	A faint blue zone
Reference solution	Test solution

**D. Examine the chromatograms obtained in the assay of total fatty acids.**

**Results** The peaks due to caproic, caprylic, capric, lauric, myristic, palmitoleic, palmitic, linoleic, linolenic, oleic and stearic acids in the chromatogram obtained with the test solution are similar in retention time to the corresponding peaks in the chromatogram obtained with reference solution (b); the principal peaks are due to lauric acid and oleic acid.

**TESTS**

**Loss on drying (2.2.32)**

Maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (710) (2.9.12) by drying in an oven at 105 °C for 2 h.

**Total ash (2.4.16)**

Maximum 5.0 per cent.

**ASSAY**

**Total fatty acids**

**Gas chromatography (2.2.28).**

**Internal standard solution** Dissolve 0.47 g of *methyl margarate R* in 20.0 mL of *dimethylformamide R* and dilute to 100.0 mL with the same solvent.

**Test solution** Reduce 50 g of the herbal drug to a powder (200) (2.9.12). Disperse 4.00 g of the powdered herbal drug in 60 mL of *dimethylformamide R*. Sonicate for 15 min and then shake for 30 min. Dilute to 100.0 mL with *dimethylformamide R*. Allow to stand for a few minutes and filter. To 20.0 mL of this solution add 4.0 mL of the internal standard solution and dilute to 25.0 mL with *dimethylformamide R*. Mix 0.4 mL of this solution and 0.6 mL of an 18.84 g/L solution of *trimethylsulfonium hydroxide R* in *methanol R*.

**Reference solution (a)** Dissolve 0.699 g of lauric acid CRS and 0.870 g of oleic acid CRS in dimethylformamide R and dilute to 10.0 mL with the same solvent. To 1.0 mL of the solution add 4.0 mL of the internal standard solution and dilute to 25.0 mL with dimethylformamide R. Mix 0.4 mL of this solution and 0.6 mL of an 18.84 g/L solution of trimethylsulfonium hydroxide R in methanol R.

**Reference solution (b)** Disperse 0.25 g of saw palmetto extract HRS in 10 mL of dimethylformamide R. Add 4.0 mL of the internal standard solution and dilute to 25.0 mL with dimethylformamide R. Mix 0.4 mL of this solution and 0.6 mL of an 18.84 g/L solution of trimethylsulfonium hydroxide R in methanol R.

**Column:**

- material: fused silica;
- size:  $l = 25$  m,  $\varnothing = 0.20$  mm;
- stationary phase: methylpolysiloxane R (film thickness 0.33  $\mu$ m).

**Carrier gas** helium for chromatography R.

**Flow rate** 0.5 mL/min.

**Split ratio** 1:40.

**Temperature:**

	Time (min)	Temperature (°C)
Column	0 - 2	150
	2 - 7	150 → 190
	7 - 12	190
	12 - 22	190 → 220
	22 - 32	220
Injection port		300
Detector		300

**Detection** Flame ionisation.

**Injection** 1  $\mu$ L.

**Identification of peaks** Use the chromatogram supplied with saw palmetto extract HRS and the chromatogram obtained with reference solution (b) to identify the peaks due to caproic, caprylic, capric, lauric, myristic, palmitoleic, palmitic, linoleic, linolenic, oleic and stearic acids and methyl margarate.

**System suitability** Reference solution (b):

- peak-to-valley ratio: minimum 1.2, where  $H_p$  = height above the baseline of the peak due to linolenic acid and  $H_v$  = height above the baseline of the lowest point of the curve separating this peak from the peak due to linoleic acid.

Calculate the percentage content of total fatty acids, where caproic, caprylic, capric, lauric, myristic, palmitoleic, palmitic and stearic acids are expressed as lauric acid ( $C_{12}H_{24}O_2$ ;  $M_r$ , 200.3) and linoleic, linolenic and oleic acids are expressed as oleic acid ( $C_{18}H_{34}O_2$ ;  $M_r$ , 282.5), using the following expression:

$$\frac{A_1 \times A_4 \times m_2 \times p_1 \times 0.5}{A_2 \times A_3 \times m_1} + \frac{A_5 \times A_4 \times m_3 \times p_2 \times 0.5}{A_6 \times A_3 \times m_1}$$

- $A_1$  = sum of the areas of the peaks due to caproic, caprylic, capric, lauric, myristic, palmitoleic, palmitic and stearic acids in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to lauric acid in the chromatogram obtained with reference solution (a);
- $A_3$  = area of the peak due to methyl margarate in the chromatogram obtained with the test solution;
- $A_4$  = area of the peak due to methyl margarate in the chromatogram obtained with reference solution (a);

- $A_5$  = sum of the areas of the peaks due to linoleic, linolenic and oleic acids in the chromatogram obtained with the test solution;
- $A_6$  = area of the peak due to oleic acid in the chromatogram obtained with reference solution (a);
- $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;
- $m_2$  = mass of lauric acid CRS used to prepare reference solution (a), in grams;
- $m_3$  = mass of oleic acid CRS used to prepare reference solution (a), in grams;
- $p_1$  = percentage content of lauric acid in lauric acid CRS;
- $p_2$  = percentage content of oleic acid in oleic acid CRS.

Ph Eur

## Schisandra Fruit

(Ph. Eur. monograph 2428)

Ph Eur

### DEFINITION

Whole, dried or steamed and dried, ripe fruit of *Schisandra chinensis* (Turcz.) Baill.

### Content

Minimum 0.40 per cent of schisandrin ( $C_{24}H_{32}O_7$ ;  $M_r$ , 432.5) (dried drug).

### IDENTIFICATION

**A.** The berry is more or less spherical, up to 8 mm in diameter; red, reddish-brown or blackish outer surface, sometimes covered in a whitish frost; strongly shrivelled pericarp; presence of 1-2 reniform, yellowish-brown, lustrous seeds, with thin seed-coat.

**B.** Microscopic examination (2.8.23). The powder is dark reddish-brown. Examine under a microscope using chloral hydrate solution R. The powder shows the following diagnostic characters (Figure 2428.-1): reddish-brown fragments of pericarp consisting of 1 layer of thin-walled epicarp cells (surface view [A]), covered by a striated cuticle [Aa] and accompanied by sparse essential oil cells [Ab], the cuticle is not striated above the essential oil cells; fragments of mesocarp [C] composed of several layers of ovoid, more or less flattened cells; fragments of the testa [B, E] with the outer layer consisting of polygonal sclereids, about 11-30  $\mu$ m in diameter (surface view [Ba]) or in palisade arrangement (side view [Ea]), with thick, lignified, finely channelled walls and small lumen with reddish-brown or blackish contents with the inner layers of the testa consisting of sclereids with yellowish or slightly reddish walls, isolated or in small groups or together with the outer sclereids, about 80  $\mu$ m in diameter, with slightly lignified, thickened and markedly channelled, pitted walls and a large lumen [Bb, Eb]; fragments of mostly colourless endosperm [D] consisting of polyhedral cells containing oil droplets [Da] and aleurone grains. Examine under a microscope using a 50 per cent *V/V* solution of glycerol R. The powder shows parenchymatous cells of the mesocarp containing numerous small, round or slightly polyhedral starch granules and rare free starch granules, rounded or slightly polyhedral, simple or 2-5 compound [F]; the hilum is often visible.

**C.** Examine the chromatograms obtained in the test for *Schisandra sphenanthera*.

**Results A** See below the sequence of quenching zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other weak quenching zones may be present in the chromatogram obtained with the test solution.

Schisandrin: an intense, brownish-green zone	An intense, brownish-green zone (schisandrin)
Reference solution	Test solution

## TESTS

### *Schisandra sphenanthera*

Thin-layer chromatography (2.2.27).

**Test solution** To 2.5 g of the powdered herbal drug (355) (2.9.12) add 10 mL of methanol R. Extract at 25 °C in an ultrasonic bath for 5 min and centrifuge.

**Reference solution** Dissolve 5 mg of schisandrin R and 5 mg of  $\gamma$ -schisandrin R in 5 mL of methanol R.

**Plate** TLC silica gel F<sub>254</sub> plate R (5–40  $\mu$ m) [or TLC silica gel F<sub>254</sub> plate R (2–10  $\mu$ m)].

**Mobile phase** acetic acid R, ethyl acetate R, toluene R (2:22:46 V/V/V).

**Application** 5  $\mu$ L [or 2  $\mu$ L] as bands of 10 mm [or 6 mm].

**Development** Over a path of 10 cm [or 7 cm].

**Drying** In air.

**Detection A** Examine in ultraviolet light at 254 nm.

**Detection B** Spray with a 100 g/L solution of sulfuric acid R in methanol R and heat in an oven at 120 °C for 7 min; examine in daylight.

**Results B** The chromatogram obtained with the test solution shows a zone due to schisandrin and a zone due to  $\gamma$ -schisandrin; the chromatogram shows no intense violet-pink zone in the middle third.

**Loss on drying** (2.2.32)

Maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

**Total ash** (2.4.16)

Maximum 6.0 per cent.

## ASSAY

Liquid chromatography (2.2.29).

**Test solution** Weigh 1.250 g of the powdered herbal drug (355) (2.9.12) into a 250 mL conical flask, add 90 mL of methanol R and sonicate for 30 min. Filter the solution into a volumetric flask, add 10 mL of methanol R whilst rinsing the filter and dilute to 100.0 mL with the same solvent.

**Reference solution** Dissolve 5.0 mg of schisandrin CRS in methanol R and dilute to 100.0 mL with the same solvent.

**Column:**

— size:  $l = 0.25$  m,  $\varnothing = 4.6$  mm;

— stationary phase: end-capped octadecylsilyl silica gel for chromatography R (5  $\mu$ m);

— temperature: 25 °C.

**Mobile phase:**

— mobile phase A: water R, methanol R (35:65 V/V);

— mobile phase B: methanol R;

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 10	100	0
10 - 16	100 → 58	0 → 42
16 - 26	58	42

**Flow rate** 1 mL/min.

**Detection** Spectrophotometer at 250 nm.

**Injection** 10  $\mu$ L.

**Retention time** Schisandrin = about 8 min.

**System suitability:**

— number of theoretical plates: minimum 5000, calculated for the peak due to schisandrin in the chromatogram obtained with the reference solution.

Calculate the percentage content of schisandrin using the following expression:

$$\frac{A_1 \times m_2 \times p}{A_2 \times m_1}$$

- $A_1$  = area of the peak due to schisandrin in the chromatogram obtained with the test solution;  
 $A_2$  = area of the peak due to schisandrin in the chromatogram obtained with the reference solution;  
 $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;  
 $m_2$  = mass of *schisandrin CRS* used to prepare the reference solution, in grams;  
 $p$  = percentage content of schisandrin in *schisandrin CRS*.

Ph Eur

## Scutellariae Baicalensis Root

(Baical Skullcap Root, Ph. Eur. monograph 2438)

Ph Eur

### DEFINITION

Dried (or steamed or treated with boiling water and dried), peeled, whole or fragmented root of *Scutellaria baicalensis* Georgi without rootlets. It is collected in spring or autumn.

### Content

Not less than 9.0 per cent of baicalin ( $C_{21}H_{18}O_{11}$ ;  $M_r$  446.4) (dried drug).

### IDENTIFICATION

**A.** The whole root is conical, twisted, 8-25 cm long and 1-3 cm in diameter. The outer surface is yellowish-brown or dark yellow, bearing sparse, warty remnants of rootlets; the upper part is rough, with longitudinal or irregularly reticulate wrinkles; the lower part bears longitudinal furrows and fine wrinkles. The texture is hard and fragile, easily broken. The fracture is yellow, with some roots showing a yellow outer part and a withered, reddish-brown core; the cortex is narrow. The central part of old roots is dark brown or brownish-black, reduced or hollowed. The root of cultivated plants is tapering, usually branched, with external bark adhering tightly to the wood. The outer surface is yellowish-brown, with relatively fine, longitudinal wrinkles.

The fragmented root occurs as slices, short fragments or irregular pieces, 0.3-1.9 cm in diameter. The outer surface is yellowish-brown or dark yellow, occasionally bearing warty remnants of rootlets. The bark may be rough or with longitudinal furrows. The cut surface has a narrow yellow or greenish-yellow cortex and lighter yellow wood part; some roots with a yellow outer part and a withered, reddish-brown core; the xylem is radially striated or may appear laminated. The central part of old roots is dark brown or brownish-black, reduced or hollowed. The texture is hard and fragile, mostly easily broken.

**B.** Microscopic examination (2.8.23). The powder is yellowish or yellowish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2438.-1): phloem fibres and sclereids, isolated [F, G] or in groups [J], sometimes adhering to parenchymatous cells [B, D, H], with thick to very thick, channelled and pitted walls; phloem fibres fusiform, 60-270  $\mu\text{m}$  long and 9-35  $\mu\text{m}$  in diameter [Ba], sclereids ovoid [Ac, Da], rectangular [J] or subsquare [G], 26-29  $\mu\text{m}$  in diameter; fragments of yellowish-brown cork, with polygonal cells (surface view [C]); fragments of the outer bark [A] with several layers of cork [Aa], phelloderm [Ab] and a few layers of cortical parenchyma consisting of cells with slightly thickened walls [Ad] and

sclereids or fibres [Ac]; numerous vessels [L, M], reticulate [La] or bordered pitted [E, Lb, Ma], 14-72  $\mu\text{m}$  in diameter, accompanied by xylem fibres, frequently broken, 10-20  $\mu\text{m}$  in diameter, mostly with sparse, oblique pits. Examine under a microscope using a 50 per cent *VIV* solution of *glycerol R*. The powder shows very numerous starch granules [K], rounded, mostly 2-10  $\mu\text{m}$  in diameter, occasionally up to 14  $\mu\text{m}$  in diameter, with a visible hilum, simple or 2-3 compound.

Figure 2438.-1. – Illustration for identification test B of powdered herbal drug of baical skullcap root

**C.** Thin-layer chromatography (2.2.27).

**Test solution** To 1 g of the powdered herbal drug (355) (2.9.12) add 10 mL of *methanol R* and sonicate for 10 min. Centrifuge and use the supernatant.

**Reference solution** Dissolve 1 mg of *baicalin R* and 1 mg of *acteoside R* in 10 mL of *methanol R*.

**Plate** TLC silica gel  $F_{254}$  plate *R* (2-10  $\mu\text{m}$ ).

**Mobile phase** *acetic acid R*, *anhydrous formic acid R*, *water R*, *ethyl acetate R* (1:1:2:15 *VIVIVV*).

**Application** 10  $\mu\text{L}$  as bands.

**Development** Over a path of 6 cm.

**Drying** In air.

**Detection** Heat at 100-105  $^{\circ}\text{C}$  for 3 min, treat with a 10 g/L solution of *diphenylboric acid aminoethyl ester R* in *methanol R*, then treat with a 50 g/L solution of *macrogol 400 R* in *methanol R*, allow to dry in air for 30 min and examine in ultraviolet light at 365 nm.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint blue fluorescent zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
	3-4 fluorescent zones
	2 fluorescent zones
Verbascoside: a blue fluorescent zone	A strong blue fluorescent zone
	A blue fluorescent zone
Baicalin: a black zone	A black zone
	A weak yellow fluorescent zone
Reference solution	Test solution

**TESTS****Loss on drying (2.2.32)**

Maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

**Total ash (2.4.16)**

Maximum 6.0 per cent.

**Ash insoluble in hydrochloric acid (2.8.1)**

Maximum 2.0 per cent.

**ASSAY**

Liquid chromatography (2.2.29).

**Test solution** To 0.300 g of the powdered herbal drug (355) (2.9.12) add 40 mL of ethanol (70 per cent V/V) R, heat under a reflux condenser on a water bath for 3 h, cool and filter. Transfer the filtrate to a 100 mL volumetric flask. Wash both the container and the residue several times with a small volume of ethanol (70 per cent V/V) R and filter the washings into the same flask. Dilute to 100.0 mL with ethanol (70 per cent V/V) R. Mix well. Dilute 1.0 mL of the solution to 10.0 mL with methanol R. Mix well.

**Reference solution (a)** Dissolve 5.0 mg of baicalin CRS in methanol R and dilute to 100.0 mL with the same solvent.

**Reference solution (b)** Dissolve 2 mg of methyl parahydroxybenzoate R in methanol R, add 20 mL of reference solution (a) and dilute to 100 mL with methanol R.

**Column:**

— size:  $l = 0.125$  m,  $\varnothing = 4$  mm;

— stationary phase: octadecylsilyl silica gel for chromatography R (5  $\mu$ m).

**Mobile phase:**

— mobile phase A: 0.1 per cent V/V solution of phosphoric acid R;

— mobile phase B: acetonitrile R;

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 30	90 → 60	10 → 40

**Flow rate** 1.0 mL/min.

**Detection** Spectrophotometer at 280 nm.

**Injection** 10  $\mu$ L.

**Retention time** Methyl parahydroxybenzoate = about 15 min; baicalin = about 16 min.

**System suitability** Reference solution (b):

— resolution: minimum 3.0 between the peaks due to methyl parahydroxybenzoate and baicalin.

Calculate the percentage content of baicalin using the following expression:

$$\frac{m_2 \times S_1 \times 10 \times p}{S_2 \times m_1}$$

$m_1$  = mass of the herbal drug, in grams;

$m_2$  = mass of baicalin used to prepare reference solution (a), in grams;

$S_1$  = area of the peak due to baicalin in the chromatogram obtained with the test solution;

$S_2$  = area of the peak due to baicalin in the chromatogram obtained with reference solution (a);

$p$  = percentage content of baicalin in baicalin CRS.

**STORAGE**

Protected from moisture.

Ph Eur

**Selfheal Fruit-Spike**

(Common Selfheal Fruit-Spike, Ph. Eur. monograph 2439)

Ph Eur

**DEFINITION**

Dried fruit-spike of *Prunella vulgaris* L.

**Content**

Minimum 0.12 per cent of the sum of oleanolic acid ( $C_{30}H_{48}O_3$ ;  $M_r$  456.7) and ursolic acid ( $C_{30}H_{48}O_3$ ;  $M_r$  456.7), expressed as ursolic acid, of which not less than 70.0 per cent consists of ursolic acid (dried drug).

**IDENTIFICATION**

**A.** Cylindrical, somewhat flattened, 1.5-8 cm long, 0.8-1.5 cm in diameter, accompanied by remains of the stem up to 15 cm long, pale brown or brownish-red. The whole spike is composed of up to 10 or more whorls of persistent calyces and bracts, each whorl with 2 opposite bracts, fan-shaped, apex acuminate, striations of vein distinct, the outer surface with white hairs. Each bract is accompanied by 3 flowers, each with a persistent bilabiate calyx but often with the corolla missing, and by 4 small brown ovoid nutlets, each white and convex at the acute end. The calyx is closed at the fruiting stage.

**B.** Microscopic examination (2.8.23). The powder is reddish-brown or brown. Examine under a microscope using chloral hydrate solution R. The powder shows the following diagnostic characters (Figure 2439.-1): very numerous covering trichomes, multicellular, scattered or on the epidermises, usually broken [E, Da, Dc], sometimes exceeding 1 mm long and 125  $\mu$ m wide at the base, with spiny walls, upper cell usually short and acuminate, fine needle-shaped crystals may be visible in the cells [Ea, Db]; fragments of the bracts (surface view [A, C]), with lobed cells on the upper surface [Aa] and slightly sinuous cells covered by a thin, striated cuticle on the lower surface [Ca], with trichomes, mostly unicellular [Cb], sometimes bi- [Cc] or tricellular, conical, acuminate, short and serrate; diacytic stomata (2.8.3) usually accompanied by 2 subsidiary cells very unequal in size [Ab, Cd] and rare glandular trichomes with a unicellular stalk and a bicellular head [Ac, G] or a bicellular stalk and a unicellular head [B]; fragments of the bracts [D] and/or calyx

margins with numerous serrate trichomes pointing in the same direction [Dd]; fragments of the calyx (surface view [L]), composed of lobed cells strongly thickened and deeply grooved; fragments of reticulate or bordered-pitted vessels from the stems; rare fragments of the nutlets (surface view [H], transverse section [J]) consisting of the epicarp [Ja], 3 layers of mesocarp, 2 of which have strongly thickened walls [Jb, Jc, Ha] and are positioned on either side of the middle layer whose cells contain microcrystals of calcium oxalate [Jd], and the endocarp [Je, Hb] consisting of cells with finely striated walls; fragments of the seed (surface view [K]) consisting of testa cells with finely reticulate walls [Ka], associated with cells of the endosperm [Kb] with oily contents; very numerous oil droplets [Kc]; rare fragments of the cauline leaves [F] may be present, with an epidermis covered with a striated cuticle [Fa] bearing glandular trichomes of lamiate type with 4 secretory cells [Fb] and diacytic stomata [Fc].

Figure 2439.-1. - Illustration for identification test B of powdered herbal drug of common selfheal fruit-spike

#### C. Thin-layer chromatography (2.2.27).

**Test solution** To 0.5 g of the powdered herbal drug (355) (2.9.12) add 5 mL of methanol R, sonicate for 10 min and centrifuge; use the supernatant.

**Reference solution** Dissolve 1 mg of  $\beta$ -sitosterol R and 1 mg of ursolic acid R in 2 mL of methanol R.

**Plate** TLC silica gel F<sub>254</sub> plate R (5-40  $\mu$ m) [or TLC silica gel F<sub>254</sub> plate R (2-10  $\mu$ m)].

**Mobile phase** glacial acetic acid R, ethyl acetate R, cyclohexane R (1:16:40 V/V/V).

**Application** 10  $\mu$ L [or 4  $\mu$ L] as bands of 10 mm [or 8 mm].

**Development** Over a path of 12 cm [or 6 cm].

**Drying** In air.

**Detection** Treat with a 10 per cent V/V solution of sulfuric acid R in anhydrous ethanol R and heat at 100 °C for 3 min; examine in ultraviolet light at 365 nm.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
	A pale violet fluorescent zone
	2 faint yellow fluorescent zones
$\beta$ -sitosterol: a violet fluorescent zone	
Ursolic acid: a yellowish-orange fluorescent zone	A yellowish-orange fluorescent zone (ursolic acid)
	2 faint green fluorescent zones
Reference solution	Test solution

#### TESTS

##### Foreign matter (2.8.2)

Maximum 5 per cent of stems longer than 15 cm and maximum 2 per cent of other foreign matter.

##### Loss on drying (2.2.32)

Maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C.

##### Total ash (2.4.16)

Maximum 12.0 per cent.

##### Ash insoluble in hydrochloric acid (2.8.1)

Maximum 4.0 per cent.

#### ASSAY

Liquid chromatography (2.2.29).

**Solvent mixture** methanol R, 1,1-dimethylethyl methyl ether R (20:80 V/V).

**Test solution** Disperse 2.000 g of the powdered herbal drug (355) (2.9.12) in 20 mL of the solvent mixture, heat under reflux at 80 °C for 30 min and filter. Repeat the extraction twice. Combine the filtrates and dilute to 100.0 mL with the solvent mixture. Evaporate 50.0 mL of this solution to dryness at 40 °C. Dissolve the residue in 1.0 mL of 1,1-dimethylethyl methyl ether R. Rinse the flask 4 times with 1.0 mL of 1,1-dimethylethyl methyl ether R. Pre-condition a 3 mL solid phase extraction column, containing 500 mg of aminopropylsilyl silica gel for chromatography R1, using 2 mL of methanol R followed by 2 mL of 1,1-dimethylethyl methyl ether R. Subsequently apply the solution and the washings to the pre-conditioned column. Wash the column with 1.0 mL of 1,1-dimethylethyl methyl ether R followed by 5 quantities, each of 1.0 mL, of methanol R. Apply 1.0 mL of a 2 per cent V/V solution of anhydrous formic acid R in methanol R and elute after 5 min. Repeat the elution 3 times and dilute the eluates to 5.0 mL with a 2 per cent V/V solution of anhydrous formic acid R in methanol R.

**Solution A** Dissolve 10.0 mg of ursolic acid CRS in methanol R and dilute to 10.0 mL with the same solvent.

**Reference solution (a)** Dilute 1.0 mL of solution A to 10.0 mL with a 2 per cent *V/V* solution of *anhydrous formic acid R* in *methanol R*.

**Reference solution (b)** Dissolve 10.0 mg of *oleanolic acid R* in *methanol R* and dilute to 10.0 mL with the same solvent. Mix 1.0 mL of the solution and 1.0 mL of solution A and dilute to 10.0 mL with a 2 per cent *V/V* solution of *anhydrous formic acid R* in *methanol R*.

**Column:**

— size:  $l = 0.15$  m,  $\varnothing = 4.6$  mm;

— stationary phase: *octadecylsilyl silica gel for chromatography R* (5  $\mu$ m).

**Mobile phase** Mix 25 volumes of a 4.6 g/L solution of *ammonium dihydrogen phosphate R* adjusted to pH 6.0 with *strong sodium hydroxide solution R*, 35 volumes of *methanol R1* and 40 volumes of *acetonitrile R1*.

**Flow rate** 1.0 mL/min.

**Detection** Spectrophotometer at 205 nm.

**Injection** 20  $\mu$ L.

**Run time** 1.1 times the retention time of ursolic acid.

**Elution order** *Oleanolic acid*, *ursolic acid*.

**Relative retention** With reference to *ursolic acid* (retention time = about 28 min): *oleanolic acid* = about 0.9.

**System suitability** Reference solution (b):

— resolution: minimum 1.5 between the peaks due to *oleanolic acid* and *ursolic acid*.

Calculate the percentage contents of *ursolic acid* and *oleanolic acid*, expressed as *ursolic acid*, using the following equations:

$$n_1 = \frac{A_1 \times m_2 \times p \times 0.1}{A_2 \times m_1}$$

$$n_2 = \frac{A_3 \times m_2 \times p \times 0.1}{A_2 \times m_1}$$

- $n_1$  = percentage content of *ursolic acid*;  
 $n_2$  = percentage content of *oleanolic acid*;  
 $A_1$  = area of the peak due to *ursolic acid* in the chromatogram obtained with the test solution;  
 $A_2$  = area of the peak due to *ursolic acid* in the chromatogram obtained with reference solution (a);  
 $A_3$  = area of the peak due to *oleanolic acid* in the chromatogram obtained with the test solution;  
 $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;  
 $m_2$  = mass of *ursolic acid CRS* used to prepare solution A, in grams;  
 $p$  = assigned percentage content of *ursolic acid* in *ursolic acid CRS*.

Calculate the sum of the percentage contents of *ursolic acid* and *oleanolic acid* ( $n_1 + n_2$ ) and the relative content of *ursolic acid* using the following expression:

$$\frac{n_1 \times 100}{(n_1 + n_2)}$$

## Senega Root

Senega

(*Ph. Eur. monograph 0202*)

When Powdered Senega Root is prescribed or demanded, material complying with the requirements below with the exception of Identification test A and the test for Foreign matter shall be dispensed or supplied.

*Ph Eur*

### DEFINITION

Dried, whole or fragmented root and root crown of *Polygala senega* L. or root of *Polygala tenuifolia* Willd., with rootlets removed.

### IDENTIFICATION

**A. *P. senega*.** The root crown of the whole drug is greyish-brown and distinctly wider than the root; it forms an irregular head up to 3 cm in diameter consisting of numerous, tightly packed remains or scars of stems and violet-brown buds. The taproot is flexuous and tortuous, brown or yellow, usually single but occasionally branched into 2 or 3 roots, usually 1-8 mm in diameter at the crown, gradually tapering to the tip; the external surface is transversely and longitudinally striated and often shows a more or less distinct, decurrent, elongated spiral ridge. The transverse section of the root is more or less triangular. The fracture is short and shows a yellowish cortex of varying thickness surrounding a paler, central, woody area irregular in shape, especially at the ridge. The fragmented drug consists of pieces of varying shape; fragments of the root crown comprise the tightly packed remains or scars of stems and violet-brown buds; fragments of the root have a brown or yellow, transversely and longitudinally striated external surface with a paler internal surface.

***P. tenuifolia*** The whole drug consists of the root, light yellowish-brown or brown, straight or curved, 3-15 cm in length and 3-8 mm in diameter, showing numerous transverse wrinkles and fissures and, to a lesser extent, longitudinal striations; round rootlet scars are often visible. The xylem is light yellow and readily detached, with some fragments consisting only of rolls of bark with their edges folded inwards. The fracture shows a yellowish cortex and a pale yellow, usually circular, central woody area. The fragmented drug consists of more or less cylindrical slices, solid or hollow in the central part where the xylem has detached. The external surface is yellowish-grey to brownish-grey and transversely striated; the transverse section is yellowish-brown and shows a rounded, pale yellow, central woody area.

**B. Microscopic examination (2.8.23).** The powder is light yellow to brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 0202.-1): fragments of lignified tissue [C, D, F] made up of numerous pitted tracheids [Ca, Da] and slightly larger, reticulate [Cb], pitted [Db] or bordered-pitted vessels [Fa]; yellowish parenchyma cells containing oil droplets [B]; fragments of cork (surface view [A], transverse section [E]), sometimes accompanied by phelloderm and parenchyma, some cells of which contain oil droplets [Ea]; numerous isolated oil droplets [J]. *P. tenuifolia* powder also contains calcium oxalate cluster crystals, isolated [G] or included in parenchymatous cells [H], and long, fine, thick-walled lignified fibres, most often fragmented, in clusters [M] or associated with vessels [Fb]. *P. senega* powder may show occasional fragments of epidermal tissue from bud scales [K, L] with stomata [La] and unicellular trichomes [Ka].

*Ph Eur*

Figure 0202.-1. – Illustration for identification test B of powdered herbal drug of senega root

### C. High-performance thin-layer chromatography (2.8.25).

**Test solution** To 0.5 g of the powdered herbal drug (355) (2.9.12) add 5.0 mL of ethanol (70 per cent V/V) R. Sonicate at 80 °C for 15 min, filter or centrifuge and use the filtrate or supernatant.

**Reference solution (a)** Dissolve 1 mg of rutoside trihydrate R and 30 mg of puerarin R in methanol R and dilute to 25.0 mL with the same solvent.

**Reference solution (b)** Dilute 2.5 mL of reference solution (a) to 10.0 mL with methanol R.

**Reference solution (c)** Dissolve 2 mg of chlorogenic acid R and 30 mg of puerarin R in methanol R and dilute to 25 mL with the same solvent.

**Intensity marker** Puerarin.

**Plate** TLC silica gel F<sub>254</sub> plate R (2-10 μm).

**Mobile phase** anhydrous formic acid R, glacial acetic acid R, water R, ethyl acetate R (11:11:26:100 V/V/V/V).

**Application** 3 μL as bands of 8 mm.

**Development** 70 mm from the lower edge of the plate.

**Drying** In a current of air at room temperature for 5 min.

**Detection** Heat at 100-105 °C for 3 min; spray the warm plate with a 10 g/L solution of diphenylboric acid aminoethyl ester R in methanol R, then with a 50 g/L solution of macrogol 400 R in methanol R or, alternatively, dip the warm plate in a 5 g/L solution of diphenylboric acid aminoethyl ester R in ethyl acetate R, then in a 50 g/L solution of macrogol 400 R in methylene chloride R; allow the plate to dry in air for about 1 min and examine in ultraviolet light at 366 nm.

**System suitability** Reference solution (c):

- the chromatogram shows in the middle third 2 distinct zones; the lower zone (chlorogenic acid) shows a light

blue fluorescence and the upper zone (puerarin) shows a blue fluorescence.

**Results** See below the sequence of fluorescent zones present in the chromatograms obtained with reference solution (a) and the test solution. Furthermore, in the chromatogram obtained with the test solution, other faint fluorescent zones may be present.

Top of the plate		
		A blue zone
Puerarin: a blue zone	A blue zone	A blue zone
	A blue zone	A blue zone
		A greyish zone, faint
Rutoside: an orange zone	An orange zone, faint	
		A greenish-blue zone (at the border between the middle and lower third)
		A bluish zone
	A whitish-blue zone	
	3 bluish zones	
Reference solution (a)	Test solution (Polygala senega)	Test solution (Polygala tenuifolia)

### TESTS

#### Loss on drying (2.2.32)

Maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

#### Total ash (2.4.16)

Maximum 6.0 per cent.

#### Ash insoluble in hydrochloric acid (2.8.1)

Maximum 3.0 per cent.

#### Extractable matter

Minimum 20.0 per cent.

To 1.00 g of the powdered herbal drug (355) (2.9.12) add a mixture of 4.5 g of ethanol (96 per cent) R and 15.5 g of water R and allow to macerate for 3 h, shaking frequently. Filter. Evaporate 5.0 g of the filtrate to dryness on a water-bath and dry in an oven at 100-105 °C for 2 h. The residue weighs a minimum of 50 mg.

#### Foam index (2.8.24)

Minimum 3.5, determined on 1.00 g of the powdered herbal drug (355) (2.9.12).

### STORAGE

Protected from humidity.

### LABELLING

The label states the species present.

Ph Eur

## Senna Pods

Alexandrian Senna Fruit  
(Ph. Eur. monograph 0207)

### Preparations

Senna Liquid Extract

Standardised Senna Granules

Senna Tablets

When Powdered Alexandrian Senna Fruit is prescribed or demanded, material complying with the requirements below, with the exception of Identification test A and the test for Foreign matter, shall be dispensed or supplied.

Ph Eur

### DEFINITION

Dried fruit of *Senna alexandrina* Mill. (syn. *Cassia acutifolia* Delile and *Cassia angustifolia* Vahl).

### Content

Minimum 2.0 per cent of total hydroxyanthracene glycosides, expressed as sennoside B (C<sub>42</sub>H<sub>38</sub>O<sub>26</sub>; M<sub>r</sub> 863) (dried drug).

