walls of varying thickness and an uneven lumen; numerous, multiseriate medullary rays, spindle-shaped (tangential section [Ca, Fb]), accompanied by either phloem fibres [Fa] or phloem parenchyma [Cb]; very numerous prisms of calcium oxalate, up to 200  $\mu\text{m}$  long, free, whole or, more usually, fragmented [A] or included in phloem parenchyma cells [Cc, Cd]; occasional sclereids of 2 types: the 1<sup>st</sup> type is sub-rectangular with pitted, slightly thickened walls, isolated [G] or included in phloem parenchyma cells [H], while the 2<sup>nd</sup> type has an irregularly shaped outline and very thick walls [J], sometimes adjacent to the bundles of phloem fibres; occasional dark brown or reddish-brown fragments of cork [D]. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows numerous, small (5-20  $\mu\text{m}$ ), mainly simple, spherical starch granules, either scattered or as compacted masses in parenchyma cells [B].

C. Thin-layer chromatography (2.2.27).

**Test solution** To 1.0 g of the powdered herbal drug (355) (2.9.12) add 5 mL of *methanol R* and 5 mL of *water R*. Sonicate for 10 min and filter.

**Reference solution** Dissolve 10 mg of *purified quillaia saponins R* and 2 mg of *sucrose R* in 1 mL of *water R* and mix with 1 mL of *methanol R*.

**Quillaia****Preparations****Quillaia Liquid Extract**

When Powdered Quillaia is prescribed or demanded, material complying with the appropriate requirements below shall be dispensed or supplied.

**DEFINITION**

Quillaia is the dried inner part of the bark of *Quillaja saponaria* Molina and of other species of *Quillaja*.

**IDENTIFICATION**

A. Pieces flat, up to about 1 metre long, 10 to 20 cm broad and 3 to 10 mm, usually 6 mm, thick. Outer surface brownish white or pale reddish brown, longitudinally striated or coarsely reticulated, with occasional blackish brown patches of adherent outer bark; inner surface yellowish white, smooth and very hard; fracture splintery and laminated, the broken surface showing numerous large prisms of calcium oxalate as glistening points. Smoothed transversely cut surface appearing chequered, with delicate radial lines representing medullary rays and tangential lines formed by alternating tangential bands of fibrous and non-fibrous phloem.

B. Outer bark, when present, consisting of reddish brown cork cells alternating with bands of brown parenchyma containing numerous groups of phloem fibres and large prisms of calcium oxalate. Inner bark consisting of alternating bands of tortuous fibres, irregularly enlarged at intervals, about 500 to 1000  $\mu\text{m}$  long and 20 to 50  $\mu\text{m}$  wide and of sieve tissue mixed with parenchyma. Medullary rays mostly

Figure 1843.-1. – Illustration for identification test B of powdered herbal drug of quillaia bark.

Plate TLC silica gel plate R (2-10 µm).

Mobile phase anhydrous acetic acid R, ethyl acetate R, water R, propanol R (1.5:30:30:40 V/V/V/V).

Application 5 µL as bands of 6 mm.

Development Over a path of 6 cm.

Drying In hot air.

Detection Treat with a 10 per cent V/V solution of sulfuric acid R in methanol R; heat at 120 °C for 5 min and examine in daylight.

Results See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

## TESTS

Loss on drying (2.2.32)

Maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

Total ash (2.4.16)

Maximum 10.0 per cent.

Ash insoluble in hydrochloric acid (2.8.1)

Maximum 1.0 per cent.

## ASSAY

Liquid chromatography (2.2.29).

**Test solution** Introduce 0.500 g of the powdered herbal drug (355) (2.9.12) into a round-bottomed flask, add 20 mL of a 20 g/L solution of potassium hydroxide R and heat under a reflux condenser in a water-bath for 2 h. After cooling, add 2 mL of phosphoric acid R and filter through a plug of absorbent cotton. Add the absorbent cotton to the residue, add 25 mL of ethanol (96 per cent) R and shake thoroughly. Filter. Combine the filtrates and dilute to 50.0 mL with water R. Filter through a membrane filter (nominal pore size 0.45 µm).

**Reference solution (a)** Dissolve 12.0 mg of quillaia saponin for assay CRS (containing monoammonium glycyrrhizate) in a mixture of equal volumes of ethanol (96 per cent) R and a 10 g/L solution of phosphoric acid R, and dilute to 50.0 mL with the same mixture of solvents.

**Reference solution (b)** Introduce 12 mg of purified quillaia saponins HRS into a 50 mL round-bottomed flask, add 20 mL of a 20 g/L solution of potassium hydroxide R and heat under a reflux condenser in a water-bath for 2 h. After cooling, add 2 mL of phosphoric acid R. Add 25 mL of ethanol (96 per cent) R and shake thoroughly. Dilute to 50.0 mL with water R. Filter through a membrane filter (nominal pore size 0.45 µm).

Column:

— size:  $l = 0.25$  m,  $\varnothing = 4.6$  mm;

— stationary phase: octadecylsilyl silica gel for chromatography R (5 µm);

— temperature:  $30 \pm 2$  °C.

Mobile phase acetone R1, 1 g/L solution of phosphoric acid R (35:65 V/V).

Flow rate 1.0 mL/min.

Detection Spectrophotometer at 210 nm.

Injection 50 µL.

Run time 1.2 times the retention time of glycyrrhizic acid.

**Identification of peaks** Use the chromatogram supplied with purified quillaia saponins HRS and the chromatogram obtained with reference solution (b) to identify the peaks due to monodesmosidic quillaia saponins 1 and 3; a minor peak due to monodesmosidic quillaia saponin 2 may be present between the peaks due to monodesmosidic quillaia saponins 1 and 3.

**Retention time** Monodesmosidic quillaia saponin 1 = about 9 min; monodesmosidic quillaia saponin 3 = about 10 min; glycyrrhizic acid = about 13 min.

Calculate the percentage content of triterpene glycosides, expressed as quillaia saponin III, using the following expression:

$$\frac{A_1 \times m_2 \times p \times 2298 \times 0.6}{A_2 \times m_1 \times 957}$$

- $A_1$  = sum of the areas of the peaks due to monodesmosidic quillaia saponins (1, 2 and 3) in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to glycyrrhizic acid derived from monoammonium glycyrrhizate in the chromatogram obtained with reference solution (a);
- $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;

$m_2$	=	mass of <i>quillaia saponin for assay CRS</i> used to prepare reference solution (a), in grams;
$p$	=	percentage content of monoammonium glycyrrhizate in <i>quillaia saponin for assay CRS</i> ;
0.6	=	response factor between monoammonium glycyrrhizate and monodesmosidic quillaia saponin 3;
2298	=	molecular mass of quillaia saponin III;
957	=	molecular mass of monodesmosidic quillaia saponin 3.

Ph Eur

## Quillaia Liquid Extract

### DEFINITION

Quillaia Liquid Extract is prepared by extracting Quillaia with Ethanol (45 per cent).

### Extemporaneous preparation

The following formula and directions apply.

Quillaia, in <i>moderately fine powder</i>	1000 g
Ethanol (45 per cent)	A sufficient quantity

Exhaust the Quillaia in *moderately fine powder* with Ethanol (45 per cent) by *percolation*, Appendix XI F, and reserve the first 850 mL of percolate. Evaporate the subsequent percolate to the consistence of a soft extract, dissolve it in the reserved portion and add sufficient Ethanol (45 per cent) to produce 1000 mL. Allow to stand for not less than 24 hours; filter.

*The extract complies with the requirements stated under Extracts and with the following requirements.*

### TESTS

#### Ethanol content

28 to 34% v/v, Appendix VIII F, Method III.

#### Dry residue

20 to 30% w/v.

#### Relative density

1.02 to 1.06, Appendix V G.

## Quillaia Tincture

### DEFINITION

Quillaia Liquid Extract	50 mL
Ethanol (45 per cent)	Sufficient to produce 1000 mL

### Extemporaneous preparation

The following directions apply.

Mix, allow to stand for not less than 12 hours and filter.

*The tincture complies with the requirements for Tinctures stated under Extracts and with the following requirements.*

### TESTS

#### Ethanol content

43 to 45% v/v, Appendix VIII F, Method III.

#### Dry residue

1.0 to 1.5% w/v. Use 10 mL.

#### Relative density

0.940 to 0.955, Appendix V G.

## Raspberry Leaf

(Ph Eur. monograph 2950)

Ph Eur

### DEFINITION

Whole or fragmented, dried leaves of *Rubus idaeus* L. harvested in spring or early summer.

### Content

Minimum 3.0 per cent of tannins, expressed as pyrogallol ( $C_6H_6O_3$ ;  $M_r$  126.1) (dried drug).

### IDENTIFICATION

A. *Whole drug.* The leaf is imparipinnate, with 3, 5 or rarely 7 ovate to lanceolate leaflets with sharply serrate or doubly-serrate margins. The upper surface is dark green to brownish-green and weakly pubescent; the lower surface is silvery grey and densely tomentose with a prominent pinnate venation. The petiole is about 1-2 mm thick, green or occasionally reddish, slightly channelled on the upper surface, and sometimes shows small, straight prickles. The stipules are long and thin. The leaves of the short shoots are often simple, more or less 3-lobed, or they are trifoliate.

*Fragmented drug* It is characterised by clumped fragments of leaves and petioles.

B. *Microscopic examination* (2.8.23). Reduce to a powder (710) (2.9.12). The powder is greyish-green and flocculent. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2950.-1): very numerous broken unicellular covering trichomes, either rigid with thickened walls [G], or twisted with slightly thickened walls [F]; fragments of the upper epidermis of the leaflet lamina (surface view [D]) with polygonal cells [Da] and rare, rigid, unicellular covering trichomes with thickened walls, measuring from 20  $\mu$ m to more than 500  $\mu$ m in length [Db], or their scars, often accompanied by palisade parenchyma [Dc] including some hypertrophied cells containing a cluster crystal of calcium oxalate [Dd]; fragments of the lower epidermis of the leaflet lamina [A] containing cells with thin, slightly lobed walls [Aa] and anomocytic stomata (2.8.3) (5-7 subsidiary cells) [Ab], with an abundant indumentum composed of unicellular, fine, twisted covering trichomes [Ac] up to 500  $\mu$ m long; annular or spiral vessels from the petioles, rachis or principal veins [J], sometimes accompanied by cells of the pith with slightly thickened, pitted walls [Ja]; fragments of pericyclic fibres [C], frequently with a crystal sheath containing small cluster crystals of calcium oxalate [Ca]; fragments of the lamina (transverse section [H]) consisting of the upper epidermis [Ha], 1 or 2 layers of palisade parenchyma [Hb], including hypertrophied cells containing a cluster crystal of calcium oxalate [Hc], spongy parenchyma [Hd] and the lower epidermis with twisted unicellular covering trichomes [He]; free cluster crystals of calcium oxalate [E]; exceptionally, secretory trichomes with a biseriate, multicellular stalk and a globular, multicellular head, located on the upper epidermis of the leaflet veins [B].

C. *High-performance thin-layer chromatography* (2.8.25).

*Test solution* To 0.5 g of the powdered herbal drug (710) (2.9.12) add 10.0 mL of *methanol R*. Sonicate for 15 min, filter or centrifuge and use the filtrate or supernatant.

*Reference solution (a)* Dissolve 2.5 mg of *hyperoside R* and 3.5 mg of *rutoside trihydrate R* in *methanol R* and dilute to 10.0 mL with the same solvent.

Figure 2950.-1. – Illustration for identification test B of powdered herbal drug of raspberry leaf

**Reference solution (b)** Dilute 2.5 mL of reference solution (a) to 10.0 mL with methanol R.

**Reference solution (c)** Dissolve 3 mg of hyperoside R and 2.5 mg of chlorogenic acid R in methanol R and dilute to 10 mL with the same solvent.

**Intensity marker** Hyperoside.

**Plate** TLC silica gel F<sub>254</sub> plate R (2-10 μm).

**Mobile phase** anhydrous formic acid R, water R, ethyl acetate R (10:10:80 V/V/V).

**Application** 10 μL of the test solution and 4 μL of reference solutions (a), (b) and (c), as bands of 8 mm.

**Development** 70 mm from the lower edge of the plate.

**Drying** In a current of air at room temperature for 5 min.

**Detection** Heat at 100-105 °C for 5 min; spray the warm plate with a 10 g/L solution of diphenylboric acid aminoethyl ester R in methanol R, then with a 50 g/L solution of macrogol 400 R in methanol R or, alternatively, dip the warm plate in a 5 g/L solution of diphenylboric acid aminoethyl ester R in ethyl acetate R, then in a 50 g/L solution of macrogol 400 R in methylene chloride R; allow to dry in air for about 1 min and examine in ultraviolet light at 366 nm.

**System suitability** Reference solution (c):

- the chromatogram shows in the middle third 2 distinct zones, which may be touching; the lower zone (chlorogenic acid) shows a light blue fluorescence and the upper zone (hyperoside) shows a yellow or orange fluorescence.

**Results** See below the sequence of fluorescent zones present in the chromatograms obtained with reference solution (a) and the test solution. Furthermore, in the chromatogram obtained with the test solution, other faint fluorescent zones,

mainly light blue, greenish and yellow or orange, may be present, especially in the upper and lower thirds.

Top of the plate	
	A red zone
	A red zone, faint
	A light blue zone, faint to equivalent
	A greenish zone, faint (possibly overlapping with an orange zone)
Hyperoside: a yellow or orange zone	A yellow or orange zone, very faint to faint (possibly overlapping with a blue zone)
	A yellow or orange zone
Rutoside: a yellow or orange zone	A yellow or orange zone, faint to equivalent
Reference solution (a)	Test solution

## TESTS

### *Rubus fruticosus* L

Microscopic examination (2.8.23). Examine the powdered herbal drug (710) (2.9.12) using chloral hydrate solution R. The presence of fasciculate-stellate covering trichomes indicates adulteration by *Rubus fruticosus* L.

### Loss on drying (2.2.32)

Maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (710) (2.9.12) by drying in an oven at 105 °C for 2 h.

### Total ash (2.4.16)

Maximum 8.0 per cent.

## ASSAY

### Tannins (2.8.14)

Use 1.000 g of the powdered herbal drug (710) (2.9.12).

Ph Eur

## Rehmannia Root

(Ph. Eur. monograph 2569)

Ph Eur

### DEFINITION

Dried root tuber of *Rehmannia glutinosa* (Gaertn.) DC. (syn. *Rehmannia glutinosa* (Gaertn.) Libosch. ex Fisch. & C.A. Mey.) with the crown and rootlets removed.

### Content

Minimum 0.2 per cent of catalpol ( $C_{15}H_{22}O_{10}$ ;  $M_r$  362.3) (dried drug).

### IDENTIFICATION

**A.** The whole drug usually occurs as irregular or oblong masses, swollen in the centre, slightly tapering at both ends and bearing lenticular rootlet scars, 6-12 cm long and 3-6 cm thick. The fragmented drug occurs as slightly compressed or twisted slices. The outer surface is blackish-brown or blackish-grey, and is heavily shrunken with irregular transverse wavy lines. Fracture is difficult, with the cut surface being lustrous, blackish-brown or jet black and viscous.

**B.** Microscopic examination (2.8.23). The blackish-brown powder consists of rather sticky particles. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2569.-1): blackish-brown cork fragments consisting of polygonal cells (surface view [A]) or composed of superimposed layers (transverse section [E]); fragments of parenchyma [D], brown, consisting of polygonal or rectangular cells with thin, wavy or wrinkled walls, some containing orange-yellow oil droplets [Da]; vessels about 100-200  $\mu\text{m}$  long and 40-60  $\mu\text{m}$  in diameter, with reticulate or pitted walls [B, C], with the junction between vessels of similar diameter being clearly visible.

**C.** High performance thin-layer chromatography (2.8.25).

**Test solution** To 0.2 g of the powdered herbal drug (355) (2.9.12) add 5.0 mL of *methanol R*. Sonicate for 10 min, then filter or centrifuge the solution. Use the filtrate or supernatant.

**Reference solution (a)** Dissolve 10.0 mg of *sucrose R* and 10.0 mg of *raffinose R* in the minimum volume of *water R* and dilute to 2.0 mL with *methanol R*.

**Reference solution (b)** Mix 1.0 mL of reference solution (a) and 3.0 mL of *methanol R*.

**Reference solution (c)** Dissolve 10 mg of *fructose R* and 10 mg of *sucrose R* in the minimum amount of *water R* and dilute to 2 mL with *methanol R*.

**Intensity marker** Sucrose.

**Plate** TLC silica gel  $F_{254}$  plate R (2-10  $\mu\text{m}$ ).

**Mobile phase** *glacial acetic acid R*, *anhydrous formic acid R*, *water R*, *ethyl acetate R* (4:5:6:12 V/V/V/V).

**Application** 2  $\mu\text{L}$  as bands of 8 mm.

**Development** 70 mm from the lower edge of the plate.

**Drying** In a current of cold air for 5 min.

**Detection** Treat with a 10 per cent V/V solution of *sulfuric acid R* in *ethanol (96 per cent) R*, heat at 120 °C for 3 min and examine in ultraviolet light at 366 nm.

**System suitability** Reference solution (c):

- the chromatogram shows in the middle third 2 distinct zones, which may be touching; both the lower zone (sucrose) and the upper zone (fructose) show a brown colour.

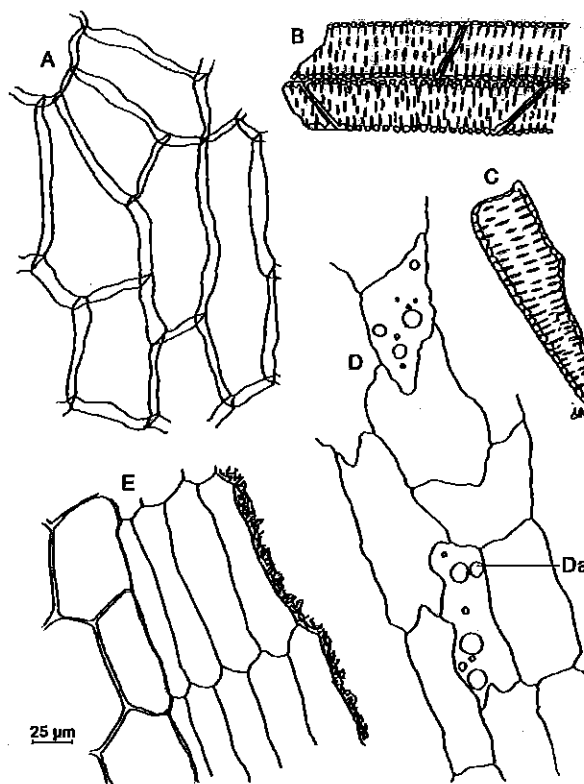

Figure 2569.-1. — Illustration for identification test B of powdered herbal drug of rehmannia root

**Results** See below the sequence of zones present in the chromatograms obtained with reference solution (a) and the test solution. Furthermore, in the chromatogram obtained with the test solution, other faint blue fluorescent zones and faint brown zones may be present.

Top of the plate	
	A blue fluorescent zone, faint to intense
	A brown zone, faint
	A blue fluorescent zone, faint
Sucrose: a brown zone	A brown zone, faint to equivalent (sucrose)
Raffinose: a brown zone	A brown zone, faint to equivalent (raffinose)
	A brown zone, intense
	A brown zone, very faint
Reference solution (a)	Test solution

## TESTS

## Loss on drying (2.2.32)

Maximum 15.0 per cent, determined on 2.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 5 h.

## Total ash (2.4.16)

Maximum 8.0 per cent.

## Ash insoluble in hydrochloric acid (2.8.1)

Maximum 3.0 per cent.

## ASSAY

## Liquid chromatography (2.2.29).

**Test solution** To 1.500 g of the powdered herbal drug (355) (2.9.12) add 50.0 mL of water R. Weigh and sonicate for 30 min at a temperature below 25 °C. Weigh again and compensate for the loss of solvent with water R. Shake well, then centrifuge for 10 min and filter the supernatant through a membrane filter (nominal pore size 0.45 µm).

**Reference solution** Dissolve 5.0 mg of catalpol CRS in water R and dilute to 25.0 mL with the same solvent.

## Column:

- size:  $l = 0.15$  m,  $\varnothing = 4.6$  mm;
- stationary phase: end-capped octadecylsilyl silica gel for chromatography R (3 µm);
- temperature: 25 °C.

## Mobile phase:

- mobile phase A: water for chromatography R;
- mobile phase B: acetonitrile R1, water for chromatography R (5:95 V/V);

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 3	90	10
3 - 20	90 → 70	10 → 30

Flow rate 0.5 mL/min.

Detection Spectrophotometer at 210 nm.

Injection 10 µL.

Retention time Catalpol = about 13 min.

System suitability Reference solution:

- repeatability: maximum relative standard deviation of 2.0 per cent determined on 6 injections.

Calculate the percentage content of catalpol using the following expression:

$$\frac{A_1 \times m_2 \times p \times 2}{A_2 \times m_1}$$

- $A_1$  = area of the peak due to catalpol in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to catalpol in the chromatogram obtained with the reference solution;
- $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;
- $m_2$  = mass of catalpol CRS used to prepare the reference solution, in grams;
- $p$  = percentage content of catalpol in catalpol CRS.

Ph Eur

## Restharrow Root

(Ph. Eur. monograph 1879)

Ph Eur

## DEFINITION

Whole or cut, dried root of *Ononis spinosa* L.

## IDENTIFICATION

A. The root is more or less flattened, twisted and branched, deeply wrinkled, brown and grooved longitudinally.

The transversely cut surface shows a thin bark and a xylem cylinder with a conspicuously radiate structure. The fracture of the root is short and fibrous.

B. Microscopic examination (2.8.23). The powder is light brown or brown. Examine under a microscope using chloral hydrate solution R. The powder shows the following diagnostic characters (Figure 1879.-1): brown fragments of cork composed of thin-walled, polygonal cells (surface view [G]); groups of thick-walled, narrow fibres, often accompanied by a parenchymatous crystal sheath containing prisms of calcium oxalate [C]; vascular fragments [D, E] consisting of vessels with numerous bordered pits, often accompanied by lignified fibres with pitted walls [Ea]; thin-walled parenchymatous cells from the bark, some containing a single prism of calcium oxalate [H]; ligneous parenchyma cells with slightly thickened and pitted walls [A, B], some of which contain prisms of calcium oxalate [Aa]; numerous free prisms of calcium oxalate [F]. Examine under a microscope using a 50 per cent V/V solution of glycerol R. The powder shows very numerous, rounded starch granules, 5-10 µm in diameter, simple or sometimes 2-4 compound, free [J] or inside parenchymatous cells [K].

Figure 1879.-1. – Illustration for identification test B of powdered herbal drug of restharrow root

### C. Thin-layer chromatography (2.2.27).

**Test solution** To 1.0 g of the powdered herbal drug (180) (2.9.12) add 15.0 mL of *methanol R* and boil under a reflux condenser for 30 min. Cool and filter.

**Reference solution** Dissolve 10 mg of *resorcinol R* and 50 mg of *vanillin R* in 10 mL of *methanol R*.

**Plate** TLC silica gel  $F_{254}$  plate R (5–40  $\mu\text{m}$ ) [or TLC silica gel  $F_{254}$  plate R (2–10  $\mu\text{m}$ )].

**Mobile phase** *ethanol (96 per cent) R*, *methylene chloride R*, *toluene R* (10:45:45 *V/V/V*).

**Application** 20  $\mu\text{L}$  [or 5  $\mu\text{L}$ ] as bands of 15 mm [or 8 mm].

**Development** Over a path of 15 cm [or 6 cm].

**Drying** In air.

**Detection A** Examine in ultraviolet light at 254 nm and 365 nm.

**Results A** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other fluorescent zones are present in the middle third of the chromatogram obtained with the test solution.

Top of the plate	
Vanillin: a zone visible at 254 nm	An intense blue fluorescent zone visible at 365 nm
Resorcinol: a zone visible at 254 nm	
Reference solution	Test solution

**Detection B** Treat with *anisaldehyde solution R*. Heat at 100–105 °C for 5–10 min. Examine in daylight.

**Results B** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution.

Top of the plate	
Vanillin: a greyish-violet zone	A violet zone (onocol)
Resorcinol: a red zone	
Reference solution	Test solution

### TESTS

#### Loss on drying (2.2.32)

Maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

#### Total ash (2.4.16)

Maximum 8.0 per cent.

#### Extractable matter

Minimum 15.0 per cent.

To 2.00 g of the powdered herbal drug (250) (2.9.12) add a mixture of 8 g of *water R* and 12 g of *ethanol (96 per cent) R* and allow to macerate for 2 h, shaking frequently. Filter, evaporate 5 g of the filtrate to dryness on a water-bath and dry in an oven at 100–105 °C for 2 h. The residue weighs a minimum of 75 mg.

## Rhatany Root

*Krameria*

(*Ph. Eur. monograph 0289*)

### Preparation

Rhatany Tincture

When Powdered Rhatany Root is prescribed or demanded, material complying with the requirements below with the exception of Identification test A and the test for Foreign matter shall be dispensed or supplied.

*Ph Eur*

### DEFINITION

Dried, usually fragmented, underground organs of *Krameria triandra* Ruiz et Pav., known as Peruvian rhatany.

### Content

Minimum 5.0 per cent of tannins, expressed as pyrogallol ( $\text{C}_6\text{H}_6\text{O}_3$ ;  $M_r$  126.1) (dried drug).

### IDENTIFICATION

**A.** The taproot is dark reddish-brown and has a thick, knotty crown. The secondary roots are the same colour and nearly straight or somewhat tortuous. The bark is rugged or scaly in the older pieces and smooth with sharp, transverse fissures in the younger pieces; it separates readily from the wood. The fracture is fibrous in the bark and splintery in the wood. The smooth, transversely cut surface shows a dark brownish-red bark about one third of the radius in thickness; a dense, pale reddish-brown and finely porous wood is present with numerous fine medullary rays; the central heartwood is often darker.

**B.** Microscopic examination (2.8.23). The powder is reddish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 0289.-1): cork cells containing dark brown phlobaphenes (surface view [A], side view [B]); fragments of phloem [C] consisting of unligified fibres, usually 12–30  $\mu\text{m}$  in diameter with moderately thickened walls [Ca], parenchyma cells some containing prisms and microcrystals of calcium oxalate [Cc], and cells of the medullary rays [Cb]; fragments of vessels usually 20–60  $\mu\text{m}$  in diameter with bordered pits [E]; fragments of tracheids [D] up to 20  $\mu\text{m}$  wide with slit-shaped pits [Da] and cells of the medullary rays [Db]; lignified parenchymatous cells with thick and channelled walls [F]. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows rounded, simple or 2- to 4-compound starch granules, an individual granule measuring up to 30  $\mu\text{m}$  in diameter [H] and some granules being found in the cells of the medullary rays and in the parenchyma [G].

### C. Thin-layer chromatography (2.2.27).

**Test solution** To 1.0 g of the powdered herbal drug (355) (2.9.12) add 10 mL of *methanol R* and sonicate for 10 min. Centrifuge or filter. Use the supernatant or filtrate.

**Reference solution** Dissolve 5 mg of *thymol R* and 20 mg of *dichlorophenolindophenol, sodium salt R* in 20 mL of *ethanol (60 per cent V/V) R*.

**Plate** TLC silica gel plate R (5–40  $\mu\text{m}$ ) [or TLC silica gel plate R (2–10  $\mu\text{m}$ )].

**Mobile phase** *methylene chloride R*.

**Application** 10  $\mu\text{L}$  [or 4  $\mu\text{L}$ ] as bands of 8 mm [or 8 mm].

**Development** Over a path of 15 cm [or 6 cm].

**Drying** In air.

*Ph Eur*

Figure 0289.-1. – Illustration for identification test B of powdered herbal drug of rhatany root

**Detection** Treat with a 5 g/L solution of *fast blue B salt R*, allow to dry in air and examine in daylight.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Thymol: a brownish-yellow zone	A faint violet zone
	An orange zone
	A bluish-grey zone
Dichlorophenolindophenol: a greyish-blue zone	An intense violet zone
Reference solution	Test solution

### TESTS

#### Foreign matter (2.8.2)

Maximum 2 per cent of foreign matter and maximum 5 per cent of fragments of crown or root exceeding 25 mm in diameter. Root without bark may be present in very small quantities.

#### Loss on drying (2.2.32)

Maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C.

Total ash (2.4.16)  
Maximum 5.5 per cent.

#### ASSAY

Tannins (2.8.14)  
Use 0.750 g of the powdered herbal drug (180) (2.9.12).

Ph Eur

## Rhatany Tincture

(Ph. Eur. monograph 1888)

Ph Eur

### DEFINITION

Tincture produced from *Rhatany root* (0289).

### Content

Minimum 1.0 per cent *m/m* of tannins, expressed as pyrogallol ( $C_6H_6O_3$ ;  $M_r$  126.1).

### PRODUCTION

The tincture is produced from 1 part of the herbal drug and 5 parts of ethanol (70 per cent *V/V*) by a suitable procedure.

### CHARACTERS

#### Appearance

Reddish-brown liquid.

### IDENTIFICATION

Thin-layer chromatography (2.2.27).

**Test solution** The tincture to be examined.

**Reference solution** Dissolve 5 mg of *thymol R* and 20 mg of *dichlorophenolindophenol, sodium salt R* in 20 mL of ethanol (60 per cent *V/V*) *R*.

**Plate** TLC silica gel plate *R* (5–40 µm) [or TLC silica gel plate *R* (2–10 µm)].

**Mobile phase** *methylene chloride R*.

**Application** 10 µL [or 4 µL] as bands of 8 mm [or 8 mm].

**Development** Over a path of 15 cm [or 6 cm].

**Drying** In air.

**Detection** Treat with a 5 g/L solution of *fast blue B salt R*, allow to dry in air and examine in daylight.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Thymol: a brownish-yellow zone	A violet zone
	An orange zone
	A bluish-grey zone
Dichlorophenolindophenol: a greyish-blue zone	An intense violet zone
Reference solution	Test solution

**TESTS****Ethanol (2.9.10)**63 per cent *V/V* to 67 per cent *V/V*.**Methanol and 2-propanol (2.9.11)**Maximum 0.05 per cent *V/V* of methanol and maximum 0.05 per cent *V/V* of 2-propanol.**ASSAY****Tannins (2.8.14)**

Use 2.500 g of the tincture to be examined.

Ph Eur

**Rhubarb**

(Ph. Eur. monograph 0291)

**Preparation****Compound Rhubarb Tincture**

When Powdered Rhubarb is prescribed or demanded, material complying with the requirements below with the exception of Identification test A and the test for Foreign matter shall be dispensed or supplied.