### IDENTIFICATION

A. Flattened, more or less reniform pods, yellowish-brown to greenish-brown with brown patches at the positions corresponding to the seeds, usually 35-60 mm long and 14-20 mm wide. At one end is a styler point and at the other a short stalk. The pods contain 5-8 flattened, obovate seeds, green or pale brown, with a more or less prominent network of transverse, wavy ridges on the testa.

B. Microscopic examination (2.8.23). The powder is brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 0207.-1): fragments of the epicarp (surface view [B, K]) with polygonal cells, anomocytic [Ba] or paracytic [Bb, Ka] stomata (2.8.3) and covering trichomes [Kb] or their scars [Bc]; isolated conical warty covering trichomes, usually bent [C]; fragments of the mesocarp (surface view [D]) with fibres [Da] in 2 crossed layers accompanied by a layer of cells containing calcium oxalate prisms [Db] and sometimes cells of the underlying endocarp [Dc]; fragments of the outer layers of the testa (transverse section [J]) covered by a thick cuticle [Ja] with palisade cells about 50 µm long, with thick walls and a reduced lumen [Jb], accompanied by the hypodermis with pillar-like cells [Jc]; palisade cells of the testa (surface view [N]) and fragments of the hypodermis of the seed forming rings (surface view [A]); fragments of cotyledons (surface view [F], transverse section [E]) consisting of small cells of the epidermis [Ea, Fa] and of the palisade tissue [Eb, Fb]; prisms and cluster crystals of calcium oxalate, free [De, Ga] or included in parenchyma [G]; fragments of vascular bundles [L] with spiral vessels [La] and fibres with moderately thickened and pitted walls [Lb]; sclereids [M, O] and fibres [H] accompanied by crystal sheaths of calcium oxalate [Ha] from fruit stalks.

C. High-performance thin-layer chromatography (2.8.25).

*Solvent mixture ethanol (96 per cent) R, water R (50:50 V/V).*

*Test solution* To 0.5 g of the powdered herbal drug (355) (2.9.12) add 5.0 mL of the solvent mixture. Sonicate for 10 min, then filter or centrifuge the solution. Use the filtrate or supernatant.

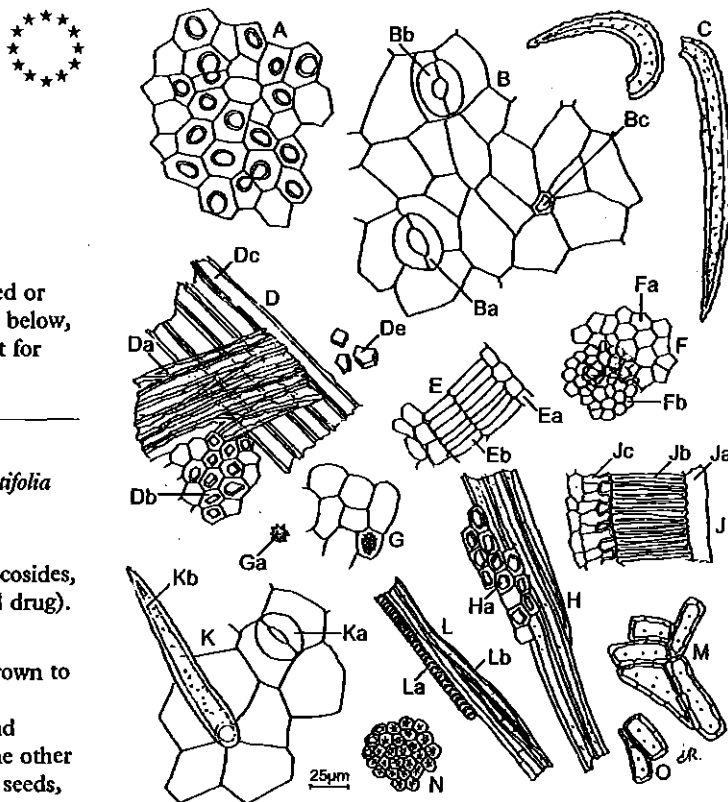

Figure 0207.-1. – Illustration for identification test B of powdered herbal drug of senna pods

*Reference solution (a)* Dissolve 3 mg of *sennoside A R* and 3 mg of *sennoside B R* in a mixture of equal volumes of *ethanol (96 per cent) R* and a 1 g/L solution of *sodium hydrogen carbonate R* and dilute to 20.0 mL with the same mixture of solvents.

*Reference solution (b)* Dilute 2.5 mL of reference solution (a) to 10.0 mL with the solvent mixture.

*Reference solution (c)* Dissolve 10 mg of *senna extract HRS* in 1 mL of the solvent mixture (a slight residue may remain).

*Intensity marker* Sennoside A.

*Plate* TLC silica gel F<sub>254</sub> plate R (2-10 µm).

*Mobile phase* water R, ethyl acetate R, propanol R (30:40:40 V/V/V).

*Application* 1 µL of the test solution and 2 µL of reference solutions (a), (b) and (c), as bands of 8 mm.

*Development* 70 mm from the lower edge of the plate.

*Drying* In a current of air at room temperature for 5 min.

*Detection* Heat at 110 °C for 10 min; treat the warm plate with a 50 g/L solution of *potassium hydroxide R* in the solvent mixture and heat at 110 °C for 10 min; examine immediately in ultraviolet light at 366 nm.

*System suitability* Reference solution (c):

- the chromatogram shows 2 distinct zones, which may be touching, near the border between the lower and middle thirds; the lower zone (sennoside A) shows a light yellow fluorescence and the upper zone (sennoside D) shows a faint brownish-yellow fluorescence.

*Results* See below the sequence of fluorescent zones present in the chromatograms obtained with reference solution (a) and the test solution. Furthermore, in the chromatogram obtained with the test solution, other blue and/or reddish

fluorescent zones may be present, mainly above the zone due to sennoside A. For sennosides,  $R_F$  values vary slightly and the zones may be curved depending on the concentration.

Top of the plate	
Reference solution (a)	Test solution
Sennoside A: a light yellow zone	<p>A light yellow zone, very faint to faint (sennoside C)</p> <p>A brownish-yellow zone, faint (sennoside D)</p> <p>A light yellow zone, equivalent to intense (sennoside A)</p>
Sennoside B: a brownish-yellow zone	A brownish-yellow zone, intense (sennoside B)

### TESTS

#### Total anthraquinones (aloe emodin and rhein)

Liquid chromatography (2.2.29). Carry out the test protected from bright light.

**Solvent mixture** 1.0 g/L solution of sodium hydrogen carbonate R, methanol R (30:70 V/V).

**Test solution** Introduce 0.500 g of the powdered herbal drug (355) (2.9.12) into a 250 mL screw-cap bottle and add 100.0 mL of the solvent mixture. Sonicate for 30 min and shake for 2 h. Filter through a membrane filter (nominal pore size 0.45  $\mu\text{m}$ ).

**Reference solution (a)** Dissolve 10 mg of aloe emodin R and 10.0 mg of rhein CRS in tetrahydrofuran R and dilute to 50.0 mL with the same solvent. Dilute 1.0 mL of the solution to 20.0 mL with the solvent mixture.

**Reference solution (b)** Dissolve 10 mg of senna extract HRS in 8 mL of the solvent mixture using sonication for 5 min and dilute to 10 mL with the solvent mixture (a slight residue may remain). Filter through a membrane filter (nominal pore size 0.45  $\mu\text{m}$ ).

**Reference solution (c)** Dissolve 5.0 mg of sennoside B CRS in 25 mL of methanol R using sonication and dilute to 50.0 mL with water R.

#### Column:

- size:  $l = 0.25$  m,  $\varnothing = 4.6$  mm;
- stationary phase: end-capped propoxybenzene silica gel for chromatography R (4  $\mu\text{m}$ );
- temperature: 30 °C.

#### Mobile phase:

- mobile phase A: 1.275 per cent V/V solution of anhydrous formic acid R;
- mobile phase B: acetonitrile R;

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 3	87	13
3 - 40	87 → 37	13 → 63

**Flow rate** 1.0 mL/min.

**Detection** Spectrophotometer at 270 nm.

**Injection** 10  $\mu\text{L}$  of the test solution and reference solutions (a) and (b).

**Identification of peaks** Use the chromatogram supplied with senna extract HRS and the chromatogram obtained with reference solution (b) to identify the peaks due to isorhamnetin diglucoside and hydroxyanthracene glycosides (peaks 2-9); any shoulder appearing on the ascending part of the peak due to sennoside B (peak 3) is included in its area; peaks 4 and 5 may be co-eluted; peaks 7 and 8 may be co-eluted; use the chromatogram obtained with reference solution (a) to identify the peaks due to aloe emodin and rhein.

**Relative retention** With reference to sennoside B (peak 3, retention time = about 14.2 min): isorhamnetin diglucoside = about 0.93; hydroxyanthracene glycoside (peak 2) = about 0.98; hydroxyanthracene glycoside (peak 4) = about 1.01; hydroxyanthracene glycoside (peak 5) = about 1.02; hydroxyanthracene glycoside (peak 6) = about 1.07; hydroxyanthracene glycoside (peak 7) = about 1.09; hydroxyanthracene glycoside (peak 8) = about 1.11; hydroxyanthracene glycoside (peak 9) = about 1.13; aloe emodin = about 2.2; rhein = about 2.3.

**System suitability** Reference solution (b):

- resolution: minimum 3.0 between the peaks due to isorhamnetin diglucoside and hydroxyanthracene glycoside (peak 2).

Calculate the percentage content of total anthraquinones (aloe emodin and rhein) (TA), expressed as rhein, using the following expression:

$$\frac{A_1 \times m_2 \times p}{A_2 \times m_1 \times 10}$$

- $A_1$  = sum of the areas of the peaks due to aloe emodin and rhein in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to rhein in the chromatogram obtained with reference solution (a);
- $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;
- $m_2$  = mass of rhein CRS used to prepare reference solution (a), in grams;
- $p$  = percentage content of rhein in rhein CRS.

Calculate the percentage content of total anthraquinones with reference to the sum of total hydroxyanthracene glycosides (THG, see Assay) and total anthraquinones, using the following expression:

$$\frac{TA}{THG + TA} \times 100$$

#### Limit:

- total anthraquinones (aloe emodin and rhein) expressed as rhein ( $\text{C}_{15}\text{H}_8\text{O}_6$ ,  $M_r$  284.2): maximum 7.0 per cent, calculated with reference to the sum of total

hydroxyanthracene glycosides and total anthraquinones (dried drug).

**Foreign matter (2.8.2)**

Maximum 1 per cent.

**Loss on drying (2.2.32)**

Maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

**Total ash (2.4.16)**

Maximum 9.0 per cent.

**Ash insoluble in hydrochloric acid (2.8.1)**

Maximum 2.0 per cent.

**ASSAY**

Liquid chromatography (2.2.29) as described in the test for total anthraquinones (aloe emodin and rhein) with the following modification.

**Injection** Test solution and reference solution (c).

Calculate the percentage content of total hydroxyanthracene glycosides (peaks 2-9) (THG), expressed as sennoside B, using the following expression:

$$\frac{A_1 \times m_2 \times 2 \times p}{A_2 \times m_1}$$

- $A_1$  = sum of the areas of the peaks due to hydroxyanthracene glycosides (peaks 2-9) in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to sennoside B in the chromatogram obtained with reference solution (c);
- $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;
- $m_2$  = mass of sennoside B CRS used to prepare reference solution (c), in grams;
- $p$  = percentage content of sennoside B in sennoside B CRS.

**STORAGE**

Protected from moisture.

Ph Eur

## Senna Liquid Extract

**DEFINITION**

Senna Fruit, Alexandrian or Tinnevely, crushed	1000 g
Coriander Oil	6 mL
Ethanol (90 per cent)	250 mL
Purified Water, freshly boiled and cooled	A sufficient quantity

**Extemporaneous preparation**

The following directions apply.

Macerate the crushed Senna Fruit in 5 litres of Purified Water for 8 hours, decant the clear liquid and strain; repeat the process twice using 2 litres of Purified Water for each maceration. Lightly press the marc, strain the expressed liquid, mix the strained liquid with the previously decanted liquid and heat the combined liquids at 80° for 3 minutes in a covered vessel. Allow to stand for not less than 24 hours; filter.

Evaporate the filtrate to 750 mL under reduced pressure at a temperature not exceeding 60°. Separately, dissolve the Coriander Oil in the Ethanol (90 per cent), add the solution to the evaporated filtrate and add sufficient Purified Water to produce 1000 mL. Allow to stand for not less than 24 hours; filter.

The extract complies with the requirements stated under Extracts and with the following requirements.

**TESTS**

**Ethanol content**

21 to 24% v/v, Appendix VIII F, Method III.

**Dry residue**

17 to 25% w/v.

**Relative density**

1.02 to 1.09, Appendix V G.

## Standardised Senna Granules

**DEFINITION**

Standardised Senna Granules contain Alexandrian Senna Fruit in powder form with suitable excipients. The granules contain 0.55% w/w of sennosides, calculated as sennoside B.

The granules comply with the requirements stated under Granules and with the following requirements.

**Content of sennosides calculated as sennoside B**

0.467 to 0.633% w/w.

**IDENTIFICATION**

A. To 25 mg, in No. 180 powder, add 50 mL of water and 2 mL of hydrochloric acid, heat in a water bath for 15 minutes, allow to cool and shake with 40 mL of ether. Dry the ether layer over anhydrous sodium sulfate, filter, evaporate 5 mL of the filtrate to dryness, cool and add 5 mL of 6M ammonia to the residue; a yellow or orange colour is produced. Heat on a water bath for 2 minutes; a reddish violet colour is produced.

B. In the Assay, the chromatogram obtained with solution (1) exhibits two peaks corresponding to the peaks due to sennoside A and sennoside B in the chromatogram obtained with solution (2).

**Loss on drying**

When dried at 105° for 5 hours, lose not more than 2.0% of their weight. Use 5 g.

**ASSAY**

Carry out the method for liquid chromatography, Appendix III D, using the following solutions.

(1) Shake 2 g of the granules with 50 mL of a 0.3% v/v solution of acetic acid adjusted to pH 5.9 with 1M sodium hydroxide for 30 minutes, centrifuge, filter through a glass fibre paper (Whatman GF/C is suitable) and use the filtrate.

(2) Prepare solution (2) in the same manner as solution (1) but using a quantity of Alexandrian senna fruit powder BPCRS containing the equivalent of 11 mg of sennoside B.

**CHROMATOGRAPHIC CONDITIONS**

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with end-capped octadecylsilyl silica gel for chromatography (5 µm) (Spherisorb ODS 2 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 350 nm.

(f) Inject 20 µL of each solution.

**MOBILE PHASE**

17 volumes of acetonitrile and 83 volumes of a 1% v/v solution of glacial acetic acid.

## DETERMINATION OF CONTENT

Calculate the total content of sennosides A and B as sennoside B in the granules using the declared content of sennosides in *Alexandrian senna fruit powder BPCRS*.

## STORAGE

Standardised Senna Granules should be kept in an airtight container.

## LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of sennoside B.

## Senna Tablets

## DEFINITION

Senna Tablets contain the powdered pericarp of Senna Fruit, Alexandrian or Tinnevely.

*The tablets comply with the requirements stated under Tablets and with the following requirements.*

Content of total sennosides, calculated as sennoside B 85.0 to 115.0% of the stated amount.

## IDENTIFICATION

The powdered tablets exhibit diagnostic structures of senna pericarp. External epidermis of isodiametric cells with very thick outer walls. Occasional stomata. Trichomes few, unicellular, conical and warty. Parenchymatous cells from inner part of a two-to five-layered zone subjacent to the epidermis, each containing a single prism of calcium oxalate. Thick-walled fibres in two to four layers, the fibres of the outer and inner zones respectively with their long axes at right angles to each other. Sutural vascular strands sheathed by cells containing prisms of calcium oxalate; elements of seed tissue may also be present.

## TESTS

## Disintegration

Maximum time, 60 minutes, Appendix XII A.

## ASSAY

Weigh and powder 20 tablets. Carry out the following procedure protected from light. To a quantity of the powder containing the equivalent of 7.5 mg of total sennosides add 30 mL of water, weigh, heat under a reflux condenser on a water bath for 15 minutes, allow to cool, weigh and restore the original weight with water. Centrifuge, transfer 20 mL of the supernatant liquid to a separating funnel, add 0.1 mL of 2M hydrochloric acid, shake with two 15 mL quantities of chloroform, allow to separate and discard the chloroform layers. Add 0.10 g of sodium hydrogen carbonate and shake for 3 minutes; centrifuge and transfer 10 mL of the liquid to a round-bottomed flask fitted with a ground-glass neck. Add a mixture of 8 mL of iron(III) chloride solution and 12 mL of water and mix. Heat under a reflux condenser on a water bath for 20 minutes, add 1 mL of hydrochloric acid and continue heating for a further 20 minutes, shaking frequently, until the precipitate is dissolved. Allow to cool, transfer the mixture to a separating funnel and extract with three 25-mL quantities of ether previously used to rinse the flask. Wash the combined ether extracts with two 15-mL quantities of water and add sufficient ether to produce 100 mL. Evaporate 10 mL just to dryness on a water-bath and dissolve the residue in 10 mL of 1M potassium hydroxide, filtering if necessary through a sintered-glass filter (ISO 4793, porosity grade 3, is suitable). Measure the absorbance of the resulting solution without delay at the maximum at 500 nm,

Appendix II B. Calculate the content of total sennosides, as sennoside B, taking 200 as the value of A(1%, 1 cm) at the maximum at 500 nm.

## LABELLING

The quantity of active ingredient is stated in terms of total sennosides expressed as the equivalent content of sennoside B.

## Senna Leaflet

## Senna Leaf

(Ph. Eur. monograph 0206)

## Preparation

Standardised Senna Leaf Dry Extract

When Powdered Senna Leaf is prescribed or demanded, material complying with the requirements below with the exception of Identification test A and the test for Foreign matter shall be dispensed or supplied.

Ph Eur

## DEFINITION

Dried leaflets of *Senna alexandrina* Mill. (syn. *Cassia acutifolia* Delile and *Cassia angustifolia* Vahl).

## Content

Minimum 2.0 per cent of total hydroxyanthracene glycosides, expressed as sennoside B ( $C_{42}H_{36}O_{20}$ ;  $M_r$  863) (dried drug).

## IDENTIFICATION

- A. The green to brownish-green leaflets are thin, elongated, lanceolate, more or less asymmetrical at the base and mucronate at the apex, 15-50 mm long and 5-20 mm wide. Both surfaces of the lamina are covered with varying numbers of fine, short trichomes and may be marked with transverse or oblique lines. Pinnate venation is visible mainly on the abaxial surface and usually shows lateral veins anastomosing at the leaf margins.
- B. Microscopic examination (2.8.23). The powder is light green or greenish-yellow. Examine under a microscope using chloral hydrate solution R. The powder shows the following diagnostic characters (Figure 0206.-1): fragments of epidermis [A, B, J, K] with polygonal cells [Aa, Ka], paracytic stomata (2.8.3) [Ab, Ac, Ba, Ja, Kb] and unicellular covering trichomes, conical in shape, with warty walls (surface view [Ad], side view [G]), or their scars [Bb, Jb], frequently accompanied by palisade parenchyma [Ae, Jc]; isolated, fragmented covering trichomes [E]; fibres [F] accompanied by crystal sheaths containing prisms of calcium oxalate [Fa]; isolated prisms of calcium oxalate [D]; isolated cluster crystals of calcium oxalate [H]; fragments of median parenchyma from the lamina [C] with some cells containing cluster crystals of calcium oxalate [Ca], often accompanied by palisade parenchyma [Cb] and annular vessels [Cc].
- C. High-performance thin-layer chromatography (2.8.25). Solvent mixture ethanol (96 per cent) R, water R (50:50 V/V). Test solution To 0.5 g of the powdered herbal drug (355) (2.9.12) add 5.0 mL of the solvent mixture. Sonicate for 10 min, then filter or centrifuge the solution. Use the filtrate or supernatant.
- Reference solution (a) Dissolve 3 mg of sennoside A R and 3 mg of sennoside B R in a mixture of equal volumes of ethanol (96 per cent) R and a 1 g/L solution of sodium hydrogen carbonate R and dilute to 20.0 mL with the same mixture of solvents.

Figure 0206.-1. - Illustration for identification test B of powdered herbal drug of senna leaflet

**Reference solution (b)** Dilute 2.5 mL of reference solution (a) to 10.0 mL with the solvent mixture.

**Reference solution (c)** Dissolve 10 mg of *senna extract HRS* in 1 mL of the solvent mixture (a slight residue may remain).

**Intensity marker** Sennoside A.

**Plate** TLC silica gel  $F_{254}$  plate R (2-10  $\mu\text{m}$ ).

**Mobile phase** water R, ethyl acetate R, propanol R (30:40:40 V/V/V).

**Application** 1  $\mu\text{L}$  of the test solution and 2  $\mu\text{L}$  of reference solutions (a), (b) and (c), as bands of 8 mm.

**Development** 70 mm from the lower edge of the plate.

**Drying** In a current of air at room temperature for 5 min.

**Detection** Heat at 110  $^{\circ}\text{C}$  for 10 min; treat the warm plate with a 50 g/L solution of potassium hydroxide R in the solvent mixture and heat at 110  $^{\circ}\text{C}$  for 10 min; examine immediately in ultraviolet light at 366 nm.

**System suitability** Reference solution (c):

- the chromatogram shows 2 distinct zones, which may be touching, near the border between the lower and middle thirds; the lower zone (sennoside A) shows a light yellow fluorescence and the upper zone (sennoside D) shows a faint brownish-yellow fluorescence.

**Results** See below the sequence of fluorescent zones present in the chromatograms obtained with reference solution (a) and the test solution. Furthermore, in the chromatogram obtained with the test solution, other blue and/or reddish fluorescent zones may be present, mainly above the zone due to sennoside A. For sennosides,  $R_f$  values vary slightly and the zones may be curved depending on the concentration.

## TESTS

### Total anthraquinones (aloe emodin and rhein)

Liquid chromatography (2.2.29). Carry out the test protected from bright light.

**Solvent mixture** 1.0 g/L solution of sodium hydrogen carbonate R, methanol R (30:70 V/V).

**Test solution** Introduce 1.00 g of the powdered herbal drug (355) (2.9.12) into a 250 mL screw-cap bottle and add 100.0 mL of the solvent mixture. Sonicate for 30 min and shake for 2 h. Filter through a membrane filter (nominal pore size 0.45  $\mu\text{m}$ ).

**Reference solution (a)** Dissolve 10 mg of aloe emodin R and 10.0 mg of rhein CRS in tetrahydrofuran R and dilute to 50.0 mL with the same solvent. Dilute 1.0 mL of the solution to 20.0 mL with the solvent mixture.

**Reference solution (b)** Dissolve 10 mg of *senna extract HRS* in 8 mL of the solvent mixture using sonication for 5 min and dilute to 10 mL with the solvent mixture (a slight residue may remain). Filter through a membrane filter (nominal pore size 0.45  $\mu\text{m}$ ).

**Reference solution (c)** Dissolve 5.0 mg of sennoside B CRS in 25 mL of methanol R using sonication and dilute to 50.0 mL with water R.

**Column:**

- size:  $l = 0.25$  m,  $\varnothing = 4.6$  mm;
- stationary phase: end-capped propoxybenzene silica gel for chromatography R (4  $\mu\text{m}$ );
- temperature: 30  $^{\circ}\text{C}$ .

**Mobile phase:**

- mobile phase A: 1.275 per cent V/V solution of anhydrous formic acid R;
- mobile phase B: acetonitrile R;

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 3	87	13
3 - 40	87 → 37	13 → 63

Flow rate 1.0 mL/min.

Detection Spectrophotometer at 270 nm.

Injection 10 µL of the test solution and reference solutions (a) and (b).

**Identification of peaks** Use the chromatogram supplied with *senna extract HRS* and the chromatogram obtained with reference solution (b) to identify the peaks due to isorhamnetin diglucoside and hydroxyanthracene glycosides (peaks 2-9); any shoulder appearing on the ascending part of the peak due to sennoside B (peak 3) is included in its area; peaks 4 and 5 may be co-eluted; peaks 7 and 8 may be co-eluted; use the chromatogram obtained with reference solution (a) to identify the peaks due to aloe emodin and rhein.

**Relative retention** With reference to sennoside B (peak 3, retention time = about 14.2 min): isorhamnetin diglucoside = about 0.93; hydroxyanthracene glycoside (peak 2) = about 0.98; hydroxyanthracene glycoside (peak 4) = about 1.01; hydroxyanthracene glycoside (peak 5) = about 1.02; hydroxyanthracene glycoside (peak 6) = about 1.07; hydroxyanthracene glycoside (peak 7) = about 1.09; hydroxyanthracene glycoside (peak 8) = about 1.11; hydroxyanthracene glycoside (peak 9) = about 1.13; aloe emodin = about 2.2; rhein = about 2.3.

**System suitability** Reference solution (b):

— resolution: minimum 3.0 between the peaks due to isorhamnetin diglucoside and hydroxyanthracene glycoside (peak 2).

Calculate the percentage content of total anthraquinones (aloe emodin and rhein) (*TA*), expressed as rhein, using the following expression:

$$\frac{A_1 \times m_2 \times p}{A_2 \times m_1 \times 10}$$

- $A_1$  = sum of the areas of the peaks due to aloe emodin and rhein in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to rhein in the chromatogram obtained with reference solution (a);
- $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;
- $m_2$  = mass of *rhein CRS* used to prepare reference solution (a), in grams;
- $p$  = percentage content of rhein in *rhein CRS*.

Calculate the percentage content of total anthraquinones with reference to the sum of total hydroxyanthracene glycosides (*THG*, see Assay) and total anthraquinones, using the following expression:

$$\frac{TA}{THG + TA} \times 100$$

**Limit:**

— total anthraquinones (aloe emodin and rhein) expressed as rhein ( $C_{15}H_8O_6$ ;  $M_r$  284.2): maximum 7.0 per cent, calculated with reference to the sum of total hydroxyanthracene glycosides and total anthraquinones (dried drug).

**Foreign matter (2.8.2)**

Maximum 4 per cent.

**Loss on drying (2.2.32)**

Maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

**Total ash (2.4.16)**

Maximum 12.0 per cent.

**Ash insoluble in hydrochloric acid (2.8.1)**

Maximum 2.5 per cent.

**ASSAY**

Liquid chromatography (2.2.29) as described in the test for total anthraquinones (aloe emodin and rhein) with the following modification.

**Injection** Test solution and reference solution (c).

Calculate the percentage content of total hydroxyanthracene glycosides (peaks 2-9) (*THG*), expressed as sennoside B, using the following expression:

$$\frac{A_1 \times m_2 \times 2 \times p}{A_2 \times m_1}$$

- $A_1$  = sum of the areas of the peaks due to hydroxyanthracene glycosides (peaks 2-9) in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to sennoside B in the chromatogram obtained with reference solution (c);
- $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;
- $m_2$  = mass of *sennoside B CRS* used to prepare reference solution (c), in grams;
- $p$  = percentage content of sennoside B in *sennoside B CRS*.

**STORAGE**

Protected from moisture.

Ph Eur

**Standardised Senna Leaf Dry Extract**

(Ph. Eur. monograph 1261)

Ph Eur

**DEFINITION**

Standardised dry extract produced from *Senna leaf (0206)*.

**Content**

5.5 per cent to 8.0 per cent of hydroxyanthracene glycosides, expressed as sennoside B ( $C_{42}H_{38}O_{20}$ ;  $M_r$  863) (dried extract). The measured content does not deviate from the value stated on the label by more than ± 10 per cent.

**PRODUCTION**

The extract is produced from the herbal drug by a suitable procedure using ethanol (50-80 per cent V/V).

**CHARACTERS**

**Appearance**

Brownish or brown powder.

**IDENTIFICATION**

A. Thin-layer chromatography (2.2.27).

**Solvent mixture** ethanol (96 per cent) R, water R (50:50 V/V).

**Test solution** To 0.1 g of the extract to be examined add 5 mL of the solvent mixture and heat to boiling. Cool and centrifuge. Use the supernatant.

**Reference solution** Dissolve 10 mg of *senna extract CRS* in 1 mL of the solvent mixture (a slight residue remains).

**Plate** TLC silica gel plate R.

**Mobile phase** glacial acetic acid R, water R, ethyl acetate R, propanol R (1:30:40:40 V/V/V/V).

**Application** 10 µL as bands.

**Development** Over a path of 10 cm.

**Drying** In air.

**Detection** Treat with a 20 per cent V/V solution of nitric acid R and heat at 120 °C for 10 min; allow to cool and treat with a 50 g/L solution of potassium hydroxide R in ethanol (50 per cent V/V) R until the zones appear.

**Results** The principal zones in the chromatogram obtained with the test solution are similar in position, colour and size to the principal zones in the chromatogram obtained with the reference solution. The chromatograms show in the lower third a prominent brown zone due to sennoside B and above it a yellow zone followed by another prominent brown zone due to sennoside A. In the upper half of the chromatograms are visible, in order of increasing  $R_F$  value, a prominent reddish-brown zone and an orange-brown zone followed by a faint pink zone and 2 yellow zones. Close to the solvent front a dark pink zone appears, which may be followed by several faint zones.

B. Place about 25 mg of the extract to be examined in a conical flask and add 50 mL of water R and 2 mL of hydrochloric acid R. Heat in a water-bath for 15 min, cool and shake with 40 mL of ether R. Separate the ether layer, dry over anhydrous sodium sulfate R, evaporate 5 mL to dryness and to the cooled residue add 5 mL of dilute ammonia R1. A yellow or orange colour develops. Heat on a water-bath for 2 min. A reddish-violet colour develops.

#### TESTS

**Loss on drying** (2.8.17)

Maximum 5.0 per cent.

#### ASSAY

Carry out the assay protected from bright light.

Place 0.150 g of the extract to be examined in a 100 mL flask, disperse in water R and dilute to 100.0 mL with the same solvent. Filter the solution, discarding the first 10 mL of the filtrate. Transfer 20.0 mL of the filtrate to a 150 mL separating funnel. Add 0.1 mL of dilute hydrochloric acid R and shake with 3 quantities, each of 15 mL, of ether R. Allow the layers to separate and discard the ether layer. Add 0.10 g of sodium hydrogen carbonate R to the aqueous layer and shake for 3 min. Centrifuge and transfer 10.0 mL of the supernatant to a 100 mL round-bottomed flask with a ground-glass neck. Add 20 mL of ferric chloride solution R1 and mix. Heat for 20 min under a reflux condenser in a water-bath with the water level above that of the liquid in the flask; add 3 mL of hydrochloric acid R and heat for a further 30 min with frequent shaking to dissolve the precipitate. Cool, transfer the mixture to a separating funnel and shake with 3 quantities, each of 25 mL, of ether R previously used to rinse the flask. Combine the ether layers and wash with 2 quantities, each of 15 mL, of water R. Transfer the ether layers to a volumetric flask and dilute to 100.0 mL with ether R. Evaporate 10.0 mL carefully to dryness and dissolve the residue in 10.0 mL of a 5.0 g/L solution of magnesium acetate R in methanol R. Measure the absorbance (2.2.25) at 515 nm using methanol R as the compensation liquid.

Calculate the percentage content of hydroxyanthracene glycosides expressed as sennoside B using the following expression:

$$\frac{A \times 4.167}{m}$$

i.e. taking the specific absorbance of sennoside B to be 240.

A = absorbance at 515 nm;  
m = mass of the extract to be examined, in grams.

#### LABELLING

The label states the content of hydroxyanthracene glycosides.

Ph Eur

## Serratula Herb

(*Serratula Coronata* Herb, Ph. Eur. monograph 2754)

Ph Eur

#### DEFINITION

Dried, whole or fragmented aerial part of *Serratula coronata* L. collected during flowering.

#### Content

Minimum 5.0 per cent of  $\beta$ -ecdysterone ( $C_{27}H_{44}O_7$ ;  $M_r$  480.6) (dried drug).

#### IDENTIFICATION

A. The stem is sulcate, erect, glabrous, usually terminally branched, rarely unbranched. Basal leaves are glabrescent, varying from pinnately lobed, or sometimes irregularly pinnatifid, to pinnatisect or pinnate; segments are elliptical to lanceolate, with hairy, irregularly serrate or dentate margins; main veins are sunken on the upper surface and prominent on the lower surface. Cauline leaves are similar to the basal leaves, but are smaller towards the top of the stem. The capitula, 15–25 mm in diameter, are campanulate and arranged as a loose, irregular panicle; they consist of an involucre, a receptacle with paleae up to 10 mm in length and numerous florets. Involucral bracts are yellowish-green tinged with reddish-brown to violet, rigid, acute and distinctly velutinous. Inner bracts are more elongated, sometimes hooked at the apex. Florets are pinkish-violet, tubular and 20–28 mm in length. Achenes, if present, are oblanceolate-ellipsoid and glabrous, sometimes still bearing a pappus of multiseriate, acute, unbranched hairs.

B. Microscopic examination (2.8.23). The powder is green. Examine under a microscope using chloral hydrate solution R. The powder shows the following diagnostic characters (Figure 2754.-1): fragments of the upper epidermis of the leaf (surface view [D]), consisting of polygonal cells with slightly sinuous anticlinal walls [Da] and anomocytic stomata (2.8.3) with 3–5 subsidiary cells [Db], usually accompanied by palisade parenchyma [Dc]; fragments of the lower epidermis of the leaf (surface view [C]), composed of irregularly shaped cells [Ca] and anomocytic stomata with 3–5 subsidiary cells [Cb] often accompanied by spongy parenchyma cells [Cc]; fragments of the margin of the leaf lamina showing the remains of the bases of numerous uniseriate covering trichomes [B, H] composed of 3–5 cells with thickened walls and a striated cuticle [Ba], occasionally bearing very thin-walled cells [Bb]; fragments of the abaxial epidermis of the bracts of the involucre [A, G] with slightly thickened, elongated cells [Aa] bearing short, unicellular, lignified covering trichomes pointing in the same direction, fusiform in surface view [Ab] and spiny in transverse section [Ga], and rare biseriate glandular trichomes [Ac]; fragments of the bristles of the calyx [J]; fragments of the

style [E] composed of fine irregular cells [Ea], 1 or 2 secretory canals with orange contents [Eb] lying parallel to the annular vessels [Ec]; pollen grains, 60-70  $\mu\text{m}$  in diameter, with 3 pores and a thick, spiny exine [F]; fragments of the ovary with long styloid calcium oxalate crystals and fragments of the corolla containing small prismatic crystals of calcium oxalate may also be present.

Figure 2754.-1. – Illustration for identification test B of powdered herbal drug of *Serratula coronata* herb

#### C. High-performance thin-layer chromatography (2.8.25).

**Test solution** To 0.25 g of the powdered herbal drug (355) (2.9.12) add 5.0 mL of *methanol R*. Sonicate for 10 min, centrifuge and use the supernatant.

**Reference solution (a)** Dissolve 1.5 mg of *rutoside trihydrate R* and 2.5 mg of *isoquercitroside R* in *methanol R* and dilute to 10.0 mL with the same solvent.

**Reference solution (b)** Dilute 2.5 mL of reference solution (a) to 10.0 mL with *methanol R*.

**Reference solution (c)** Dissolve 1.5 mg of *chlorogenic acid R* and 1.5 mg of *hyperoside R* in *methanol R* and dilute to 10.0 mL with the same solvent.

**Intensity marker** Isoquercitroside.

**Plate** TLC silica gel  $F_{254}$  plate *R* (2-10  $\mu\text{m}$ ).

**Mobile phase** anhydrous formic acid *R*, water *R*, ethyl acetate *R* (10:10:80 V/V/V).

**Application** 2  $\mu\text{L}$  as bands of 8 mm.

**Development** 70 mm from the lower edge of the plate.

**Drying** In a current of air at room temperature for 5 min.

**Detection** Heat at 100-105  $^{\circ}\text{C}$  for 3 min; spray the warm plate with a 10 g/L solution of *diphenylboric acid aminoethyl ester R* in *methanol R*, then with a 50 g/L solution of *macrogol 400 R* in *methanol R* or, alternatively, dip the warm plate in a 5 g/L solution of *diphenylboric acid aminoethyl ester R* in *ethyl*

*acetate R*, then in a 50 g/L solution of *macrogol 400 R* in *methylene chloride R*; allow the plate to dry in air for about 1 min and examine in ultraviolet light at 366 nm.

**System suitability** Reference solution (c):

— the chromatogram shows in the middle third 2 distinct zones, which may be touching; the lower zone (chlorogenic acid) shows a light blue fluorescence and the upper zone (hyperoside) shows a yellow or orange fluorescence.

**Results** See below the sequence of fluorescent zones present in the chromatograms obtained with reference solution (a) and the test solution. Furthermore, in the chromatogram obtained with the test solution, other faint to very faint fluorescent zones may be present.

Top of the plate	
	A red zone, very faint to equivalent A yellow zone, very faint to intense
	2 greenish-blue zones, very faint to equivalent (possibly overlapping with the yellow or orange zone below)
Isoquercitroside: a yellow or orange zone	A yellow or orange zone, very faint to faint A greenish-blue zone, equivalent A bluish zone, very faint to faint
Rutoside: a yellow or orange zone	A yellow or orange zone, very faint to faint
Reference solution (a)	Test solution

#### TESTS

##### Loss on drying (2.2.32)

Maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105  $^{\circ}\text{C}$  for 2 h.

##### Total ash (2.4.16)

Maximum 12.0 per cent.

#### ASSAY

##### Liquid chromatography (2.2.29).

**Test solution** Place 4.0 g of the powdered herbal drug (355) (2.9.12) in the cartridge of a continuous extraction apparatus (Soxhlet type). Place 150 mL of *methanol R* and a magnetic stirrer in a 500 mL round-bottomed flask and heat under reflux for 8 h. Transfer the resulting extract to a volumetric flask and dilute to 200.0 mL with *methanol R*.

**Reference solution (a)** Dissolve 10.0 mg of  $\beta$ -ecdysterone CRS in *methanol R* using sonication and dilute to 50.0 mL with the same solvent.

**Reference solution (b)** Dissolve 2 mg of *makisterone A R* in reference solution (a) using sonication and dilute to 10 mL with reference solution (a).

**Column:**

- size:  $l = 0.25$  m,  $\varnothing = 4.0$  mm;
- stationary phase: end-capped octadecylsilyl diol silica gel for chromatography compatible with highly aqueous mobile phases R (5  $\mu$ m);
- temperature: 25 °C.

**Mobile phase:**

- mobile phase A: 0.125 per cent V/V solution of anhydrous formic acid R;
- mobile phase B: acetonitrile for chromatography R;

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 2	85	15
2 - 17	85 → 72.5	15 → 27.5
17 - 23	72.5 → 10	27.5 → 90

**Flow rate** 1.0 mL/min.

**Detection** Spectrophotometer at 248 nm.

**Injection** 20  $\mu$ L.

**Identification of peaks** Use the chromatogram obtained with reference solution (a) to identify the peak due to  $\beta$ -ecdysterone; use the chromatogram obtained with reference solution (b) to identify the peak due to *makisterone A*.

**Retention time**  $\beta$ -ecdysterone = about 11 min.

**System suitability** Reference solution (b):

- resolution: minimum 5.0 between the peaks due to  $\beta$ -ecdysterone and *makisterone A*.

Calculate the percentage content of  $\beta$ -ecdysterone using the following expression:

$$\frac{A_1 \times m_2 \times p \times 4}{A_2 \times m_1}$$

- $A_1$  = area of the peak due to  $\beta$ -ecdysterone in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to  $\beta$ -ecdysterone in the chromatogram obtained with reference solution (a);
- $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;
- $m_2$  = mass of  $\beta$ -ecdysterone CRS used to prepare reference solution (a), in grams;
- $p$  = assigned percentage content of  $\beta$ -ecdysterone in  $\beta$ -ecdysterone CRS.

Ph Eur

## Sesame Seed

### DEFINITION

Sesame seeds are the dried seeds of *Sesamum indicum* L.

### IDENTIFICATION

A. The seed is a flattened pyriform shape. Size, testa colour and surface texture vary according to cultivar: sizes range from 1.5 to 4 mm long, 1 to 2 mm wide and 0.5 to 1 mm thick; the dull testa may be white, cream, yellow, grey, brown, red or black; medicinal cultivars from China and India are predominantly yellow, dark brown or black; and surface texture ranges from smooth to finely reticulate or rugose. The wider end is rounded and the narrow end tapers to a short point with a punctiform white or brown hilum. When viewed with a hand lens the seed margin is smooth or

narrowly 1- or 2-ridged throughout all or part of its length, and a longitudinal line may be visible on one of the flat surfaces, notably in those cultivars with a pale coloured testa. Inside the thin testa, a narrow whitish endosperm and an embryo comprised of a two large, yellowish and oily cotyledons are present.

B. Reduce to a powder. The powder varies in colour from yellow to brown or blackish. Epidermis of the testa, a single layer of palisade-like cells thin-walled, with yellowish coloured contents and an embedded cluster crystal of calcium oxalate in each cell, except in those of the ridges which have no contents; the remainder of the testa is composed of collapsed cells. Endosperm 3 layered, rarely 2 layered, consisting of polygonal cells containing fixed oils and small aleurone grains. Epidermis of cotyledons, a single layer covered with a thin cuticle, with an underlying single layer of palisade-like cells; endosperm tissue composed of polygonal, parenchyma cells containing fixed oil and aleurone grains. Cluster crystals of calcium oxalate and fragments may be found scattered in the powder.

C. Carry out the test for the identification of fatty oils by thin-layer chromatography, Appendix X N, using the following solutions.

(1) Add 100 mL of dichloromethane to 10.0 g of the powdered herbal drug. Shake for 24 hours on a mechanical shaker, filter and evaporate to dryness at 40°. Dissolve 60 mg of the oily residue in 9 mL of dichloromethane.

(2) 0.67% w/v of sesame oil in dichloromethane.

### CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating octadecylsilyl silica gel for HPTLC (Merck silica gel 60 RP-18 HPTLC plates are suitable).

(b) Use mobile phase A and mobile B described below.

(c) Apply 1  $\mu$ L of each solution as 6 mm bands.

(d) Develop the plate twice to 0.5 cm in mobile phase A, drying the plate after each application. Develop the plate a further two times to 8 cm in mobile phase B, drying the plate after each application.

(e) After removal of the plate, dry in air and spray with a 10% w/v solution of ethanolic phosphomolybdic acid solution, heat at 120° for 3 minutes and examine in daylight.

### MOBILE PHASE

**Mobile phase A** ether

**Mobile phase B** 20 volumes of dichloromethane, 40 volumes of glacial acetic acid and 50 volumes of acetone.

### SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (2) shows 4 clearly separated bands.

### CONFIRMATION

The chromatogram obtained with solution (1) shows 4 grey bands with varying intensities. The 4 principal bands are similar in position, colour and size to the bands obtained with solution (2). Other bands may be present.

### TESTS

#### Loss on drying

When dried for 2 hours at 100° to 105°, loses not more than 5.0% of its weight, Appendix IX D. Use 1 g.

#### Total Ash

Not more than 9%, Appendix XI J, Method II.

## Sophora Flavescens Root

(Lightyellow Sophora Root, Ph. Eur. monograph 2440)

Ph Eur

### DEFINITION

Whole or fragmented, dried root of *Sophora flavescens* Aiton, with root crown and rootlets removed, collected in spring or autumn.

### Content

Minimum 1.2 per cent for the sum of matrine ( $C_{15}H_{24}N_2O_2$ ;  $M_r$  248.4) and oxymatrine ( $C_{15}H_{24}N_2O_2$ ;  $M_r$  264.4) (dried drug).

### IDENTIFICATION

A. The root is cylindrical, usually branched in the lower part, 10-30 cm long, 1-6.5 cm in diameter, externally greyish-brown or brownish-yellow, exhibiting longitudinal wrinkles and transverse elongated lenticel-like protuberances. The outer bark is thin, mostly broken and recurved, easily exfoliated, with the exposed surface appearing yellow and smooth. The texture is hard and difficult to break.

The fracture is fibrous. Slices are 3-6 mm thick; the transversely cut surface is yellowish-white with radial lines and cracks, sometimes exhibiting abnormal vascular bundles arranged in concentric rings or scattered irregularly.

B. Microscopic examination (2.8.23). The powder is pale brownish-yellow. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2440.-1): very numerous unlignified fibres, single or in groups [C, G], usually surrounded by crystal sheaths of calcium oxalate [Ca]; some fibres accompanied by medullary rays with cells having slightly thickened and pitted walls [Ga]; xylem vessels, pitted or reticulate [K, L], 50-200  $\mu$ m in diameter; calcium oxalate prisms, 10-25  $\mu$ m in diameter, either isolated [B] or inside parenchymatous cells [Da], sometimes several prisms in the same cell, or forming crystal sheaths around the fibres [Ca]; numerous fragments of parenchyma with rounded to ovoid, slightly pitted cells [D]; fragments of cork (surface view [A]) consisting of polygonal cells, finely reticulate inside; rare sclereids, either in groups [F] or, more often, isolated [E]. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows very abundant starch granules, either included in parenchyma cells [J] or isolated [H]; some are simple, most are 2-8 compound of variable size; the hilum is usually visible.

C. Thin-layer chromatography (2.2.27).

**Test solution** To 1.0 g of the powdered herbal drug (355) (2.9.12) add 20 mL of *water R*. Heat on a water-bath under a reflux condenser at 90 °C for 30 min. Allow to cool and centrifuge for 5 min. Dilute 5 mL of the supernatant to 10 mL with *methanol R*. A white precipitate is formed. Centrifuge for 5 min and use the clear, slightly yellow supernatant.

**Reference solution** Dissolve 1 mg of *brucine R* and 1 mg of *quinine R* in 5 mL of *ethanol (96 per cent) R*.

**Plate** TLC silica gel  $F_{254}$  plate *R* (2-10  $\mu$ m).

**Mobile phase** concentrated ammonia *R*, *methanol R*, *methylene chloride R* (5:10:85 *V/V/V*).

**Application** 5  $\mu$ L as bands of 8 mm.

**Development** Over a path of 6 cm.

**Drying** In air.

Figure 2440.-1. – Illustration for identification test B of powdered herbal drug of lightyellow sophora root

**Detection** Treat with *potassium iodobismuthate solution R* and then with *dilute hydrogen peroxide solution R* until the orange or brown zones become visible against a yellow background; examine in daylight.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
	A faint brown or orange-red zone
	A brown or orange-red zone
An orange-red zone (brucine)	
A brown or orange-red zone (quinine)	
	2 or 3 prominent brown or orange-red zones
Reference solution	Test solution

### TESTS

**Loss on drying** (2.2.32)

Maximum 11.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C.

**Total ash (2.4.16)**

Maximum 8.0 per cent.

**Ash insoluble in hydrochloric acid (2.8.1)**

Maximum 1.5 per cent.

**ASSAY**

Liquid chromatography (2.2.29).

**Test solution** To 0.300 g of the powdered herbal drug (355) (2.9.12) add 0.5 mL of concentrated ammonia R and 25.0 mL of methylene chloride R, weigh and sonicate for 30 min. Allow to cool, weigh and adjust to the original mass with methylene chloride R, shake well and filter. Transfer 5.0 mL of the filtrate to a chromatographic column about 0.2 m long and 10 mm in internal diameter packed with 5 g of neutral aluminium oxide R (60-210 µm). Elute with 20 mL of a mixture of 3 volumes of methanol R and 7 volumes of methylene chloride R. Evaporate the eluate to dryness. Dissolve the residue in ethanol (96 per cent) R and dilute to 10.0 mL with the same solvent.

**Reference solution** Dissolve 5.0 mg of matrine CRS and 5.0 mg of oxymatrine CRS in a mixture of 2 volumes of anhydrous ethanol R and 8 volumes of acetonitrile R, and dilute to 5.0 mL with the same mixture of solvents. Dilute 1.0 mL of the solution to 20.0 mL with a mixture of 2 volumes of anhydrous ethanol R and 8 volumes of acetonitrile R.

**Column:**— size:  $l = 0.125$  m,  $\varnothing = 4.0$  mm;

— stationary phase: aminopropylsilyl silica gel for chromatography R (5 µm).

**Mobile phase** 1 per cent V/V solution of phosphoric acid R in ethanol (96 per cent) R, acetonitrile for chromatography R (20:80 V/V).

**Flow rate** 1.0 mL/min.**Detection** Spectrophotometer at 220 nm.**Injection** 20 µL.

**Retention time** Matrine = about 14 min; oxymatrine = about 24 min.

**System suitability** Reference solution:

— resolution: minimum 5.0 between the peaks due to matrine and oxymatrine.

Calculate the percentage content of the sum of matrine and oxymatrine using the following expression:

$$\frac{A_1 \times m_2 \times p_1 \times 0.50}{A_2 \times m_1} + \frac{A_3 \times m_3 \times p_2 \times 0.50}{A_4 \times m_1}$$

- $A_1$  = area of the peak due to matrine in the chromatogram obtained with the test solution;  
 $A_2$  = area of the peak due to matrine in the chromatogram obtained with the reference solution;  
 $A_3$  = area of the peak due to oxymatrine in the chromatogram obtained with the test solution;  
 $A_4$  = area of the peak due to oxymatrine in the chromatogram obtained with the reference solution;  
 $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;  
 $m_2$  = mass of matrine CRS used to prepare the reference solution, in grams;  
 $m_3$  = mass of oxymatrine CRS used to prepare the reference solution, in grams;  
 $p_1$  = percentage content of matrine in matrine CRS;  
 $p_2$  = percentage content of oxymatrine in oxymatrine CRS.

Ph Eur

**Sophora Flower**

(Ph. Eur. monograph 2639)

Ph Eur

**DEFINITION**

Dried, opened flower of *Styphnolobium japonicum* (L.) Schott (syn. *Sophora japonica* L.).

**Content**

- minimum 8.0 per cent of total flavonoids, expressed as rutoside ( $C_{27}H_{30}O_{16}$ ;  $M_r$  611) (dried drug);
- minimum 6.0 per cent of rutoside ( $C_{27}H_{30}O_{16}$ ;  $M_r$  611) (dried drug).

**IDENTIFICATION**

**A.** The opened flower is crumpled, rolled, and has a very thin and short pedicel. The dark green or brown, campanulate calyx is about 3-4 mm long and consists of 5 fused sepals with longitudinal striations at the base, divided at the apex into 5 slightly bilabiate lobes. The pale yellow or light yellowish-brown, papilionaceous type corolla is often broken and measures about 10-15 mm; the upper petal is the largest, subrounded, with a reflexed apex and a bright yellow unguis at its internal base. The other 4 petals are oblong. There are 10 free stamens surrounding a cylindrical and curved central style.

**B.** Microscopic examination (2.8.23). The powder is yellowish-green. Examine under a microscope using chloral hydrate solution R. The powder shows the following diagnostic characters (Figure 2639.-1): roundish [La] or triangular [Lb] pollen grains [L] with 3 pores and a smooth exine, about 18 µm in diameter; isolated covering trichomes [A, B, F, O] of varying lengths (60-660 µm), slightly flexed, usually consisting of 1 or 2 basal cells and a long pointed distal cell, with smooth or slightly warty walls; fragments of sepals [C] composed of anomocytic stomata (2.8.3) with 4-8 subsidiary cells [Ca], covering trichomes [Cb] or their scars [Cc]; fragments of petals [G, H] with cells covered by a finely striated cuticle [Ga, Ha], sometimes accompanied by fine annular or spiral vessels [Hb] and parenchyma with some cells containing crystalline masses of rutoside [Hc]; fragments of parenchyma [E] from the sepals containing prisms of calcium oxalate [Ea] and crystalline masses of rutoside [Eb]; fragments of anthers [N] showing the characteristic fibrous layer (transverse section [Na], surface view [K]) and immature pollen grains [Nb]; free prisms of calcium oxalate [M]. Examine under a microscope using chloral hydrate solution R, without heating the preparation: brownish-yellow rutoside crystals are visible, free or included in cells, as crystalline masses [Eb, Hc, J] or in fan-shaped aggregates of very fine needles [D, Ec, Gb].

**C.** Thin-layer chromatography (2.2.27).

**Test solution** To 1 g of the powdered herbal drug (355) (2.9.12) add 5.0 mL of methanol R, sonicate for 10 min and filter.

**Reference solution** Dissolve 10 mg of hyperoside R and 10 mg of rutoside trihydrate R in 10 mL of methanol R.

**Plate** TLC silica gel plate R (5-40 µm) [or TLC silica gel plate R (2-10 µm)].

**Mobile phase** anhydrous formic acid R, water R, ethyl acetate R (10:10:80 V/V/V).

**Application** 10 µL [or 5 µL] as bands of 10 mm [or 8 mm].

**Development** Over a path of 10 cm [or 6 cm].

**Drying** In air.

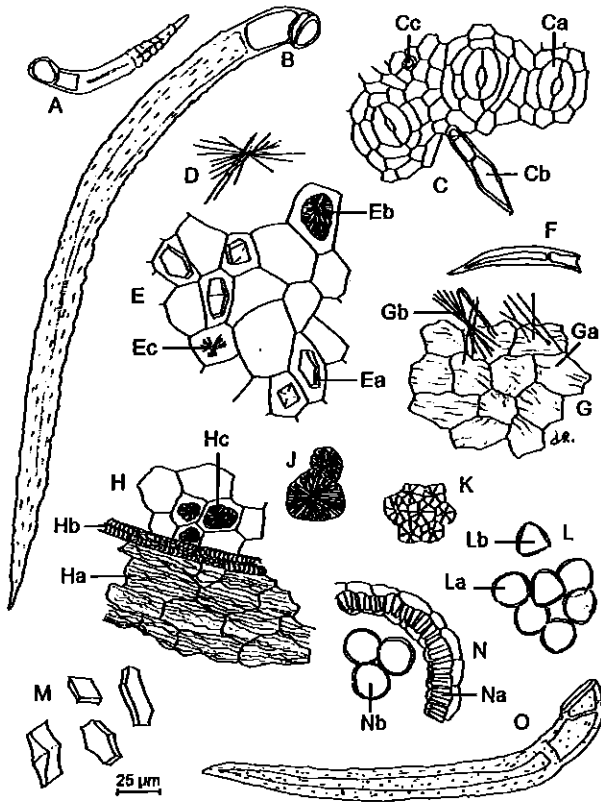

Figure 2639.-1. – Illustration for identification test B of powdered herbal drug of sophora flower

**Detection** Treat with a 10 g/L solution of *diphenylboric acid aminoethyl ester R* in *methanol R* and then with a 50 g/L solution of *macrogol 400 R* in *methanol R*, allow to dry in air for about 30 min, and examine in ultraviolet light at 365 nm.

**Results** See below the sequence of fluorescent zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint fluorescent zones may be present in the chromatogram obtained with the test solution.

Top of the plate

Reference solution	Test solution

## TESTS

### Foreign matter (2.8.2)

Maximum 5 per cent of flower buds and maximum 2 per cent of other foreign matter.

### Loss on drying (2.2.32)

Maximum 11.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

### Total ash (2.4.16)

Maximum 9.0 per cent.

## ASSAY

### Total flavonoids

**Stock solution** Place 2.000 g of the powdered herbal drug (355) (2.9.12) in the cartridge of a continuous-extraction apparatus (Soxhlet type). Add 100 mL of *heptane R* and heat under a reflux condenser until the extraction liquid is colourless. Allow to cool and discard the heptane. Add 90 mL of *methanol R* and continue the extraction with heating under a reflux condenser until the extraction liquid is colourless. Allow to cool. Transfer the methanolic solution to a 100 mL volumetric flask. Rinse the extraction flask with a few millilitres of *methanol R*. Combine the methanolic solutions and dilute to 100.0 mL with *methanol R*. Dilute 10.0 mL of this solution to 100.0 mL with *water R* and shake vigorously.

**Test solution** Dilute 10.0 mL of the stock solution to 100.0 mL with a 20 g/L solution of *aluminium chloride R* in *methanol R*.

**Compensation solution** Dilute 10.0 mL of the stock solution to 100.0 mL with *methanol R*.

Measure the absorbance (2.2.25) of the test solution after 15 min by comparison with the compensation solution at 425 nm.

Calculate the percentage content of total flavonoids, expressed as rutoside, using the following expression:

$$\frac{A \times 1000}{m \times 37}$$

i.e. taking the specific absorbance of rutoside to be 370.

*A* = absorbance of the test solution at 425 nm;  
*m* = mass of the herbal drug to be examined, in grams.

## Rutoside

### Liquid chromatography (2.2.29).

**Test solution** Place 0.500 g of the powdered herbal drug (355) (2.9.12) in a conical flask and add 50.0 mL of *methanol R*. Weigh, sonicate for 30 min and allow to cool. Weigh and compensate for the loss of solvent with *methanol R*. Shake vigorously, filter, and dilute 2.0 mL of the filtrate to 10.0 mL with *methanol R*.

**Reference solution (a)** Dissolve 10.0 mg of *rutoside trihydrate CRS* in 2 mL of *methanol R* and dilute to 10.0 mL with a 50 per cent *V/V* solution of *methanol R*. Dilute 2.0 mL of this solution to 10.0 mL with a 50 per cent *V/V* solution of *methanol R*.

**Reference solution (b)** Dissolve 10.0 mg of *apigenin 7-glucoside R* and 10.0 mg of *rutoside trihydrate R* in 30 mL of *methanol R* and dilute to 50.0 mL with a 50 per cent *V/V* solution of *methanol R*.

### Column:

- size:  $l = 0.25$  m,  $\varnothing = 4.6$  mm;
- stationary phase: *octadecylsilyl silica gel for chromatography R* (5 μm).

### Mobile phase:

- mobile phase A: 1 per cent *V/V* solution of *glacial acetic acid R*;
- mobile phase B: *methanol R*;

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 5	68	32
5 - 20	68 → 50	32 → 50
20 - 30	50 → 0	50 → 100
30 - 35	0	100

**Flow rate** 1.3 mL/min.

**Detection** Spectrophotometer at 350 nm.

**Injection** 20 µL.

**Relative retention** With reference to rutoside (retention time = about 17 min): apigenin 7-glucoside = about 1.1.

**System suitability** Reference solution (b):

— **resolution**: minimum 1.5 between the peaks due to rutoside and apigenin 7-glucoside.

Calculate the percentage content of rutoside using the following expression:

$$\frac{A_1 \times m_2 \times p \times 5}{A_2 \times m_1}$$

- $A_1$  = area of the peak due to rutoside in the chromatogram obtained with the test solution;  
 $A_2$  = area of the peak due to rutoside in the chromatogram obtained with reference solution (a);  
 $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;  
 $m_2$  = mass of rutoside trihydrate CRS used to prepare reference solution (a), in grams;  
 $p$  = assigned percentage content of rutoside in rutoside trihydrate CRS.

Ph Eur

## Sophora Flower-Bud

(Ph. Eur. monograph 2427)

Ph Eur

### DEFINITION

Whole, dried flower bud of *Styphnolobium japonicum* (L.) Schott (syn. *Sophora japonica* L.).

### Content

- minimum 20.0 per cent of total flavonoids, expressed as rutoside ( $C_{27}H_{30}O_{16}$ ;  $M_r$  611) (dried drug);
- minimum 15.0 per cent of rutoside ( $C_{27}H_{30}O_{16}$ ;  $M_r$  611) (dried drug).

### IDENTIFICATION

**A.** The flat flower bud, ovoid or ellipsoid, has a very thin and short pedicel and is about 7-10 mm long and 3-4 mm thick. The dark green or brown calyx, forming the lower part of the bud, is about 3-4 mm long and consists of 5 fused sepals with longitudinal striations at the base. The pale yellow or brownish-yellow corolla, unopened, delicate, extends beyond the calyx and contains 10 free stamens surrounding a central style.

**B.** Microscopic examination (2.8.23). The powder is pale yellow. Examine under a microscope using chloral hydrate solution R. The powder shows the following diagnostic characters (Figure 2427.-1): roundish [La] or triangular [Lb] pollen grains [L] with 3 pores and a smooth exine, about 18 µm in diameter; isolated covering trichomes [A, B, F, O] of varying lengths (60-660 µm), slightly flexed, usually consisting of 1 or 2 basal cells and a long pointed distal cell, with smooth or slightly warty walls; fragments of sepals [C]

composed of anomocytic stomata (2.8.3) with 4-8 subsidiary cells [Ca], covering trichomes [Cb] or their scars [Cc]; fragments of petals [G, H] with cells covered by a finely striated cuticle [Ga, Ha], sometimes accompanied by fine annular or spiral vessels [Hb] and parenchyma with some cells containing crystalline masses of rutoside [Hc]; fragments of parenchyma [E] from the sepals containing prisms of calcium oxalate [Ea] and crystalline masses of rutoside [Eb]; fragments of anthers [N] showing the characteristic fibrous layer (transverse section [Na], surface view [K]) and immature pollen grains [Nb]; free prisms of calcium oxalate [M]. Examine under a microscope using chloral hydrate solution R, without heating the preparation: brownish-yellow rutoside crystals are visible, free or included in cells, as crystalline masses [Eb, Hc, J] or in fan-shaped aggregates of very fine needles [D, Ec, Gb].

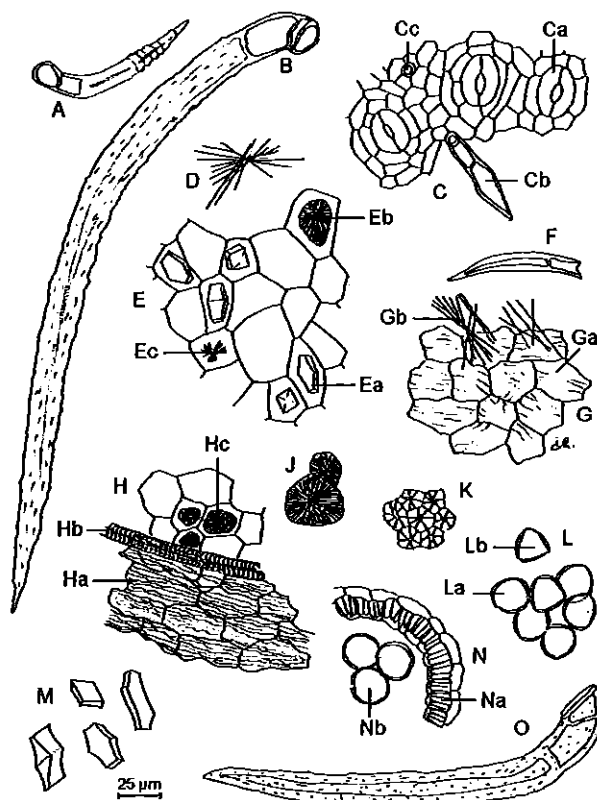

Figure 2427.-1. – Illustration for identification test B of powdered herbal drug of sophora flower-bud

**C.** Thin-layer chromatography (2.2.27).

**Test solution** To 0.2 g of the powdered herbal drug (355) (2.9.12) add 5.0 mL of methanol R, sonicate for 10 min and filter.

**Reference solution** Dissolve 10 mg of hyperoside R and 10 mg of rutoside trihydrate R in 10 mL of methanol R.

**Plate** TLC silica gel plate R (5-40 µm) [or TLC silica gel plate R (2-10 µm)].

**Mobile phase** anhydrous formic acid R, water R, ethyl acetate R (10:10:80 V/V/V).

**Application** 10 µL [or 5 µL] as bands of 10 mm [or 8 mm].

**Development** Over a path of 10 cm [or 6 cm].

**Drying** In air.

**Detection** Treat with a 10 g/L solution of diphenylboric acid aminoethyl ester R in methanol R and then with a 50 g/L

solution of *macrogol 400 R* in *methanol R*, allow to dry in air for about 30 min, and examine in ultraviolet light at 365 nm.

**Results** See below the sequence of fluorescent zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint fluorescent zones may be present in the chromatogram obtained with the test solution.

 $m_2$  = mass of *rutoside trihydrate CRS* used to prepare reference solution (a), in grams;  
 $p$  = assigned percentage content of rutoside in *rutoside trihydrate CRS*.

Ph Eur

## Spearmint Oil

### DEFINITION

Spearmint Oil is obtained by distillation from fresh flowering plants of *Mentha spicata* L. and *Mentha × cardiaca* (Gray) Bak.

### CHARACTERISTICS

A clear, colourless, pale yellow or greenish yellow liquid when recently distilled, but becoming darker and viscous on keeping; visibly free from water; odour, that of spearmint.

### IDENTIFICATION

Examine the chromatograms obtained in the test for Chromatographic profile. The retention times of the principal peaks in the chromatogram obtained with solution (1) are similar to those of the principal peaks in the chromatogram obtained with solution (2).

### TESTS

#### Optical rotation

American-type oil,  $-45^{\circ}$  to  $-60^{\circ}$ ; Chinese-type oil,  $-50^{\circ}$  to  $-62^{\circ}$ ; Appendix V F.

#### Refractive index

1.484 to 1.491, Appendix V E.

#### Solubility in ethanol

Soluble, at  $20^{\circ}$ , in 1 part of ethanol (80%), Appendix X M. The solution may become cloudy when diluted.

#### Weight per mL

American-type oil, 0.917 to 0.934 g; Chinese-type oil, 0.935 to 0.952 g, Appendix V G.

#### Chromatographic profile

Carry out the method for gas chromatography,

Appendix III B, using the following solutions. Solution (1) is the substance being examined. For solution (2) mix carefully 0.1 g of limonene, 0.2 g of cineole, 0.4 g of menthone, 0.1 g of (+)-isomenthone, 0.4 g of menthyl acetate, 0.2 g of pulegone, 0.6 g of menthol and 0.1 g of carvone with 1 g of hexane.

The chromatographic procedure may be carried out using (a) a glass capillary column (25 m to 60 m  $\times$  about 0.25 mm) coated with polyethylene glycol 20,000 as bonded phase (Carbowax 20M is suitable) and (b) helium as the carrier gas at a flow rate of 1.5 mL per minute. Maintain the temperature of the column at  $55^{\circ}$  for 6 minutes then increase it at the rate of  $4^{\circ}$  per minute to  $180^{\circ}$ ; keep the injection port temperature at  $220^{\circ}$  and the detector at  $230^{\circ}$ .

Inject 0.1  $\mu$ L of solution (2). When the chromatograms are recorded in the prescribed conditions, the components elute in the order indicated in the composition of the reference solution. Record the retention times of these substances.

The test is not valid unless the number of theoretical plates calculated from the limonene peak is at least 30,000 and the resolution factor between the peaks corresponding to limonene and cineole is at least 1.5.

Inject 0.1  $\mu$ L of solution (1). Using the retention times determined from the chromatogram obtained with solution (2) locate the components of the reference solution on the chromatogram obtained with solution (1) (disregard the peak due to hexane). Determine the percentage content of the components by normalisation. The percentages are within the following ranges:

Limonene 2.0 to 25.0%.

Cineole less than 2.5%.

Menthone less than 2.5%.

Isomenthone less than 1.0%.

Menthyl acetate less than 1.0%.

Pulegone less than 0.5%.

Menthol less than 2.0%.