Ph Eur

**DEFINITION**

Rhubarb consists of the whole or cut, dried underground parts of *Rheum palmaum* L. or of *Rheum officinale* Baillon or of hybrids of these two species or of a mixture.

The underground parts are often divided; the stem and most of the bark with the rootlets are removed. It contains not less than 2.2 per cent of hydroxyanthracene derivatives, expressed as rhein (C<sub>15</sub>H<sub>8</sub>O<sub>6</sub>, M<sub>r</sub> 284.2), calculated with reference to the dried drug.

**CHARACTERS**

Characteristic, aromatic odour.

**IDENTIFICATION**

A. The appearance is variable: disc-shaped pieces up to 10 cm in diameter and 1 cm to 5 cm in thickness; cylindrical pieces; oval or planoconvex pieces. The surface has a pinkish tinge and is usually covered with a layer of brownish-yellow powder. It shows, especially after moistening, a reticulum of darker lines. This structure causes the marbled appearance of the drug. The fracture is granular. The transverse section of the rhizome shows a narrow outer zone of radiating brownish-red lines. These medullary rays are crossed perpendicularly by a dark cambial ring. Inside this zone is a ring of small star-spot formations of anomalous vascular bundles. The root shows a more radiate structure.

B. Microscopic examination (2.8.23). The powder is orange to brownish-yellow. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: large calcium oxalate cluster crystals, which may measure more than 100 µm, and their fragments; reticulately thickened non-lignified vessels measuring up to 175 µm. Numerous groups of rounded or polygonal, thin-walled parenchyma cells. Sclereids and fibres are absent.

Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows simple, rounded or compound (2 to 4) starch granules with a star-shaped hilum.

C. Examine by thin-layer chromatography (2.2.27), using a suitable silica gel as the coating substance.

*Test solution* Heat 50 mg of the powdered herbal drug (180) (2.9.12) in a water-bath for 15 min with a mixture of 1 mL

of *hydrochloric acid R* and 30 mL of *water R*. Allow to cool and shake the liquid with 25 mL of *ether R*. Dry the ether layer over *anhydrous sodium sulfate R* and filter. Evaporate the ether layer to dryness and dissolve the residue in 0.5 mL of *ether R*.

*Reference solution* Dissolve 5 mg of *emodin R* in 5 mL of *ether R*.

Apply separately to the plate as bands 20 µL of each solution. Develop over a path of 10 cm using a mixture of 1 volume of *anhydrous formic acid R*, 25 volumes of *ethyl acetate R* and 75 volumes of *light petroleum R*. Allow the plate to dry in air and examine in ultraviolet light at 365 nm. The chromatogram obtained with the reference solution shows in its central part a zone of orange fluorescence (emodin). The chromatogram obtained with the test solution shows: a zone due to emodin; above the emodin zone, two zones of similar fluorescence (physcione and chrysophanol, in order of increasing *R<sub>F</sub>* value); below the emodin zone, also two zones of similar fluorescence (rhein and aloe-emodin, in order of decreasing *R<sub>F</sub>* value). Spray with a 100 g/L solution of *potassium hydroxide R* in *methanol R*. All the zones become red to violet.

D. To about 50 mg of the powdered herbal drug (180) (2.9.12) add 25 mL of *dilute hydrochloric acid R* and heat the mixture on a water-bath for 15 min. Allow to cool, shake with 20 mL of *ether R* and discard the aqueous layer. Shake the ether layer with 10 mL of *dilute ammonia R1*. The aqueous layer becomes red to violet.

**TESTS****Rheum rhaponticum**

Examine by thin-layer chromatography (2.2.27), using *silica gel G R* as the coating substance.

*Test solution* To 0.2 g of the powdered herbal drug (180) (2.9.12) add 2 mL of *methanol R* and boil for 5 min under a reflux condenser. Allow to cool and filter. Use the filtrate as the test solution.

*Reference solution* Dissolve 10 mg of *rhaponticin R* in 10 mL of *methanol R*.

Apply separately to the plate, as bands not more than 20 mm by 3 mm, 20 µL of each solution. Develop over a path of 12 cm using a mixture of 20 volumes of *methanol R* and 80 volumes of *methylene chloride R*. Allow the plate to dry in air and spray with *phosphomolybdic acid solution R*. The chromatogram obtained with the test solution does not show a blue zone near the line of application (rhaponticin) corresponding to the zone in the chromatogram obtained with the reference solution.

**Loss on drying (2.2.32)**

Not more than 12.0 per cent, determined on 1.000 g of the powdered herbal drug (180) (2.9.12) by drying in an oven at 105 °C.

**Total ash (2.4.16)**

Not more than 12.0 per cent.

**Ash insoluble in hydrochloric acid (2.8.1)**

Not more than 2.0 per cent.

**ASSAY**

Carry out the assay protected from bright light.

Introduce 0.100 g of the powdered herbal drug (180) (2.9.12) into a 100 mL flask. Add 30.0 mL of *water R*, mix and weigh. Heat in a water-bath under a reflux condenser for 15 min. Allow to cool, add 50 mg of *sodium hydrogen carbonate R*, weigh and adjust to the original mass with *water R*. Centrifuge and transfer 10.0 mL of the liquid to a

100 mL round-bottomed flask with a ground-glass neck. Add 20 mL of *ferric chloride solution RI* and mix. Heat under a reflux condenser on a water-bath for 20 min, add 1 mL of *hydrochloric acid R* and heat for a further 20 min, shaking frequently. Cool, transfer to a separating funnel and shake with three quantities, each of 25 mL, of *ether R* previously used to rinse the flask. Combine the ether extracts and wash with two quantities, each of 15 mL, of *water R*. Filter the ether extracts through a plug of absorbent cotton into a volumetric flask and dilute to 100.0 mL with *ether R*. Evaporate 10.0 mL carefully to dryness on a water-bath and dissolve the residue in 10.0 mL of a 5 g/L solution of *magnesium acetate R* in *methanol R*. Measure the absorbance (2.2.25) at 515 nm, using *methanol R* as the compensation liquid.

Calculate the percentage content of rhein from the expression:

$$\frac{A \times 0.64}{m}$$

i.e. taking the specific absorbance of rhein to be 468, calculated on the basis of the specific absorbance of barbaloin.

*A* = absorbance at 515 nm,  
*m* = mass of the herbal drug used, in grams.

Ph Eur

## Compound Rhubarb Tincture

### DEFINITION

Rhubarb, in moderately coarse powder	100 g
Cardamom Oil	0.40 mL
Coriander Oil	0.03 mL
Glycerol	100 mL
Ethanol (60 per cent)	Sufficient to produce 1000 mL

### Extemporaneous preparation

The following directions apply.

Moisten the Rhubarb with a sufficient quantity of Ethanol (60 per cent) and prepare 850 mL of tincture by *percolation*, Appendix XI F. Add the Cardamom Oil, the Coriander Oil and the Glycerol and sufficient Ethanol (60 per cent) to produce 1000 mL. Mix and filter, if necessary.

The tincture complies with the requirements for Tinctures stated under *Extracts* and with the following requirements.

### TESTS

#### Ethanol content

48 to 53% v/v, Appendix VIII F, Method III.

#### Glycerol

9.0 to 11.0% v/v when determined by the following method. Dilute 20 mL to 100 mL with *water*, to 10 mL of this solution add 100 mL of *water* and 1 g of *activated charcoal* and boil under a reflux condenser for 15 minutes. Filter, wash the filter and charcoal with sufficient *water* to produce 150 mL, add 0.25 mL of *bromocresol purple solution* and neutralise with 0.1M *sodium hydroxide* or 0.05M *sulfuric acid* to the blue colour of the indicator. Add 1.4 g of *sodium periodate*, allow to stand for 15 minutes, add 3 mL of *propane-1,2-diol*, shake and allow to stand for 5 minutes. Add 0.25 mL of *bromocresol purple solution* and titrate with

0.1M *sodium hydroxide VS* to the same blue colour. Each mL of 0.1M *sodium hydroxide VS* is equivalent to 9.210 mg of glycerol. Calculate the percentage v/v of glycerol, taking 1.260 g as its weight per mL.

#### Relative density

0.958 to 0.977, Appendix V G.

## Roselle

(Ph. Eur. monograph 1623)

Ph Eur

### DEFINITION

Whole or cut dried calyces and epicalyces of *Hibiscus sabdariffa* L. collected during fruiting.

### Content

Minimum 13.5 per cent of acids, expressed as citric acid (C<sub>6</sub>H<sub>8</sub>O<sub>7</sub>; M<sub>r</sub> 192.1) (dried drug).

### CHARACTERS

Acidic taste.

### IDENTIFICATION

A. The calyx is joined in the lower half to form an urceolate structure, the upper half dividing to form 5 long acuminate recurved tips. The tips have a prominent, slightly protruding midrib and a large, thick nectary gland about 1 mm in diameter. The epicalyx consists of 8-12 small, obovate leaflets, which are adnate to the base of the calyx. The calyx and epicalyx are fleshy, dry, easily fragmented and bright red or deep purple, somewhat lighter at the base of the inner side.

B. Microscopic examination (2.8.23). The powder is red or violet-red. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 1623.-1): predominantly red fragments [A, F] consisting of polygonal epidermal cells with very irregularly thickened walls (surface view [Ac, Fa]), some containing cluster crystals of calcium oxalate [Fb], with underlying parenchyma consisting of ovoid cells with slightly thickened walls [Aa], some containing cluster crystals of calcium oxalate [Ab] whilst others are filled with mucilage, unicellular, long, flexuous, twisted covering trichomes [Ad], rigid, straight, unicellular covering trichomes, simple or in groups of 2-4 [Fd], glandular trichomes with a unicellular stalk and a globular or oval, multicellular and biseriate head [Fe] and stomata usually of the anisocytic type (2.8.3) [Fc]; numerous fragments of vascular bundles [D] with spiral or reticulate vessels [Da], sometimes accompanied by sclerenchymatous fibres with a wide lumen [Db], and parenchyma [Dc], of which some cells contain cluster crystals of calcium oxalate [Dd], whilst others are mucilage-filled [De]; rare, rectangular, parenchymatous sclereids [H]; numerous fragments of rigid [C, G] or flexuous [J] covering trichomes; free cluster crystals of calcium oxalate [B] and glandular trichomes [E]; exceptionally, spherical pollen grains, about 200 µm in diameter, with a spiny exine.

C. Thin-layer chromatography (2.2.27).

*Test solution* To 1 g of the powdered herbal drug (355) (2.9.12) add 10 mL of *ethanol (60 per cent VIV) R*. Shake for 15 min and filter.

*Reference solution* Dissolve 2.5 mg of *quinaldine red R* and 2.5 mg of *sulfan blue R* in 10 mL of *methanol R*.

Figure 1623.-1. – Illustration for identification test B of powdered herbal drug of roselle

**Plate** TLC silica gel plate R (5-40 µm) [or TLC silica gel plate R (2-10 µm)].

**Mobile phase** anhydrous formic acid R, water R, butanol R (10:12:40 V/V/V).

**Application** 5 µL [or 2 µL] as bands of 10 mm [or 8 mm].

**Development** Over a path of 10 cm [or 6 cm].

**Drying** In air.

**Detection** Examine immediately in daylight.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Quinacrine red: an orange-red zone	An intense violet zone
Sulfan blue: a blue zone	An intense violet-blue zone
Reference solution	Test solution

## TESTS

### Foreign matter (2.8.2)

Maximum 2 per cent of fragments of fruits (red funicles and parts of the 5-cavined capsule with yellowish-grey pericarp, whose thin walls consist of several layers of differently

directed fibres; flattened, reniform seeds with a dotted surface) and maximum 2 per cent of other foreign matter.

### Loss on drying (2.2.32)

Maximum 11.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

### Total ash (2.4.16)

Maximum 10.0 per cent.

### Colouring intensity

Reduce 100 g to a powder (1400) (2.9.12) and homogenise. Further reduce about 10 g of this powder to a finer powder (355) (2.9.12). To 1.0 g of this powder in a 100 mL flask add 25 mL of boiling water R and heat for 15 min on a water-bath with frequent shaking. Filter the hot mixture into a 50 mL graduated flask; rinse successively the 100 mL flask and the filter with 3 quantities, each of 5 mL, of warm water R. After cooling, dilute to 50 mL with water R. Dilute 5 mL of this solution to 50 mL with water R. Measure the absorbance (2.2.25) at 520 nm using water R as the compensation liquid. The absorbance is not less than 0.350 for the whole drug and not less than 0.250 for the cut drug.

### ASSAY

Shake 1.00 g of the powdered herbal drug (355) (2.9.12) with 100.0 mL of carbon dioxide-free water R for 15 min. Filter. To 50.0 mL of the filtrate add 100 mL of carbon dioxide-free water R. Titrate with 0.1 M sodium hydroxide to pH 7.0, determining the end-point potentiometrically (2.2.20).

1 mL of 0.1 M sodium hydroxide is equivalent to 6.4 mg of citric acid.

Ph Eur

## Rosemary Leaf

(Ph. Eur. monograph 1560)

Ph Eur

### DEFINITION

Whole, dried leaf of *Rosmarinus officinalis* L.

### Content

- minimum 12 mL/kg of essential oil (anhydrous drug);
- minimum 3 per cent of total hydroxycinnamic derivatives, expressed as rosmarinic acid (C<sub>18</sub>H<sub>16</sub>O<sub>8</sub>; M<sub>r</sub> 360.3) (anhydrous drug).

### CHARACTERS

Strongly aromatic odour.

### IDENTIFICATION

**A.** The leaves are sessile, tough, linear or linear-lanceolate, 1-4 cm long and 2-4 mm wide, with recurved edges. The upper surface is dark green, glabrous and grainy, the lower surface is greyish-green and densely tomentose with a prominent midrib.

**B.** Microscopic examination (2.8.23). The powder is greyish-green or yellowish-green. Examine under a microscope using chloral hydrate solution R. The powder shows the following diagnostic characters (Figure 1560.-1): fragments of the lower epidermis (surface view [B, J]) with straight or sinuous-walled cells [Ba] and numerous diacytic stomata (2.8.3) [Bb] and glandular trichomes [Ja] or covering trichomes or their scars [Bc, Bd]; numerous multicellular, mostly branched, covering trichomes of the lower epidermis, usually

fragmented [A, C, D]; fragments of the upper epidermis (surface view [F]) with cells with straight, thickened and pitted walls [Fa], and an underlying hypodermis composed of large, irregular cells with thickened and beaded anticlinal walls [Fb]; fragments of the lamina (transverse section [G]), showing the epidermis covered by a very thick cuticle [Ga], hypodermal cells extending across the mesophyll [Gb] at intervals, separating 1 or 2 layers of palisade parenchyma into large, crescent-shaped areas [Gc]; glandular trichomes of 2 types, the majority with a short, unicellular stalk and a radiate head composed of 8 cells (surface view [E], side view [H]), others, less abundant, with a uni- or bicellular stalk and a spherical, unicellular head [Ja, K].

Figure 1560.-1. – Illustration for identification test B of powdered herbal drug of rosemary leaf

#### C. Thin-layer chromatography (2.2.27).

**Test solution** Dissolve 20 µL of the oil obtained in the assay in 1 mL of *hexane R*.

**Reference solution** Dissolve 5 mg of *borneol R*, 5 mg of *bornyl acetate R* and 10 µL of *cineole R* in 1 mL of *hexane R*.

**Plate** TLC silica gel plate *R*.

**Mobile phase** *ethyl acetate R*, *toluene R* (5:95 *V/V*).

**Application** 10 µL as bands.

**Development** Over a path of 15 cm.

**Drying** In air.

**Detection** Treat with *anisaldehyde solution R*, heat at 100-105 °C for 10 min and examine in daylight.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution.