Carvone Not less than 55.0%.

### STORAGE

Spearmint Oil should be kept in a well-filled container and protected from light.

### LABELLING

The label states whether the oil is American-type oil or Chinese-type oil.

## Squill

### Preparations

Squill Liquid Extract

Squill Oxymel

Opiate Squill Linctus

Indian Squill

Paediatric Opiate Squill Linctus

When Powdered Squill is prescribed or demanded, material complying with the appropriate requirements below shall be dispensed or supplied.

### DEFINITION

Squill consists of the bulb of *Drimia maritima* (L.) Stearn, collected when the foliage and leaves are absent, divested of its dry, outer, membranous coats, cut into transverse slices and dried. It is known in commerce as white squill. It may be powdered.

### IDENTIFICATION

A. Transverse slices, about 5 to 8 mm thick, occurring as straight or curved triangular pieces about 5 to 50 mm long and 3 to 8 mm wide at mid-point, tapering towards each end, yellowish white in colour, texture horny, somewhat translucent, breaking with an almost glassy fracture when quite dry, but readily absorbing moisture when exposed to the air and becoming tough and flexible; transversely cut surface showing a single row of prominent, vascular bundles near the concave edge and numerous smaller bundles scattered throughout the mesophyll.

B. Epidermis: cells polygonal and axially elongated, 1 to 2 times longer than wide, cuticle thick, stratified; stomata very rare, anomocytic, Appendix XI H, and nearly circular in outline, about 50 to 60  $\mu$ m in diameter; mesophyll of colourless, thin-walled parenchyma containing very occasional starch granules, many cells containing bundles of acicular crystals of calcium oxalate embedded in mucilage, crystals up to about 1 mm long and about 1 to 15  $\mu$ m wide; other cells containing sinistrin; vascular bundles collateral, scattered throughout the mesophyll; xylem vessels with spiral and annular wall thickening; trichomes absent.

C. The mucilage contained in the cells of the mesophyll is stained red with alkaline corallin solution but produces no red colour with ruthenium red solution and no purple colour with 0.01M iodine.

### TESTS

#### Acid-insoluble ash

Not more than 1.5%, Appendix XI K, Method I.

#### Extractive soluble in ethanol (60%)

Not less than 68.0%, Appendix XI B1. Use material that has been dried for 2 hours at  $105^{\circ}$  and powdered.

**Loss on drying**

When dried at 100° to 105° for 2 hours, loses not more than 14.0% of its weight. Use 1 g.

**STORAGE**

Squill should be stored in a dry place.

**Indian Squill****Preparations****Squill Oxymel**

When Powdered Indian Squill is prescribed or demanded, material complying with the appropriate requirements below shall be dispensed or supplied.

**DEFINITION**

Indian Squill consists of the bulb of *Drimia indica* (Roxb.) J P Jessop, collected soon after the plant has flowered, divested of dry, outer membranous coats and usually cut longitudinally into slices and dried.

**CHARACTERISTICS**

Odourless or almost odourless.

**Macroscopical**

Curved or irregularly shaped strips, about 10 to 50 mm long, 3 to 10 mm wide and 1 to 3 mm thick, frequently tapering towards the ends, occasionally grouped three or four together and attached to a portion of the axis; ridged in the direction of their length and varying in colour from pale yellowish brown to buff; brittle when dry, but tough and flexible when exposed to air.

**Microscopical**

Epidermis: cells tetrahedral to hexahedral, thin-walled, three to five times longer than wide, having a thick, striated cuticle; stomata rare, *anomocytic*, Appendix XI H, circular in outline, 40 to 42 µm in diameter; mesophyll of thin-walled polygonal cells containing mucilage, some cells also containing bundles of acicular crystals of calcium oxalate, 20 to 900 µm in length; vascular bundles collateral, scattered throughout the mesophyll; xylem vessels with spiral and annular wall thickening; trichomes and starch absent.

**IDENTIFICATION**

The mucilage contained in the cells of the mesophyll is stained red with *alkaline corallin solution* and reddish purple with 0.01M *iodine*.

**TESTS****Ash**

Not more than 6.0%, Appendix XI J.

**STORAGE**

Indian Squill should be stored in a dry place.

**Squill Liquid Extract****DEFINITION**

Squill Liquid Extract is prepared by extracting Squill with Ethanol (70 per cent).

**Extemporaneous preparation**

The following formula and directions apply.

Squill, in coarse powder	1000 g
Ethanol (70 per cent)	A sufficient quantity

Exhaust the Squill, in coarse powder, with Ethanol (70 per cent) by *percolation*, Appendix XI F. Reserve the first 850 mL of the percolate; evaporate the subsequent percolate to the consistence of a soft extract and dissolve it in the

reserved portion. Add sufficient Ethanol (70 per cent) to produce 1000 mL and filter.

*The extract complies with the requirements stated under Extracts and with the following requirements.*

**TESTS****Ethanol content**

34 to 50% v/v, Appendix VIII F, Method III.

**Dry residue**

40 to 55% w/v.

**Relative density**

1.00 to 1.14, Appendix V G.

**Squill Oxymel****DEFINITION**

Squill, bruised or Indian Squill, bruised	50 g
Acetic Acid (33 per cent)	90 mL or a sufficient quantity
Purified Water, freshly boiled and cooled	250 mL
Purified Honey	A sufficient quantity

**Extemporaneous preparation**

The following directions apply.

Macerate the Squill or the Indian Squill with the Acetic Acid (33 per cent) and the Purified Water for 7 days with occasional agitation, strain, press out the liquid, heat the mixed liquids to boiling, filter whilst hot, cool, determine the content of acetic acid, add sufficient Acetic Acid (33 per cent) to the remainder of the filtrate to produce a solution containing about 8.5% w/v of acetic acid and mix. To every three volumes of the resulting solution add seven volumes of Purified Honey and mix thoroughly.

**Content of acetic acid, C<sub>2</sub>H<sub>4</sub>O<sub>2</sub>**

2.2 to 2.7% w/v.

**TESTS****Optical rotation**

+0.6° to -3.0°, Appendix V F, when measured in a 25% w/v solution in *water* decolourised, if necessary, with *activated charcoal*.

**Weight per mL**

1.260 to 1.270 g, Appendix V G.

**ASSAY**

Dilute 20 mL with 20 mL of *carbon dioxide-free water* and titrate with 1M *sodium hydroxide VS* using *phenolphthalein solution RI* as indicator. Each mL of 1M *sodium hydroxide VS* is equivalent to 60.05 mg of C<sub>2</sub>H<sub>4</sub>O<sub>2</sub>.

**Opiate Squill Linctus**

Compound Squill Linctus; Gee's Linctus; Opiate Squill Oral Solution

**DEFINITION**

Opiate Squill Linctus is an opalescent *oral solution* containing 33% v/v each of Squill Oxymel and Camphorated Opium Tincture in a suitable vehicle with a tolu flavour.

**Extemporaneous preparation**

The following formula applies.

Squill Oxymel	300 mL
Camphorated Opium Tincture	300 mL
Tolu Syrup	300 mL

*The linctus complies with the requirements stated under Oral Liquids and with the following requirements.*

Content of anhydrous morphine,  $C_{17}H_{19}NO_3$ , 0.013 to 0.020% w/v.

#### TESTS

##### Ethanol content

18.0 to 22.0% v/v, Appendix VIII F.

#### ASSAY

To 12 g add 5 mL of water and 1 mL of 5M ammonia and extract with 30 mL of a mixture of equal volumes of ethanol (96%) and chloroform and then with two 22.5-mL quantities of a mixture of 2 volumes of chloroform and 1 volume of ethanol (96%), washing each extract with the same 20 mL of a mixture of equal volumes of ethanol (96%) and water. Evaporate the combined extracts, extract the residue with 10 mL of calcium hydroxide solution, filter and wash the filter with 10 mL of calcium hydroxide solution. To the combined filtrate and washings add 0.1 g of ammonium sulfate, extract with two 10 mL quantities of ethanol-free chloroform, wash the combined extracts with 10 mL of water and discard the chloroform solution. To the combined alkaline liquid and aqueous washings add 10 mL of 1M hydrochloric acid, heat on a water bath to remove any chloroform, cool and dilute to 100 mL with water. To 20 mL of this solution add 8 mL of a freshly prepared 1.0% w/v solution of sodium nitrite, allow to stand for 15 minutes, add 12 mL of 5M ammonia, dilute to 50 mL with water and measure the absorbance of a 4-cm layer of the resulting solution at the maximum at 442 nm, Appendix II B, using in the reference cell a solution prepared in the same manner and at the same time but using 8 mL of water in place of the solution of sodium nitrite. Calculate the content of  $C_{17}H_{19}NO_3$  from a calibration curve prepared using quantities of 2, 4, 6 and 8 mL of a 0.008% w/v solution of anhydrous morphine in 0.1M hydrochloric acid, each diluted to 20 mL with 0.1M hydrochloric acid and using the method described above beginning at the words 'add 8 mL ...'. Determine the weight per mL of the linctus, Appendix V G, and calculate the content of  $C_{17}H_{19}NO_3$ , weight in volume.

## Paediatric Opiate Squill Linctus

Opiate Linctus for Infants; Paediatric Opiate Squill Oral Solution

#### DEFINITION

Paediatric Opiate Squill Linctus is an oral solution containing 6% v/v each of Squill Oxymel and Camphorated Opium Tincture in a suitable vehicle with a tolu flavour.

#### Extemporaneous preparation

The following formula applies.

Squill Oxymel	60 mL
Camphorated Opium Tincture	60 mL
Tolu Syrup	60 mL
Glycerol	200 mL
Syrup	Sufficient to produce 1000 mL

The linctus complies with the requirements stated under Oral Liquids and with the following requirements.

Content of anhydrous morphine,  $C_{17}H_{19}NO_3$ , 0.0024 to 0.0036% w/v.

#### ASSAY

To 32 g add 5 mL of water and 1 mL of 5M ammonia and extract with 30 mL of a mixture of equal volumes of ethanol (96%) and chloroform and then with two 22.5-mL quantities of a mixture of 2 volumes of chloroform and 1 volume of ethanol (96%), washing each extract with the same 20 mL of

a mixture of equal volumes of ethanol (96%) and water. Evaporate the combined extracts, extract the residue with 10 mL of calcium hydroxide solution, filter and wash the filter with 10 mL of calcium hydroxide solution. To the combined filtrate and washings add 0.1 g of ammonium sulfate, extract with two 10 mL quantities of ethanol-free chloroform, wash the combined extracts with 10 mL of water and discard the chloroform solution. To the combined alkaline liquid and aqueous washings add 5 mL of 1M hydrochloric acid, heat on a water bath to remove any chloroform, cool and dilute to 50 mL with water. To 20 mL of this solution add 8 mL of a freshly prepared 1.0% w/v solution of sodium nitrite, allow to stand for 15 minutes, add 12 mL of 5M ammonia, dilute to 50 mL with water and measure the absorbance of a 4-cm layer of the resulting solution at the maximum at 442 nm, Appendix II B, using in the reference cell a solution prepared in the same manner and at the same time but using 8 mL of water in place of the solution of sodium nitrite. Calculate the content of  $C_{17}H_{19}NO_3$  from a calibration curve prepared using quantities of 2, 4, 6 and 8 mL of a 0.008% w/v solution of anhydrous morphine in 0.1M hydrochloric acid, each diluted to 20 mL with 0.1M hydrochloric acid and using the method described above beginning at the words 'add 8 mL ...'. Determine the weight per mL of the linctus, Appendix V G, and calculate the content of  $C_{17}H_{19}NO_3$ , weight in volume.

## St. John's Wort

#### Hypericum

(Ph. Eur. monograph 1438)

#### Preparation

St. John's Wort Dry Extract, Quantified

Ph Eur

#### DEFINITION

Whole or fragmented, dried flowering tops of *Hypericum perforatum* L., harvested during flowering time.

#### Content

Minimum 0.08 per cent of total hypericins, expressed as hypericin ( $C_{30}H_{16}O_8$ ;  $M_r$  504.4) (dried drug).

#### IDENTIFICATION

A. The branched and bare stem shows 2 more or less prominent longitudinal ridges. The leaves are opposite, sessile, exstipulate, oblong-oval and 15-30 mm long; present on the leaf margins are glands which appear as black dots and over all the surface of the leaves many small, strongly translucent excretory glands which are visible in transmitted light. The flowers are regular and form corymbose clusters at the apex of the stem. They have 5 green, acute sepals, with black secretory glands on the margins; 5 orange-yellow petals, also with black secretory glands on the margins; 3 staminal blades, each divided into many orange-yellow stamens and 3 carpels surmounted by red styles.

The drug may also show the following: immature and ripe fruits and seeds. Immature fruits are green or yellowish, seeds are whitish. Occasional ripe fruits may be present; these are dry trilobular capsules containing numerous seeds, brown, broad or small-ovate, 5-10 mm long, with broad linear or punctiform glands, irregularly striated ducts, conducting secretions. Ripe seeds are 1-1.3 mm long, cylindrical or trigonous, shortly pointed at both ends, brown or almost black, minutely pitted longitudinally.

B. Microscopic examination (2.8.23). The powder is greenish-yellow. Examine under a microscope using chloral

*hydrate solution R.* The powder shows the following diagnostic characters (Figure 1438.-1): fragments of the leaf epidermis [A, B] or stems [H] with paracytic [Ab, Ha], anisocytic [Ac, Bb, Hb] or anomocytic [Ae] stomata (2.8.3); fragments of the leaf epidermis often accompanied by palisade parenchyma [Ad, Bc]; polygonal cells of the upper epidermis with thickened and beaded walls [Ba]; more or less sinuous, thin-walled cells of the lower epidermis [Aa]; fragments of the leaf and sepal [E] with large, red-pigmented oil glands [Ea] associated with palisade parenchyma [Eb] and small vessels [Ec]; elongated cells of fragments of the petal epidermis with straight or wavy anticlinal walls [J]; vessels [D] with reticulate or pitted walls [Da] and groups of thick-walled fibres [Db]; fragments of the central parenchyma of the stems [K] with lignified and pitted rectangular cells [Ka] sometimes associated with vessels [Kb]; fragments of the anthers [F] showing the central part consisting of small cells containing cluster crystals of calcium oxalate [Fb] and cells from the fibrous layer [Fa]; fragments of the staminal filament with elongated, thin-walled cells with a striated cuticle [C]; numerous pollen grains with 3 germinal pores and a smooth exine, occurring singly [G] or in dense groups.

Figure 1438.-1. – Illustration for identification test B of powdered herbal drug of St. John's wort

**C. High-performance thin-layer chromatography (2.8.25).**

*Test solution* To 0.5 g of the powdered herbal drug (355) (2.9.12) add 5.0 mL of *methanol R*. Sonicate for 15 min, then filter or centrifuge the solution and use the filtrate or supernatant.

*Reference solution (a)* Dissolve 2.5 mg of *hyperoside R* and 3.5 mg of *rutoside trihydrate R* in *methanol R* and dilute to 10.0 mL with the same solvent.

*Reference solution (b)* Dilute 2.5 mL of reference solution (a) to 10.0 mL with *methanol R*.

*Reference solution (c)* Dissolve 2.5 mg of *hyperoside R* and 3 mg of *chlorogenic acid R* in *methanol R* and dilute to 10.0 mL with the same solvent.

*Intensity marker* Hyperoside.

*Plate* TLC silica gel *F<sub>254</sub>* plate *R* (2-10 µm).

*Mobile phase* *anhydrous formic acid R, water R, ethyl acetate R* (6:9:90 *V/V/V*).

*Application* 4 µL as bands of 8 mm.

*Development* 70 mm from the lower edge of the plate.

*Drying* In a current of air at room temperature for 5 min.

*Detection* Heat at 100-105 °C for 5 min. Spray the warm plate with a 10 g/L solution of *diphenylboric acid aminoethyl ester R* in *methanol R*, then with a 50 g/L solution of *macrogol 400 R* in *methanol R* or, alternatively, dip the warm plate in a 5 g/L solution of *diphenylboric acid aminoethyl ester R* in *ethyl acetate R*, then in a 50 g/L solution of *macrogol 400 R* in *methylene chloride R*. Allow the plate to dry in air for about 1 min and examine in ultraviolet light at 366 nm.

*System suitability* Reference solution (c):

- the chromatogram shows 2 distinct zones in the lower third which may, however, be partially overlapping. The lower zone (chlorogenic acid) shows a light blue fluorescence and the upper zone (hyperoside) shows a yellow or orange fluorescence.

*Results* See below the sequence of zones present in the chromatograms obtained with reference solution (a) and the test solution. Furthermore, in the chromatogram obtained with the test solution, other faint to very faint fluorescent zones, which may be blue, red or orange-yellow, may be present, especially above the red zones due to hypericin and pseudohypericin; the light blue fluorescent zone due to chlorogenic acid may be overlapped by the yellow or orange fluorescent zone due to hyperoside.

Top of the plate	
	A red fluorescent zone or a faint red fluorescent zone
	2 red fluorescent zones (hypericin and pseudohypericin)
	2 yellow or orange fluorescent zones or 2 faint yellow or orange fluorescent zones
	A yellow or orange fluorescent zone or a faint yellow or orange fluorescent zone
Hyperoside: a yellow or orange fluorescent zone	A yellow or orange fluorescent zone or an intense yellow or orange fluorescent zone (hyperoside)
	A light blue fluorescent zone or a faint light blue fluorescent zone (chlorogenic acid)
Rutoside: a yellow or orange fluorescent zone	A yellow or orange fluorescent zone (rutoside)
Reference solution (a)	Test solution

**TESTS****Foreign matter (2.8.2)**

Maximum 3 per cent of stems with a diameter greater than 5 mm and maximum 2 per cent of other foreign matter.

**Loss on drying (2.2.32)**

Maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (500) (2.9.12) by drying in an oven at 105 °C for 2 h.

**Total ash (2.4.16)**

Maximum 7.0 per cent.

**ASSAY**

**Test solution** In a 100 mL round-bottomed flask, introduce 0.800 g of the powdered herbal drug (500) (2.9.12), 60 mL of a mixture of 20 volumes of *water R* and 80 volumes of *tetrahydrofuran R* and a magnetic stirrer. Boil the mixture in a water-bath at 70 °C under a reflux condenser for 30 min. Centrifuge (2 min at 700 g) and decant the supernatant into a 250 mL flask. Take up the residue with 60 mL of a mixture of 20 volumes of *water R* and 80 volumes of *tetrahydrofuran R*. Heat again under a reflux condenser for 30 min. Centrifuge (2 min at 700 g) and decant the supernatant. Combine the extracts and evaporate to dryness. Take up the residue with 15 mL of *methanol R* using ultrasound and transfer to a 25 mL measuring flask. Rinse the 250 mL flask with *methanol R* and dilute to 25.0 mL with the same solvent. Centrifuge again, filter 10 mL through a syringe filter (0.2 µm). Discard the first 2 millilitres of the filtrate. Introduce 5.0 mL of the filtrate into a measuring flask and dilute to 25.0 mL with *methanol R*.

**Compensation liquid** *methanol R*.

Measure the absorbance (2.2.25) of the test solution at 590 nm, by comparison with the compensation liquid.

Calculate the percentage content of total hypericins, expressed as hypericin, using the following expression:

$$\frac{A \times 125}{m \times 870}$$

i.e. taking the specific absorbance of hypericin to be 870.

*A* = absorbance at 590 nm;  
*m* = mass of the herbal drug to be examined, in grams.

Ph Eur

## Quantified St. John's Wort Dry Extract

(Ph. Eur. monograph 1874)

Ph Eur

**DEFINITION**

Quantified dry extract obtained from *St. John's wort* (1438).

**Content**

- total hypericins, expressed as hypericin (C<sub>30</sub>H<sub>16</sub>O<sub>8</sub>; M<sub>r</sub> 504.4): 0.10 per cent to 0.30 per cent (anhydrous extract);
- flavonoids, expressed as rutoside (C<sub>27</sub>H<sub>30</sub>O<sub>16</sub>; M<sub>r</sub> 610.5): minimum 6.0 per cent (anhydrous extract);
- hyperforin (C<sub>35</sub>H<sub>52</sub>O<sub>4</sub>; M<sub>r</sub> 536.8): maximum 6.0 per cent (anhydrous extract) and not more than the content stated on the label.

**PRODUCTION**

The extract is produced from the herbal drug by a suitable procedure using ethanol (50-80 per cent V/V) or methanol (50-80 per cent V/V).

**CHARACTERS****Appearance**

Brownish-grey powder.

**IDENTIFICATION**

High-performance thin-layer chromatography (2.8.25).

**Test solution** To 0.1 g of the extract to be examined add 5.0 mL of *methanol R*. Sonicate for 15 min, then filter or centrifuge the solution and use the filtrate or supernatant.

**Reference solution (a)** Dissolve 2.5 mg of *hyperoside R* and 3.5 mg of *rutoside trihydrate R* in *methanol R* and dilute to 10.0 mL with the same solvent.

**Reference solution (b)** Dilute 2.5 mL of reference solution (a) to 10.0 mL with *methanol R*.

**Reference solution (c)** Dissolve 2.5 mg of *hyperoside R* and 3 mg of *chlorogenic acid R* in *methanol R* and dilute to 10.0 mL with the same solvent.

**Intensity marker** Hyperoside.

**Plate** TLC silica gel F<sub>254</sub> plate R (2-10 µm).

**Mobile phase** anhydrous formic acid R, water R, ethyl acetate R (6:9:90 V/V/V).

**Application** 4 µL as bands of 8 mm.

**Development** 70 mm from the lower edge of the plate.

**Drying** In a current of air at room temperature for 5 min.

**Detection** Heat at 100-105 °C for 5 min. Spray the warm plate with a 10 g/L solution of *diphenylboric acid aminoethyl ester R* in *methanol R*, then with a 50 g/L solution of *macrogol 400 R* in *methanol R* or, alternatively, dip the warm plate in a 5 g/L solution of *diphenylboric acid aminoethyl ester R* in *ethyl acetate R*, then in a 50 g/L solution of *macrogol 400 R* in *methylene chloride R*. Allow the plate to dry in air for about 1 min and examine in ultraviolet light at 366 nm.

**System suitability** Reference solution (c):

— the chromatogram shows 2 distinct zones in the lower third which may, however, be partially overlapping.

The lower zone (chlorogenic acid) shows a light blue fluorescence and the upper zone (hyperoside) shows a yellow or orange fluorescence.

**Results** See below the sequence of zones present in the chromatograms obtained with reference solution (a) and the test solution. Furthermore, in the chromatogram obtained with the test solution, other faint to very faint fluorescent zones, which may be blue, red or orange-yellow, may be present, especially above the red zones due to hypericin and pseudohypericin; the light blue fluorescent zone due to chlorogenic acid may be overlapped by the yellow or orange fluorescent zone due to hyperoside.

Top of the plate	
	A yellow or orange fluorescent zone or a faint yellow or orange fluorescent zone
	2 red fluorescent zones (hypericin and pseudohypericin) 2 yellow or orange fluorescent zones or 2 faint yellow or orange fluorescent zones
Hyperoside: a yellow or orange fluorescent zone	A yellow or orange fluorescent zone or a faint yellow or orange fluorescent zone An intense yellow or orange fluorescent zone (hyperoside) A light blue fluorescent zone or a faint light blue fluorescent zone (chlorogenic acid)
Rutoside: a yellow or orange fluorescent zone	A yellow or orange fluorescent zone (rutoside)
Reference solution (a)	Test solution

**TESTS****Water (2.5.12)**

Maximum 4.0 per cent, determined on 0.500 g.

**ASSAY****Total hypericins**

Liquid chromatography (2.2.29).

**Test solution** Dissolve 70.0 mg of the extract to be examined in 25.0 mL of methanol R. Sonicate and centrifuge the solution. Expose the solution to a xenon lamp at about 765 W/m<sup>2</sup> for 8 min.

**Reference solution** Dissolve a quantity of *St. John's wort dry extract HRS* corresponding to 0.15 mg of hypericin in 25.0 mL of methanol R. Sonicate and centrifuge. Expose the solution to a xenon lamp at about 765 W/m<sup>2</sup> for 8 min.

**Column:**

— size:  $l = 0.15$  m,  $\varnothing = 4.6$  mm;

— stationary phase: octadecylsilyl silica gel for chromatography R (5  $\mu$ m);

— temperature: 40 °C.

**Mobile phase** Mix 39 volumes of ethyl acetate R, 41 volumes of a 15.6 g/L solution of sodium dihydrogen phosphate R adjusted to pH 2 with phosphoric acid R and 160 volumes of methanol R.

**Flow rate** 1.0 mL/min.

**Detection** Spectrophotometer at 590 nm.

**Injection** 20  $\mu$ L.

**Run time** 15 min.

**Identification of peaks** Use the chromatogram supplied with *St. John's wort dry extract HRS* and the chromatogram obtained with the reference solution to identify the peaks due to pseudohypericin and hypericin.

**System suitability** Reference solution:

— the chromatogram obtained is similar to the chromatogram supplied with *St. John's wort dry extract HRS*;

— resolution: minimum 2 between the peaks due to pseudohypericin and hypericin.

Calculate the percentage content of total hypericins, expressed as hypericin, using the following expression:

$$\frac{(A_1 + A_2) \times m_2 \times p}{A_3 \times m_1}$$

- $A_1$  = area of the peak due to pseudohypericin in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to hypericin in the chromatogram obtained with the test solution;
- $A_3$  = area of the peak due to hypericin in the chromatogram obtained with the reference solution;
- $m_1$  = mass of the extract to be examined used to prepare the test solution, in grams;
- $m_2$  = mass of *St. John's wort dry extract HRS* used to prepare the reference solution, in grams;
- $p$  = percentage content of hypericin in *St. John's wort dry extract HRS*.

**Hyperforin and flavonoids**

Liquid chromatography (2.2.29). Carry out the assay protected from light.

**Solvent mixture** water R, methanol R (20:80 V/V).

**Test solution** Dissolve 75.0 mg of the extract to be examined in 20.0 mL of the solvent mixture. Sonicate and centrifuge.

**Reference solution (a)** Dissolve 20.0 mg of rutoside trihydrate CRS in 200.0 mL of the solvent mixture.

**Reference solution (b)** Dissolve 75.0 mg of *St. John's wort dry extract HRS* in 20.0 mL of the solvent mixture. Sonicate and centrifuge.

**Column:**

— size:  $l = 0.15$  m,  $\varnothing = 4.6$  mm;

— stationary phase: octadecylsilyl silica gel for chromatography R (3  $\mu$ m).

**Mobile phase:**

— mobile phase A: phosphoric acid R, water R (3:1000 V/V);

— mobile phase B: phosphoric acid R, acetone R (3:1000 V/V);

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)	Flow rate (mL/min)
0 - 8	82	18	0.8
8 - 18	82 → 47	18 → 53	0.8
18 - 18.1	47 → 3	53 → 97	0.8
18.1 - 19	3	97	0.8 → 1.2
19 - 31	3	97	1.2

**Detection** Spectrophotometer at 360 nm, then at 275 nm after the elution of biapigenin (about 22 min).

**Injection** 10  $\mu$ L.

**Identification of peaks** Use the chromatogram supplied with *St. John's wort dry extract HRS* and the chromatogram obtained with reference solution (b) to identify the peaks due to rutoside, hyperoside, isoquercitroside, quercitrin, quercetin, biapigenin, hyperforin and adhyperforin.

**System suitability** Reference solution (b):

— the chromatogram obtained is similar to the chromatogram supplied with *St. John's wort dry extract HRS*;

— *resolution*: minimum 2.0 between the peaks due to rutoside and hyperoside, and minimum 2.0 between the peaks due to hyperforin and adhyperforin.

Calculate the percentage content of hyperforin using the following expression:

$$\frac{A_4 \times m_4 \times p \times 2.3}{A_5 \times m_3 \times 10}$$

- $A_4$  = area of the peak due to hyperforin in the chromatogram obtained with the test solution;  
 $A_5$  = area of the peak due to rutoside in the chromatogram obtained with reference solution (a);  
 $m_3$  = mass of the extract to be examined used to prepare the test solution, in grams;  
 $m_4$  = mass of *rutoside trihydrate CRS* used to prepare reference solution (a), in grams;  
 2.3 = correction factor for hyperforin with respect to rutoside;  
 $p$  = percentage content of rutoside in *rutoside trihydrate CRS*.

Calculate the percentage content of flavonoids, expressed as rutoside, using the following expression:

$$\frac{m_4 \times p \times (A_6 + A_7 + A_8 + A_9 + A_{10} + A_{11})}{m_3 \times A_5 \times 10}$$

- $A_5$  = area of the peak due to rutoside in the chromatogram obtained with reference solution (a);  
 $A_6$  = area of the peak due to rutoside in the chromatogram obtained with the test solution;  
 $A_7$  = area of the peak due to hyperoside in the chromatogram obtained with the test solution;  
 $A_8$  = area of the peak due to isoquercitroside in the chromatogram obtained with the test solution;  
 $A_9$  = area of the peak due to quercitrin in the chromatogram obtained with the test solution;  
 $A_{10}$  = area of the peak due to quercetin in the chromatogram obtained with the test solution;  
 $A_{11}$  = area of the peak due to biapigenin in the chromatogram obtained with the test solution;  
 $m_3$  = mass of the extract to be examined used to prepare the test solution, in grams;  
 $m_4$  = mass of *rutoside trihydrate CRS* used to prepare reference solution (a), in grams;  
 $p$  = percentage content of rutoside in *rutoside trihydrate CRS*.

#### LABELLING

The label states the content of hyperforin.

Ph Eur

## Stephania Tetrandra Root

(*Fourstamen Stephania Root*, Ph. Eur. monograph 2478)

Ph Eur

#### DEFINITION

Scraped, cut and dried root of *Stephania tetrandra* S.Moore.

#### Content

Minimum 1.6 per cent for the sum of tetrandrine and fangchinoline, expressed as tetrandrine ( $C_{38}H_{42}N_2O_6$ ;  $M_r$  623) (dried drug).

#### IDENTIFICATION

A. The root is found as slices or irregularly cylindrical or semi-cylindrical pieces, mostly tortuous, about 0.5–1 cm thick and 1–5 cm in diameter. The greyish-yellow outer surface usually shows deep and sinuous transversal striations; the curved parts are knotty and bumpy. The texture is dense and compact. The cut surface is greyish-white and shows radial striations.

B. Microscopic examination (2.8.23). The powder is whitish-grey. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: numerous fragments of parenchyma with cells having slightly thickened and moniliform walls; reticulate or pitted xylem vessels accompanied by fibres; fragments of phelloderm containing sclereids; rare cork fragments; rare, fine, rod-shaped calcium oxalate crystals. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows very many round or truncated, simple or 2- or 3-compound starch granules, 10–20  $\mu\text{m}$  in diameter, with a punctiform hilum.

#### C. Thin-layer chromatography (2.2.27).

*Test solution* To 0.4 g of the powdered herbal drug (355) (2.9.12) add 10 mL of a mixture of 1 volume of *anhydrous formic acid R*, 9 volumes of *water R* and 40 volumes of *methanol R*. Sonicate at 25 °C for 10 min and filter.

*Reference solution* Dissolve 10 mg of *protopine hydrochloride R* and 10 mg of *tetrandrine R* in *methanol R* and dilute to 10 mL with the same solvent.

*Plate* TLC silica gel plate R (5–40  $\mu\text{m}$ ) [or TLC silica gel plate R (2–10  $\mu\text{m}$ )].

*Mobile phase* concentrated ammonia R, methanol R, ethyl acetate R, toluene R (0.3:5:10:10 *V/V/V/V*).

*Application* 10  $\mu\text{L}$  [or 5  $\mu\text{L}$ ] as bands of 10 mm [or 8 mm].

*Development* Over a path of 10 cm [or 6 cm].

*Drying* In a current of warm air for 5 min.

*Detection* Treat with a 5 g/L solution of *iodine R* in *ethanol (96 per cent) R* until the background becomes yellow; examine in daylight after the yellow colour has disappeared.

*Results* See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Reference solution	Test solution

#### TESTS

##### *Aristolochia fangchi*

Test for aristolochic acids in herbal drugs (2.8.21). The drug to be examined complies with method A.

##### Loss on drying (2.2.32)

Maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

##### Total ash (2.4.16)

Maximum 4.0 per cent.

##### Ash insoluble in hydrochloric acid (2.8.1)

Maximum 1.0 per cent.

#### ASSAY

##### Tetrandrine and fangchinoline

Liquid chromatography (2.2.29).

**Test solution** In a 50 mL round-bottomed flask, weigh 0.500 g of the powdered herbal drug (355) (2.9.12). Add 25 mL of a 2 per cent *V/V* solution of hydrochloric acid R in methanol R. Weigh. Heat under a reflux condenser on a water-bath at 60 °C for 30 min. Cool and weigh. Adjust to the initial weight using a 2 per cent *V/V* solution of hydrochloric acid R in methanol R. Filter. Dilute 5.0 mL of the filtrate to 10.0 mL with the mobile phase.

**Reference solution** Dissolve 10.0 mg of tetrandrine CRS in 5 mL of methanol R and dilute to 10.0 mL with the mobile phase.

**Column:**

— size:  $l = 0.25$  m,  $\varnothing = 4.6$  mm;

— stationary phase: octadecylsilyl silica gel for chromatography R (5  $\mu$ m).

**Mobile phase** 4.1 g/L solution of sodium laurylsulfonate for chromatography R in a mixture of 1 volume of glacial acetic acid R, 30 volumes of methanol R, 30 volumes of water R and 40 volumes of acetomitrile R.