Top of the plate	
Bornyl acetate: a yellowish-brown zone	A red zone A yellowish-brown zone of low intensity
Cineole: a violet zone	A coloured zone of low intensity A violet zone
Borneol: a violet-brown zone	Coloured zones of low intensity A violet-brown zone
Reference solution	A coloured zone of low intensity Test solution

#### D. Thin-layer chromatography (2.2.27).

**Test solution** Grind 1.0 g of the herbal drug in 10 mL of *methanol R* and filter.

**Reference solution** Dissolve 1.0 mg of *caffeic acid R* and 5.0 mg of *rosmarinic acid R* in 10 mL of *methanol R*.

**Plate** TLC silica gel plate *R*.

**Mobile phase** *anhydrous formic acid R*, *acetone R*, *methylene chloride R* (8.5:25:85 *V/V/V*).

**Application** 10 µL of the test solution and 20 µL of the reference solution, as bands.

**Development** Over a path of 8 cm.

**Drying** In air.

**Detection** Examine in ultraviolet light at 365 nm.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution.

Top of the plate	
Caffeic acid: a light blue fluorescent zone	A pink fluorescent zone A blue fluorescent zone of low intensity
Rosmarinic acid: a light blue fluorescent zone	An intense light blue fluorescent zone
Reference solution	Test solution

#### TESTS

##### Foreign matter (2.8.2)

Maximum 5 per cent of stems and maximum 2 per cent of other foreign matter.

##### Water (2.2.13)

Maximum 100 mL/kg, determined on 20.0 g of the powdered herbal drug (355) (2.9.12).

##### Total ash (2.4.16)

Maximum 9.0 per cent.

#### ASSAY

##### Total hydroxycinnamic derivatives

**Stock solution** To 0.200 g of the powdered herbal drug (355) (2.9.12) add 80 mL of *ethanol (50 per cent V/V) R*. Boil in a water-bath under a reflux condenser for 30 min. Allow to cool and filter. Rinse the filter with 10 mL of *ethanol (50 per cent V/V) R*. Combine the filtrate and the rinsings in a volumetric flask and dilute to 100.0 mL with *ethanol (50 per cent V/V) R*.

**Test solution** To 1.0 mL of the stock solution add 2 mL of 0.5 M *hydrochloric acid*, 2 mL of a solution prepared by dissolving 10 g of *sodium nitrite R* and 10 g of *sodium*

molybdate R in 100 mL of water R, and then add 2 mL of dilute sodium hydroxide solution R and dilute to 10.0 mL with water R; mix.

**Compensation solution** Dilute 1.0 mL of the stock solution to 10.0 mL with water R.

Measure immediately the absorbance (2.2.25) of the test solution at 505 nm.

Calculate the percentage content of total hydroxycinnamic derivatives, expressed as rosmarinic acid, using the following expression:

$$\frac{A \times 2.5}{m}$$

i.e. taking the specific absorbance of rosmarinic acid to be 400.

*A* = absorbance of the test solution at 505 nm;  
*m* = mass of the substance to be examined, in grams.

### Essential oil (2.8.12)

Use 25.0 g of the crushed herbal drug, a 1000 mL flask and 300 mL of water R as the distillation liquid. Distil at a rate of 2-3 mL/min for 3 h.

Ph Eur

## Rosemary Oil

(Ph. Eur. monograph 1846)

Ph Eur

### DEFINITION

Essential oil obtained by steam distillation from the flowering aerial parts of *Rosmarinus officinalis* L.

### CHARACTERS

#### Appearance

Clear, mobile, colourless or pale yellow liquid.

Characteristic odour.

### IDENTIFICATION

**First identification: B.**

**Second identification: A.**

**A. Thin-layer chromatography (2.2.27).**

**Test solution** Dissolve 0.5 mL of the substance to be examined in toluene R and dilute to 10 mL with the same solvent.

**Reference solution** Dissolve 50 mg of borneol R, 50 mg of bornyl acetate R and 100 µL of cineole R in toluene R and dilute to 10 mL with the same solvent.

**Plate** TLC silica gel plate R.

**Mobile phase** ethyl acetate R, toluene R (5:95 V/V).

**Application** 10 µL, as bands.

**Development** Over a path of 15 cm.

**Drying** In air.

**Detection** Spray the plate with vanillin reagent R and heat the plate at 100-105 °C for 10 min. Examine immediately in daylight.

**Results** See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, several violet-blue to violet-grey zones of medium intensity (terpene alcohols) are present in

the lower third of the chromatogram obtained with the test solution.

Top of the plate	
	An intense violet zone
	A violet-grey zone
Bornyl acetate: a bluish-grey zone of low intensity	A bluish-grey zone of low intensity (bornyl acetate)
	A violet-pink zone
Cineole: an intense blue zone	An intense blue zone (cineole)
Borneol: a violet-blue zone of medium intensity	A violet-blue zone of medium intensity (borneol)
Reference solution	Test solution

**B. Examine the chromatograms obtained in the test for chromatographic profile.**

**Results** The characteristic peaks in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with the reference solution.

### TESTS

**Relative density (2.2.5)**  
0.895 to 0.920.

**Refractive index (2.2.6)**  
1.464 to 1.473.

**Optical rotation (2.2.7)**  
-5° to +8°.

**Acid value (2.5.1)**  
Maximum 1.0.

### Chromatographic profile

**Gas chromatography (2.2.28):** use the normalisation procedure.

**Test solution** Dissolve 0.20 mL of the substance to be examined in hexane R and dilute to 10.0 mL with the same solvent.

**Reference solution** Dissolve 20 µL of α-pinene R, 10 mg of camphene R, 20 µL of β-pinene R, 10 µL of β-myrcene R, 20 µL of limonene R, 50 µL of cineole R, 10 µL of p-cymene R, 50 mg of camphor R, 30 mg of bornyl acetate R, 10 mg of α-terpineol R, 10 mg of borneol R and 10 µL of verbenone R in hexane R and dilute to 10.0 mL with the same solvent.

### Column:

- material: fused silica,
- size: *l* = 30 m (a film thickness of 1 µm may be used) to 60 m (a film thickness of 0.2 µm may be used),  
Ø = 0.25-0.53 mm,
- stationary phase: macrogol 20 000 R.

**Carrier gas** helium for chromatography R.

**Flow rate** 1 mL/min.

**Split ratio** 1:50.

## Temperature:

	Time (min)	Temperature (°C)
Column	0 - 10	50
	10 - 85	50 → 200
	85 - 110	200
Injection port		200
Detector		250

**Detection** Flame ionisation.

**Injection** 1 µL.

**Elution order** Order indicated in the composition of the reference solution. Record the retention times of these substances.

**System suitability** Reference solution:

- **resolution:** minimum 1.5 between the peaks due to limonene and cineole and minimum 1.5 between the peaks due to  $\alpha$ -terpineol and borneol.

Using the retention times determined from the chromatogram obtained with the reference solution, locate the components of the reference solution in the chromatogram obtained with the test solution.

Determine the percentage content of these components.

For rosemary oil, Spanish type, the percentages are within the following ranges:

- $\alpha$ -pinene: 18 per cent to 26 per cent,
- camphene: 8.0 per cent to 12.0 per cent,
- $\beta$ -pinene: 2.0 per cent to 6.0 per cent,
- $\beta$ -myrcene: 1.5 per cent to 5.0 per cent,
- limonene: 2.5 per cent to 5.0 per cent,
- cineole: 16.0 per cent to 25.0 per cent,
- *p*-cymene: 1.0 per cent to 2.2 per cent,
- camphor: 13.0 per cent to 21.0 per cent,
- bornyl acetate: 0.5 per cent to 2.5 per cent,
- $\alpha$ -terpineol: 1.0 per cent to 3.5 per cent,
- borneol: 2.0 per cent to 4.5 per cent,
- verbenone: 0.7 per cent to 2.5 per cent.

For rosemary oil, Moroccan and Tunisian type, the percentages are within the following ranges:

- $\alpha$ -pinene: 9.0 per cent to 14.0 per cent,
- camphene: 2.5 per cent to 6.0 per cent,
- $\beta$ -pinene: 4.0 per cent to 9.0 per cent,
- $\beta$ -myrcene: 1.0 per cent to 2.0 per cent,
- limonene: 1.5 per cent to 4.0 per cent,
- cineole: 38.0 per cent to 55.0 per cent,
- *p*-cymene: 0.8 per cent to 2.5 per cent,
- camphor: 5.0 per cent to 15.0 per cent,
- bornyl acetate: 0.1 per cent to 1.5 per cent,
- $\alpha$ -terpineol: 1.0 per cent to 2.6 per cent,
- borneol: 1.5 per cent to 5.0 per cent,
- verbenone: maximum 0.4 per cent;

**STORAGE**

At a temperature not exceeding 25 °C.

**LABELLING**

The label states that the content is Spanish type or Moroccan and Tunisian type.

**Round Amomum Fruit**

(Ph. Eur. monograph 2555)

Ph Eur

**DEFINITION**

Dried, whole, peeled or unpeeled ripe fruit of *Amomum krervanh* Pierre ex Gagnep. or *Amomum compactum* Sol. ex Maton.

**Content**

- **essential oil:** minimum 50 mL/kg for *A. krervanh* (anhydrous drug) and minimum 40 mL/kg for *A. compactum* (anhydrous drug);
- **1,8-cineole** (C<sub>10</sub>H<sub>18</sub>O; *M<sub>r</sub>* 154.3): minimum 65.0 per cent of the essential oil.

**IDENTIFICATION**

**A. *A. krervanh*.** The fruit is a trilobular, indehiscent capsule, subspherical, about 1.5-2 cm in diameter. The outer surface is whitish-yellow or pale brownish-yellow, smooth, and shows 3 deep longitudinal furrows. The apex bears a prominent stylopodium; the base shows the dentate scar of the stalk. Both ends and the hollows of the furrows are covered by a pale brown pubescence. The thin, brittle pericarp is easily broken, showing 3 locules each containing 4-10 seeds. The seeds are hard, irregularly polyhedral, with a slightly raised dorsal surface, 3-4 mm in diameter, brown on the surface, finely wrinkled, bearing the remains of the fine, membranous aril.

***A. compactum*** The fruit is a trilobular, indehiscent capsule, subspherical, about 1-2 cm in diameter. The outer surface is whitish-yellow or pale brownish-yellow, sometimes slightly reddish, and shows about 15 longitudinal furrows, 3 of which are deep. The apex bears a prominent stylopodium; the stalk is usually fragmented. Both ends and the hollows of the furrows are covered by a brownish-yellow pubescence. The thin, brittle pericarp is easily broken, showing 3 locules each containing 6-12 seeds. The seeds are hard, irregularly polyhedral, 2-3 mm in diameter, blackish-brown on the surface, wrinkled, bearing the remains of the transparent, membranous aril.

**B. *A. krervanh*.** Microscopic examination (2.8.23).

The powder is greyish-brown. Examine under a microscope using chloral hydrate solution R. The powder shows the following diagnostic characters: fragments of epicarp consisting of polyhedral cells, numerous scars of covering trichomes with thick, channelled walls and rare stomata, paracytic or anomocytic (2.8.3); covering trichomes, mostly unicellular and usually fragmented, with regularly thickened walls, up to 800 µm in length; fragments of mesocarp composed of round cells with spaces between them, containing fine acicular crystals or prisms of calcium oxalate; groups of ovoid sclereids with thick, channelled walls, about 50 µm in diameter, from the inner layers of the mesocarp; vascular bundles composed of spiral or reticulate vessels accompanied by fibres with thick, channelled walls and sclereids; fragments of the aril consisting of very fine cells, some of which contain small crystals; fragments of the outer testa consisting of elongated cells with distinct, yellow, finely and regularly thickened walls and rounded ends, accompanied by an underlying layer consisting of rectangular or polyhedral cells with orange-yellow contents, perpendicular to the previous layer; fragments of the reddish-brown inner testa composed of very thick-walled cells, regularly polyhedral in surface view and U-shaped in side view; fragments of the endosperm with round cells. Examine

Ph Eur

under a microscope using a 50 per cent *VIV* solution of *glycerol R*. The powder shows numerous round cells of the endosperm, filled with small starch granules aggregated into masses and free aggregates of starch granules.

**A. compactum** Microscopic examination (2.8.23). The powder is yellowish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of epicarp consisting of polyhedral cells, numerous scars of covering trichomes with thick, channelled walls and rare stomata, usually paracytic (2.8.3); unicellular covering trichomes, usually fragmented, with regularly thickened walls, up to 800 µm in length; fragments of mesocarp composed of round cells with spaces between them, containing fine acicular crystals or prisms of calcium oxalate, and oil cells; groups of ovoid sclereids with thick, channelled walls, about 50 µm in diameter, from the inner layers of the mesocarp; vascular bundles composed of spiral or reticulate vessels accompanied by fibres with thick, channelled walls and sclereids; fragments of the aril consisting of very fine cells, some of which contain small crystals; fragments of the pale yellow outer testa consisting of elongated cells with indistinct walls and rounded ends, accompanied by an underlying layer consisting of rectangular or polyhedral cells with dark orange-red contents, perpendicular to the previous layer; fragments of the reddish-brown inner testa composed of thick-walled cells, regularly polyhedral in surface view and U-shaped in side view; fragments of the endosperm, with polyhedral cells. Examine under a microscope using a 50 per cent *VIV* solution of *glycerol R*. The powder shows numerous fragments of the endosperm with polyhedral cells, filled with small starch granules aggregated into masses and free aggregates of starch granules.

**C. Thin-layer chromatography (2.2.27).**

**Test solution** To 1 g of the powdered herbal drug (355) (2.9.12) add 5 mL of *methylene chloride R*. Sonicate for 10 min. Centrifuge and use the supernatant.

**Reference solution** Dissolve 10 µL of *bornyl acetate R*, 10 µL of *cineole R* and 10 mg of *borneol R* in 1 mL of *toluene R*.

**Plate** TLC silica gel plate R (2-10 µm).

**Mobile phase** *ethyl acetate R*, *toluene R* (7:93 *VIV*).

**Application** 5 µL as bands of 8 mm.

**Development** Over a path of 6 cm.

**Drying** In air.

**Detection A** Examine in ultraviolet light at 366 nm.

**Results A** See below the sequence of zones present in the chromatogram obtained with the test solution. The reference solution shows no spots at 366 nm. Furthermore, other faint fluorescent zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
	A blue fluorescent zone
	A blue fluorescent zone
Reference solution	Test solution

**Detection B** Treat with *anisaldehyde solution R*, heat at 100-105 °C for 3 min and examine in daylight.

**Results B** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
	A reddish-brown zone
	A bluish-violet zone
Bornyl acetate: a greyish-brown zone	
	A bluish-violet zone (1,8-cineole)
1,8-Cineole: a bluish-violet zone	A greyish-brown zone
Borneol: a greyish-brown zone at the border between the middle and lower thirds	
	A bluish-violet zone
	1 or 2 bluish-violet zones
Reference solution	Test solution

**TESTS**

**Water (2.2.13)**

Maximum 120 mL/kg, determined by distillation on 20.0 g of the powdered herbal drug (355) (2.9.12).

**Total ash (2.4.16)**

Maximum 8.0 per cent.

**ASSAY**

**Essential oil (2.8.12)**

Use 10.0 g of the herbal drug reduced to a powder (1400) (2.9.12) immediately before the assay, a 500 mL round-bottomed flask, 200 mL of *water R* as the distillation liquid and 0.5 mL of *trimethylpentane R* in the graduated tube. Distil at a rate of 3-3.5 mL/min for 5 h.

**1,8-Cineole**

Gas chromatography (2.2.28): use the normalisation procedure.

**Test solution** Dilute a volume of the essential oil-trimethylpentane mixture obtained in the assay of essential oil corresponding to 150 µL of the essential oil in *heptane R* and dilute to 10.0 mL with the same solvent.

**Reference solution (a)** Dilute 10 µL of  $\beta$ -pinene R and 15 µL of *cineole R* in *heptane R* and dilute to 5.0 mL with the same solvent.

**Reference solution (b)** Dilute 5 µL of *cineole R* to 100.0 mL with *heptane R*. Dilute 1.5 mL of the solution to 10.0 mL with *heptane R*.

**Column:**

- material: fused silica;
- size:  $l = 60$  m,  $\varnothing = 0.25$  mm;
- stationary phase: *macrogol 20 000 R* (film thickness  $0.25$   $\mu\text{m}$ ).

Carrier gas *helium for chromatography R*.

Flow rate  $0.9$  mL/min.

Split ratio 1:50.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 60	60 → 210
Injection port		230
Detector		250

Detection Flame ionisation.

Injection  $1$   $\mu\text{L}$ .

**Identification of peaks** Use the chromatogram obtained with reference solution (a) to identify the peaks due to  $\beta$ -pinene and 1,8-cineole.

**Relative retention** With reference to  $\beta$ -pinene (retention time = about 11 min): 1,8-cineole = about 1.3.

**System suitability** Reference solution (a):

— resolution: minimum 5 between the peaks due to  $\beta$ -pinene and 1,8-cineole.

Calculate the percentage content of 1,8-cineole. Disregard any peak due to the solvent or with an area less than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

**LABELLING**

The label states the species present.

Ph Eur

**Safflower Flower**

(Ph. Eur. monograph 2386)

Ph Eur

**DEFINITION**

Dried flower of *Carthamus tinctorius* L.

**Content**

Minimum 1.0 per cent of total flavonoids, expressed as hyperoside ( $\text{C}_{21}\text{H}_{20}\text{O}_{12}$ ;  $M_r$  464.4) (dried drug).

**IDENTIFICATION**

A. The orange-yellow or reddish-orange, tubular, gamopetalous, actinomorphic florets are separate from the capitulum. Each floret consists of a long, filiform tube, about 1 cm long divided into 5 equal, narrow, lanceolate lobes, about 0.5 cm long. From the opening of the tube emerges the hollow cylinder formed by the fused yellow anthers, in which the filiform style persists, thickened near the apex.

B. Microscopic examination (2.8.23). The powder is orange-yellow. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2386.-1): fragments of the corolla tube [E] with epidermis consisting of elongated, thin-walled, finely striated cells whose margins are lobed [B, Ea, J], and with parenchyma consisting of small polygonal cells containing prisms of calcium oxalate [Eb]; outer epidermis bearing glandular trichomes, usually sheared off, with only the

base [Ja] persisting on the epidermis; these trichomes are isolated, biseriate with a multicellular stalk and a bicellular head [C]; fragments of the lobes of the corolla showing at their apices a large number of small, rounded, very prominent papillae [G]; fragments of parenchyma containing vascular bundles [Ed] surrounded by secretory canals with reddish-brown contents [Ec]; fragments of the filaments of the anthers consisting of elongated, thick-walled, pitted cells [K] and fragments of the characteristic layer of the anther whose walls show thickenings in bands [H]; fragments of the stigma, covered with rather long, conical papillae [D], usually accompanied by pollen grains; rounded or elliptical pollen grains up to  $60$   $\mu\text{m}$  in diameter with 3 pores and an echinulate exine [A]; isolated prisms of calcium oxalate [F].

Figure 2386.-1. – Illustration for identification test B of powdered herbal drug of safflower flower

C. Thin-layer chromatography (2.2.27).

**Test solution** To 1.0 g of the powdered herbal drug (355) (2.9.12) add 10 mL of *methanol R*. Sonicate for 10 min and centrifuge.

**Reference solution** Dissolve 1 mg of *rutoside trihydrate R* and 5 mg of *quercetin dihydrate R* in 50 mL of *methanol R*.

**Plate** TLC silica gel plate R (5-40  $\mu\text{m}$ ) [or TLC silica gel plate R (2-10  $\mu\text{m}$ )].

**Mobile phase** *acetic acid R*, *anhydrous formic acid R*, *water R*, *ethyl acetate R* (11:11:27:100 V/V/V/V).

**Application** 25  $\mu\text{L}$  [or 10  $\mu\text{L}$ ] as bands of 15 mm [or 8 mm].

**Development** Over a path of 12 cm [or 7 cm].

**Drying** In air.

**Detection A** Examine in daylight.

**Results A** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Top of the plate

## TESTS

### Absorbance (2.2.25)

**A. Yellow pigment:** macerate 0.1 g of the powdered herbal drug (355) (2.9.12) in 150 mL of *water R*, stir for 1 h, filter through a sintered-glass filter (40) (2.1.2) and dilute to 500.0 mL, washing the residue, with *water R*. The absorbance is not less than 0.40 at 401 nm.

**B. Red pigment:** to 0.25 g of the powdered herbal drug (355) (2.9.12) add 50 mL of a mixture of 20 volumes of *water R* and 80 volumes of *acetone R*. Heat on a water-bath at 50 °C for 90 min. Allow to cool, filter through a sintered-glass filter

(40) (2.1.2) and dilute to 100.0 mL, washing the residue with a mixture of 20 volumes of *water R* and 80 volumes of *acetone R*. The absorbance is not less than 0.40 at 518 nm.

### Loss on drying (2.2.32)

Maximum 11.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

### Total ash (2.4.16)

Maximum 10.0 per cent.

### Ash insoluble in hydrochloric acid (2.8.1)

Maximum 3.0 per cent.

## ASSAY

**Solution A** Place 0.250 g of the powdered herbal drug (180) (2.9.12) in a 250 mL flask and add 95 mL of *methanol R*. Heat under a reflux condenser on a water-bath for 30 min. Allow to cool and filter. Rinse the filter with 5 mL of *methanol R*. Combine the filtrate and the rinsing solution in a volumetric flask and dilute to 100.0 mL with *methanol R*.

**Test solution** Place 5.0 mL of solution A in a volumetric flask and dilute to 20.0 mL with a 20 g/L solution of *aluminium chloride R* in *methanol R*.

**Compensation solution** Place 5.0 mL of solution A in a volumetric flask and dilute to 20.0 mL with *methanol R*.

After exactly 15 min, measure the absorbance (2.2.25) of the test solution at 420 nm by comparison with the compensation solution. Calculate the percentage content of total flavonoids, expressed as hyperoside, using the following expression:

$$\frac{A}{m}$$

taking the specific absorbance of hyperoside at 420 nm to be 400.

$A$  = absorbance of the test solution at 420 nm;  
 $m$  = mass of the herbal drug to be examined, in grams.

Ph Eur

## Sage Leaf

(*Sage Leaf (Salvia officinalis)*, Ph. Eur. monograph 1370)

### Preparation

Sage Tincture

Ph Eur

### DEFINITION

Whole or cut, dried leaves of *Salvia officinalis* L.

### Essential oil content:

- for the whole drug, minimum 12 mL/kg (anhydrous drug);
- for the cut drug, minimum 10 mL/kg (anhydrous drug).

### IDENTIFICATION

**A.** The lamina of whole sage leaf (*Salvia officinalis*) is about 2-10 cm long and 1-2 cm wide, oblong-ovate, elliptical. The margin is finely crenate to smooth. The apex is rounded or subacute and the base is shrunken at the petiole and rounded or cordate. The upper surface is greenish-grey and finely granular; the lower surface is white and pubescent and shows a dense network of raised veinlets.

**B. Microscopic examination (2.8.23).** The powder is light grey or brownish-green. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 1370.-1): very numerous articulated and bent covering trichomes with narrow elongated cells and a base cell with very thick walls, whole [Bc] or fragmented, either isolated [C, G, H] or on an epidermis (surface view [Be], transverse section [Ab]); glandular trichomes of lamiate type, with a unicellular stalk and an 8- to 12-celled head covered by a common cuticle, isolated (side view [D]) or on an epidermis (surface view [Fa]); small glandular trichomes with a unicellular [Aa, Bd] or multicellular [Fb] stalk and a unicellular head, usually on an epidermis; more rarely, glandular trichomes (surface view [Eb, Ec], side view [Ed]) with a unicellular stalk [Ec] and a bicellular head [Eb, Ed]; fragments of the upper epidermis (surface view [E], transverse section [A]) with pitted, somewhat polygonal cells [Ea], covering trichomes and glandular trichomes, sometimes accompanied by 1 or 2 layers of palisade parenchyma [Ac, Ee]; some diacytic stomata (2.8.3) may be present; fragments of the lower epidermis [B, F] with sinuous cells [Ba] and numerous diacytic stomata (2.8.3) [Bb].

Figure 1370.-1. – Illustration for identification test B of powdered herbal drug of sage leaf

**C. Thin-layer chromatography (2.2.27).**

**Test solution** Shake 0.5 g of the freshly powdered herbal drug (355) (2.9.12) with 5 mL of *ethanol R* for 5 min.

**Reference solution** Dissolve 20 µL of *thujone R* and 25 µL of *cineole R* in 20 mL of *ethanol R*.

**Plate** TLC silica gel plate R.

**Mobile phase** *ethyl acetate R*, *toluene R* (5:95 V/V).

**Application** 20 µL as bands.

**Development** Over a path of 15 cm.

**Drying** In air.

**Detection** Treat with a 200 g/L solution of *phosphomolybdic acid R* in *ethanol R* and heat at 100-105 °C for 10 min; examine in daylight.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones are present in the chromatogram obtained with the test solution.

Top of the plate	
	A blue zone (near the solvent front)
$\alpha$ -Thujone and $\beta$ -thujone: 2 pinkish-violet zones	2 pinkish-violet zones ( $\alpha$ -thujone and $\beta$ -thujone)
Cineole: a blue zone	A blue zone (cineole)
	Blue zones
Reference solution	Test solution

**TESTS**

**Foreign matter (2.8.2)**

Maximum 3 per cent of stems and maximum 2 per cent of other foreign matter.

**Water (2.2.13)**

Maximum 100 mL/kg, determined on 20.0 g.

**Total ash (2.4.16)**

Maximum 10.0 per cent.

**ASSAY**

**Essential oil (2.8.12)**

Use 20.0 g of the herbal drug, cut, if necessary, immediately before the assay, a 500 mL flask and 250 mL of *water R* as the distillation liquid. Add 0.50 mL of *xylene R* in the graduated tube. Distil at a rate of 2-3 mL/min for 2 h.

Ph Eur

**Sage Tincture**

(Ph. Eur. monograph 1889)

Ph Eur

**DEFINITION**

Tincture produced from *Sage leaf (Salvia officinalis)* (1370).

**Content**

Minimum 0.1 per cent *m/m* of essential oil.

**PRODUCTION**

The tincture is produced from 1 part of comminuted drug and 10 parts of ethanol (70 per cent V/V) by a suitable procedure.

**CHARACTERS**

**Appearance**

Brownish liquid with a characteristic odour.

**IDENTIFICATION**

Thin-layer chromatography (2.2.27).

**Test solution** The tincture to be examined.

**Reference solution** Dissolve 20 µL of *thujone R* and 25 µL of *cineole R* in 20 mL of *ethanol R*.

Plate TLC silica gel plate R.

Mobile phase ethyl acetate R, toluene R (5:95 V/V).

Application 20 µL, as bands.

Development Over a path of 15 cm.

Drying In air.

Detection Spray with a 200 g/L solution of phosphomolybdic acid R in ethanol R and heat at 100-105 °C for 10 min.

Examine in daylight.

Results See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones are present in the chromatogram obtained with the test solution.

Reference solution	Test solution

#### TESTS

**Ethanol content (2.9.10)**

64 per cent V/V to 69 per cent V/V.

**Methanol and 2-propanol (2.9.11)**

Maximum 0.05 per cent V/V of methanol and maximum 0.05 per cent of 2-propanol.

**Dry residue (2.8.16)**

Minimum 2.0 per cent, determined on 3.00 g.

#### ASSAY

In a 500 mL round-bottomed flask, place 30.0 g of the tincture and add 100 mL of water R. Distil, using a descending condenser, into a separating funnel which has been marked beforehand at 50 mL. Stop the distillation process as soon as the distillate reaches the 50 mL mark. Rinse the condenser with 10 mL of pentane R. Dissolve in the distillate sufficient sodium chloride R to produce a saturated solution. Shake with 3 quantities, each of 20 mL, of pentane R. Dry the combined pentane layers, including the pentane from rinsing the condenser, over anhydrous sodium sulfate R and filter through a plug of absorbent cotton into a weighed 100 mL round-bottomed flask. Wash the sodium sulfate several times with small quantities of pentane R. Remove the pentane carefully at a temperature not exceeding 40 °C. Dry the residue in a desiccator over diphosphorus pentoxide R and hard paraffin at atmospheric pressure and at room temperature for 2 h. Weigh the residue (essential oil).

Ph Eur

## Three-lobed Sage Leaf

(Ph. Eur. monograph 1561)

Ph Eur

#### DEFINITION

Whole or cut, dried leaves of *Salvia fruticosa* Mill. (syn. *Salvia triloba* L. fil).

**Essential oil content:**

— for the whole drug, minimum 18 mL/kg (anhydrous drug);

— for the cut drug, minimum 12 mL/kg (anhydrous drug).

#### CHARACTERS

Spicy odour when ground, similar to eucalyptus oil.

#### IDENTIFICATION

A. The lamina of whole three-lobed sage leaf is about 8-50 mm long and about 4-20 mm wide, and oblong-ovate or lanceolate. The margin is finely crenate and undulate but indistinct owing to the dense, hairy covering on both surfaces. The base is obtuse and sometimes bears 1 or 2 more or less developed lobes. The upper surface is grey-tomentose pubescent, the lower surface is densely white-tomentose pubescent; the venation is indistinct. The densely white-tomentose pubescent petiole is about 1 mm in diameter.

B. Microscopic examination (2.8.23). The powder is greyish-green and tomentose. Examine under a microscope using chloral hydrate solution R. The powder shows the following diagnostic characters (Figure 1561.-1): very numerous covering and glandular trichomes, whole and attached to fragments of the epidermises [A, D, G, H] or fragmented and free [B, C, E, F]; uniseriate covering trichomes, either unicellular [Ab] or multicellular articulated and thick-walled [Ad]; those on the upper epidermis are straight [Ga], those on the lower epidermis are tortuous [Da]; glandular trichomes of 2 types: some with a unicellular [Hd] or multicellular [Ca, Gb, He] stalk and a unicellular [Cb, Hd] or bicellular [Cc] head; others of lamiate type, with a unicellular stalk and a head composed of 8-12 radiating cells with a raised common cuticle [Ae, B]; the upper epidermis (surface view [A], transverse section [G]) with pitted and beaded cells [Aa], somewhat polygonal, with a few diacytic stomata (2.8.3), covering trichomes [Ab, Ad, Ga] or their scars [Ac] and glandular trichomes [Ae, Af, Gb]; the lower epidermis (surface view [H], transverse section [D]) with sinuous or wavy-walled cells [Ha] and numerous diacytic stomata (2.8.3) [Hb], glandular trichomes [Db, Hd, He] and covering trichomes [Da, Hc], some of which are unicellular and short, with finely pitted walls [Dc].