**Flow rate** 2.0 mL/min.

**Detection** Spectrophotometer at 280 nm.

**Injection** 20  $\mu$ L.

**Run time** 30 min.

**Relative retention** With reference to tetrandrine (retention time = about 18 min): fangchinoline = about 0.7.

**System suitability** Test solution:

— resolution: minimum 3.0 between the peaks due to fangchinoline and tetrandrine.

Calculate the percentage content of tetrandrine and fangchinoline, expressed as tetrandrine, using the following expression:

$$\frac{(A_1 + A_3) \times m_2 \times p \times 5}{A_2 \times m_1}$$

$A_1$	=	area of the peak due to tetrandrine in the chromatogram obtained with the test solution;
$A_2$	=	area of the peak due to tetrandrine in the chromatogram obtained with the reference solution;
$A_3$	=	area of the peak due to fangchinoline in the chromatogram obtained with the test solution;
$m_1$	=	mass of the herbal drug to be examined used to prepare the test solution, in grams;
$m_2$	=	mass of tetrandrine CRS used to prepare the reference solution, in grams;
$p$	=	assigned percentage content of tetrandrine in tetrandrine CRS.

Ph Eur

## Sterculia

Sterculia Gum; Karaya Gum

### Preparations

Sterculia Granules

When Powdered Sterculia is prescribed or demanded, material complying with the appropriate requirements below and containing not less than 10.0% of volatile acid shall be dispensed or supplied.

### DEFINITION

Sterculia is the gum obtained from *Sterculia urens* Roxb. and other species of *Sterculia*.

### CHARACTERISTICS

It has the macroscopical and microscopical characters described under Identification tests A and B.

Sparingly soluble in water, but swells into a homogeneous, adhesive, gelatinous mass. Practically insoluble in ethanol (96%).

### IDENTIFICATION

A. Irregular or vermiform pieces, about 5 to 20 mm thick; greyish white with a brown or pink tinge; surface striated.

B. When powdered and mounted in ethanol (96%) it appears as small, transparent, angular particles of various sizes and shapes; the particles lose their sharp edges when water is added and each gradually swells until a large, indefinite, almost structureless mass results; when mounted in ruthenium red solution the particles are stained red; no blue coloured particles (starch) are visible when mounted in iodine solution R1.

C. Add 1 g to 80 mL of water and allow to stand for 24 hours, shaking occasionally. A tacky and viscous granular mucilage is produced. Retain the mucilage for use in test D.

D. Boil 4 mL of the mucilage obtained in test C with 0.5 mL of hydrochloric acid, add 1 mL of 5M sodium hydroxide, filter, add 3 mL of cupri-tartaric solution R1 to the filtrate and heat. A red precipitate is produced.

E. Warm 0.5 g with 2 mL of 5M sodium hydroxide. A brown colour is produced.

### TESTS

#### Acid-insoluble ash

Not more than 1.0%, Appendix XI K.

#### Foreign matter

Complies with the test for foreign matter, Appendix XI D.

#### Ash

Not more than 7.0%, Appendix XI J.

#### Volatile acid

Not less than 14.0%, calculated as acetic acid,  $C_2H_4O_2$ , when determined by the following method. To 1 g contained in a 700 mL Kjeldahl flask add 100 mL of water and 5 mL of orthophosphoric acid, allow to stand for several hours, or until the gum is completely swollen, and boil gently under a reflux condenser for 2 hours. Steam distil until 800 mL of distillate is obtained and the acid residue measures about 20 mL and titrate the distillate with 0.1M sodium hydroxide VS using phenolphthalein solution R1 as indicator. Repeat the operation without the substance being examined. The difference between the titrations represents the amount of alkali required to neutralise the volatile acid. Each mL of 0.1M sodium hydroxide VS is equivalent to 6.005 mg of volatile acid, calculated as  $C_2H_4O_2$ .

#### Microbial contamination

1.0 g is free from *Escherichia coli*, Appendix XVI B1.

### STORAGE

Sterculia should be stored in a dry place.

## Sterculia Granules

### DEFINITION

Sterculia Granules are Sterculia in granule form.

The granules comply with the requirements stated under Granules and with the following requirements.

### CHARACTERISTICS

White or buff with a distinct odour of acetic acid; transparent, irregular shaped granules of about 1 to 4 mm which swell when treated with water.

**IDENTIFICATION**

- A. Irregular or vermiform pieces, about 5 to 20 mm thick; greyish white with a brown or pink tinge; surface striated.
- B. When powdered and mounted in *ethanol* (96%) it appears as small, transparent, angular particles of various sizes and shapes; the particles lose their sharp edges when *water* is added and each gradually swells until a large, indefinite, almost structureless mass results; when mounted in *ruthenium red solution* the particles are stained red; no blue coloured particles (starch) are visible when mounted in *iodine solution R1*.
- C. Add 1 g to 80 mL of *water* and allow to stand for 24 hours, shaking occasionally. A tacky and viscous granular mucilage is produced. Retain the mucilage for use in test D.
- D. Boil 4 mL of the mucilage obtained in test C with 0.5 mL of *hydrochloric acid*, add 1 mL of 5M *sodium hydroxide*, filter, add 3 mL of *cupri-tartaric solution R1* to the filtrate and heat. A red precipitate is produced.

**TESTS****Acid-insoluble ash**

Not more than 1.0%, Appendix XI K.

**Ash**

Not more than 7.0%, Appendix XI J.

**Volatile acid**

Not less than 13.0%, calculated as acetic acid,  $C_2H_4O_2$ , when determined by the following method. To 1 g contained in a 700 mL Kjeldahl flask add 100 mL of *water* and 5 mL of *orthophosphoric acid*, allow to stand for several hours, or until the granules are completely swollen, and boil gently under a reflux condenser for 2 hours. Steam distil until 800 mL of the distillate is obtained and the acid residue measures about 20 mL and titrate the distillate with 0.1M *sodium hydroxide VS* using *phenolphthalein solution R1* as indicator. Repeat the operation without the substance being examined. The difference between the titrations represents the amount of alkali required to neutralise the volatile acid. Each mL of 0.1M *sodium hydroxide VS* is equivalent to 6.005 mg of volatile acid, calculated as  $C_2H_4O_2$ .

**Loss on drying**

The powdered granules, when dried to constant weight at 105°, lose not more than 20.0% of their weight. Use 1 g.

**Microbial contamination**

1.0 g is free from *Escherichia coli*, Appendix XVI B1.

**STORAGE**

*Sterculia* Granules should be stored in a dry place.

**Stramonium Leaf**

(Ph. Eur. monograph 0246)

**Preparation**

Prepared Stramonium

When Stramonium Leaf or Powdered Stramonium Leaf is prescribed, Prepared Stramonium shall be dispensed.

Ph Eur

**DEFINITION**

Dried leaf or dried leaf and flowering, and occasionally fruit-bearing, tops of *Datura stramonium* L. and its varieties.

**Content**

Minimum 0.25 per cent of total alkaloids, expressed as hyoscyamine ( $C_{17}H_{23}NO_3$ ;  $M_r$  289.4) (dried drug).

The alkaloids consist mainly of hyoscyamine with varying proportions of hyoscyne (scopolamine).

**CHARACTERS**

Unpleasant odour.

**IDENTIFICATION**

A. The leaves are dark brownish-green or dark greyish-green with a short petiole, often much twisted and shrunken during drying, thin and brittle, ovate or triangular-ovate, dentately lobed with an acuminate apex and often unequal at the base. Young leaves are pubescent on the veins, older leaves are nearly glabrous. Stems are green or purplish-green, slender, curved and twisted, wrinkled longitudinally and sometimes wrinkled transversely, branched dichasially, with a single flower or an immature fruit in the fork. Flowers, on short pedicels, have a gamosepalous calyx with 5 lobes and trumpet-shaped brownish-white or purplish corolla. The fruit is a capsule, usually covered with numerous short, stiff emergences; seeds are brown or black with a minutely pitted testa.

B. Microscopic examination (2.8.23). The powder is greyish-green. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 0246.-1): fragments of upper [A] and lower [C] epidermises of the lamina, in surface view, showing cells with slightly wavy anticlinal walls and a smooth cuticle accompanied by palisade [Aa] and spongy [Ca] parenchyma; anisocytic [Ac, Cb] and anomocytic [Ab] stomata (2.8.3), more frequent on the lower epidermis; fragments of covering trichomes, conical [E], uniseriate with 3-5 cells with warty walls, some of them collapsed [Ea]; glandular trichomes, short and clavate (side view [B]) with heads formed by 2-7 cells; dorsiventral mesophyll (transverse section [F]), with a single layer of palisade cells [Fa] and a spongy parenchyma [Fb] containing cluster crystals of calcium oxalate [Fc]; fragments of spongy parenchyma [D] with some cells containing small cluster crystals of calcium oxalate [Db], associated with annularly and spirally thickened vessels [Da], in surface view. The powdered herbal drug may also show: fibres and reticulately thickened vessels from the stems; subspherical pollen grains about 60-80  $\mu$ m in diameter with 3 germinal pores and a nearly smooth exine [G]; fragments of the corolla [H] with wavy-walled cells [Ha] and underlying mesophyll [Hb] with some cells containing prisms [Hc] or cluster crystals [Hd] of calcium oxalate; seed fragments containing yellowish-brown, sinuous, thick-walled sclereids of the testa [I], and occasional prisms and microspenoidal crystals of calcium oxalate.

C. Examine the chromatograms obtained in the chromatography test.

**Results** The principal zones in the chromatograms obtained with the test solution are similar in position, colour and size to the principal zones in the chromatogram obtained with the same volume of the reference solution.

D. Shake 1 g of the powdered herbal drug (180) (2.9.12) with 10 mL of *dilute sulfuric acid R1* for 2 min. Filter and add to the filtrate 1 mL of *concentrated ammonia R* and 5 mL of *water R*. Shake cautiously with 15 mL of *peroxide-free ether R*, avoiding the formation of an emulsion. Separate the ether layer and dry over *anhydrous sodium sulfate R*. Filter and evaporate the ether in a porcelain dish. Add 0.5 mL of *nitric acid R* and evaporate to dryness on a water-bath. Add 10 mL of *acetone R* and, dropwise, a 30 g/L solution of *potassium hydroxide R* in *ethanol* (96 per cent) *R*. A deep violet colour develops.

Figure 0246.-1. – Illustration for identification test B of powdered herbal drug of stramonium leaf

## TESTS

### Chromatography

#### Thin-layer chromatography (2.2.27).

**Test solution** To 1.0 g of the powdered herbal drug (180) (2.9.12) add 10 mL of dilute sulfuric acid R1, shake for 15 min and filter. Wash the filter with dilute sulfuric acid R1 until 25 mL of filtrate is obtained. To the filtrate add 1 mL of concentrated ammonia R and shake with 2 quantities, each of 10 mL, of peroxide-free ether R. If necessary, separate by centrifugation. Dry the combined ether layers over anhydrous sodium sulfate R, filter and evaporate to dryness on a water-bath. Dissolve the residue in 0.5 mL of methanol R.

**Reference solution** Dissolve 50 mg of hyoscyamine sulfate R in 9 mL of methanol R. Dissolve 15 mg of hyoscine hydrobromide R in 10 mL of methanol R. Mix 3.8 mL of the hyoscyamine sulfate solution and 4.2 mL of the hyoscine hydrobromide solution and dilute to 10 mL with methanol R.

**Plate** TLC silica gel G plate R.

**Mobile phase** concentrated ammonia R, water R, acetone R (3:7:90 V/V/V).

**Application** 10 µL and 20 µL of each solution, as bands of 20 mm by 3 mm, leaving 1 cm between the bands.

**Development** Over a path of 10 cm.

**Drying** At 100-105 °C for 15 min; allow to cool.

**Detection A** Spray with potassium iodobismuthate solution R2, using about 10 mL for a plate 200 mm square, until the orange or brown zones become visible against a yellow background.

**Results A** The zones in the chromatograms obtained with the test solution are similar in position (hyoscyamine in the lower third, hyoscine in the upper third of the chromatograms) and colour to those in the chromatograms obtained with the reference solution. The zones in the chromatograms obtained with the test solution are at least equal in size to the corresponding zones in the chromatogram obtained with the same volume of the reference solution. Faint secondary zones may appear, particularly in the middle of the chromatogram obtained with 20 µL of the test solution or near the point of application in the chromatogram obtained with 10 µL of the test solution.

**Detection B** Spray with sodium nitrite solution R until the coating is transparent; examine after 15 min.

**Results B** The zones due to hyoscyamine in the chromatograms obtained with the reference solution and the test solution change from brown to reddish-brown but not to greyish-blue (atropine) and any secondary zones disappear.

### Foreign matter (2.8.2)

Maximum 3 per cent of stems with a diameter greater than 5 mm.

### Total ash (2.4.16)

Maximum 20.0 per cent.

### Ash insoluble in hydrochloric acid (2.8.1)

Maximum 4.0 per cent.

## ASSAY

a) Determine the loss on drying (2.2.32) on 2.000 g of the powdered herbal drug (180) (2.9.12) by drying in an oven at 105 °C.

b) Moisten 10.0 g of the powdered herbal drug (180) (2.9.12) with a mixture of 5 mL of ammonia R, 10 mL of ethanol (96 per cent) R and 30 mL of peroxide-free ether R and mix thoroughly. Transfer the mixture to a suitable percolator, if necessary with the aid of the extracting mixture. Allow to macerate for 4 h and percolate with a mixture of 1 volume of chloroform R and 3 volumes of peroxide-free ether R until the alkaloids are completely extracted. Evaporate to dryness a few millilitres of the liquid flowing from the percolator, dissolve the residue in 0.25 M sulfuric acid and verify the absence of alkaloids using potassium tetraiodomercurate solution R. Concentrate the percolate to about 50 mL by distilling on a water-bath and transfer it to a separating funnel, rinsing with peroxide-free ether R. Add a quantity of peroxide-free ether R equal to at least 2.1 times the volume of the percolate to produce a liquid of a density well below that of water. Shake the solution with no fewer than 3 quantities, each of 20 mL, of 0.25 M sulfuric acid, separate the 2 layers by centrifugation if necessary and transfer the acid layers to a 2<sup>nd</sup> separating funnel. Make the acid layer alkaline with ammonia R and shake with 3 quantities, each of 30 mL, of chloroform R. Combine the chloroform layers, add 4 g of anhydrous sodium sulfate R and allow to stand for 30 min with occasional shaking. Decant the chloroform and wash the anhydrous sodium sulfate with 3 quantities, each of 10 mL, of chloroform R. Add the washings to the chloroform extract, evaporate to dryness on a water-bath and heat in an oven at 100-105 °C for 15 min. Dissolve the residue in a few millilitres of chloroform R, add 20.0 mL of 0.01 M sulfuric acid and remove the chloroform by evaporation on a water-bath. Titrate the excess of acid with 0.02 M sodium hydroxide using methyl red mixed solution R as indicator.

Calculate the percentage content of total alkaloids, expressed as hyoscyamine, using the following expression:

$$\frac{57.88 \times (20 - n)}{(100 - d) \times m}$$

- d* = loss on drying, as a percentage;  
*n* = volume of 0.02 M sodium hydroxide, in millilitres;  
*m* = mass of the powdered herbal drug, in grams.

**STORAGE**

Protected from moisture.

Ph Eur

**Prepared Stramonium**

(Ph. Eur. monograph 0247)

Ph Eur

**DEFINITION**

Stramonium leaf powder (180) (2.9.12) adjusted, if necessary, by the addition of powdered lactose or stramonium leaf of lower content of total alkaloids.

**Content**

0.23 per cent to 0.27 per cent of total alkaloids, expressed as hyoscyamine (C<sub>17</sub>H<sub>23</sub>NO<sub>3</sub>; M<sub>r</sub> 289.4) (dried drug).

**CHARACTERS****Appearance**

Greyish-green powder.

Unpleasant odour.

**IDENTIFICATION**

A. Microscopic examination (2.8.23) of the powder (180) (2.9.12). Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of leaf lamina showing epidermal cells with slightly wavy anticlinal walls and smooth cuticle; stomata are more frequent on the lower epidermis (anisocytic and anomocytic) (2.8.3); covering trichomes are conical, uniseriate with 3-5 cells and warty walls; glandular trichomes are short and clavate with heads formed by 2-7 cells; dorsiventral mesophyll, with a single layer of palisade cells and a spongy parenchyma containing cluster crystals of calcium oxalate; annularly and spirally thickened vessels. The powdered herbal drug may also show the following diagnostic characters: fibres and reticulately thickened vessels from the stems; subspherical pollen grains usually about 60-80 µm in diameter with 3 germinal pores and nearly smooth exine; fragments of the corolla with papillose epidermis; seed fragments containing yellowish-brown, sinuous, thick-walled sclereids of testa; occasional prisms and microsphenoidal crystals of calcium oxalate. Examined in *glycerol (85 per cent) R*, it may be seen to contain lactose crystals.

B. Examine the chromatograms obtained in the Chromatography test.

*Results* The principal zones in the chromatogram obtained with the test solution are similar in position, colour and size to the principal zones in the chromatogram obtained with the same volume of the reference solution.

C. Shake 1 g with 10 mL of *dilute sulfuric acid R1* for 2 min. Filter and add to the filtrate 1 mL of *concentrated ammonia R* and 5 mL of *water R*. Shake cautiously with 15 mL of *peroxide-free ether R*, avoiding the formation of an emulsion. Separate the ether layer and dry over *anhydrous sodium sulfate R*. Filter and evaporate the ether in a porcelain dish. Add 0.5 mL of *nitric acid R* and evaporate to dryness on a

water-bath. Add 10 mL of *acetone R* and, dropwise, a 30 g/L solution of *potassium hydroxide R* in *ethanol (96 per cent) R*. A deep violet colour develops.

**TESTS****Chromatography**

Thin-layer chromatography (2.2.27).

*Test solution* To 1.0 g of the drug to be examined add 10 mL of *dilute sulfuric acid R1*, shake for 15 min and filter. Wash the filter with *dilute sulfuric acid R1* until 25 mL of filtrate is obtained. To the filtrate add 1 mL of *concentrated ammonia R* and shake with 2 quantities, each of 10 mL, of *peroxide-free ether R*. If necessary, separate by centrifugation. Dry the combined ether layers over *anhydrous sodium sulfate R*, filter and evaporate to dryness on a water-bath. Dissolve the residue in 0.5 mL of *methanol R*.

*Reference solution* Dissolve 50 mg of *hyoscyamine sulfate R* in 9 mL of *methanol R*. Dissolve 15 mg of *hyoscyne hydrobromide R* in 10 mL of *methanol R*. Mix 3.8 mL of the hyoscyamine sulfate solution and 4.2 mL of the hyoscyne hydrobromide solution and dilute to 10 mL with *methanol R*.

*Plate* TLC silica gel G plate R.

*Mobile phase* concentrated ammonia R, water R, acetone R (3:7:90 V/V/V).

*Application* 10 µL and 20 µL of each solution as bands of 20 mm by 3 mm, leaving 1 cm between the bands.

*Development* Over a path of 10 cm.

*Drying* At 100-105 °C for 15 min and allow to cool.

*Detection A* Spray with *potassium iodobismuthate solution R2*, using about 10 mL for a plate 200 mm square, until the orange or brown zones become visible against a yellow background.

*Results A* The zones in the chromatograms obtained with the test solution are similar in position (hyoscyamine in the lower third, hyoscyne in the upper third of the chromatogram) and colour to those in the chromatograms obtained with the reference solution. The zones in the chromatograms obtained with the test solution are at least equal in size to the corresponding zones in the chromatogram obtained with the same volume of the reference solution. Faint secondary zones may appear, particularly in the middle of the chromatogram obtained with 20 µL of the test solution or near the point of application in the chromatogram obtained with 10 µL of the test solution.

*Detection B* Spray with *sodium nitrite solution R* until the coating is transparent; examine after 15 min.

*Results B* The zones due to hyoscyamine in the chromatograms obtained with the test solution and the reference solution change from brown to reddish-brown but not to greyish-blue (atropine) and any secondary zones disappear.

**Loss on drying (2.2.32)**

#### STORAGE

In an airtight container.

Ph Eur

## Szechwan Lovage Rhizome

(Ph. Eur. monograph 2634)

Ph Eur

#### DEFINITION

Whole or fragmented rhizome, gently baked to dryness, of *Ligusticum sinense* Oliv. 'Chuanxiong' (*Conioselinum anthriscoides* (H.Boissieu) Pimenov & Kljuykov, syn. *Ligusticum chuanxiong* Hort. ex S.H.Qiu, Y.Q.Zeng, K.Y.Pan, Y.C.Tang & J.M.Xu), with rootlets removed, collected in summer when the nodes of the stem become obviously swollen and purplish.

#### Content

Minimum 3.5 mL/kg of essential oil.

#### IDENTIFICATION

A. *Whole drug*. The whole rhizome is irregularly knotty and fist-like, 2–7 cm in diameter. Externally, greyish-brown to

yellowish-brown, rough and shrunken, with many nodular stem bases on the upper part of the rhizome, each with parallel and raised annulations and concave, subrounded stem scars. Numerous tuberculous rootlet scars are visible on the lower part and at the nodes.

*Fragmented drug* The fragmented rhizome occurs as thick slices or irregular pieces. The slices have a conspicuously irregular outline. The cut surface is whitish-yellow to brownish-yellow. The texture is compact, difficult to break; the fracture shows a yellowish-white or greyish-yellow medulla, scattered with yellowish-brown oil dots. The cambium occurs as an undulate ring.

B. *Microscopic examination* (2.8.23). The powder is pale yellow to brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2634.-1): brownish-yellow cork fragments, showing polyhedral cells with slightly sinuous walls (surface view [A]) or rectangular cells (transverse section [E]); very numerous fragments of parenchyma [B, G] with slightly thickened cells; cluster crystals of calcium oxalate (10–25 µm in diameter), isolated [F] or included in the parenchyma cells [G], more or less numerous depending on the sample; reticulate or scalariform spiral vessels (14–50 µm in diameter), isolated or included in the parenchyma with thin-walled cells [D]; secretory canals, usually broken with thin-walled secretory cells containing droplets of oil, are sometimes visible (longitudinal section [C], transverse section [H]); very rarely fusiform fibres with thickened walls. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows very numerous starch granules, isolated [Ba] or included in parenchyma cells [B]; the granules are simple, rounded, ovoid, oblong or reniform, 5–16 µm in diameter and up to 22 µm long; the punctiform, slit- or V-shaped hilum may be visible. Occasional 2- to 4-compound starch granules may be present.

Figure 2634.-1. – Illustration for identification test B of powdered herbal drug of szechwan lovage rhizome

**C. Thin-layer chromatography (2.2.27).**

**Test solution** To 1.0 g of the powdered herbal drug (355) (2.9.12) add 5.0 mL of *methanol R* and mix for 10 min. Centrifuge and use the supernatant.

**Reference solution** Dissolve 1 mg of *imperatorin R* and 1 mg of *osthole R* in 1.0 mL of *methanol R*.

**Plate** TLC silica gel  $F_{254}$  plate *R* (2-10  $\mu\text{m}$ ).

**Mobile phase** *glacial acetic acid R*, *ethyl acetate R*, *toluene R* (1:10:90 *V/V/V*).

**Application** 4  $\mu\text{L}$  as bands of 8 mm.

**Development** Over a path of 6 cm.

**Drying** In air.

**Detection A** Examine in ultraviolet light at 254 nm.

**Results A** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint quenching zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
	A bluish fluorescent zone
	A weak quenching zone
Osthole: a blue fluorescent zone.	2 quenching zones
Imperatorin: a quenching zone	
	2 quenching zones
Reference solution	Test solution

**Detection B** Treat with a 10 per cent *V/V* solution of *sulfuric acid R* in *methanol R*, heat at 120 °C for 3 min and examine in daylight.

**Results B** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
	A reddish zone
	A weak yellowish zone ( <i>Z-ligustilide</i> )
	2 pink zones
Osthole: a violet zone

**TESTS**

**Loss on drying (2.2.32)**

Maximum 8.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

**Total ash (2.4.16)**

Maximum 6.0 per cent.

**Ash insoluble in hydrochloric acid (2.8.1)**

Maximum 2.0 per cent.

**ASSAY**

**Essential oil (2.8.12)**

Use 25.0 g of the freshly crushed herbal drug, a 500 mL round-bottomed flask, 200 mL of *water R* as the distillation liquid and 0.50 mL of *trimethylpentane R* in the graduated tube. Distil at a rate of 3-3.5 mL/min for 3 h.

*Ph Eur*

**Tea Tree Oil**

Melaleuca Oil

(*Ph. Eur. monograph 1837*)

*Ph Eur*

**DEFINITION**

Essential oil obtained by steam distillation from the foliage and terminal branchlets of *Melaleuca alternifolia* (Maiden and Betch) Cheel, *M. linariifolia* Smith, *M. dissitiflora* F. Mueller and/or other species of *Melaleuca*.

**CHARACTERS**

**Appearance**

Clear, mobile, colourless or pale yellow liquid.

Characteristic odour.

**IDENTIFICATION**

*First identification: B.*

*Second identification: A.*

**A. Thin-layer chromatography (2.2.27).**

**Test solution** Dissolve 0.1 mL of the substance to be examined in 5 mL of *heptane R*.

**Reference solution** Dissolve 30 µL of *cineole R*, 60 µL of *terpinen-4-ol R* and 10 mg of *α-terpineol R* in 10 mL of *heptane R*.

**Plate** TLC silica gel plate *R*.

**Mobile phase** *ethyl acetate R*, *heptane R* (20:80 *V/V*).

**Application** 10 µL, as bands.

**Development** Over a path of 10 cm.

**Drying** In air.

**Detection** Spray with *anisaldehyde solution R*. Heat at 100-105 °C for 5-10 min while observing. Examine in daylight.

**Results** See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones are present in the chromatogram obtained with the test solution.

Top of the plate	
Cineole: a violet-brown zone	A violet-brown zone, less intense (cineole)
Terpinen-4-ol: a brownish-violet zone	A brownish-violet zone (terpinen-4-ol)
α-terpineol: a violet or brownish-violet zone	A violet or brownish-violet zone (α-terpineol)
Reference solution	Test solution

**B. Examine the chromatograms obtained in the test for chromatographic profile.**

**Results** The characteristic peaks in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with the reference solution.

**TESTS**

**Relative density (2.2.5)**

0.885 to 0.906.

**Refractive index (2.2.6)**

1.475 to 1.482.

**Optical rotation (2.2.7)**

+ 5° to + 15°.

**Chromatographic profile**

Gas chromatography (2.2.28): use the normalisation procedure.

**Test solution** Dissolve 0.15 mL of the substance to be examined in 10 mL of *hexane R*.

**Reference solution** Dissolve 5 µL of *α-pinene R*, 5 µL of *sabinene R*, 15 µL of *α-terpinene R*, 5 µL of *limonene R*, 5 µL of *cineole R*, 30 µL of *γ-terpinene R*, 5 µL of *p-cymene R*, 5 µL of *terpinolene R*, 60 µL of *terpinen-4-ol R*, 5 µL of *aromadendrene R* and 5 mg of *α-terpineol R* in 10 mL of *hexane R*.

**Column:**

— **material:** fused silica,

— **size:** *l* = 30 m (a film thickness of 1 µm may be used) to 60 m (a film thickness of 0.2 µm may be used),

Ø = 0.25-0.53 mm,

— **stationary phase:** *macrogol 20 000 R*.

**Carrier gas** *helium for chromatography R*.

**Flow rate** 1.3 mL/min.

**Split ratio** 1:50.

**Temperature:**

	Time (min)	Temperature (°C)
Column	0 - 1	50
	1 - 37	50 → 230
	37 - 45	230
Injection port		240
Detector		240

**Detection** Flame ionisation.

**Injection** 1 µL.

**Elution order** Order indicated in the composition of the reference solution. Record the retention times of these substances.

**System suitability** Reference solution:

— **resolution:** minimum 2.7 between the peaks due to *terpinen-4-ol* and *aromadendrene*.

Using the retention times determined from the chromatogram obtained with the reference solution, locate the components of the reference solution in the chromatogram obtained with the test solution. Disregard the peak due to *hexane*.

Determine the percentage content of these components.

The percentages are within the following ranges:

— *α-pinene*: 1.0 per cent to 6.0 per cent,

— *sabinene*: maximum 3.5 per cent,

— *α-terpinene*: 5.0 per cent to 13.0 per cent,

— *limonene*: 0.5 per cent to 4.0 per cent,

— *cineole*: maximum 15.0 per cent,

— *γ-terpinene*: 10.0 per cent to 28.0 per cent,

— *p-cymene*: 0.5 per cent to 12.0 per cent,

— *terpinolene*: 1.5 per cent to 5.0 per cent,

— *terpinen-4-ol*: minimum 30.0 per cent,

— *aromadendrene*: maximum 7.0 per cent,

— *α-terpineol*: 1.5 per cent to 8.0 per cent.

**STORAGE**

At a temperature not exceeding 25 °C.

Ph Eur

**Terminalia Arjuna Stem Bark****DEFINITION**

*Terminalia Arjuna* Stem Bark consists of cut dried bark of the stems of *Terminalia arjuna* W. and A. It contains not less than 6% of tannins, expressed as *pyrogallol*, calculated with reference to the dried drug.

**IDENTIFICATION**

A. Irregularly flattened or slightly curved or recurved pieces, up to about 8 cm long, 4 cm wide and 1 cm thick; outer surface uneven, dark brown or sometimes mottled greyish-brown, smooth or, more frequently, irregularly striated longitudinally with occasional transverse ridges; inner surface pink to reddish brown with longitudinal striations and occasional paler brown patches. Fracture short and starchy in the inner part, the outer part frequently laminated.

B. Reduce to a powder (355). The powder is reddish-brown. Examine under a microscope using *chloral hydrate solution*.

The powder shows a variety of parenchymatous cells, some thin-walled, square or round and others yellowish, polygonal and thick-walled. Rectangular or polygonal, pitted, thin-walled, light brown, lightly lignified cells from the cork layer or outer areas of the cortex are present.

Fibres occur singly and in small or large groups, individual cells narrowing to highly pointed ends, and possibly showing wavy invaginations of the walls where surrounding cells have become detached; degree of lignification varies; walls are yellowish brown, some pitted, others not. Single fibres may be complete, but those in groups are usually fragmented, individual cells being straight or noticeably curved in places. Rounded cells of the medullary rays, which are one cell wide, intersperse the fibres.

Small, calcium oxalate cluster crystals occur scattered throughout as well as being found within parenchymatous cells, some forming a crystal sheath alongside the fibres. Other crystals are very large and less well defined, and usually free.

Examine under a microscope using 50% v/v of glycerol. Starch granules are frequent, but not abundant, mainly free, but some in parenchymatous cells. They are small, simple, round, oval or irregular in shape, and occasionally in 2 to 3 compound granules, without visible hila. More or less frequent scattered lumps of brown pigment may be found sometimes in parenchymatous cells.

C. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Shake 1.0 g of the powdered drug with 10 mL of *absolute ethanol*, centrifuge at 3000 rpm for 5 minutes and filter (Whatman GF/C is suitable).

(2) 0.01% w/v each of *arjunolic acid* and *gallic acid* in *absolute ethanol*.

#### CHROMATOGRAPHIC CONDITIONS

- Use as the coating high performance silica gel (Merck silica gel 60 HPTLC plates are suitable).
- Use the mobile phase described below.
- Apply as bands 8  $\mu$ L of each solution.
- Develop the plate to 8 cm.
- Remove the plate and allow it to dry in air for 5 minutes. Spray the plate with *anisaldehyde solution*, heat at 100° to 105° for 5 minutes and examine in daylight.

#### MOBILE PHASE

15 volumes of *ethyl acetate*, 15 volumes of *formic acid* and 70 volumes of *toluene*.

#### SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (2) shows two clearly separated bands.

#### CONFIRMATION

The chromatogram obtained with solution (1) shows a band with an Rf value of approximately 0.30 corresponding in colour and position to the band obtained for arjunolic acid in solution (2); two clearly separated dark bands with an Rf value of approximately 0.2; a band with an Rf value of 0.63 is present. Other bands may be present.

Top of the plate	
Dark band	
Dark band	Dark band: arjunolic acid
Two separated dark bands	Yellow band: gallic acid
Solution (1)	Solution (2)

#### TESTS

##### Ash

Not more than 25%, Appendix XI J.

##### Loss on drying

When dried for 2 hours at 100° to 105°, loses not more than 10% of its weight. Use 1 g.

##### Water soluble extractive

Not less than 20%, Appendix XI B2.

#### ASSAY

Carry out the determination of *tannins in herbal drugs*, Appendix XI M. Use 1.0 g of powdered drug.

## Terminalia Belerica Fruit

#### DEFINITION

Terminalia Belerica Fruit consists of pericarp of dried ripe fruits of *Terminalia belerica* Roxb. It contains not less than 10% of tannins, expressed as pyrogallol, calculated with reference to the dried drug.

#### IDENTIFICATION

A. The dried fruits are spherical to subspherical, about 3 to 5 cm in diameter, slightly depressed at the upper end and more or less tapering to the scar of the pedicel at the lower end. The surface is brown to yellowish brown with a grey velvety sheen, irregularly wrinkled and sometimes with faint, incomplete, longitudinal ridges. Cut transversely, the fruit shows the pericarp about 4 to 5 mm thick enclosing a very hard, yellowish-white seed.