C. Examine the chromatograms obtained in the test for thujone.

Results The chromatogram obtained with the test solution shows a blue zone due to cineole, equal or greater in size and intensity to the zone in the chromatogram obtained with the reference solution. Further zones are present.

Figure 1561.-1. —Illustration for identification test B of powdered herbal drug of three-lobed sage leaf

### TESTS

#### Thujone

Thin-layer chromatography (2.2.27).

**Test solution** Shake 0.3 g of the freshly powdered herbal drug (355) (2.9.12) with 5.0 mL of anhydrous ethanol R for 5 min.

**Reference solution** Dilute 20 μL of thujone R and 25 μL of cineole R in 20 mL of anhydrous ethanol R.

**Plate** TLC silica gel plate R.

**Mobile phase** ethyl acetate R, toluene R (5:95 V/V).

**Application** 20 μL as bands.

**Development** Over a path of 15 cm.

**Drying** In air.

**Detection** Treat with a 200 g/L solution of phosphomolybdic acid R in anhydrous ethanol R and heat at 100–105 °C for 10 min. Examine in daylight.

**Results** The chromatogram obtained with the reference solution shows in the middle part a blue zone (cineole) and in the upper part a pink-blue zone (thujone). The chromatogram obtained with the test solution shows no zone or a very faint pink-blue zone due to thujone.

#### Foreign matter (2.8.2)

Maximum 8 per cent of stems and maximum 2 per cent of other foreign matter.

#### Water (2.2.13)

Maximum 100 mL/kg, determined on 20.0 g.

#### Total ash (2.4.16)

Maximum 10.0 per cent.

### ASSAY

#### Essential oil (2.8.12)

Use 20.0 g of the herbal drug, cut, if necessary, immediately before the assay, a 500 mL flask and 250 mL of water R as

the distillation liquid. Add 0.50 mL of xylene R in the graduated tube. Distil at a rate of 2–3 mL/min for 2 h.

Ph Eur

## Sage Oil

(Clary Sage Oil, Ph. Eur. monograph 1850)

Ph Eur

### DEFINITION

Essential oil obtained by steam distillation from the fresh or dried flowering stems of *Salvia sclarea* L.

### CHARACTERS

#### Appearance

Colourless or brownish-yellow liquid, usually pale yellow.

Characteristic odour.

### IDENTIFICATION

**First identification:** B.

**Second identification:** A.

**A.** Thin-layer chromatography (2.2.27).

**Test solution** Dissolve 1 mL of the substance to be examined in toluene R and dilute to 10 mL with the same solvent.

**Reference solution** Dissolve 60 μL of linalol R, 200 μL of linalyl acetate R and 60 μL of α-terpineol R in toluene R and dilute to 10 mL with the same solvent.

**Plate** TLC silica gel plate R.

**Mobile phase** ethyl acetate R, toluene R (5:95 V/V).

**Application** 5 μL of the test solution and 10 μL of the reference solution, as bands.

**Development** Over a path of 15 cm.

**Drying** In air.

**Detection** Spray with vanillin reagent R and heat at 100–105 °C for 5–10 min; examine in daylight within 5 min.

**Results** See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones are present in the chromatogram obtained with the test solution.

Top of the plate	
α-Terpineol: a dark violet zone	A dark violet zone
Linalyl acetate: a dark violet zone	A dark violet zone
Linalol: a dark violet zone	A dark violet zone
Reference solution	Test solution

**B.** Examine the chromatograms obtained in the test for chromatographic profile.

**Results** The chromatogram obtained with the test solution shows 5 peaks similar in position to the 5 peaks in the chromatogram obtained with the reference solution. The 2 peaks corresponding to α- and β-thujone may be absent.

### TESTS

#### Relative density (2.2.5)

0.890 to 0.908.

#### Refractive index (2.2.6)

1.456 to 1.466.

**Optical rotation (2.2.7)**

-26° to -10°.

**Acid value (2.5.1)**

Maximum 1.0.

**Chromatographic profile**

Gas chromatography (2.2.28): use the normalisation procedure.

**Test solution** The substance to be examined.**Reference solution** To 1 g of hexane R, add 5 µL of thujone R, 5 µL of linalol R, 100 µL of linalyl acetate R, 10 µL of α-terpineol R and 25 mg (± 20 per cent) of sclareol R. Mix thoroughly by stirring.**Column:**— **material:** fused silica,— **size:** *l* = 30 m (a film thickness of 1 µm may be used) to 60 m (a film thickness of 0.2 µm may be used),  
Ø = 0.25-0.53 mm,— **stationary phase:** macrogol 20 000 R.**Carrier gas** helium for chromatography R.**Split ratio** 1:100.**Temperature:**

	Time (min)	Temperature (°C)
Column	0 - 10	60
	10 - 75	60 → 190
	75 - 120	190
Injection port		220
Detector		240

**Detection** Flame ionisation.**Injection** 0.2 µL.**Elution order** Order indicated in the composition of the reference solution. Record the retention times of these substances.**System suitability** Reference solution:— **resolution:** minimum 1.5 between the peaks due to linalol and linalyl acetate,

Using the retention times determined from the chromatogram obtained with the reference solution, locate the components of the reference solution in the chromatogram obtained with the test solution (disregard any peak due to hexane). Thujone R is a mixture of α- and β-thujone. α-Thujone elutes before β-thujone under the described conditions.

Determine the percentage content of each of these components.

Also determine the percentage content of germacrene-D.

The germacrene-D peak can be identified in the chromatogram obtained with the test solution by its relative retention of 1.23 with reference to linalol under the described operating conditions.

The percentages are within the following ranges:

- α- and β-thujone: maximum 0.2 per cent,
- linalol: 6.5 per cent to 24 per cent,
- linalyl acetate: 56 per cent to 78 per cent,
- α-terpineol: maximum 5.0 per cent,
- germacrene-D: 1.0 per cent to 12 per cent,
- sclareol: 0.4 per cent to 2.6 per cent.

**STORAGE**

At a temperature not exceeding 25 °C.

**Spanish Sage Oil**

(Ph. Eur. monograph 1849)

Ph Eur

**DEFINITION**Essential oil obtained by steam distillation from the aerial parts of *Salvia lavandulifolia* Vahl, collected at the flowering stage.**CHARACTERS****Appearance**

Clear, colourless or pale yellow, mobile liquid.

Camphor-like odour.

**IDENTIFICATION****First identification:** B.**Second identification:** A.

A. Thin-layer chromatography (2.2.27).

**Test solution** Dissolve 0.1 mL of the essential oil to be examined in 10 mL of toluene R.**Reference solution** Dissolve 20 µL of thujone R and 30 µL of cineole R in 10 mL of toluene R.**Plate** TLC silica gel plate R (5-40 µm) [or TLC silica gel plate R (2-10 µm)].**Mobile phase** ethyl acetate R, toluene R (5:95 V/V).**Application** 10 µL [or 3 µL] as bands of 10 mm [or 6 mm].**Development** Over a path of 15 cm [or 6 cm].**Drying** In air.**Detection** spray with a freshly prepared 200 g/L solution of phosphomolybdic acid R in ethanol (96 per cent) R and heat at 105 °C for 10 min; examine in daylight.**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
	A blue zone
Thujone: 2 pinkish-violet zones	
Cineole: a blue zone	A blue zone (cineole)
	3 blue zones
Reference solution	Test solution

B. Examine the chromatograms obtained in the test for chromatographic profile.

**Results** The characteristic peaks in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with reference solution (a).**TESTS****Relative density (2.2.5)**

0.907 to 0.932.

**Refractive index (2.2.6)**

1.465 to 1.473.

**Optical rotation (2.2.7)**

+ 7° to + 17°.

Ph Eur

**Acid value (2.5.1)**

Maximum 2.0, determined on 5.00 g.

**Solubility in alcohol (2.8.10)**

1 volume is soluble in 2 volumes and more of ethanol (80 per cent V/V) R.

**Chromatographic profile**

Gas chromatography (2.2.28): use the normalisation procedure.

**Test solution** Dissolve 0.200 g of the essential oil to be examined in heptane R and dilute to 10.0 mL with the same solvent.

**Reference solution (a)** Dissolve 0.200 g of Spanish sage oil for peak identification CRS in heptane R and dilute to 10.0 mL with the same solvent.

**Reference solution (b)** Dissolve 5 µL of limonene R in heptane R and dilute to 50.0 mL with the same solvent. Dilute 0.5 mL of this solution to 5.0 mL with heptane R.

**Column:**

- material: fused silica;
- size:  $l = 60$  m,  $\varnothing = 0.25$  mm;
- stationary phase: macrogol 20 000 R (film thickness 0.25 µm).

**Carrier gas** helium for chromatography R.

**Flow rate** 1.5 mL/min.

**Split ratio** 1:50.

**Temperature:**

	Time (min)	Temperature (°C)
Column	0 - 43	60 → 232
Injection port		250
Detector		250

**Detection** Flame ionisation.

**Injection** 1 µL.

**System suitability** Reference solution (a):

- the chromatogram obtained is similar to the chromatogram supplied with Spanish sage oil for peak identification CRS;
- resolution: minimum 1.5 between the peaks due to limonene and 1,8-cineole and minimum 1.5 between the peaks due to  $\alpha$ -terpinyl acetate and borneol.

Use the chromatogram supplied with Spanish sage oil for peak identification CRS and the chromatogram obtained with reference solution (a) to locate the peaks due to  $\alpha$ -pinene, sabinene, limonene, 1,8-cineole, thujone, camphor, linalol, linalyl acetate, terpinen-4-ol, sabinyl acetate,  $\alpha$ -terpinyl acetate and borneol.

Determine the percentage content of each of these components. The percentages are within the following ranges:

- $\alpha$ -pinene: 4.0 per cent to 11.0 per cent;
- sabinene: 0.1 per cent to 3.5 per cent;
- limonene: 2.0 per cent to 6.5 per cent;
- 1,8-cineole: 10.0 per cent to 30.5 per cent;
- thujone: maximum 0.5 per cent;
- camphor: 11.0 per cent to 36.0 per cent;
- linalol: 0.3 per cent to 4.0 per cent;
- linalyl acetate: maximum 5.0 per cent;
- terpinen-4-ol: maximum 2.0 per cent;
- sabinyl acetate: 0.5 per cent to 9.0 per cent;
- $\alpha$ -terpinyl acetate: 0.5 per cent to 9.0 per cent;
- borneol: 1.0 per cent to 7.0 per cent;

— disregard limit: the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

**STORAGE**

At a temperature not exceeding 25 °C.

Ph Eur

## Salvia Miltiorrhiza Root and Rhizome

(Ph. Eur. monograph 2663)

Ph Eur

**DEFINITION**

Dried, whole or fragmented rhizome and root of *Salvia miltiorrhiza* Bunge, collected in spring or autumn.

**Content**

- salvianolic acid B ( $C_{36}H_{30}O_{16}$ ;  $M_r$  719): minimum 3.0 per cent (dried drug);
- tanshinone II<sub>A</sub> ( $C_{19}H_{18}O_3$ ;  $M_r$  294.3): minimum 0.12 per cent (dried drug).

**IDENTIFICATION**

**A.** The rhizome is short and thick, sometimes with stem remnants at the apex. The roots are numerous, about 10-20 cm long and 0.3-1 cm in diameter, cylindrical and slightly curved; some are branched, with secondary roots and rootlets. The outer surface is reddish-brown or dark reddish-brown, marked with longitudinal striations. The bark of old roots comes off usually as purplish-brown scales. The texture is hard and fragile. The fracture is soft, fissured or slightly even and dense, with a reddish-brown outer part and a greyish-yellow or purplish-brown wood, showing bundles of yellowish-white vessels, arranged radially.

Cultivars are relatively stout, about 0.5-1.5 cm in diameter. The outer surface is brownish-red, longitudinally wrinkled. The bark adheres closely to the wood and is difficult to remove. The texture is compact; the fracture is relatively even.

**B.** Microscopic examination (2.8.23). The powder is brownish-red. Examine under a microscope using chloral hydrate solution R. The powder shows the following diagnostic characters (Figure 2663.-1): fragments of cork consisting of subrectangular or polygonal cells, up to 150 µm in diameter, containing yellowish-brown pigment (surface view [A], transverse section [E]); fragments of parenchyma (longitudinal section [C]) consisting of polygonal or elongated cells, often septate [Ca]; fragments of parenchyma (transverse section [B]) with rounded cells; xylem fibres usually in bundles [F], long and fusiform, with walls showing pits shaped as crosses or oblique slits; very numerous reticulate or pitted vessels, 3-120 µm in diameter, free, in bundles (longitudinal section [D], transverse section [G]) or sometimes accompanying the fibres [Fa].

**C.** Thin-layer chromatography (2.2.27).

**Test solution** To 1 g of the powdered herbal drug (355) (2.9.12) add 40 mL of methanol R. Sonicate for 15 min. Filter. Evaporate the filtrate to 1 mL.

**Reference solution** Dissolve 2 mg of salvianolic acid B R and 2 mg of tanshinone II<sub>A</sub> R in 1 mL of methanol R.

**Plate** TLC silica gel F<sub>254</sub> plate R (2-10 µm).

Figure 2663.-1. – Illustration for identification test B of powdered herbal drug of salvia miltiorrhiza root and rhizome

**Mobile phase** methanol R, anhydrous formic acid R, toluene R, methylene chloride R, ethyl acetate R (5:20:20:30:40 V/V/V/V/V).

**Application** 5 μL as bands of 8 mm.

**Development** Over a path of 6 cm.

**Drying** In air.

**Detection A** Examine in daylight.

**Results A** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the upper third and middle part of the chromatogram obtained with the test solution.

Top of the plate	
Tanshinone II <sub>A</sub> : a prominent red zone	A prominent red zone (tanshinone II <sub>A</sub> ) An orange zone
Salvianolic acid B: a faint grey zone	A faint brownish-green zone A faint grey zone (salvianolic acid B)
Reference solution	Test solution

**Detection B** Examine in ultraviolet light at 254 nm.

**Results B** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present

in the upper third and middle part of the chromatogram obtained with the test solution.

Top of the plate	
Tanshinone II <sub>A</sub> : a prominent quenching zone	A prominent quenching zone (tanshinone II <sub>A</sub> ) A quenching zone
Salvianolic acid B: a prominent quenching zone	A quenching zone A prominent quenching zone (salvianolic acid B)
Reference solution	Test solution

**TESTS**

**Loss on drying (2.2.32)**

Maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

**Total ash (2.4.16)**

Maximum 10.0 per cent.

**Ash insoluble in hydrochloric acid (2.8.1)**

Maximum 3.0 per cent.

**ASSAY**

**Liquid chromatography (2.2.29).** Protect the solutions from light.

**Test solution** Disperse 0.30 g of the powdered herbal drug (355) (2.9.12) in 50.0 mL of a 70 per cent V/V solution of methanol R. Sonicate for 1 h. Filter through a membrane filter (nominal pore size 0.45 μm).

**Reference solution (a)** Dissolve 5.0 mg of tanshinone II<sub>A</sub> CRS in methanol R and dilute to 50.0 mL with the same solvent. Dilute 2.0 mL of the solution to 10.0 mL with methanol R.

**Reference solution (b)** Dissolve 5.0 mg of salvianolic acid B CRS in methanol R and dilute to 25.0 mL with the same solvent.

**Reference solution (c)** Dissolve 1 mg of rosmarinic acid R in methanol R, add 5 mL of reference solution (b) and dilute to 10.0 mL with methanol R.

**Column:**

— size: l = 0.25 m, Ø = 4.6 mm;

— stationary phase: end-capped octadecylsilyl silica gel for chromatography R (5 μm).

**Mobile phase:**

— mobile phase A: 0.1 per cent V/V solution of anhydrous formic acid R;

— mobile phase B: acetonitrile for chromatography R;

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 10	79 → 71	21 → 29
10 - 15	71 → 65	29 → 35
15 - 25	65 → 28	35 → 72
25 - 37	28 → 0	72 → 100

**Flow rate** 1.0 mL/min.

**Detection** Spectrophotometer at 280 nm.

**Injection** 10 μL.

**Identification of peaks** Use the chromatogram obtained with reference solution (a) to identify the peak due to tanshinone II<sub>A</sub> and the chromatogram obtained with reference solution (b) to identify the peak due to salvianolic acid B.

**Relative retention** With reference to tanshinone II<sub>A</sub> (retention time = about 33 min): rosmarinic acid = about 0.3; salvianolic acid B = about 0.4.

**System suitability:**

- **resolution:** minimum 5.0 between the peaks due to rosmarinic acid and salvianolic acid B in the chromatogram obtained with reference solution (c);
- **symmetry factor:** maximum 2.0 for the peak due to salvianolic acid B in the chromatogram obtained with reference solution (b).

Calculate the percentage content of tanshinone II<sub>A</sub> using the following expression:

$$\frac{A_1 \times m_2 \times p_1}{A_2 \times m_1 \times 5}$$

- $A_1$  = area of the peak due to tanshinone II<sub>A</sub> in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to tanshinone II<sub>A</sub> in the chromatogram obtained with reference solution (a);
- $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;
- $m_2$  = mass of tanshinone II<sub>A</sub> CRS used to prepare reference solution (a), in grams;
- $p_1$  = percentage content of tanshinone II<sub>A</sub> in tanshinone II<sub>A</sub> CRS.

Calculate the percentage content of salvianolic acid B using the following expression:

$$\frac{A_3 \times m_3 \times p_2 \times 2}{A_4 \times m_1}$$

- $A_3$  = area of the peak due to salvianolic acid B in the chromatogram obtained with the test solution;
- $A_4$  = area of the peak due to salvianolic acid B in the chromatogram obtained with reference solution (b);
- $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;
- $m_3$  = mass of salvianolic acid B CRS used to prepare reference solution (b), in grams;
- $p_2$  = percentage content of salvianolic acid B in salvianolic acid B CRS.

Ph Eur

## Processed *Salvia Miltiorrhiza* Rhizome and Root

### DEFINITION

Processed *Salvia Miltiorrhiza* Rhizome and Root is *Salvia Miltiorrhiza* Rhizome and Root that has been processed. It contains not less than 0.04% of tanshinone II<sub>A</sub> (C<sub>19</sub>H<sub>18</sub>O<sub>3</sub>), not less than 0.17% of rosmarinic acid (C<sub>18</sub>H<sub>16</sub>O<sub>8</sub>) and not less than 3.0% of salvianolic acid B (C<sub>36</sub>H<sub>36</sub>O<sub>16</sub>), calculated with reference to the dried material.

### PRODUCTION

It is collected in spring or autumn, separated from soil, washed clean, softened thoroughly, sliced longitudinally or transversely and dried. It may be stir baked with wine.

### IDENTIFICATION

A. The longitudinally-sliced pieces are up to about 5 cm long, 1.5 cm wide and 1 to 2 mm thick; those cut from the thinner roots show the dark brown striated cork covering one longitudinal surface and the yellowish to cream inner tissues on the other; slices cut from the thicker rhizomes are usually cut obliquely so that parts of the outer and inner tissues are included on both longitudinal surfaces. The transversely-cut slices are irregularly elliptical to nearly circular, 4 to 12 mm wide and 2 to 3 mm thick; the outer surface is dark brown and uneven; the smoothed transverse surface shows the outer layers about 1 to 2 mm wide separated by a darker line from the yellowish white, radiate vascular tissue; some pieces show a small, light brown central pith.

B. Reduce to a powder (355). The powder is reddish-brown. Examine under a microscope using chloral hydrate solution. The powder shows a surface view of cork cells almost rectangular or polygonal, containing yellowish-brown pigment, 12 to 151 μm in diameter. Parenchymatous cells in cortex squarish or polygonal, containing reddish-brown pigmental sediments. Xylem fibres usually in bundles, long fusiform, with oblique or criss-cross striations, 11 to 60 μm in diameter, vivid yellow when examined under a polarizing microscope. Numerous mainly bordered or reticulated vessels, 3 to 120 μm in diameter.

C. Carry out the method for thin-layer chromatography, Appendix III A, using the following solutions.

- (1) Place 2 g of the powdered drug (355) in a cellulose fingerstall in a continuous extraction apparatus (Soxhlet type). Add 75 mL of methanol and heat for 1 hour. Evaporate the extract to 20 mL, cool and filter if necessary.
- (2) 0.1% w/v each of tanshinone II<sub>A</sub> CRS, rosmarinic acid CRS and salvianolic acid B CRS in methanol.

### CHROMATOGRAPHIC CONDITIONS

- (a) Use as the coating silica gel F<sub>254</sub>.
- (b) Use the mobile phase described below.
- (c) Apply as bands 8 μL of solution (1) and 5 μL of solution (2).
- (d) Develop the plate to 15 cm.
- (e) After removal of the plate, dry in air and examine under ultraviolet light (366 nm).

### MOBILE PHASE

10 volumes of water, 13.5 volumes of methanol and 100 volumes of ethyl acetate.

### SYSTEM SUITABILITY

The chromatogram obtained with solution (2) shows three clearly separated bands.

### CONFIRMATION

The blue fluorescent bands with R<sub>f</sub> values of approximately 0.7 (tanshinone II<sub>A</sub>), 0.2 (rosmarinic acid) and 0.06 (salvianolic acid B) in the chromatogram obtained with solution (1) correspond in colour and position to those in the chromatogram obtained with solution (2). Other bands may be present in the chromatogram obtained with solution (1) as shown below.

Top of the plate	
A fluorescent band	Tanshinone II <sub>A</sub> : a fluorescent band
Several fluorescent bands	
A fluorescent band	Rosmarinic acid: a fluorescent band
A fluorescent band	Salvianolic acid B: a fluorescent band
Solution (1)	Solution (2)

**TESTS****Total ash**

Not more than 10%, Appendix XI J.

**Acid-insoluble ash**

Not more than 2.0%, Appendix XI K.

**Loss on drying**

When dried for 2 hours at 105°, loses not more than 12.0% of its weight. Use 1 g.

**ASSAY****For tanshinone II<sub>A</sub>**

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

- (1) Finely powder about 5.0 g of the herbal drug being examined. Transfer 0.5 g of the powder into a 25 mL volumetric flask and add 20 mL of the mobile phase given below. Shake and mix with the aid of ultrasound for 30 minutes, shaking intermittently. Add the mobile phase to give a total volume of 25 mL. Filter through a 0.45- $\mu$ m filter.
- (2) 0.002% w/v of tanshinone II<sub>A</sub> CRS in the mobile phase.

**CHROMATOGRAPHIC CONDITIONS**

- (a) Use a stainless steel column (25 cm  $\times$  4.6 mm) packed with octadecylsilyl silica gel for chromatography (5  $\mu$ m) (Nucleosil ODS is suitable).
- (b) Use isocratic elution and the mobile phase described below.
- (c) Use a flow rate of 1 mL per minute.
- (d) Use an ambient column temperature.
- (e) Use a detection wavelength of 270 nm.
- (f) Inject 20  $\mu$ L of each solution.

**MOBILE PHASE**

0.01M sodium octyl sulfonate in a mixture of 25 volumes of water and 75 volumes of methanol adjusted to pH 5.0 with acetic acid.

**SYSTEM SUITABILITY**

The test is not valid, unless in the chromatogram obtained with solution (2):

- the *symmetry factor* of the peak due to tanshinone II<sub>A</sub> is less than 1.2;
- the number of *theoretical plates* is not less than 4500.

**DETERMINATION OF CONTENT**

Using the retention time and peak area from the chromatograms obtained with solution (2), locate and integrate the peak due to tanshinone II<sub>A</sub> in the chromatogram obtained with solution (1).

Calculate the content of tanshinone II<sub>A</sub> in the sample using the declared content of tanshinone II<sub>A</sub> (C<sub>19</sub>H<sub>18</sub>O<sub>3</sub>) in tanshinone II<sub>A</sub> CRS and the following expression:

$$\frac{A_1}{A_2} \times \frac{m_2}{V_2} \times \frac{V_1}{m_1} \times p \times \frac{100}{100-d}$$

- A<sub>1</sub> = Area of the peak due to tanshinone II<sub>A</sub> in the chromatogram obtained with solution (1).  
 A<sub>2</sub> = Area of the peak due to tanshinone II<sub>A</sub> in the chromatogram obtained with solution (2).  
 m<sub>1</sub> = Weight of the drug in mg.  
 m<sub>2</sub> = Weight of tanshinone II<sub>A</sub> CRS in mg.  
 V<sub>1</sub> = Dilution volume of solution (1) in mL.  
 V<sub>2</sub> = Dilution volume of solution (2) in mL.  
 p = Percentage content of tanshinone II<sub>A</sub> in tanshinone II<sub>A</sub> CRS.  
 d = Percentage loss on drying of the herbal drug being examined.

**For rosmarinic acid and salvianolic acid B**

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions prepared immediately before use.

- (1) Finely powder about 5.0 g of the herbal drug being examined. Transfer 0.5 g of the powder into a 25-mL volumetric flask and add 20 mL of the mobile phase given below. Shake and mix with ultrasound for 30 minutes, shaking intermittently. Add the mobile phase to give a total volume of 25 mL. Filter through a 0.45- $\mu$ m filter.
- (2) 0.003% w/v each of rosmarinic acid CRS and ferulic acid in water.
- (3) 0.06% w/v of salvianolic acid B CRS in the mobile phase.

**CHROMATOGRAPHIC CONDITIONS**

- (a) Use a stainless steel column (25 cm  $\times$  4.6 mm) packed with octadecylsilyl silica gel for chromatography (5  $\mu$ m) (Nucleosil ODS is suitable).
- (b) Use isocratic elution and the mobile phase described below.
- (c) Use a flow rate of 1 mL per minute.
- (d) Use an ambient column temperature.
- (e) Use a detection wavelength of 330 nm.
- (f) Inject 20  $\mu$ L of each solution.

**MOBILE PHASE**

22 volumes of acetonitrile and 78 volumes of 0.4% v/v of formic acid.

**SYSTEM SUITABILITY**

The test is not valid unless, in the chromatogram obtained with solution (2), the *resolution factor* between the two main peaks, rosmarinic acid and ferulic acid, is at least 5.0.

**DETERMINATION OF CONTENT**

**Rosmarinic acid** Using the retention time and peak area from the chromatogram obtained with solution (2), locate and integrate the peak due to rosmarinic acid in the chromatogram obtained with solution (1).

Calculate the content of rosmarinic acid in the sample using the declared content of rosmarinic acid (C<sub>18</sub>H<sub>16</sub>O<sub>8</sub>) in rosmarinic acid CRS and the following expression:

$$\frac{A_1}{A_2} \times \frac{m_2}{V_2} \times \frac{V_1}{m_1} \times p \times \frac{100}{100-d}$$

- $A_1$  = Area of the peak due to rosmarinic acid in the chromatogram obtained with solution (1).  
 $A_2$  = Area of the peak due to rosmarinic acid in the chromatogram obtained with solution (2).  
 $m_1$  = Weight of the drug in mg.  
 $m_2$  = Weight of rosmarinic acid CRS in mg.  
 $V_1$  = Dilution volume of solution (1) in mL.  
 $V_2$  = Dilution volume of solution (2) in mL.  
 $p$  = Percentage content of rosmarinic acid in rosmarinic acid CRS.  
 $d$  = Percentage loss on drying of the herbal drug being examined.

**Salvianolic acid B** Using the retention time and peak area from the chromatogram obtained with solution (3), locate and integrate the peak due to salvianolic acid B in the chromatogram obtained with solution (1).

Calculate the content of salvianolic acid B in the sample using the declared content of salvianolic acid B ( $C_{36}H_{36}O_{16}$ ) in salvianolic acid B CRS and the following expression:

$$\frac{A_1}{A_2} \times \frac{m_2}{V_2} \times \frac{V_1}{m_1} \times p \times \frac{100}{100 - d}$$

- $A_1$  = Area of the peak due to salvianolic acid in the chromatogram obtained with solution (1).  
 $A_2$  = Area of the peak due to salvianolic acid in the chromatogram obtained with solution (3).  
 $m_1$  = Weight of the drug in mg.  
 $m_2$  = Weight of salvianolic acid B CRS in mg.  
 $V_1$  = Dilution volume of solution (1) in mL.  
 $V_2$  = Dilution volume of solution (2) in mL.  
 $p$  = Percentage content of salvianolic acid B in salvianolic acid B CRS.  
 $d$  = Percentage loss on drying of the herbal drug being examined.

#### STORAGE

Processed *Salvia Miltiorrhiza* Rhizome and Root should be protected from moisture.

## Saw Palmetto Extract

(Ph. Eur. monograph 2579)

Ph Eur

#### DEFINITION

Extract produced from *Saw palmetto fruit* (1848).

#### Content

- total fatty acids: minimum 80.0 per cent (anhydrous extract);
- lauric acid ( $C_{12}H_{24}O_2$ ;  $M_r$  200.3): minimum 23.0 per cent (anhydrous extract);
- total sterols, expressed as  $\beta$ -sitosterol ( $C_{29}H_{50}O$ ;  $M_r$  414.7): minimum 0.20 per cent (anhydrous extract);
- $\beta$ -sitosterol ( $C_{29}H_{50}O$ ;  $M_r$  414.7): minimum 0.10 per cent (anhydrous extract).

#### PRODUCTION

The extract is produced from the herbal drug by a suitable procedure using ethanol (minimum 90 per cent V/V), or supercritical carbon dioxide or a mixture of mainly *n*-hexane and methylpentanes (bp: 65–70 °C).

#### CHARACTERS

##### Appearance

The ethanol extract is a dark greenish-brown, oily liquid; the supercritical carbon dioxide extract is a yellowish-brown or orange-brown, oily liquid; the hexane extract is a yellowish-green or orange-yellow, oily liquid.

**Odour:** strong but not rancid.

#### IDENTIFICATION

**First identification B.**

**Second identification A.**

**A. Thin-layer chromatography (2.2.27).**

**Test solution** Dissolve 0.25 g of the extract to be examined in 20 mL of ethanol (96 per cent) R.

**Reference solution** Dissolve 4 mg of  $\beta$ -amyryn R and 10 mg of  $\beta$ -sitosterol R in 10 mL of ethanol (96 per cent) R.

**Plate** TLC silica gel plate R (2–10  $\mu$ m).

**Mobile phase** anhydrous acetic acid R, ethyl acetate R, toluene R (1:30:70 V/V/V).

**Application** 2  $\mu$ L as bands of 8 mm.

**Development** Over a path of 6 cm.

**Drying** In air.

**Detection** Treat with anisaldehyde solution R, heat at 100–105 °C for 5–10 min and examine in daylight.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present, especially in the lower third, in the chromatogram obtained with the test solution.