B. Reduce to a powder (355). The powder is light-brown. Examine under a microscope using *chloral hydrate solution*. The powder shows many free, unicellular, straight or slightly bent trichomes from the epicarp. A variety of thick-walled, heavily pitted, lignified fibro-sclereids of elongated and spherical shapes occur in large and small groups; occasional medium sized reticulate vessels; heavily pitted, lignified parenchymatous cells and others with reticulate thickenings; many lignified, pitted, thin walled sclereids and groups of fragmented, thick-walled, pitted, fibres are present. Rarely oil globules, starch granules, and calcium oxalate crystals may be found in the parenchymatous cells from the embryo. Examine under a microscope using 50% v/v of *glycerol*. The powder shows minute, either single or 2 to 4 compound starch granules, some scattered, but mainly filling

parenchymatous cells. Some have slit or stellate hila; simple granules are often not perfectly spherical. Larger calcium oxalate crystals, with fewer small ones, are scattered or in parenchymatous cells.

C. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Add 10 mL of *absolute ethanol* to 1.0 g of the powdered drug, centrifuge at 3000 rpm for 5 minutes and filter (Whatman GF/C is suitable).

(2) 0.01% w/v each of *arjunolic acid*, *gallic acid* and *ellagic acid* in *absolute ethanol*.

#### CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating high performance silica gel F<sub>254</sub> (Merck silica gel 60 F<sub>254</sub> HPTLC plates are suitable).

(b) Use the mobile phase described below.

(c) Apply as bands 8 µL of each solution.

(d) Develop the plate to 8 cm.

(e) Remove the plate and allow it to dry in air for 5 minutes. Examine under *ultraviolet light* (254 nm). Spray the plate with *anisaldehyde solution*, heat at 100° to 105° for 5 minutes and examine in daylight.

#### MOBILE PHASE

15 volumes of *ethyl acetate*, 15 volumes of *formic acid* and 70 volumes of *toluene*.

#### SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (2) shows two clearly separated bands under both *ultraviolet light* (254 nm) and daylight.

#### CONFIRMATION

Under *ultraviolet light* (254 nm) the chromatogram obtained with solution (1) shows bands with R<sub>f</sub> values of approximately 0.11 and 0.15 corresponding in colour and position to the bands obtained with ellagic acid and gallic acid in solution (2) and light blue bands with R<sub>f</sub> values of approximately 0.04 and 0.36. Other bands may be present.

Top of the plate	
Light blue band	
Blue band	Blue band: gallic acid
Dark band	Dark band: ellagic acid
Light blue band	
Solution (1)	Solution (2)

Under daylight after spraying with *anisaldehyde solution* the chromatogram obtained with solution (1) shows a band with an R<sub>f</sub> value of approximately 0.15 corresponding in colour and position to the band obtained gallic acid in solution (2); a dark band with an R<sub>f</sub> value of 0.36; several dark bands in the upper part of the plate.

Top of the plate	
Several dark bands	
Dark band	Dark band: arjunolic acid
Light brown band	Light brown band: gallic acid
Solution (1)	Solution (2)

#### TESTS

##### Ash

Not more than 7%, Appendix XI J.

##### Loss on drying

When dried for 2 hours at 100° to 105°, loses not more than 5.0% of its weight. Use 1 g.

##### Water soluble extractive

Not less than 45%, Appendix XI B2.

#### ASSAY

Carry out the determination of *tannins in herbal drugs*, Appendix XI M. Use 1.0 g of powdered drug.

## Terminalia Chebula Fruit

#### DEFINITION

*Terminalia Chebula* Fruit consists of pericarp of mature fruits of *Terminalia chebula* Retz. It contains not less than 20% of tannins, expressed as pyrogallol, calculated with reference to the dried drug.

#### IDENTIFICATION

A. The dried fruits are sub-globular to ovoid, 3 to 4 cm long and 1.5 to 2 cm wide, bluntly pointed at the tip and tapering towards the base. The surface is yellowish to greenish, sometimes brown, shiny and more or less wrinkled and has distinct longitudinal ridges. Cut transversely, the fruit shows the pericarp about 3 to 4 mm thick, non-adherent to the very hard, creamy-white seed.

B. Reduce to a powder (355). The powder is yellowish brown. Examine under a microscope using *chloral hydrate solution*. The powder shows round, oval or elongated, thin-walled parenchymatous cells in groups. Occasional narrow-walled, unpitted, lightly lignified fibres occur in small or larger groups, some forming wave-like arrangements. Large groups of fragmented, heavily lignified and pitted fibres also occur. A variety of thick-walled, heavily pitted, lignified fibro-sclereids of elongated, rectangular, and irregular shapes occur in large and small groups. Fewer pitted, lignified parenchyma, or thinner-walled, less lignified and pitted sclereids, with broad lumens, are also found. There are very

occasional small, spiral, lignified vessel fragments. Small, greenish, thick-walled polygonal epicarp cells are seen in surface view. Parenchymatous cells with reticulate thickenings across the surface are rare, as are others without such thickenings, but containing oil globules. Examine under a microscope using 50% v/v of *glycerol*. The powder shows minute, either single or 2 to 4 compound granules, some scattered, but mainly filling parenchymatous cells. Some have slit or stellate hila; simple granules are often not perfectly spherical. Larger calcium oxalate crystals, with fewer small ones, are scattered or in parenchymatous cells.

C. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) To 1.0 g of the powdered drug, add 10 mL of *absolute ethanol*, centrifuge at 3000 rpm for 5 minutes and filter (Whatman GF/C is suitable).

(2) 0.01% w/v each of *arjunolic acid*, *gallic acid* and *ellagic acid* in *absolute ethanol*.

#### CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating high performance silica gel F<sub>254</sub> (Merck silica gel 60 F<sub>254</sub> HPTLC plates are suitable).

(b) Use the mobile phase described below.

(c) Apply as bands 8 µL of each solution.

(d) Develop the plate to 8 cm.

(e) Remove the plate and allow it to dry in air for 5 minutes. Examine under *ultraviolet light* (254 nm). Spray the plate with *anisaldehyde solution*, heat at 100° to 105° for 5 minutes and examine in daylight.

#### MOBILE PHASE

A mixture of 15 volumes of *ethyl acetate*, 15 volumes of *formic acid* and 70 volumes of *toluene*.

#### SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (2) shows two clearly separated bands under both *ultraviolet light* (254 nm) and daylight.

#### CONFIRMATION

When examined under *ultraviolet light* (254 nm) the chromatogram obtained with solution (1) shows bands with Rf values of approximately 0.11 and 0.15 corresponding in colour and position to the bands obtained with gallic acid and ellagic acid in solution (2).

Top of the plate	
Blue band Dark band	Blue band: gallic acid Dark band: ellagic acid
Solution (1)	Solution (2)

When examined under daylight after spraying with *anisaldehyde solution* the chromatogram obtained with solution (1) shows a band with an Rf value of approximately 0.15 corresponding in colour and position to the band obtained for gallic acid in solution (2) and a dark band with an Rf value of approximately 0.30. There may be some faint brown bands with Rf values of approximately 0.40 and 0.70.

Not less than 50%, Appendix XI B2.

#### ASSAY

Carry out the determination of *tannins in herbal drugs*, Appendix XI M. Use 1.0 g of powdered drug.

## Thyme

(Ph. Eur. monograph 0865)

Ph Eur

#### DEFINITION

Whole leaves and flowers separated from the previously dried stems of *Thymus vulgaris* L. or *Thymus zygis* L. or a mixture of both species.

#### Content

- *essential oil*: minimum 12 mL/kg (anhydrous drug);
- *sum of the contents of thymol and carvacrol* (both C<sub>10</sub>H<sub>14</sub>O; M<sub>r</sub> 150.2): minimum 40 per cent in the essential oil.

#### CHARACTERS

Strong odour reminiscent of thymol.

#### IDENTIFICATION

A. The leaf of *Thymus vulgaris* is usually 4-12 mm long and up to 3 mm wide, sessile or with a very short petiole. The lamina is tough, entire, lanceolate or ovate, covered on

both surfaces by a grey or greenish-grey indumentum; the edges are markedly rolled up towards the abaxial surface. The midrib is depressed on the adaxial surface and is very prominent on the abaxial surface. The calyx is green, often with violet spots and is tubular; at the end are 2 lips of which the upper one is bent back and at the end has 3 lobes, the lower is longer and has 2 hairy teeth. After flowering, the calyx tube is closed by a crown of long, stiff hairs. The corolla, about twice as long as the calyx, is usually brownish in the dry state and is slightly bilabiate.

The leaf of *Thymus zygis* is usually 1.7-6.5 mm long and 0.4-1.2 mm wide; it is acicular or linear-lanceolate and the edges are markedly rolled towards the abaxial surface. Both surfaces of the lamina are green or greenish-grey and the midrib is sometimes violet; the edges, in particular at the base, have long, white hairs. The dried flowers are very similar to those of *T. vulgaris*.

**B. Microscopic examination (2.8.23).** The powder of both species is greyish-green or greenish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 0865.-1 and Figure 0865.-2): fragments of the outer epidermis of the corolla (surface view [A, C, F]), consisting of cells with wavy and slightly thickened [Fc] or unthickened [Ac] walls, numerous uniseriate, multicellular, covering trichomes, often with 1 cell collapsed [Aa], glandular trichomes with a unicellular head and a unicellular [Ca, Fb] or multicellular [Ab] stalk, diacytic stomata (2.8.3) [Fa] and glandular trichomes generally with 12 cells [D]; cells of the epidermis from the base of the corolla, isodiametric with slightly thickened walls [C]; pollen grains, relatively rare, spherical and smooth, with 6 germinal slit-like pores, measuring about 35  $\mu\text{m}$  in diameter [B]; the powder of *T. zygis* also contains numerous thick bundles of fibres from the main veins and from fragments of stems; the epidermises of the leaves (surface view [G, K]) have cells with anticlinal walls that are sinuous and beaded [Ga, Ka], and diacytic stomata (2.8.3) [Gb]; numerous glandular trichomes made up of 12 secretory cells, the cuticle of which is generally raised by the secretion to form a globular or ovoid, bladder-like covering [Kb]; glandular trichomes with a unicellular stalk and a globular or ovoid head [Kc]; in both species, the adaxial epidermis bears covering trichomes with warty walls that are shaped as pointed teeth [Gc], and is usually associated with underlying palisade parenchyma [Gd, Kd]; the abaxial epidermis (transverse section [H, L]) bears covering trichomes of different types: unicellular, straight or slightly curved [Ha, La]; bicellular or tricellular, articulated and most often elbow-shaped [Hb, J] (*T. vulgaris*); bicellular or tricellular, more or less straight [N], or very large, multicellular [M], at the base of the lamina (*T. zygis*); fragments of calyx covered by numerous, uniseriate trichomes with 5-6 cells and a weakly striated cuticle (surface view [E]).

**C. Thin-layer chromatography (2.2.27).**

**Test solution** To 0.5 g of the powdered herbal drug (355) (2.9.12) add 5 mL of *methanol R*. Sonicate for 10 min. Centrifuge or filter; use the supernatant or the filtrate.

**Reference solution** Dissolve 1 mg of *rutoside trihydrate R* and 1 mg of *rosmarinic acid R* in 5 mL of *methanol R*.

**Plate** TLC silica gel F<sub>254</sub> plate R (5-40  $\mu\text{m}$ ) [or TLC silica gel F<sub>254</sub> plate R (2-10  $\mu\text{m}$ )].

**Mobile phase** *anhydrous formic acid R*, *water R*, *ethyl acetate R* (1:1:15 V/V/V).

**Application** 20  $\mu\text{L}$  [or 5  $\mu\text{L}$ ] as bands of 20 mm [or 8 mm].

**Development** Over a path of 15 cm [or 6 cm].

Figure 0865.-1. – Illustration for identification test B of powdered herbal drug of thyme

Figure 0865.-2. – Illustration for identification test B of powdered herbal drug of thyme

**Drying** In air.

**Detection** Heat at 100 °C for 3 min, treat the still-hot plate with a 5 g/L solution of *diphenylboric acid aminoethyl ester R* in *ethyl acetate R*, then treat with a 50 g/L solution of *macrogol 400 R* in *methylene chloride R*; examine in ultraviolet light at 365 nm.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint fluorescent zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
	2 red fluorescent zones
Rosmarinic acid: a blue fluorescent zone	A blue fluorescent zone (rosmarinic acid)
	1 or 2 blue fluorescent zones
	2 yellow or orange fluorescent zones
	A green fluorescent zone may be present
Rutoside: an orange-yellow fluorescent zone	
Reference solution	Test solution

D. Examine the chromatograms obtained in the assay for thymol and carvacrol.

**Results** The characteristic peaks in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with reference solution (a).

## TESTS

### Foreign matter (2.8.2)

Maximum 10 per cent of stems and maximum 2 per cent of other foreign matter. Stems must not be more than 1 mm in diameter and 15 mm in length.

### *Thymus serpyllum* L.

Adulteration with *T. serpyllum* L. is indicated by the presence of leaves with long trichomes at their base and with weakly pubescent other parts.

### Water (2.2.13)

Maximum 100 mL/kg, determined on 20.0 g of the powdered herbal drug (355) (2.9.12).

### Total ash (2.4.16)

Maximum 15.0 per cent.

### Ash insoluble in hydrochloric acid (2.8.1)

Maximum 3.0 per cent.

## ASSAY

### Essential oil (2.8.12)

Use 30.0 g of the herbal drug, a 1000 mL round-bottomed flask and 400 mL of *water R* as the distillation liquid. Distil at a rate of 2-3 mL/min for 2 h without *xylene R* in the graduated tube.

### Thymol and carvacrol

Gas chromatography (2.2.28): use the normalisation procedure.

**Test solution** Filter the essential oil obtained in the determination of essential oil over a small amount of *anhydrous sodium sulfate R* and dilute to 5.0 mL with *heptane R* by rinsing the apparatus and the anhydrous sodium sulfate. Dilute a volume of the filtered solution corresponding to 100 µL of the essential oil to 5.0 mL with *heptane R*.

**Reference solution (a)** Dissolve 0.20 g of *thymol R* and 50 mg of *carvacrol R* in *heptane R* and dilute to 5.0 mL with the same solvent.

**Reference solution (b)** Dilute 10 µL of *carvacrol R* to 10.0 mL with *heptane R*. Dilute 100 µL of the solution to 10.0 mL with *heptane R*.

### Column:

- **material:** fused silica;
- **size:**  $l = 30-60$  m,  $\varnothing = 0.25$  mm;
- **stationary phase:** *macrogol 20 000 R* (film thickness 0.25 µm).

**Carrier gas** *nitrogen for chromatography R* or *helium for chromatography R*.

**Flow rate** 1-2 mL/min.

**Split ratio** 1:100.

**Temperature:**

	Time (min)	Temperature (°C)
Column	0 - 45	40 → 220
Injection port		190
Detector		210

**Detection** Flame ionisation.

**Injection** 0.2 µL.

**Elution order** Order indicated in the composition of reference solution (a); record the retention times of these substances.

**System suitability** Reference solution (a):

- **resolution:** minimum 1.5 between the peaks due to thymol and carvacrol.

Using the retention times determined from the chromatogram obtained with reference solution (a), locate the components of the reference solution in the chromatogram obtained with the test solution.

Determine the percentage content of thymol and carvacrol. Disregard any peak due to the solvent or with an area less than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Ph Eur

## Thyme Oil, Thymol Type

(Ph. Eur. monograph 1374)

Ph Eur

## DEFINITION

Essential oil obtained by steam distillation from the fresh flowering aerial parts of *Thymus vulgaris* L., *T. zygis* L. or a mixture of both species.

## CHARACTERS

### Appearance

Clear, yellow or very dark reddish-brown, mobile liquid.

Odour reminiscent of thymol.

### Solubility

Miscible with anhydrous ethanol and with light petroleum.

1.490 to 1.505.**Chromatographic profile**

Gas chromatography (2.2.28): use the normalisation procedure.

*Test solution* Dissolve 200 µL of the substance to be examined in *heptane R* and dilute to 10.0 mL with the same solvent.*Reference solution (a)* Dissolve 5 µL of *β-myrcene R*, 5 µL of *α-terpinene R*, 20 µL of *p-cymene R*, 10 µL of *γ-terpinene R*, 5 µL of *linalol R*, 5 µL of *terpinen-4-ol R*, 40 mg of *thymol R* and 5 µL of *carvacrol R* in 5 mL of *heptane R*.*Reference solution (b)* Dissolve 10 µL of *carvacrol R* in *heptane R* and dilute to 10.0 mL with the same solvent. Dilute 100 µL of the solution to 10.0 mL with *heptane R*.*Column:*— *material:* fused silica;— *size:*  $l = 60$  m,  $\varnothing = 0.25$  mm;— *stationary phase:* *phenyl(5)methyl(95)polysiloxane R* (film thickness 0.25 µm).*Carrier gas* *helium for chromatography R*.*Flow rate* 1.5 mL/min.*Split ratio* 1:50.*Temperature:*

	Time (min)	Temperature (°C)
Column	0 - 75	65 → 215
Injection port		230
Detector		250

*Detection* Flame ionisation.*Injection* 1 µL.*Elution order* Order indicated in the composition of reference solution (a); record the retention times of these substances.*System suitability* Reference solution (a):— *resolution:* minimum 1.5 between the peaks due to thymol and carvacrol.*Identification of peaks* Using the retention times determined from the chromatogram obtained with reference solution (a), locate the components of reference solution (a) in the chromatogram obtained with the test solution. The peak due to *α-thujene* elutes with a relative retention of about 0.8 with reference to *β-myrcene*. The peak due to carvacrol methyl ether elutes with a relative retention of about 0.9 with reference to thymol.

Determine the percentage content of these components.

The limits are within the following ranges:

- *α-thujene:* 0.2 per cent to 1.5 per cent;
- *β-myrcene:* 1.0 per cent to 3.0 per cent;
- *α-terpinene:* 0.9 per cent to 2.6 per cent;
- *p-cymene:* 14.0 per cent to 28.0 per cent;
- *γ-terpinene:* 4.0 per cent to 12.0 per cent;
- *linalol:* 1.5 per cent to 6.5 per cent;
- *terpinen-4-ol:* 0.1 per cent to 2.5 per cent;
- *carvacrol methyl ether:* 0.05 per cent to 1.5 per cent;
- *thymol:* 37.0 per cent to 55.0 per cent;
- *carvacrol:* 0.5 per cent to 5.5 per cent;
- *disregard limit:* the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

**STORAGE**

At a temperature not exceeding 25 °C.

Ph Eur

## Wild Thyme

(Ph. Eur. monograph 1891)

Ph Eur

### DEFINITION

Whole or cut, dried, flowering aerial parts of *Thymus serpyllum* L.

### Content

Minimum 3.0 mL/kg of essential oil (dried drug).

### IDENTIFICATION

A. The stem is much branched, up to about 1.5 mm in diameter, cylindrical or indistinctly quadrangular, green, reddish or purplish, the older stems brown and woody, the younger stems pubescent. The leaves are opposite, 3-12 mm long and up to 4 mm wide, elliptical to ovate-lanceolate with an obtuse apex, cuneate and shortly petiolate at the base; the margin is entire and markedly ciliate, especially near the base; both surfaces are more or less glabrous but distinctly punctate. The inflorescence is composed of about 6-12 flowers in rounded to ovoid, terminal heads. The calyx is tubular, 2-lipped with the upper lip dividing to form 3 teeth, the lower lip with 2 teeth, edged with long hairs; the inner surfaces are strongly pubescent, the hairs forming a closed tube after flowering. The corolla is purplish-violet or red, 2-lipped, the lower lip with 3 lobes and the upper lip notched, the inner surface is strongly pubescent; 4 epipetalous stamens project from the corolla tube.

B. Microscopic examination (2.8.23). The powder is greyish-green or greenish-brown. Examine under a microscope using chloral hydrate solution R. The powder shows the following diagnostic characters (Figure 1891.-1): fragments of the leaf epidermises [A, B, F] covered by a finely striated cuticle and consisting of cells with sinuous anticlinal walls [Aa, Ba, Fa] and diacytic stomata (2.8.3) [Ab, Bb, Fb]; cells of the adaxial leaf epidermis [B] with wavy, irregularly thickened anticlinal walls [Ba]; numerous covering trichomes on both epidermises and the leaf margins, with some of the cells containing very small crystals of calcium oxalate [Af, Ca, Fd], the majority are short, conical, unicellular, with thickened and warty walls (surface view [Bc], side view [Fc]); fewer multicellular covering trichomes, long, tapering to a point, composed of up to 8 cells, slightly swollen at the joints, with finely pitted walls, on an epidermis [Ae] or fragmented [C]; abundant glandular trichomes, mostly multicellular of the lamiaeous type [Ac] with a unicellular stalk and a glandular head consisting of 12 inconspicuous cells, others with a unicellular stalk and a unicellular globular or ovoid head [Ad]; purplish-violet fragments of the corolla whose inner epidermis consists of cells with rounded papillae [D] and whose outer epidermis [E], with a striated cuticle, consists of cells with lobed walls [Ea], unicellular [Eb] or multicellular [Ec] uniseriate covering trichomes, glandular trichomes with a unicellular head and a unicellular stalk [Ed] and glandular trichomes of the lamiaeous type; relatively rare pollen grains, spherical, about 30 µm in diameter, with a finely pitted exine and 6 germinal pores [G].

C. Thin-layer chromatography (2.2.27).

**Test solution** To 0.5 g of the powdered herbal drug (355) (2.9.12) add 5 mL of methanol R. Sonicate for 10 min. Centrifuge or filter; use the supernatant or the filtrate.

**Reference solution** Dissolve 1 mg of rutoside trihydrate R and 1 mg of rosmarinic acid R in 5 mL of methanol R.

Figure 1891.-1.— Illustration for identification test B of powdered herbal drug of wild thyme

**Plate** TLC silica gel F<sub>254</sub> plate R (5-40 µm) [or TLC silica gel F<sub>254</sub> plate R (2-10 µm)].

**Mobile phase** anhydrous formic acid R, water R, ethyl acetate R (1:1:15 V/V/V).

**Application** 20 µL [or 5 µL] as bands of 20 mm [or 8 mm].

**Development** Over a path of 15 cm [or 6 cm].

**Drying** In air.

**Detection** Heat at 100 °C for 3 min; treat the still-hot plate with a 5 g/L solution of diphenylboric acid aminoethyl ester R in ethyl acetate R, then treat with a 50 g/L solution of macrogol 400 R in methylene chloride R; examine in ultraviolet light at 365 nm.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint fluorescent zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
	A red fluorescent zone
Rosmarinic acid: a blue fluorescent zone	A blue fluorescent zone (rosmarinic acid)
	1 or 2 blue fluorescent zones
	A yellow or orange fluorescent zone
	A green or blue fluorescent zone may be present
Rutoside: an orange-yellow fluorescent zone	
Reference solution	Test solution

**TESTS****Foreign matter (2.8.2)**

Maximum 3 per cent, determined on 30 g.

***Thymus vulgaris* L. or *Thymus zygis* L.**

Adulteration with *T. vulgaris* L. or *T. zygis* L. is indicated by the presence of acicular to linear-lanceolate leaves with a strongly bent margin, the adaxial surface showing covering trichomes shaped as pointed teeth with warty walls, the abaxial surface showing many types of warty covering trichomes: unicellular, straight or slightly curved, bicellular or tricellular, often elbow-shaped, and bicellular or tricellular, more or less straight.

**Loss on drying (2.2.32)**

Maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

**Total ash (2.4.16)**

Maximum 10.0 per cent.

**Ash insoluble in hydrochloric acid (2.8.1)**

Maximum 3.0 per cent.

**ASSAY****Essential oil (2.8.12)**

Use 50.0 g of the cut herbal drug, a 1000 mL round-bottomed flask and 500 mL of *water R* as the distillation liquid. Distil at a rate of 2-3 mL/min for 2 h without *xylene R* in the graduated tube.

Ph Eur

**Tinospora Stem****DEFINITION**

Dried, whole or fragmented stem of *Tinospora cordifolia* (Willd.) Miers. and/or *Tinospora sinensis* (Lour.) Merr.

**IDENTIFICATION**

A. Transversely or obliquely cut pieces showing considerable variation in size, up to about 6 cm in length and 2 cm or more in diameter; more or less cylindrical, sometimes branched; outer surface dark brown, rough, with a thin papery cork which is sometimes exfoliating; deeply ridged longitudinally with occasional branch scars and more numerous small, whitish scars of adventitious roots.

The transversely cut surface shows a wide bark surrounding a conspicuously radiate and porous xylem with creamish-white, narrow medullary rays separating the wedge-shaped strands of vascular tissue; the small central pith is slightly depressed.

B. Reduce to a powder (355), Appendix XVII A.

The powder is creamish-brown. Examine under a microscope using *chloral hydrate solution*. The powder shows lignified fibres and crystal fibres containing prisms of calcium oxalate from the pericycle; tracheids and vessel elements with bordered pits from the xylem. Examine under a microscope using 50% v/v of *glycerol*. Simple, ovoid or ovoidelliptical starch grains are frequent.

C. Carry out the method for *high performance thin-layer chromatography*, Appendix XI W, using the following solutions.

(1) Extract approximately 2 g of the powdered herbal drug (710), Appendix XVII A with 10 mL of *methanol* in a stoppered conical flask. Shake immediately and then sonicate for 15 minutes and filter.

(2) 0.08% w/v of  $\beta$ -sitosterol and 0.06% w/v of *columbin* in *methanol*.

(3) Dilute 1 volume of solution (2) to 4 volumes with *methanol*. Use  $\beta$ -sitosterol as the intensity marker for zones (a) to (f) and (h); use *columbin* as the intensity marker for zone (g).

(4) 0.06% w/v of *columbin* and 0.02% w/v of *resorcinol* in *methanol*.

**CHROMATOGRAPHIC CONDITIONS**

(a) Use as the coating *high performance silica gel F* (Merck silica gel 60 plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 10  $\mu$ L of solution (1) and 2  $\mu$ L of each of solutions (2), (3) and (4), as 8 mm bands.

(d) Develop the plate to 7 cm.

(e) After removal of the plate, dip it in *anisaldehyde solution*, dry at 100° for three minutes and examine under white light.

**MOBILE PHASE**

3 volumes of *ethyl acetate* and 10 volumes of *toluene*.

**SYSTEM SUITABILITY**

The test is not valid unless the chromatogram obtained with solution (4) shows two clearly separated zones under white light.

**CONFIRMATION**

The chromatogram obtained with solution (1) shows a purple zone and a very faint brown to purple zone at the top of the plate, 4 less intense purple zones in the middle of the plate, and a green zone may be present in the lower third (indicative of *T. cordifolia*) or absent (indicative of *T. sinensis*). Other zones may be present.

Top of the plate		
—	—	a faint to intense purple zone (a) a very faint brown or purple zone (b)
—	—	a faint to intense purple zone (c) a faint to equivalent purple zone (d)
—	a purple zone (β-sitosterol)	a faint to equivalent purple zone (β-sitosterol) (e) a faint to equivalent purple zone (f) —
an orange zone (resorcinol)	—	—
a green zone (columbin)	a green zone (columbin)	a very faint green zone (columbin) (g) very faint to equivalent brown and purple zones (h)
Solution (4) System suitability test	Solutions (2) and (3) Intensity marker and dilution	Solution (1) Test Solution

**TESTS****Foreign matter**

Not more than 2.0%, Appendix XI D.

**Loss on drying**

When dried for 2 hours at 105°, loses not more than 11.0% of its weight, Appendix IX D. Use 1 g.

**Total Ash**

Not more than 11.0%, Appendix XI J.

**Tolu Balsam**

(Ph. Eur. monograph 1596)

Ph Eur

**DEFINITION**

Oleo-resin obtained from the trunk of *Myroxylon balsamum* (L.) Harms var. *balsamum*.

**Content**

25.0 per cent to 50.0 per cent of free or combined acids, expressed as cinnamic acid (C<sub>9</sub>H<sub>8</sub>O<sub>2</sub>; M<sub>r</sub> 148.2) (dried drug).

**CHARACTERS****Appearance**

Hard, friable, brownish to reddish-brown mass; thin fragments are brownish-yellow when examined against the light.

Reminiscent odour of vanillin.

**Solubility**

Practically insoluble in water, very soluble to freely soluble in alcohol, practically insoluble in light petroleum.

**IDENTIFICATION**

Thin-layer chromatography (2.2.27).

**Test solution** Stir 0.40 g of the fragmented drug with 10 mL of methylene chloride R for 5 min and filter.

**Reference solution** Dissolve 50 mg of benzyl cinnamate R in methylene chloride R, add 50 µL of benzyl benzoate R and dilute to 10 mL with methylene chloride R.

**Plate** TLC silica gel G plate R.

**Mobile phase** light petroleum R, toluene R (5:95 V/V).

**Application** 20 µL, as bands.

**Development** Over a path of 15 cm.

**Drying** In air.

**Detection** Spray with vanillin reagent R and heat at 100-105 °C for 5 min. Examine in daylight.

**Results** See below the sequence of the zones present in the chromatograms obtained with the test and reference solutions. Furthermore, other coloured zones are present in the chromatogram obtained with the test solution.

Top of the plate	
Benzyl benzoate: a greyish-blue zone	a greyish-blue zone
Benzyl cinnamate: a greyish-green zone	a greyish-green zone
Reference solution	Test solution

**TESTS****Acid value**

100 to 160.

Dissolve 0.5 g of the fragmented drug in 50 mL of alcohol R. Add 0.5 mL of acid blue 93 solution R and 5.0 mL of 0.5 M alcoholic potassium hydroxide. Stir vigorously and titrate with 0.5 M hydrochloric acid until the colour changes from brownish-red to blackish-green (n<sub>1</sub> mL of 0.5 M hydrochloric acid). Carry out a blank test in the same manner (n<sub>2</sub> mL of 0.5 M hydrochloric acid). Calculate the acid value in the same manner as the saponification value (2.5.6).

**Matter insoluble in alcohol**

Maximum 5 per cent.

Boil 2.0 g of the fragmented drug with 25 mL of alcohol (90 per cent V/V) R and filter. Wash the residue with alcohol (90 per cent V/V) R, boiling until completely extracted, then dry the residue at 100-105 °C. Weigh the residue.

**Loss on drying (2.2.32)**

Maximum 5.0 per cent, determined on 2.000 g of the fragmented drug by spreading on a flat evaporating dish 9 cm in diameter and allowing to dry *in vacuo* for 4 h.

**Total ash (2.4.16)**

Maximum 0.3 per cent.

**ASSAY**

Boil 1.500 g under a reflux condenser with 25 mL of 0.5 M alcoholic potassium hydroxide for 1 h. Evaporate the ethanol and heat the residue with 50 mL of water R until the substance is homogeneously distributed. After cooling, add 80 mL of water R and a solution of 1.5 g of magnesium sulfate R in 50 mL of water R. Mix, and allow to stand for 10 min. Filter through a pleated filter paper and wash the residue with 20 mL of water R. Combine the filtrate and the washings, acidify with hydrochloric acid R and extract with 4 quantities, each of 40 mL, of ether R. Discard the aqueous layer. Combine the organic extracts and wash with 2 quantities, each of 20 mL, and with 3 quantities, each of 10 mL, of a 50 g/L solution of sodium hydrogen carbonate R. Discard the ether layer. Combine the aqueous extracts, acidify with hydrochloric acid R and stir once with 30 mL, twice with 20 mL and once with 10 mL of methylene

*chloride R*. Dry the combined methylene chloride extracts over *anhydrous sodium sulfate R*. Filter through a pleated filter and wash the residue with 10 mL of *methylene chloride R*. Reduce the combined methylene chloride extracts to 10 mL by distillation and eliminate the remaining methylene chloride in a current of air. Dissolve the residue with heating in 10 mL of *alcohol R* previously neutralised to *phenol red solution R*. After cooling, titrate with 0.1 M *sodium hydroxide*, using the same indicator.

1 mL of 0.1 M *sodium hydroxide* is equivalent to 14.82 mg of total acids, expressed as cinnamic acid.

#### STORAGE

Do not store in powdered form.

Ph Eur

## Tolu-flavour Solution

### DEFINITION

Cinnamic acid of commerce	5.0 g
Benzoic Acid	2.5 g
Ethyl Cinnamate	0.3 g
Vanillin	0.1 g
Cinnamon Oil	0.02 mL
Sucrose	500 g
Ethanol (96 per cent)	350 mL
Water	Sufficient to produce 1000 mL

#### Extemporaneous preparation

The following directions apply.

Dissolve the Sucrose in 320 mL of Water. Add 250 mL of the Ethanol (96 per cent), with mixing. Dissolve the cinnamic acid of commerce, Benzoic Acid, Ethyl Cinnamate, Vanillin and Cinnamon Oil in the remaining 100 mL of Ethanol (96 per cent), add this solution to the sucrose solution with mixing, dilute to 1000 mL with Water and mix. Allow to stand for a few hours before use.

#### IDENTIFICATION

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

- (1) The solution being examined.
- (2) 0.5% w/v of cinnamic acid, 0.25% w/v of benzoic acid and 0.03% v/v of ethyl cinnamate in ethanol (90%).

#### CHROMATOGRAPHIC CONDITIONS

- Use as the coating silica gel *GF<sub>254</sub>*.
- Use the mobile phase as described below.
- Apply 5 µL of each solution.
- Develop the plate to 15 cm.
- After removal of the plate, dry in air for 15 minutes and repeat the development using the same mobile phase. Remove the plate, allow the solvent to evaporate and examine under *ultraviolet light (254 nm)*.

#### MOBILE PHASE

15 volumes of *glacial acetic acid*, 25 volumes of *hexane* and 75 volumes of *n-pentane*.

#### CONFIRMATION

The spots in the chromatogram obtained with solution (1) are similar in size and position to those in the chromatogram obtained with solution (2).

#### TESTS

##### Ethanol content

31 to 36% v/v, Appendix VIII F.

##### Weight per mL

1.125 to 1.155 g, Appendix V G.

## Tolu Syrup

### DEFINITION

Tolu-flavour Solution  
Syrup

100 mL  
Sufficient to produce 1000 mL

The syrup complies with the requirements stated under *Oral Liquids* and with the following requirement.

##### Weight per mL

1.29 to 1.32 g, Appendix V G.

## Paediatric Compound Tolu Linctus

Paediatric Compound Tolu Oral Solution

### DEFINITION

Paediatric Compound Tolu Linctus is an *oral solution* containing 0.6% w/v of Citric Acid Monohydrate in a suitable vehicle with a tolu flavour.

The linctus complies with the requirements stated under *Oral Liquids* and with the following requirements.

Content of total acid, calculated as citric acid monohydrate,  $C_6H_8O_7 \cdot H_2O$

0.60 to 0.66% w/v.

#### ASSAY

To 15 g add 100 mL of *water* and titrate with 0.1M *sodium hydroxide VS* using *phenolphthalein solution R1* as indicator. Each mL of 0.1M *sodium hydroxide VS* is equivalent to 7.005 mg of  $C_6H_8O_7 \cdot H_2O$ . Determine the *weight per mL* of the linctus, Appendix V G, and calculate the content of  $C_6H_8O_7 \cdot H_2O$ , weight in volume.

## Tormentil

(Ph. Eur. monograph 1478)

### Preparation

Tormentil Tincture

Ph Eur

### DEFINITION

Whole or cut, dried rhizome, freed from the roots, of *Potentilla erecta* (L.) Raesch. (*P. tormentilla* Stokes).

#### Content

Minimum 7 per cent of tannins, expressed as pyrogallol ( $C_6H_6O_3$ ;  $M_r$  126.1) (dried drug).

### IDENTIFICATION

A. The rhizome is cylindrically spindle-shaped, with a very irregular appearance, often forming, twisted, knotty tubers, up to 10 cm long and 1-2 cm thick, very hard and scarcely branched. The surface is brown to reddish-brown, rugose and has remains of roots and transversely elongated depressed whitish scars from the stems. At the top of the rhizome the remains of numerous aerial stems may be

present. The fracture is short and granular, dark red to brownish-yellow.

**B. Microscopic examination (2.8.23).** The powder is reddish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: coarsely serrate cluster crystals of calcium oxalate, up to 60 µm in diameter; fragments of thin-walled parenchyma containing reddish-brown tannin; groups of narrow, bordered-pitted vessels with lateral pores; thick-walled and pitted, polygonal parenchyma; groups and fragments of sclerenchymatous thick-walled fibres; occasional fragments of cork with thin-walled, brown, tabular cells. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows spherical or elliptical starch granules, up to about 20 µm in length.

**C. Thin-layer chromatography (2.2.27).**

**Test solution** To 0.5 g of the powdered herbal drug (355) (2.9.12) add 10 mL of *water R*, shake for 10 min and filter. Shake the filtrate with 2 quantities, each of 10 mL, of *ethyl acetate R* and filter the combined upper phases over 6 g of *anhydrous sodium sulfate R*. Evaporate the filtrate to dryness under reduced pressure and dissolve the residue in 1.0 mL of *ethyl acetate R*.

**Reference solution** Dissolve 1.0 mg of *catechin R* in 1.0 mL of *methanol R*.

**Plate** TLC silica gel plate *R*.

**Mobile phase** *glacial acetic acid R*, *ether R*, *hexane R*, *ethyl acetate R* (20:20:20:40 *V/V/V/V*).

**Application** 10 µL as bands.

**Development** Over a path of 10 cm.

**Drying** In air for 10-15 min.

**Detection** Spray with a freshly prepared 5 g/L solution of *fast blue B salt R*. Reddish zones appear. Expose the plate to ammonia vapour, the zones become more intense turning reddish-brown. Examine in daylight.

**Results** See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other fainter zones are present in the chromatogram obtained with the test solution.

Top of the plate	
Catechin: an intense reddish-brown zone	A more intense reddish-brown zone (catechin)
	A fainter zone
	An intense zone
	Fainter zones
Reference solution	Test solution

## TESTS

### Foreign matter (2.8.2)

Maximum 3 per cent of root and stems as well as rhizomes with black fracture and maximum 2 per cent of other foreign matter.

### Cadmium (2.4.27)

Maximum 2.0 ppm.

### Loss on drying (2.2.32)

Maximum 12.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

### Total ash (2.4.16)

Maximum 5.0 per cent.

## ASSAY

### Tannins (2.8.14)

Use 0.500 g of the powdered herbal drug (180) (2.9.12).

Ph Eur

## Tormentil Tincture

(Ph. Eur. monograph 1895)

Ph Eur

## DEFINITION

Tincture produced from *Tormentil* (1478).

## Content

Minimum 1.5 per cent *m/m* of tannins, expressed as pyrogallol (C<sub>6</sub>H<sub>6</sub>O<sub>3</sub>; M<sub>r</sub> 126.1).

## PRODUCTION

The tincture is produced from 1 part of comminuted drug and 5 parts of ethanol (70 per cent *V/V*) by a suitable procedure.

## CHARACTERS

Red or reddish-brown liquid.

## IDENTIFICATION

Thin-layer chromatography (2.2.27).

**Test solution** Mix 1.0 mL of the tincture to be examined with 1.0 mL of *alcohol (70 per cent V/V) R*.

**Reference solution** Dissolve 1.0 mg of *catechin R* in 1.0 mL of *methanol R*.

**Plate** TLC silica gel plate *R*.

**Mobile phase** *ether R*, *glacial acetic acid R*, *hexane R*, *ethyl acetate R* (20:20:20:40 *V/V/V/V*).

**Application** 10 µL as bands.

**Development** Over a path of 10 cm.

**Drying** In air for 10-15 min.

**Detection** Spray with a freshly prepared 5 g/L solution of *fast blue B salt R*. Reddish zones appear. Expose the plate to ammonia vapour, the zones become more intense, turning reddish-brown. Examine in daylight.

**Results** See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution.

***Trachyspermum Ammi*****DEFINITION***Trachyspermum Ammi* is the dried ripe fruit of *Trachyspermum ammi* (L.) Sprague (syn. *C. [Carum] copticum* (L.) Benth. & Hook.f. ex C.B. Clarke).**Content**

It contains not less than 2.5% v/w of essential oil calculated with reference to the anhydrous drug.

**IDENTIFICATION**

A. The dried fruits occur mainly as entire cremocarps with carpophore present, yellowish green, ovoid, laterally compressed, 1 to 3 mm in length and 1 to 2.8 mm in diameter, usually with pedicel attached; styles remaining as a curved, bifid stylopod at the apex. Each fruit composed of two mericarps, dorsal surface convex with five distinct ridges, surface warty; commissural surface flat; vittae visible as two darker longitudinal bands.

B. Reduce to a powder (355). The powder is greenish brown. Examine under a microscope using *chloral hydrate solution*. The powder contains numerous fragments of the papillose epicarp, also showing cuticular striations, with attached or detached whole or fragmented unicellular, warty-walled trichomes; parquetry layer of endocarp in surface view; endosperm of thick-walled cells containing oil globules and aleurone grains with embedded microsette crystals of calcium oxalate; fragments of yellowish-brown septate vittae; bicollateral vascular bundles with associated lignified, reticulate or pitted parenchyma.

C. Examine the chromatograms obtained in the test for Chromatographic profile. The retention times of the principal peaks in the chromatogram obtained with solution (1) are similar to those in the chromatogram obtained with solution (3).

**TESTS****Water**

Not more than 10% w/w, Appendix IX C. Use 10.0 g.

**Total Ash**

Not more than 10%, Appendix XI J, Method II.

**Chromatographic profile**Carry out the method for *gas chromatography*, Appendix III B, using the following solutions.

(1) Use the essential oil-toluene mixture obtained in the determination of essential oil.

(2) 0.4% v/v each of *γ-terpinene* and *p-cymene* in *toluene*.(3) 0.1% v/v each of *p-cymene* and *γ-terpinene* and 0.1% w/v of *thymol* in *toluene*.(4) 0.01% v/v of *γ-terpinene* in *toluene*.**SYSTEM SUITABILITY**The test is not valid unless in the chromatogram obtained with solution (2), the *resolution factor* between the peaks due to *γ-terpinene* and *p-cymene* is at least 2.5.In the chromatogram obtained with solution (3), the peaks elute in the following order: *γ-terpinene*, *p-cymene* and *thymol*.**DETERMINATION OF CONTENT**Using the retention times determined from the chromatogram obtained with solution (3), locate the components of solution (3) in the chromatogram obtained with solution (1) and calculate the content of *p-cymene*, *γ-terpinene* and *thymol* by normalisation.**Limits:**

- *p-cymene* 10 to 25%,
- *γ-terpinene* 10 to 30%,
- *thymol* 45 to 70%.

Disregard any peak with an area less than the peak in the chromatogram obtained with solution (4).

**ASSAY****Essential oil**Carry out the method for *Essential Oils in Herbal Drugs*, Appendix XI E, using 15 g of the powdered drug with 1000 mL of *water* as distillation liquid. Distil at a rate of 2 to 3 mL per minute for 2 hours using 0.5 mL of *toluene* in the graduated tube. Measure the quantity of essential oil distilled and use for the test for Chromatographic profile.

## Tribulus Terrestris Fruit

### DEFINITION

Tribulus Terrestris Fruit is the dried, ripe, entire fruit of *Tribulus terrestris* L.

### IDENTIFICATION

A. The fruit is pale greenish yellow, stalked, up to 10 mm long and 4 to 6 mm broad, with five ribs or angles, and covered with short, pubescent hairs. There are 5 (occasionally 4) pairs of short, stiff, and very sharp spines, each pointing downwards, the tips of each pair almost meeting and together forming a pentagonal framework around the fruit. The ripe fruit separates into five plano-convex or half-moon shaped nutlets or cocci, each armed with a pair of spines and appearing as a single fruit; each nutlet contains one chamber containing four or more seeds.

B. Reduce to a powder, Appendix XVII A. The powder is pale greenish brown. Examine under a microscope using *chloral hydrate solution*. The powder contains numerous unicellular trichomes; small, rectangular epidermal cells of the cocci; large parenchyma cells of the mesocarp, some containing rosette crystals of calcium oxalate; small parenchyma cells containing prism crystals of calcium oxalate.

C. Carry out the method for *high-performance thin-layer chromatography*, Appendix XI W, using the following solutions.

(1) Mix 0.3 g of freshly powdered drug, Appendix XVII A, with 3 mL of *methanol* and sonicate for 15 minutes; filter or centrifuge at 5000 rpm for 5 minutes and use the filtrate or the supernatant liquid.

(2) Add 50 µL of *linalool* to 1 mL of *methanol* and dilute 1 volume of the resulting solution to 40 volumes with *methanol*.

(3) Add 50 µL of *linalyl acetate* to 1 mL of *methanol* and dilute 1 volume of the resulting solution to 20 volumes with *methanol*.

(4) Mix 1 volume of solution (2) with 3 volumes of *methanol*.

(5) Mix 1 volume of solution (3) with 3 volumes of *methanol*.

(6) Add 50 µL of *carvone* to 1 mL of *methanol* and dilute 1 volume of the resulting solution to 100 volumes with *methanol*.

(7) A 0.05% w/v solution of *thymol* in solution (6).

### CHROMATOGRAPHIC CONDITIONS

(a) Use high-performance *silica gel 60 F<sub>254</sub>* plates (Merck silica gel F<sub>254</sub> HPTLC plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 5 µL of solution (1) and 2 µL each of solutions (2) to (5) and solution (7) as 8 mm-bands.

(d) Develop the plate to 7 cm.

(e) Remove the plate, dip in freshly-prepared *anisaldehyde solution*, heat at 100° for about 3 minutes and examine in daylight within 15 minutes of derivatisation.

### MOBILE PHASE

A mixture of 5 volumes of *ethyl acetate* and 95 volumes of *toluene*.

### SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (7) shows two clearly separated bands.

### CONFIRMATION

The chromatogram obtained with solution (1) shows one intense purple band above and two purple-grey bands below

the band corresponding to linalyl acetate in the chromatogram obtained with solution (3); a purple-to-intense purple band and three purple bands in the lower third of the chromatogram. The middle of the three bands corresponds in position to the band due to linalool in the chromatogram obtained with solution (2). Other bands may be present.

Top of the plate		
Intense purple band	A purple to brown band (linalyl acetate)	An orange-yellow band (thymol) A brown band (carvone)
2 purple-grey bands		
A purple band A purple band A purple band	A purple to brown band (linalool)	
Intense purple band		
<b>Solution (1)</b>	<b>Solutions (2) and (3)</b>	<b>Solution (7)</b>

### TESTS

#### Total Ash

Not more than 15.0%, Appendix XI J.

#### Acid-insoluble Ash

Not more than 1.0%, Appendix XI K.

#### Foreign matter

Not more than 2%, Appendix XI D.

#### Loss on drying

When dried for 2 hours at 105°, loses not more than 10.0% of its weight. Use 1 g of the powdered drug (355).

### ANNEX

*This section is non-mandatory.*

#### DNA reference sequence

A DNA reference sequence for the identity of *Tribulus Terrestris* Fruit is published in *Supplementary Chapter VII D*.

## Javanese Turmeric

(Ph. Eur. monograph 1441)

Ph Eur

### DEFINITION

Dried rhizome, cut in slices, of *Curcuma zanthorrhiza* Roxb. (syn. *C. zanthorrhiza* D. Dietrich).

### Content

— *essential oil*: minimum 50 mL/kg (anhydrous drug);  
— *dicinnamoyl methane derivatives, expressed as curcumin* (C<sub>21</sub>H<sub>20</sub>O<sub>6</sub>; M<sub>r</sub> 368.4): minimum 1.0 per cent (anhydrous drug).

### CHARACTERS

Aromatic odour.

### IDENTIFICATION

A. Orange-yellow or yellowish-brown or greyish-brown slices, mostly peeled 1.5–6 mm thick and 15–50 mm, more rarely up to 70 mm, in diameter. Fragments of the brownish-grey cork are sporadically present. The transverse surface is yellow with dark spots in the paler centre. The fracture is short and finely grained.

**B. Microscopic examination (2.8.23).** The powder is orange-yellow or yellowish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 1441.-1): fragments of parenchyma [C, E] with large, rounded or ovoid cells containing orange-yellow or yellowish-brown secretory cells [Ea]; fragments of spiral [Fa, G] or reticulate [F] vessels; rare fragments of cork (surface view [B], side view [D]); fragments of epidermis [H] with fragments of thick-walled unicellular covering trichomes [Ha] with a pointed tip [Hb]. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows numerous ovoid or irregular starch granules [A], about 30-50 µm long and about 10-30 µm wide, with a more or less visible eccentric hilum.

Figure 1441.-1. – Illustration for identification test B of powdered herbal drug of Javanese turmeric

**C. Thin-layer chromatography (2.2.27).** Examine the chromatograms obtained in the test for *Curcuma longa L*.  
**Results A** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Curcuminoids: a greenish fluorescent zone	A greenish fluorescent zone (curcuminoids)
Curcuminoids: 2 greenish fluorescent zones	A greenish fluorescent zone (curcuminoids)
Reference solution	Test solution

**Results B** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
	A faint pink zone
	An intense reddish zone
	A dark zone
Thymol: a dark zone	
	A pinkish-red zone
Curcuminoids: a brown zone	A brown zone (curcuminoids)
Curcuminoids: 2 yellow zones	A yellow zone (curcuminoids)
Reference solution	Test solution

**TESTS**

**Curcuma longa L**

Thin-layer chromatography (2.2.27).

**Test solution** To 1 g of the freshly powdered herbal drug (355) (2.9.12) add 10 mL of *ethanol (96 per cent) R*, shake, allow to stand for 30 min with occasional shaking and filter; use the filtrate.

**Reference solution** Dissolve 20 mg of *curcuminoids R* and 10 mg of *thymol R* in 10 mL of *ethanol (96 per cent) R*.

**Plate** TLC silica gel *F<sub>254</sub>* plate R (5-40 µm) [or TLC silica gel *F<sub>254</sub>* plate R (2-10 µm)].

**Mobile phase** *glacial acetic acid R*, *toluene R* (20:80 *V/V*).

**Application** 10 µL [or 3 µL] as bands of 10 mm [or 8 mm].

**Development** Over a path of 10 cm [or 6 cm].

**Drying** In air.

**Detection A** Examine in ultraviolet light at 365 nm.

**Results A** The chromatogram obtained with the test solution does not show a very intense greenish fluorescent zone in the lower third.

**Detection B** Treat with *anisaldehyde solution R* and heat at 100-105 °C for 10 min; examine in ultraviolet light at 365 nm.

**Water (2.2.13)**

Maximum 120 mL/kg, determined on 20.0 g of the powdered herbal drug (500) (2.9.12).

**Total ash (2.4.16)**

Maximum 8.0 per cent.

**ASSAY**

**Essential oil (2.8.12)**

Use 2.5 g of the freshly powdered herbal drug (500) (2.9.12), a 2 L round-bottomed flask, 400 mL of *water R* as the distillation liquid and 0.5 mL of *xylene R* in the graduated tube. Distil at a rate of 2 mL/min for 3 h.

**Dicinnamoyl methane derivatives**

Disperse 0.500 g of the powdered herbal drug (500) (2.9.12) in 30 mL of *ethanol (96 per cent) R* in a 100 mL round-bottomed flask. Heat under a reflux condenser for 2.5 h. Cool and filter into a volumetric flask, rinse the round-bottomed flask and the filter with *ethanol (96 per cent) R* and

dilute to 100.0 mL with the same solvent. Dilute 1.0 mL of the solution to 50.0 mL with ethanol (96 per cent) R. Measure the absorbance (2.2.25) at 425 nm using ethanol (96 per cent) R as the compensation liquid.

Calculate the percentage content of dicinnamoyl methane derivatives, expressed as curcumin, using the following expression:

$$\frac{A \times 5000}{1607 \times m}$$

i.e. taking the specific absorbance of curcumin to be 1607.

A = absorbance at 425 nm,  
m = mass of the herbal drug to be examined, in grams.

Ph Eur

## Turmeric Rhizome

(Ph. Eur. monograph 2543)

Ph Eur

### DEFINITION

Whole, cured (by boiling or steaming), dried rhizome of *Curcuma longa* L. (syn. *Curcuma domestica* Valetton) with roots and outer surface removed.

### Content

- essential oil: minimum 25 mL/kg (anhydrous drug);
- dicinnamoyl methane derivatives, expressed as curcumin (C<sub>21</sub>H<sub>20</sub>O<sub>6</sub>; M<sub>r</sub> 368.4): minimum 2.0 per cent (anhydrous drug).

### CHARACTERS

Spicy odour.

### IDENTIFICATION

A. The rhizome is ovate, oblong-ovoid, pyriform or cylindrical, often shortly branched, up to 6 cm long and 15 mm thick. The primary rhizome shows scars from the lateral branches. The surface is slightly dusty, spotted and brownish-yellow, yellow or brownish-grey, finely striated. The fracture is granular, smooth, non-fibrous, slightly glossy, uniformly orange-yellow; it shows a narrow cortex that is darker on the outside.

B. Microscopic examination (2.8.23). The powder is orange-yellow. Examine under a microscope using chloral hydrate solution R. The powder shows the following diagnostic characters (Figure 2543.-1): fragments of parenchyma including some secretory cells that contain masses of brownish-yellow oil [G]; reticulate or pitted vessels [B, D]; rare fragments of epidermis (surface view [F]), with cells whose walls are slightly and irregularly thickened [Fa] and scars of covering trichomes [Fb]; occasional long and flexuous, thick-walled, unicellular covering trichomes, fragmented and free [E] or attached to fragments of epidermis [J]; rare fragments of cork (surface view [A], side view [H]), sometimes covered by epidermis [Ha]. Examine under a microscope using a 50 per cent V/V solution of glycerol R. The powder shows starch granules, free or included in parenchymatous cells, usually gelatinised and agglomerated in a starchy paste; occasional ovoid starch granules, often deformed by curing [C], are also present.

Figure 2543.-1. – Illustration for identification test B of powdered herbal drug of turmeric rhizome

C. Thin-layer chromatography (2.2.27). Examine the chromatograms obtained in the test for *Curcuma xanthorrhiza* Roxb.

Results A See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Curcuminoids: a greenish fluorescent zone	A greenish fluorescent zone (curcuminoids)
Curcuminoids: 2 greenish fluorescent zones	2 greenish fluorescent zones (curcuminoids)
Reference solution	Test solution

Results B See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
	A faint pink zone An intense reddish zone
Thymol: a dark zone	A pinkish-red zone
Curcuminoids: a brown zone	A brown zone (curcuminoids)
Curcuminoids: 2 yellow zones	2 yellow zones (curcuminoids)
Reference solution	Test solution

**TESTS**

**Curcuma zanthorrhiza** Roxb.  
(syn. *Curcuma zanthorrhiza* D. Dietr.). Thin-layer chromatography (2.2.27).

**Test solution** To 1 g of the freshly powdered herbal drug (355) (2.9.12) add 10 mL of ethanol (96 per cent) R, shake, allow to stand for 30 min with occasional shaking and filter; use the filtrate.

**Reference solution** Dissolve 20 mg of curcuminoids R and 10 mg of thymol R in 10 mL of ethanol (96 per cent) R.

**Plate** TLC silica gel F<sub>254</sub> plate R (5-40 µm) [or TLC silica gel F<sub>254</sub> plate R (2-10 µm)].

**Mobile phase** glacial acetic acid R, toluene R (20:80 V/V).

**Application** 10 µL [or 3 µL] as bands of 10 mm [or 8 mm].

**Development** Over a path of 10 cm [or 6 cm].

**Drying** In air.

**Detection A** Examine in ultraviolet light at 365 nm.

**Detection B** Treat with anisaldehyde solution R and heat at 100-105 °C for 10 min; examine in ultraviolet light at 365 nm.

**Results B** The chromatogram obtained with the test solution shows no dark zone just above the zone due to thymol in the chromatogram obtained with the reference solution.

**Water** (2.2.13)

Maximum 120 mL/kg, determined on 15.0 g of the powdered herbal drug (500) (2.9.12).

**Total ash** (2.4.16)

Maximum 7.0 per cent.

**ASSAY**

**Essential oil** (2.8.12)

Use 2.5 g of the freshly powdered herbal drug (500) (2.9.12), a 2 L round-bottomed flask, 400 mL of water R as the distillation liquid and 0.5 mL of xylene R in the graduated tube. Distil at a rate of 2 mL/min for 3 h.

**Dicinnamoyl methane derivatives**

Disperse 0.500 g of the powdered herbal drug (500) (2.9.12) in 30 mL of ethanol (96 per cent) R in a 100 mL round-bottomed flask. Heat under a reflux condenser for 2.5 h. Cool and filter into a volumetric flask, rinse the round-bottomed flask and the filter with ethanol (96 per cent) R and dilute to 100.0 mL with the same solvent. Dilute 1.0 mL of the solution to 50.0 mL with ethanol (96 per cent) R. Measure the absorbance (2.2.25) at 425 nm using ethanol (96 per cent) R as the compensation liquid.

Calculate the percentage content of dicinnamoyl methane derivatives, expressed as curcumin, using the following expression:

$$\frac{A \times 5000}{1607 \times m}$$

i.e. taking the specific absorbance of curcumin to be 1607.

*A* = absorbance at 425 nm;  
*m* = mass of the herbal drug to be examined, in grams.

Ph Eur

**Turpentine Oil**

Turpentine Oil, Pinus Pinaster Type

(Ph. Eur. monograph 1627)

**Preparation**

White Liniment

Ph Eur

**DEFINITION**

Essential oil obtained by steam distillation, followed by rectification at a temperature below 180 °C, from the oleoresin obtained by tapping *Pinus pinaster* Aiton and/or *Pinus massoniana* D. Don. A suitable antioxidant may be added.

**CHARACTERS****Appearance**

Clear, colourless or pale yellow liquid.

Odour reminiscent of α-pinene and β-pinene.

**IDENTIFICATION**

**First identification:** B.

**Second identification:** A.

**A.** Thin-layer chromatography (2.2.27).

**Test solution** Dilute 1 mL of the oil to be examined in 10 mL of toluene R.

**Reference solution** Dissolve 10 µL of β-caryophyllene R and 10 mg of caryophyllene oxide R in 10 mL of toluene R.

**Plate** TLC silica gel plate R (5-40 µm) [or TLC silica gel plate R (2-10 µm)].

**Mobile phase** ethyl acetate R, toluene R (5:95 V/V).

**Application** 10 µL [or 2 µL] as bands of 10 mm [or 8 mm].

**Development** Over a path of 15 cm [or 6 cm].

**Drying** In air.

**Detection** Treat with anisaldehyde solution R and heat at 100-105 °C for 5-10 min; examine in daylight.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present below the zone due to caryophyllene oxide in the chromatogram obtained with the test solution.

Top of the plate	
$\beta$ -Caryophyllene: a pink zone	A pink zone
Caryophyllene oxide: a pink zone	A pink zone (caryophyllene oxide)
	A brownish-violet zone
Reference solution	Test solution

B. Examine the chromatograms obtained in the test for chromatographic profile.

**Results** The peaks in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with reference solution (a).

#### TESTS

**Relative density (2.2.5)**

0.856 to 0.872.

**Refractive index (2.2.6)**

1.465 to 1.475.

**Optical rotation (2.2.7)**

-40° to -28°.

**Acid value (2.5.1)**

Maximum 1.0.

**Peroxide value (2.5.5, Method B)**

Maximum 20.

**Fatty oils and resinified essential oils (2.8.7)**

It complies with the test.

#### Chromatographic profile

**Gas chromatography (2.2.28):** use the normalisation procedure.

**Test solution** Dilute 1.0 mL of the oil to be examined in heptane R and dilute to 10.0 mL with the same solvent.

**Reference solution (a)** Dissolve 30  $\mu$ L of  $\alpha$ -pinene R, 10 mg of camphene R, 20  $\mu$ L of  $\beta$ -pinene R, 10  $\mu$ L of car-3-ene R, 10  $\mu$ L of  $\beta$ -myrcene R, 20  $\mu$ L of limonene R, 10  $\mu$ L of longifolene R, 10  $\mu$ L of  $\beta$ -caryophyllene R and 10 mg of caryophyllene oxide R in 1.0 mL of heptane R.

**Reference solution (b)** Dissolve 5  $\mu$ L of  $\beta$ -caryophyllene R in heptane R and dilute to 10.0 mL with the same solvent. Dilute 0.1 mL of the solution to 1.0 mL with heptane R.

#### Column:

- material: fused silica;
- size:  $l = 60$  m,  $\varnothing = 0.25$  mm;
- stationary phase: macrogol 20 000 R (film thickness 0.25  $\mu$ m).

**Carrier gas** helium for chromatography R.

**Flow rate** 1.0 mL/min.

**Split ratio** 1:200.

**Temperature:**

	Time (min)	Temperature (°C)
Column	0 - 10	60
	10 - 80	60 → 200
	80 - 120	200
Injection port		200
Detector		250

**Detection** Flame ionisation.

**Injection** 1.0  $\mu$ L.

**Elution order** Order indicated in the composition of reference solution (a); record the retention times of these substances.

**System suitability** Reference solution (a):

— resolution: minimum 1.5 between the peaks due to car-3-ene and  $\beta$ -myrcene.

Using the retention times determined from the chromatogram obtained with reference solution (a), locate the components of reference solution (a) in the chromatogram obtained with the test solution.

Determine the percentage content of these components.

The limits are within the following ranges:

- $\alpha$ -pinene: 70.0 per cent to 85.0 per cent;
- camphene: 0.5 per cent to 2.0 per cent;
- $\beta$ -pinene: 5.0 per cent to 20.0 per cent;
- car-3-ene: maximum 1.0 per cent;
- $\beta$ -myrcene: 0.4 per cent to 1.5 per cent;
- limonene: 1.0 per cent to 7.0 per cent;
- longifolene: 0.2 per cent to 4.0 per cent;
- $\beta$ -caryophyllene: 0.1 per cent to 3.0 per cent;
- caryophyllene oxide: maximum 1.0 per cent;
- disregard limit: the area of the peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

**Residue on evaporation (2.8.9)**

Maximum 2.5 per cent, determined after heating on a water-bath for 3 h.

#### STORAGE

At a temperature not exceeding 25 °C.

Ph Eur

## Typhae Pollen

(Ph. Eur. monograph 2937)

Ph Eur

#### DEFINITION

Dried pollen of *Typha angustifolia* L., *Typha orientalis* C.Presl or other species of the genus *Typha* with single pollen grains (monads).

#### Content

Minimum 0.8 per cent of total flavonoids, expressed as typhaneoside ( $C_{34}H_{42}O_{20}$ ;  $M_r$  771) (dried drug).

#### IDENTIFICATION

A. Yellow or brownish-yellow, granular powder, mixed with small, irregular, mostly translucent, fragments of floral organs. The powder floats on water and disperses rapidly. The texture is fine and light, feels silky when rubbed between the fingers and easily adheres to the skin.

B. Microscopic examination (2.8.23). The powder is yellow to brownish-yellow. Examine under a microscope using chloral hydrate solution R. The powder shows the following diagnostic characters (Figure 2937.-1): single, light yellow pollen grains (monads), usually rounded, subtriangular or subrectangular with numerous intermediary forms, 17-32  $\mu$ m in diameter, with a single, more or less distinct, germinal pore and a finely reticulate exine; a few collapsed grains [F]. The following fragments of floral organs may be present: fragments of stamens, either containing pollen grains [C] or showing the endothecium [G]; the endothecium is covered

by a cuticle and, in side view [D], shows cells with walls thickened on 3 sides, whereas in surface view or from an angle [Ga, H], the cell walls appear as wave-shaped or punctiform thickenings; fragments of bracts consisting of either slightly lignified, fusiform cells [A] or slightly thickened, narrow, elongated, rectangular cells sometimes containing fine annular vessels [E]; raphides of calcium oxalate, either free [J] or included in rounded, thin-walled, parenchymatous cells; styloid crystals of calcium oxalate, usually broken [B].

Figure 2937.-1. – Illustration for identification test B of powdered herbal drug of typhae pollen

#### C. High-performance thin-layer chromatography (2.8.25).

**Test solution** To 0.5 g of the powdered herbal drug (355) (2.9.12) add 5.0 mL of methanol R and sonicate for 15 min. Centrifuge or filter and use the supernatant or the filtrate. If necessary, filter through a membrane filter (nominal pore size 0.45 µm).

**Reference solution (a)** Dissolve 3.0 mg of isorhamnetin-3-O-neohesperidoside R and 3.0 mg of typhaneoside R in methanol R and dilute to 10.0 mL with the same solvent.

**Reference solution (b)** Dilute 2.5 mL of reference solution (a) to 10.0 mL with methanol R.

**Reference solution (c)** Dissolve 3 mg of chlorogenic acid R and 3 mg of isorhamnetin-3-O-neohesperidoside R in methanol R and dilute to 10 mL with the same solvent.

**Intensity marker** Typhaneoside.

**Plate** TLC silica gel plate R (2-10 µm).

**Mobile phase** anhydrous formic acid R, glacial acetic acid R, water R, ethyl acetate R (11:11:27:100 V/V/V/V).

**Application** 5 µL as bands of 8 mm.

**Development** 7 cm from the lower edge of the plate.

**Drying** In a current of cold air for 5 min.

**Detection** Heat at 100 °C for 3 min; treat the warm plate with a 5 g/L solution of diphenylboric acid aminoethyl ester R in ethyl acetate R, then with a 50 g/L solution of macrogol 400 R in methylene chloride R; examine in ultraviolet light at 366 nm.

**System suitability** Reference solution (c):

- the chromatogram shows in the middle third 2 distinct zones, which may be touching; the lower zone (isorhamnetin-3-O-neohesperidoside) shows a green

fluorescence and the upper zone (chlorogenic acid) shows a light blue fluorescence.

**Results** See below the sequence of zones present in the chromatograms obtained with reference solution (a) and the test solution. Furthermore, in the chromatogram obtained with the test solution, other faint to very faint blue, green and/or orange fluorescent zones may be present.

Top of the plate	
Isorhamnetin-3-O-neohesperidoside: a green fluorescent zone, intense	A green fluorescent zone, intense (isorhamnetin-3-O-neohesperidoside) A yellow fluorescent zone, faint
Typhaneoside: a green fluorescent zone, intense	A green fluorescent zone, intense (typhaneoside) A yellow fluorescent zone, faint
Reference solution (a)	Test solution

#### TESTS

##### Foreign matter

Maximum 10 per cent.

Weigh 10 g of the herbal drug onto a sieve (125) (2.1.4) and sieve gently with light tapping. The material remaining on the sieve weighs a maximum of 1.0 g.

##### Loss on drying (2.2.32)

Maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

##### Total ash (2.4.16)

Maximum 7.0 per cent.

##### Ash insoluble in hydrochloric acid (2.8.1)

Maximum 4.0 per cent.

#### ASSAY

Liquid chromatography (2.2.29).

**Test solution** Introduce 1.0 g of the sieved herbal drug obtained in the test for foreign matter into a round-bottomed flask and add 50 mL of methanol R. Heat in a water-bath under a reflux condenser at 90 °C for 30 min. Allow to cool and filter. Repeat the extraction with a further 50 mL of methanol R. Allow to cool and filter. Combine the filtrates and evaporate to dryness under reduced pressure. Dissolve the residue in methanol R and dilute to 10.0 mL with the same solvent. Filter through a membrane filter (nominal pore size 0.22 µm).

**Reference solution (a)** Dissolve 8.0 mg of typhaneoside CRS in methanol R and dilute to 25.0 mL with the same solvent.