Top of the plate	
	A blue zone
	A blue zone
$\beta$ -Amyryn: a blue zone	A strong bluish-violet zone
$\beta$ -Sitosterol: a blue zone	
Reference solution	Test solution

**B. Examine the chromatograms obtained in the assay of total fatty acids.**

**Results** The peaks due to methyl caproate, methyl caprylate, methyl caprate, methyl laurate, methyl myristate, methyl palmitoleate, methyl palmitate, methyl linoleate, methyl linolenate, methyl oleate and methyl stearate in the chromatogram obtained with the test solution are similar in retention time to the corresponding peaks in the chromatogram obtained with reference solution (b); the principal peaks are due to methyl laurate and methyl oleate.

#### TESTS

**Water (2.5.12, Method A)**

Maximum 3.0 per cent, determined on 0.5 g.

**Relative density (2.2.5)**

0.850 to 0.950.

**Refractive index (2.2.6)**

1.40 to 1.50.

**Acid value (2.5.1)**

150.0 to 220.0, determined on 0.500 g.

**Iodine value (2.5.4, Method A)**

30.0 to 60.0.

**Peroxide value (2.5.5)**

Maximum 5.0.

**Saponification value (2.5.6)**  
220.0 to 250.0.

**Solvents**

Residual solvents are controlled as described in chapter 5.4, unless otherwise justified and authorised.

**ASSAY**

**Total fatty acids**

Gas chromatography (2.2.28).

**Internal standard solution** Dissolve 0.47 g of methyl margarate R in 20 mL of dimethylformamide R and dilute to 100.0 mL with the same solvent.

**Test solution** Disperse 0.25 g of the extract to be examined in 10 mL of dimethylformamide R. Add 4.0 mL of the internal standard solution and dilute to 25.0 mL with dimethylformamide R. Mix 0.4 mL of this solution and 0.6 mL of a 18.84 g/L solution of trimethylsulfonium hydroxide R in methanol R.

**Reference solution (a)** Dissolve 0.699 g of lauric acid CRS and 0.870 g of oleic acid CRS in dimethylformamide R and dilute to 10.0 mL with the same solvent. To 1.0 mL of the solution add 4.0 mL of the internal standard solution and dilute to 25.0 mL with dimethylformamide R. Mix 0.4 mL of this solution and 0.6 mL of a 18.84 g/L solution of trimethylsulfonium hydroxide R in methanol R.

**Reference solution (b)** Disperse 0.25 g of saw palmetto extract HRS in 10 mL of dimethylformamide R. Add 4.0 mL of the internal standard solution and dilute to 25.0 mL with dimethylformamide R. Mix 0.4 mL of this solution and 0.6 mL of a 18.84 g/L solution of trimethylsulfonium hydroxide R in methanol R.

**Column:**

- material: fused silica;
- size:  $l = 25$  m,  $\varnothing = 0.20$  mm;
- stationary phase: methylpolysiloxane R (film thickness 0.33  $\mu$ m).

**Carrier gas** helium for chromatography R.

**Flow rate** 0.5 mL/min.

**Split ratio** 1:40.

**Temperature:**

	Time (min)	Temperature (°C)
Column	0 - 2	150
	2 - 7	150 → 190
	7 - 12	190
	12 - 22	190 → 220
	22 - 32	220
Injection port		300
Detector		300

**Detection** Flame ionisation.

**Injection** 1  $\mu$ L.

**Identification of peaks** Use the chromatogram supplied with saw palmetto extract HRS and the chromatogram obtained with reference solution (b) to identify the peaks due to methyl caproate, methyl caprylate, methyl caprate, methyl laurate, methyl myristate, methyl palmitoleate, methyl palmitate, methyl linoleate, methyl linolenate, methyl oleate, methyl stearate and methyl margarate.

**System suitability** Reference solution (b):

- peak-to-valley ratio: minimum 1.2, where  $H_p$  = height above the baseline of the peak due to methyl linolenate and  $H_v$  = height above the baseline of the lowest point of

the curve separating this peak from the peak due to methyl linoleate.

Calculate the percentage content of total fatty acids, where caproic, caprylic, capric, lauric, myristic, palmitoleic, palmitic and stearic acids are expressed as lauric acid ( $C_{12}H_{24}O_2$ ;  $M_r$  200.3) and linoleic, linolenic and oleic acids are expressed as oleic acid ( $C_{18}H_{34}O_2$ ;  $M_r$  282.5), using the following expression:

$$\frac{A_1 \times A_4 \times m_2 \times p_1 \times 0.1}{A_2 \times A_3 \times m_1} + \frac{A_5 \times A_4 \times m_3 \times p_2 \times 0.1}{A_6 \times A_3 \times m_1}$$

- $A_1$  = sum of the areas of the peaks due to methyl caproate, methyl caprylate, methyl caprate, methyl laurate, methyl myristate, methyl palmitoleate, methyl palmitate and methyl stearate in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to methyl laurate in the chromatogram obtained with reference solution (a);
- $A_3$  = area of the peak due to methyl margarate in the chromatogram obtained with the test solution;
- $A_4$  = area of the peak due to methyl margarate in the chromatogram obtained with reference solution (a);
- $A_5$  = sum of the areas of the peaks due to methyl linoleate, methyl linolenate and methyl oleate in the chromatogram obtained with the test solution;
- $A_6$  = area of the peak due to methyl oleate in the chromatogram obtained with reference solution (a);
- $m_1$  = mass of the extract to be examined used to prepare the test solution, in grams;
- $m_2$  = mass of lauric acid CRS used to prepare reference solution (a), in grams;
- $m_3$  = mass of oleic acid CRS used to prepare reference solution (a), in grams;
- $p_1$  = percentage content of lauric acid in lauric acid CRS;
- $p_2$  = percentage content of oleic acid in oleic acid CRS.

Calculate the percentage content of lauric acid using the following expression:

$$\frac{A_1 \times A_4 \times m_2 \times p \times 0.1}{A_2 \times A_3 \times m_1}$$

- $A_1$  = area of the peak due to methyl laurate in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to methyl laurate in the chromatogram obtained with reference solution (a);
- $A_3$  = area of the peak due to methyl margarate in the chromatogram obtained with the test solution;
- $A_4$  = area of the peak due to methyl margarate in the chromatogram obtained with reference solution (a);
- $m_1$  = mass of the extract to be examined used to prepare the test solution, in grams;
- $m_2$  = mass of lauric acid CRS used to prepare reference solution (a), in grams;
- $p$  = percentage content of lauric acid in lauric acid CRS.

**Total sterols**

Gas chromatography (2.2.28).

**Derivatisation solution (a)** chlorotrimethylsilane R, *N,O*-bis(trimethylsilyl)acetamide R, *N*-trimethylsilylimidazole R (2:3:3 VIVIV).

**Derivatisation solution (b)** Derivatisation solution (a), *N,O*-bis(trimethylsilyl)trifluoroacetamide R, pyridine R (1:1:1 VIVIV).

**Internal standard solution** Dissolve 0.25 g of cholesterol R in 25.0 mL of methylene chloride R.

**Test solution** Introduce 1.0 mL of the internal standard solution into a 50 mL round-bottomed flask and evaporate to dryness. Place 3.35 g of the extract to be examined, accurately weighed, into the round-bottomed flask and add 20 mL of a solution prepared as follows: dissolve 130 g of potassium hydroxide R in 200 mL of water R and dilute to 1000 mL with methanol R. Heat under reflux for 2 h, transfer quantitatively to a flask and dilute to 25.0 mL with water R. Apply 3.0 mL of this solution to a cartridge containing

*diatomaceous earth R* capable of holding 3 mL of aqueous phase. Absorb the solution into the column by applying vacuum. Maintain the vacuum for at least 20 min, until the column returns to room temperature, indicating that the methanol is completely evaporated. Rinse the column with 90 mL of *methylene chloride R* and evaporate the eluate to dryness. Dissolve the residue in 1.0 mL of derivatisation solution (b).

**Reference solution (a)** To 9.0 mg of  $\beta$ -sitosterol CRS add 1.0 mL of the internal standard solution and dilute to 5.0 mL with *methylene chloride R*. Evaporate 0.6 mL of this solution to dryness under a stream of *nitrogen R*. Dissolve the residue in 1.0 mL of derivatisation solution (b).

**Reference solution (b)** Introduce 1.0 mL of the internal standard solution into a 50 mL round-bottomed flask and evaporate to dryness. Place 3.35 g of *saw palmetto extract HRS*, accurately weighed, into the round-bottomed flask and add 20 mL of a solution prepared as follows: dissolve 130 g of *potassium hydroxide R* in 200 mL of *water R* and dilute to 1000 mL with *methanol R*. Heat under reflux for 2 h, transfer quantitatively to a flask and dilute to 25.0 mL with *water R*. Apply 3.0 mL of this solution to a cartridge containing *diatomaceous earth R* capable of holding 3 mL of aqueous phase. Absorb the solution into the column by applying vacuum. Maintain the vacuum for at least 20 min, until the column returns to room temperature, indicating that the methanol is completely evaporated. Rinse the column with 90 mL of *methylene chloride R* and evaporate the eluate to dryness. Dissolve the residue in 1.0 mL of derivatisation solution (b).

**Column:**

- *material*: fused silica;
- *size*:  $l = 25$  m,  $\varnothing = 0.20$  mm;
- *stationary phase*: *methylpolysiloxane R* (film thickness 0.33  $\mu$ m).

**Carrier gas** helium for chromatography R.

**Flow rate** 0.5 mL/min.

**Split ratio** 1:40.

	Time (min)	Temperature (°C)
Column	0 - 3	200
	3 - 13	200 → 300
	13 - 35	300
Injection port		325
Detector		325

**Detection** Flame ionisation.

**Injection** 1  $\mu$ L.

**Identification of peaks** Use the chromatogram supplied with *saw palmetto extract HRS* and the chromatogram obtained with reference solution (b) to identify the peaks due to the trimethylsilyl derivatives of cholesterol, campesterol, stigmasterol,  $\beta$ -sitosterol and stigmastanol.

**System suitability** Reference solution (b):

- *resolution*: minimum 1.6 between the peaks due to the trimethylsilyl derivatives of  $\beta$ -sitosterol and stigmastanol.

Calculate the percentage content of total sterols (campesterol, stigmasterol,  $\beta$ -sitosterol and stigmastanol), expressed as  $\beta$ -sitosterol, using the following expression:

$$\frac{A_1 \times A_4 \times m_2 \times p}{A_2 \times A_3 \times m_1}$$

- $A_1$  = sum of the areas of the peaks due to the trimethylsilyl derivatives of campesterol, stigmasterol,  $\beta$ -sitosterol and stigmastanol in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to the trimethylsilyl derivative of  $\beta$ -sitosterol in the chromatogram obtained with reference solution (a);
- $A_3$  = area of the peak due to the trimethylsilyl derivative of cholesterol in the chromatogram obtained with the test solution;
- $A_4$  = area of the peak due to the trimethylsilyl derivative of cholesterol in the chromatogram obtained with reference solution (a);
- $m_1$  = mass of the extract to be examined used to prepare the test solution, in grams;
- $m_2$  = mass of  $\beta$ -sitosterol CRS used to prepare reference solution (a), in grams;
- $p$  = percentage content of  $\beta$ -sitosterol in  $\beta$ -sitosterol CRS.

Calculate the percentage content of  $\beta$ -sitosterol using the following expression:

$$\frac{A_1 \times A_4 \times m_2 \times p}{A_2 \times A_3 \times m_1}$$

- $A_1$  = area of the peak due to the trimethylsilyl derivative of  $\beta$ -sitosterol in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to the trimethylsilyl derivative of  $\beta$ -sitosterol in the chromatogram obtained with reference solution (a);
- $A_3$  = area of the peak due to the trimethylsilyl derivative of cholesterol in the chromatogram obtained with the test solution;
- $A_4$  = area of the peak due to the trimethylsilyl derivative of cholesterol in the chromatogram obtained with reference solution (a);
- $m_1$  = mass of the extract to be examined used to prepare the test solution, in grams;
- $m_2$  = mass of  $\beta$ -sitosterol CRS used to prepare reference solution (a), in grams;
- $p$  = percentage content of  $\beta$ -sitosterol in  $\beta$ -sitosterol CRS.

Ph Eur

## Saw Palmetto Fruit

(Ph. Eur. monograph 1848)

Ph Eur

### DEFINITION

Dried ripe fruit of *Serenoa repens* (W.Bartram) Small (syn. *Sabal serrulata* (Michx.) Schult.f.).

### Content

Minimum 11.0 per cent of total fatty acids (dried drug).

### CHARACTERS

**Odour** Strong but not rancid.

### IDENTIFICATION

**First identification:** A, B, D.

**Second identification:** A, B, C.

A. The fruit is an ovoid or subspherical drupe, with a dark brown or blackish, roughly wrinkled surface and more or less coppery sheen, up to 2.5 cm long and 1.5 cm in diameter. The apex sometimes bears the remains of the style and tubular calyx, with 3 teeth, and the base bears a small depression with the scar of the stalk. The epicarp and underlying mesocarp form a thin fragile layer, which partially peels off, revealing the thin, hard, pale brown endocarp, which is fibrous and easily separable. The seed is irregularly spherical or ovoid, up to 12 mm long and 8 mm in diameter, with a hard, smooth or finely pitted surface which is reddish-brown with a paler, raised and membranous area over the raphe and micropyle; cut transversely, the seed has a thin

testa, narrow perisperm and a large area of dense, horny, greyish-white endosperm, with the embryo positioned to one side.

**B. Microscopic examination (2.8.23).** Reduce to a powder (1000) (2.9.12). The powder is reddish or blackish-brown and oily. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 1848.-1): fragments of epicarp [A] consisting of polyhedral cells (10-40 µm), reddish-brown, pigmented and highly cutinised, in small groups separated by thin walls [Aa] and accompanied by considerably larger cells of the underlying layers [Ab]; groups of parenchyma cells of the mesocarp [E]; groups of xylem tissue of the mesocarp showing small, lignified, annular or spirally thickened vessels [F], sometimes accompanied by parenchyma containing small sclereids [Fa]; sclereids of the mesocarp (20-200 µm), usually occurring singly [J] but sometimes in small groups [G], with walls that are moderately thickened, distinctly striated and finely pitted; fragments of endocarp containing groups of sclereids about 300 µm long, with strongly thickened walls and numerous pits [B]; isolated sclereids of the endocarp [K]; fragments of the testa [C] consisting of small, thin-walled cells with brown contents [Ca] and underlying sclereids [Cb]; thick-walled endosperm cells [D] with large conspicuous pits, and containing aleurone grains and oil; very numerous fragments of the brown cuticle [H].

Figure 1848.-1. – Illustration for identification test B of powdered herbal drug of saw palmetto fruit

**C. Thin-layer chromatography (2.2.27).**

**Test solution** To 1.5 g of the powdered herbal drug (710) (2.9.12), add 20 mL of *ethanol (96 per cent) R* and stir for 15 min. Filter.

**Reference solution** Dissolve 4 mg of *β-amyryn R* and 10 mg of *β-sitosterol R* in 10 mL of *ethanol (96 per cent) R*.

**Plate** *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

**Mobile phase** *acetic acid R, ethyl acetate R, toluene R* (1:30:70 V/V/V).

**Application** 10 µL [or 2 µL] as bands of 10 mm [or 8 mm].

**Development** Over a path of 10 cm [or 6 cm].

**Drying** In air.

**Detection** Treat with *anisaldehyde solution R*; heat at 100-105 °C for 5-10 min; examine in daylight.