**Reference solution (b)** Dissolve 0.230 g of typhae pollen dry extract for system suitability HRS in methanol R and dilute to 10 mL with the same solvent. Weigh and sonicate for 10 min. Allow to cool, weigh again and compensate for the loss of solvent with methanol R. Shake thoroughly and filter through a membrane filter (nominal pore size 0.22 µm).

**Column:**

— size:  $l = 0.15$  m,  $\varnothing = 2.1$  mm;

— stationary phase: end-capped octadecylsilyl silica gel for chromatography R (1.8 µm);

— temperature: 25 °C.

Mobile phase acetonitrile R, 0.1 per cent V/V solution of anhydrous formic acid R (12.5:87.5 V/V).

Flow rate 0.4 mL/min.

Detection Spectrophotometer at 254 nm.

Injection 2 µL.

Run time 30 min.

**Identification of peaks** Use the chromatogram supplied with *typhae pollen dry extract for system suitability* HRS and the chromatogram obtained with reference solution (b) to identify the peaks due to flavonoids 1, 2, 3, 5 and 6; use the chromatogram obtained with reference solution (a) to identify the peak due to typhaneoside (flavonoid 4).

**Relative retention** With reference to typhaneoside (retention time = about 16.2 min): flavonoid 1 = about 0.55; flavonoid 2 = about 0.76; flavonoid 3 = about 0.90; flavonoid 5 = about 1.23; flavonoid 6 = about 1.41.

**System suitability** Reference solution (b):

— resolution: minimum 3.3 between the peaks due to flavonoid 3 and typhaneoside.

Calculate the percentage content of total flavonoids, expressed as typhaneoside, using the following expression:

$$\frac{A_1 \times m_2 \times p \times 2}{A_2 \times m_1 \times 5}$$

- $A_1$  = sum of the areas of the peaks due to typhaneoside and flavonoids 1, 2, 3, 5 and 6 in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to typhaneoside in the chromatogram obtained with reference solution (a);
- $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;
- $m_2$  = mass of typhaneoside CRS used to prepare reference solution (a), in grams;
- $p$  = percentage content of typhaneoside in typhaneoside CRS.

Ph Eur

## Uncaria Stem with Hooks

(Ph. Eur. monograph 2729)

Ph Eur

### DEFINITION

Fragments of dried branch or stem of *Uncaria rhynchophylla* (Miq.) Miq. ex Havil., each bearing paired hooks.

### Content

Minimum 0.2 per cent of total alkaloids, expressed as isorhynchophylline (C<sub>22</sub>H<sub>28</sub>N<sub>2</sub>O<sub>4</sub>; M<sub>r</sub> 384.5) (dried drug).

### IDENTIFICATION

A. The glabrous, reddish-brown fragments of the stem are about 2-3 cm long and bear paired hooks. The stem is cylindrical or sub-square, 2-5 mm in diameter, with fine longitudinal striations. The hooks, rounded and curved downwards, are paired, opposite to each other on the stem; occasionally there is only 1 hook; the hooks are about 1-5 cm long, with an acute apex and a relatively broad base. Petiole scars and arc-shaped stipule scars are visible on the stem, below the hook. A transverse section of the stem shows either a central cavity or a spongy, whitish pith.

B. Microscopic examination (2.8.23). The powder is reddish-brown or yellowish-brown. Examine under a microscope using *chloral hydrate solution* R. The powder shows the following diagnostic characters (Figure 2729.-1): brown fragments of the epidermis composed of irregular polygonal cells (surface view [D]); fragments of the dermal tissue (transverse section [A]) consisting of the epidermis [Ab] covered by a thick cuticle [Aa] and collenchymatous cells of the parenchyma [Ac]; fragments of phloem parenchyma with some cells containing sandy crystals of calcium oxalate (longitudinal section [J]); numerous pericyclic fibres, often in groups, with thick unchannelled walls [C]; sclereids of the cortical parenchyma with slightly thickened walls and oblique pits, varying greatly in shape and size, sometimes elongated [G], sometimes rectangular [H], isolated or in small groups; fragments of the xylem [E, K] consisting of large bordered-pitted vessels [Ka], bordered-pitted tracheids [Kb], annular vessels [Ea], these vessels are often associated with the outer layers of the pith with cells with channelled walls [Eb]; numerous rectangular cells of the medullary rays (longitudinal section [F]) with cells whose walls are regularly thickened and pitted; fragments of the pith with rounded to ovoid cells with slightly pitted walls [B].

C. Thin-layer chromatography (2.2.27).

**Test solution** To 1.0 g of the powdered herbal drug (710) (2.9.12) add 1 mL of *concentrated ammonia* R. After 30 min, add 25 mL of *ethyl acetate* R and sonicate for 20 min. Filter and evaporate the filtrate to dryness under reduced pressure. Dissolve the residue in 1 mL of *methanol* R, centrifuge and use the supernatant.

**Reference solution** Dissolve 1 mg of *isorhynchophylline* R and 1 mg of *rhynchophylline* R in 2 mL of *methanol* R.

**Plate** TLC silica gel F<sub>254</sub> plate R (2-10 µm).

**Mobile phase** water R, *methanol* R, *methylene chloride* R (1:15:125 V/V/V).

**Application** 5 µL as bands of 8 mm.

**Development** Over a path of 6 cm.

**Drying** In air.

**Detection** Examine in ultraviolet light at 254 nm.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other quenching zones may be present in the chromatogram obtained with the test solution.

Top of the plate

Figure 2729.-1. – Illustration for identification test B of powdered herbal drug of *Uncaria stem with hooks*

#### TESTS

##### Loss on drying (2.2.32)

Maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

##### Total ash (2.4.16)

Maximum 3.0 per cent.

#### ASSAY

Liquid chromatography (2.2.29). Use freshly prepared solutions. Store and inject them at 5 °C, using a cooled autosampler.

**Test solution** To 0.500 g of the powdered herbal drug (710) (2.9.12) add 3.0 mL of concentrated ammonia R. After 30 min, add 50.0 mL of a mixture of equal volumes of methanol R and methylene chloride R. Sonicate for 30 min. Filter and evaporate the filtrate to dryness under reduced pressure. Dissolve the residue in methanol R and dilute to 10.0 mL with the same solvent.

**Reference solution (a)** Dissolve 5.0 mg of isorhynchophylline CRS in a mixture of equal volumes of methanol R and methylene chloride R and dilute to 25.0 mL with the same mixture of solvents. Dilute 1.0 mL of the solution to 10.0 mL with methanol R.

**Reference solution (b)** Dissolve 5.0 mg of *Uncaria stem with hooks* dry extract for system suitability HRS in 1.0 mL of methanol R. Filter through a membrane filter (nominal pore size 0.45 µm).

##### Column:

- size:  $l = 0.15$  m,  $\varnothing = 4.6$  mm;
- stationary phase: end-capped octadecylsilyl silica gel for chromatography with extended pH range R (5 µm).

##### Mobile phase:

- mobile phase A: dilute 0.15 mL of diethylamine R to 1 L with water for chromatography R;

– mobile phase B: acetonitrile for chromatography R;

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 3	75	25
3 - 15	75 → 70	25 → 30
15 - 25	70 → 55	30 → 45
25 - 35	55	45
35 - 40	55 → 10	45 → 90

Flow rate 1.0 mL/min.

Detection Spectrophotometer at 245 nm.

Injection 10 µL.

**Identification of peaks** Use the chromatogram supplied with *Uncaria stem with hooks* dry extract for system suitability HRS and the chromatogram obtained with reference solution (b) to identify the peaks due to alkaloids 1, 2, 3, 4, 6, 7, 8 and 9; use the chromatogram obtained with reference solution (a) to identify the peak due to isorhynchophylline.

**Relative retention** With reference to isorhynchophylline (retention time = about 28 min): alkaloid 1 = about 0.50; alkaloid 2 = about 0.58; alkaloid 3 = about 0.94; alkaloid 4 = about 0.97; alkaloid 6 = about 1.05; alkaloid 7 = about 1.13; alkaloid 8 = about 1.22; alkaloid 9 = about 1.27. Additional peaks may be present.

**System suitability** Reference solution (b):

– resolution: minimum 1.5 between the peaks due to alkaloid 4 and isorhynchophylline.

Calculate the percentage content of total alkaloids expressed as isorhynchophylline using the following expression:

$$\frac{(\sum A_1) \times m_2 \times p}{A_2 \times m_1 \times 25}$$

- $\Sigma A_1$  = sum of the areas of the peaks due to alkaloids 1, 2, 3, 4, 6, 7, 8, 9 and the peak due to isorhynchophylline, in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to isorhynchophylline in the chromatogram obtained with reference solution (a);
- $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;
- $m_2$  = mass of isorhynchophylline CRS used to prepare reference solution (a), in grams;
- $p$  = percentage content of isorhynchophylline in isorhynchophylline CRS.

Ph Eur

## Valerian

(Valerian Root, Ph. Eur. monograph 0453)

#### Preparations

Valerian Dry Extract

Valerian Dry Hydroalcoholic Extract

Valerian Tincture

When Powdered Valerian is prescribed or demanded, material complying with the appropriate requirements below shall be dispensed or supplied.

Ph Eur

#### DEFINITION

Dried, whole or fragmented underground parts of *Valeriana officinalis* L. s.l., including the rhizome surrounded by the roots and stolons.

**Content**

- *essential oil*: minimum 4 mL/kg (dried drug);
- *sesquiterpenic acids*: minimum 0.17 per cent *m/m*, expressed as valerenic acid ( $C_{15}H_{22}O_2$ ;  $M_r$  234.3) (dried drug).

**IDENTIFICATION**

A. The rhizome is yellowish-grey or pale brownish-grey, obconical or cylindrical, up to about 50 mm long and 30 mm in diameter; the base is elongated or compressed, usually entirely covered by numerous roots. The apex usually exhibits a cup-shaped scar from the aerial parts; stem bases are rarely present. When cut longitudinally, the pith exhibits a central cavity transversed by septa. The roots are numerous, almost cylindrical, of the same colour as the rhizome, 1-3 mm in diameter and sometimes more than 100 mm long. A few filiform fragile secondary roots are present. The fracture is short. The stolons show prominent nodes separated by longitudinally striated internodes, each 20-50 mm long, with a fibrous fracture.

Figure 0453.-1. – Illustration for identification test B of powdered herbal drug of valerian root

B. Microscopic examination (2.8.23). The powder is pale yellowish-grey or pale greyish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 0453.-1): occasional groups of rectangular sclereids with moderately thickened walls and a large lumen, from the stem base [H]; very numerous fragments of parenchyma with large ovoid cells (longitudinal section [K], transverse section [J]); spiral, reticulate or pitted lignified vessels, isolated or in small groups [D, G]; thin-walled, elongated cells of the piliferous layer (surface view [A], transverse section [B]), some with root hairs [Aa, Ba] or their scars [Ab]; the piliferous layer is usually accompanied by an underlying layer of cells with slightly thickened and elongated walls [Ac, Bb]; fragments of dermal tissue from the rhizome composed of 1 or 2 layers of

polygonal cells with irregularly thickened walls [F]; a few groups of sclereids with thick walls and a narrow lumen [E] from the pith of the rhizome. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows numerous starch granules, simple or 2- to 6-compound, but frequently separated, rounded or irregular and up to about 15 µm in diameter; most of the granules show a rather indistinct cleft or radiate hilum [C].

C. Thin-layer chromatography (2.2.27).

**Test solution** Suspend 1 g of the powdered herbal drug (355) (2.9.12) in 10 mL of *methanol R* and sonicate for 10 min. Filter the supernatant through a membrane filter (nominal pore size 0.45 µm). Use the filtrate.

**Reference solution** Dissolve 5 mg of *acetoxyvalerenic acid R* and 5 mg of *valerenic acid R* in 20 mL of *methanol R*.

**Plate** *TLC silica gel plate R* (5-40 µm) [or *TLC silica gel plate R* (2-10 µm)].

**Mobile phase** *glacial acetic acid R*, *ethyl acetate R*, *cyclohexane R* (2:38:60 *V/V/V*).

**Application** 20 µL [or 5 µL] as bands of 10 mm [or 8 mm].

**Development** Over a path of 10 cm [or 6 cm].

**Drying** In air.

**Detection** Treat with *anisaldehyde solution R* and heat at 100-105 °C for 5-10 min; examine in daylight.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other violet zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Valerenic acid: a violet zone	A violet zone (valerenic acid)
Acetoxyvalerenic acid: a violet zone	A violet zone (acetoxyvalerenic acid)
	2 faint or very faint violet zones
Reference solution	Test solution

**TESTS****Foreign matter (2.8.2)**

Maximum 5 per cent of stem bases and maximum 2 per cent of other foreign matter.

**Loss on drying (2.2.32)**

Maximum 12.0 per cent, determined on 1.000 g of well-homogenised powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

**Total ash (2.4.16)**

Maximum 12.0 per cent.

**Ash insoluble in hydrochloric acid (2.8.1)**

Maximum 5.0 per cent.

**ASSAY****Essential oil (2.8.12)**

Use 40.0 g of freshly powdered herbal drug (500) (2.9.12), a 2000 mL flask, 500 mL of *water R* as the distillation liquid and 0.50 mL of *1,2,4-trimethylbenzene R* in the graduated tube. Distil at a rate of 3-4 mL/min for 4 h.

**Sesquiterpenic acids**

Liquid chromatography (2.2.29).

**Test solution** Place 1.50 g of the powdered herbal drug (710) (2.9.12) in a 100 mL round-bottomed flask with a

ground-glass neck. Add 20 mL of *methanol R1*. Mix and heat on a water-bath under a reflux condenser for 30 min. Allow to cool and filter. Place the filter with the residue in the 100 mL round-bottomed flask. Add 20 mL of *methanol R1* and heat on a water-bath under the reflux condenser for 15 min. Allow to cool and filter. Combine the filtrates and dilute to 50.0 mL with *methanol R1*, rinsing the round-bottomed flask and the filter.

**Reference solution** Dissolve an amount of *valerian dry extract HRS* corresponding to 1.0 mg of valerenic acid in *methanol R1* and dilute to 10.0 mL with the same solvent. Sonicate for 10 min and filter through a membrane filter (nominal pore size 0.45 µm).

**Column:**

- size:  $l = 0.25$  m,  $\varnothing = 4.6$  mm;
- stationary phase: octadecylsilyl silica gel for chromatography R (5 µm).

**Mobile phase:**

- mobile phase A: acetonitrile R1, 5 g/L solution of phosphoric acid R (20:80 V/V);
- mobile phase B: 5 g/L solution of phosphoric acid R, acetonitrile R1 (20:80 V/V);

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 5	55	45
5 - 18	55 → 20	45 → 80
18 - 22	20	80

**Flow rate** 1.5 mL/min.

**Detection** Spectrophotometer at 220 nm.

**Injection** 20 µL.

**Peak identification** Use the chromatogram supplied with *valerian dry extract HRS* and the chromatogram obtained with the reference solution to identify the peaks due to acetoxyvalerenic acid and valerenic acid.

**System suitability** Reference solution:

- relative retention with reference to valerenic acid (retention time = about 19 min): acetoxyvalerenic acid = about 0.5.

Calculate the percentage content of sesquiterpenic acids, expressed as valerenic acid, using the following expression:

$$\frac{(A_1 + A_2) \times m_2 \times p \times 5}{A_3 \times m_1}$$

- $A_1$  = area of the peak due to acetoxyvalerenic acid in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to valerenic acid in the chromatogram obtained with the test solution;
- $A_3$  = area of the peak due to valerenic acid in the chromatogram obtained with the reference solution;
- $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;
- $m_2$  = mass of *valerian dry extract HRS* used to prepare the reference solution, in grams;
- $p$  = percentage content of valerenic acid in *valerian dry extract HRS*.

Ph Eur

## Cut Valerian

(*Valerian Root, Cut Ph. Eur. monograph 2526*)

Ph Eur

### DEFINITION

Dried, cut underground parts of *Valeriana officinalis* L. s.l., including the rhizome, roots and stolons.

It is produced from *Valerian root (0453)* for the purpose of being used in herbal teas.

### Content

- essential oil: minimum 3 mL/kg (dried drug);
- sesquiterpenic acids: minimum 0.10 per cent *m/m* expressed as valerenic acid ( $C_{15}H_{22}O_2$ ;  $M_r$  234.3) (dried drug).

### IDENTIFICATION

**A. Microscopic examination (2.8.23).** The powder is pale yellowish-grey or pale greyish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2526.-1): occasional groups of rectangular sclereids with moderately thickened walls and a large lumen, from the stem base [H]; very numerous fragments of parenchyma with large ovoid cells (longitudinal section [K], transverse section [J]); spiral, reticulate or pitted lignified vessels, isolated or in small groups [D, G]; thin-walled, elongated cells of the piliferous layer (surface view [A], transverse section [B]), some with root hairs [Aa, Ba] or their scars [Ab]; the piliferous layer is usually accompanied by an underlying layer of cells with slightly thickened and elongated walls [Ac, Bb]; fragments of dermal tissue from the rhizome composed of 1 or 2 layers of polygonal cells with irregularly thickened walls [F]; a few groups of sclereids with thick walls and a narrow lumen [E] from the pith of the rhizome. Examine under a microscope using a 50 per cent V/V solution of *glycerol R*. The powder shows numerous starch granules, simple or 2- to 6-compound, but frequently separated, rounded or irregular and up to about 15 µm in diameter; most of the granules show a rather indistinct cleft or radiate hilum [C].

**B. Thin-layer chromatography (2.2.27).**

**Test solution** Suspend 1 g of the powdered herbal drug (355) (2.9.12) in 10 mL of *methanol R* and sonicate for 10 min. Filter the supernatant through a membrane filter (nominal pore size 0.45 µm). Use the filtrate.

**Reference solution** Dissolve 5 mg of *acetoxyvalerenic acid R* and 5 mg of *valerenic acid R* in 20 mL of *methanol R*.

**Plate** TLC silica gel plate R (5-40 µm) [or TLC silica gel plate R (2-10 µm)].

**Mobile phase** glacial acetic acid R, ethyl acetate R, cyclohexane R (2:38:60 V/V/V).

**Application** 20 µL [or 5 µL] as bands of 10 mm [or 8 mm].

**Development** Over a path of 10 cm [or 6 cm].

**Drying** In air.

**Detection** Treat with *anisaldehyde solution R* and heat at 100-105 °C for 5-10 min; examine in daylight.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other violet zones may be present in the chromatogram obtained with the test solution.

## TESTS

### Foreign matter (2.8.2)

Maximum 5 per cent of stem bases and maximum 2 per cent of other foreign matter, determined on the herbal drug prior to cutting.

### Loss on drying (2.2.32)

Maximum 12.0 per cent, determined on 1.000 g of well-homogenised powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

### Total ash (2.4.16)

Maximum 12.0 per cent.

### Ash insoluble in hydrochloric acid (2.8.1)

Maximum 5.0 per cent.

## ASSAY

### Essential oil (2.8.12)

Use 40.0 g of freshly powdered herbal drug (500) (2.9.12), a 2000 mL flask, 500 mL of water R as the distillation liquid and 0.50 mL of 1,2,4-trimethylbenzene R in the graduated tube. Distil at a rate of 3–4 mL/min for 4 h.

## Sesquiterpenic acids

Liquid chromatography (2.2.29).

**Test solution** Place 1.50 g of the powdered herbal drug (710) (2.9.12) in a 100 mL round-bottomed flask with a ground-glass neck. Add 20 mL of methanol R1. Mix and heat on a water-bath under a reflux condenser for 30 min. Allow to cool and filter. Place the filter with the residue in the 100 mL round-bottomed flask. Add 20 mL of methanol R1 and heat on a water-bath under the reflux condenser for 15 min. Allow to cool and filter. Combine the filtrates and dilute to 50.0 mL with methanol R1, rinsing the round-bottomed flask and the filter.

**Reference solution** Dissolve an amount of valerian dry extract HRS corresponding to 1.0 mg of valerenic acid in methanol R1 and dilute to 10.0 mL with the same solvent. Sonicate for 10 min and filter through a membrane filter (nominal pore size 0.45 µm).

### Column:

- size:  $l = 0.25$  m,  $\varnothing = 4.6$  mm;
- stationary phase: octadecylsilyl silica gel for chromatography R (5 µm).

### Mobile phase:

- mobile phase A: acetonitrile R1, 5 g/L solution of phosphoric acid R (20:80 V/V);
- mobile phase B: 5 g/L solution of phosphoric acid R, acetonitrile R1 (20:80 V/V);

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 5	55	45
5 - 18	55 → 20	45 → 80
18 - 22	20	80

Flow rate 1.5 mL/min.

Detection Spectrophotometer at 220 nm.

Injection 20 µL.

**Peak identification** Use the chromatogram supplied with valerian dry extract HRS and the chromatogram obtained with the reference solution to identify the peaks due to acetoxyvalerenic acid and valerenic acid.

**System suitability** Reference solution:

- relative retention with reference to valerenic acid (retention time = about 19 min): acetoxyvalerenic acid = about 0.5.

Calculate the percentage content of sesquiterpenic acids, expressed as valerenic acid, using the following expression:

$$\frac{(A_1 + A_2) \times m_2 \times p \times 5}{A_3 \times m_1}$$

- $A_1$  = area of the peak due to acetoxyvalerenic acid in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to valerenic acid in the chromatogram obtained with the test solution;
- $A_3$  = area of the peak due to valerenic acid in the chromatogram obtained with the reference solution;
- $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;
- $m_2$  = mass of valerian dry extract HRS used to prepare the reference solution, in grams;
- $p$  = percentage content of valerenic acid in valerian dry extract HRS.

Ph Eur

## Valerian Dry Aqueous Extract

(Ph. Eur. monograph 2400)

Ph Eur

### DEFINITION

Extract produced from *Valerian root* (0453).

### Content

Minimum 0.02 per cent of sesquiterpenic acids, expressed as valerenic acid (C<sub>15</sub>H<sub>22</sub>O<sub>2</sub>; M<sub>r</sub> 234.3) (dried extract).

### PRODUCTION

The extract is produced from the herbal drug by a suitable procedure using water at not less than 60 °C.

### CHARACTERS

#### Appearance

Brown or brownish, hygroscopic powder.

### IDENTIFICATION

Thin-layer chromatography (2.2.27).

**Test solution** Suspend 1.0 g of the extract to be examined in 10 mL of *methanol R* and sonicate for 10 min. Filter the supernatant through a membrane filter (nominal pore size 0.45 µm). Use the filtrate as the test solution.

**Reference solution** Dissolve 5 mg of *acetoxyvalerenic acid R* and 5 mg of *valerenic acid R* in 20 mL of *methanol R*.

**Plate** TLC silica gel plate R (5-40 µm) [or TLC silica gel plate R (2-10 µm)].

**Mobile phase** glacial acetic acid R, ethyl acetate R, cyclohexane R (2:38:60 V/V/V).

**Application** 20 µL [or 5 µL] as bands of 10 mm [or 8 mm].

**Development** Over a path of 10 cm [or 6 cm].

**Drying** In air.

**Detection** Spray with *anisaldehyde solution R* and heat at 100-105 °C for 5-10 min; examine in daylight.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. A faint violet zone due to valerenic acid may be present in the chromatogram obtained with the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Valerenic acid: a violet zone	
Acetoxyvalerenic acid: a violet zone	A violet zone (acetoxyvalerenic acid)
	A violet zone (hydroxyvalerenic acid)
Reference solution	Test solution

### TESTS

**Loss on drying** (2.8.17)

Maximum 6.0 per cent.

### ASSAY

Liquid chromatography (2.2.29).

**Solvent mixture** *methanol R*, *water R* (50:50 V/V).

**Test solution** In a 300 mL conical flask suspend 1.00 g of the extract to be examined in 40 mL of *water R* whilst

swirling. Add 40 mL of *methanol R* and swirl for 1 h at 200 r/min. Filter the suspension into a volumetric flask and rinse the conical flask with 3 quantities, each of 5 mL, of the solvent mixture. Dilute to 100.0 mL with the solvent mixture.

**Reference solution (a)** Dissolve a quantity of *valerian dry extract HRS* corresponding to 1.0 mg of valerenic acid in *methanol R* and dilute to 10.0 mL with the same solvent. Sonicate for 10 min and filter through a membrane filter (nominal pore size 0.45 µm).

**Reference solution (b)** Dilute 1.0 mL of reference solution (a) to 50.0 mL with *methanol R*.

#### Column:

— size:  $l = 0.25$  m,  $\varnothing = 4$  mm;

— stationary phase: octadecylsilyl silica gel for chromatography R (5 µm).

#### Mobile phase:

— mobile phase A: acetonitrile R1, 5 g/L solution of phosphoric acid R (20:80 V/V);

— mobile phase B: 5 g/L solution of phosphoric acid R, acetonitrile R1 (20:80 V/V);

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 5	55	45
5 - 18	55 → 20	45 → 80
18 - 22	20	80

**Flow rate** 1.5 mL/min.

**Detection** Spectrophotometer at 220 nm.

**Injection** 20 µL.

**Identification of peaks** Use the chromatogram supplied with *valerian dry extract HRS* and the chromatogram obtained with reference solution (a) to identify the peaks due to acetoxyvalerenic acid and hydroxyvalerenic acid.

**Relative retention** With reference to valerenic acid (retention time = about 19 min): hydroxyvalerenic acid = about 0.2; acetoxyvalerenic acid = about 0.5.

Calculate the percentage content of sesquiterpenic acids, expressed as valerenic acid, using the following expression:

$$\frac{(A_1 + A_2) \times m_2 \times p \times 0.2}{A_3 \times m_1}$$

- $A_1$  = area of the peak due to hydroxyvalerenic acid in the chromatogram obtained with the test solution;  
 $A_2$  = area of the peak due to acetoxyvalerenic acid in the chromatogram obtained with the test solution;  
 $A_3$  = area of the peak due to valerenic acid in the chromatogram obtained with reference solution (b);  
 $m_1$  = mass of the extract to be examined used to prepare the test solution, in grams;  
 $m_2$  = mass of *valerian dry extract HRS* used to prepare reference solution (a), in grams;  
 $p$  = percentage content of valerenic acid in *valerian dry extract HRS*.

Ph Eur

## Valerian Dry Hydroalcoholic Extract

(Ph. Eur. monograph 1898)

Ph Eur

### DEFINITION

Extract produced from *Valerian root* (0453).

### Content

Minimum 0.25 per cent *m/m* of sesquiterpenic acids, expressed as valerenic acid (C<sub>15</sub>H<sub>22</sub>O<sub>2</sub>; M<sub>r</sub> 234.3) (anhydrous extract).

### PRODUCTION

The extract is produced from the herbal drug by a suitable procedure using ethanol (30-90 per cent *V/V*) or methanol (40-55 per cent *V/V*).

### CHARACTERS

#### Appearance

Brown, hygroscopic powder.

### IDENTIFICATION

Thin-layer chromatography (2.2.27).

**Test solution** Suspend 1 g of the extract to be examined in 10 mL of *methanol R* and sonicate for 10 min. Filter the supernatant through a membrane filter (nominal pore size 0.45 µm).

**Reference solution** Dissolve 5 mg of *acetoxyvalerenic acid R* and 5 mg of *valerenic acid R* in 20 mL of *methanol R*.

**Plate** TLC silica gel plate R (5-40 µm) [or TLC silica gel plate R (2-10 µm)].

**Mobile phase** *glacial acetic acid R*, *ethyl acetate R*, *cyclohexane R* (2:38:60 *V/V/V*).

**Application** 20 µL [or 5 µL] as bands of 10 mm [or 8 mm].

**Development** Over a path of 10 cm [or 6 cm].

**Drying** In air.

**Detection** Treat with *anisaldehyde solution R* and heat at 100-105 °C for 5-10 min; examine in daylight.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other violet zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Valerenic acid: a violet zone	A violet zone (valerenic acid)
Acetoxyvalerenic acid: a violet zone	A violet zone (acetoxyvalerenic acid)
	2 faint or very faint violet zones
Reference solution	Test solution

### TESTS

#### Water (2.5.12)

Maximum 5.0 per cent, determined on 0.5 g.

### ASSAY

Liquid chromatography (2.2.29).

**Test solution** Suspend 1.00 g of the extract to be examined in 50.0 mL of *methanol R1*, sonicate for 10 min and filter through a membrane filter (nominal pore size 0.45 µm).

**Reference solution** Dissolve a quantity of *valerian dry extract HRS* corresponding to 0.5 mg of valerenic acid in

*methanol R1* and dilute to 10.0 mL with the same solvent. Sonicate for 10 min and filter through a membrane filter (nominal pore size 0.45 µm).

#### Column:

— size: *l* = 0.25 m,  $\varnothing$  = 4.6 mm;

— stationary phase: *octadecylsilyl silica gel for chromatography R* (5 µm).

#### Mobile phase:

— mobile phase A: *acetonitrile R1*, 5 g/L solution of *phosphoric acid R* (20:80 *V/V*);

— mobile phase B: 5 g/L solution of *phosphoric acid R*, *acetonitrile R1* (20:80 *V/V*);

Time (min)	Mobile phase A (per cent <i>V/V</i> )	Mobile phase B (per cent <i>V/V</i> )
0 - 5	55	45
5 - 18	55 → 20	45 → 80
18 - 22	20	80

**Flow rate** 1.5 mL/min.

**Detection** Spectrophotometer at 220 nm.

**Injection** 20 µL.

**Identification of peaks** Use the chromatogram supplied with *valerian dry extract HRS* and the chromatogram obtained with the reference solution to identify the peaks due to hydroxyvalerenic acid, acetoxyvalerenic acid and valerenic acid.

**System suitability** Reference solution:

— relative retention with reference to valerenic acid (retention time = about 19 min): hydroxyvalerenic acid = about 0.2; acetoxyvalerenic acid = about 0.5.

Calculate the percentage content of sesquiterpenic acids, expressed as valerenic acid, using the following expression:

$$\frac{(A_1 + A_2 + A_3) \times m_2 \times p \times 5}{A_4 \times m_1}$$

- A*<sub>1</sub> = area of the peak due to hydroxyvalerenic acid in the chromatogram obtained with the test solution;  
*A*<sub>2</sub> = area of the peak due to acetoxyvalerenic acid in the chromatogram obtained with the test solution;  
*A*<sub>3</sub> = area of the peak due to valerenic acid in the chromatogram obtained with the test solution;  
*A*<sub>4</sub> = area of the peak due to valerenic acid in the chromatogram obtained with the reference solution;  
*m*<sub>1</sub> = mass of the extract to be examined used to prepare the test solution, in grams;  
*m*<sub>2</sub> = mass of *valerian dry extract HRS* used to prepare the reference solution, in grams;  
*p* = percentage content of valerenic acid in *valerian dry extract HRS*.

Ph Eur

## Valerian Tincture

(Ph. Eur. monograph 1899)

Ph Eur

### DEFINITION

Tincture produced from *Valerian root* (0453).

### Content

Minimum 0.015 per cent *m/m* of sesquiterpenic acids, expressed as valerenic acid (C<sub>15</sub>H<sub>22</sub>O<sub>2</sub>; M<sub>r</sub> 234.3).

### PRODUCTION

The tincture is produced from 1 part of the drug and 5 parts of ethanol (60 to 80 per cent *V/V*) by an appropriate procedure.

**CHARACTERS**

**Appearance**  
Brown liquid.

**IDENTIFICATION**

Thin-layer chromatography (2.2.27).

**Test solution** Dilute 5 mL of the tincture to be examined with 5 mL of ethanol (70 per cent V/V) R.

**Reference solution** Dissolve 5 mg of acetoxyvaleric acid R and 5 mg of valeric acid R in 20 mL of methanol R.

**Plate** TLC silica gel plate R (5-40 µm) [or TLC silica gel plate R (2-10 µm)].

**Mobile phase** glacial acetic acid R, ethyl acetate R, cyclohexane R (2:38:60 V/V/V).

**Application** 20 µL [or 5 µL] as bands of 10 mm [or 8 mm].

**Development** Over a path of 10 cm [or 6 cm].

**Drying** In air.

**Detection** Spray with anisaldehyde solution R and heat at 100-105 °C for 5-10 min; examine in daylight.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other violet zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Valeric acid: a violet zone	A violet zone (valeric acid)
Acetoxyvaleric acid: a violet zone	A violet zone (acetoxyvaleric acid)
	2 faint or very faint violet zones
Reference solution	Test solution

**TESTS****Ethanol (2.9.10)**

95 per cent to 105 per cent of the quantity stated on the label.

**ASSAY**

Liquid chromatography (2.2.29).

**Test solution** Dilute 10.0 g of the tincture to be examined to 50.0 mL with methanol R1.

**Reference solution** Dissolve an amount of valerian dry extract HRS corresponding to 1.0 mg of valeric acid in methanol R1 and dilute to 10.0 mL with the same solvent. Sonicate for 10 min and filter through a membrane filter (nominal pore size 0.45 µm).

**Column:**

— size:  $l = 0.25$  m,  $\varnothing = 4.6$  mm;

— stationary phase: octadecylsilyl silica gel for chromatography R (5 µm).

**Mobile phase:**

— mobile phase A: acetonitrile R1, 5 g/L solution of phosphoric acid R (20:80 V/V);

— mobile phase B: 5 g/L solution of phosphoric acid R, acetonitrile R1 (20:80 V/V);

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 5	55	45
5 - 18	55 → 20	45 → 80
18 - 22	20	80

**Flow rate** 1.5 mL/min.

**Detection** Spectrophotometer at 220 nm.

**Injection** 20 µL.

**Peak identification** Use the chromatogram supplied with valerian dry extract HRS and the chromatogram obtained with the reference solution to identify the peaks due to acetoxyvaleric acid and valeric acid.

**System suitability** Reference solution:

— relative retention with reference to valeric acid (retention time = about 19 min); acetoxyvaleric acid = about 0.5.

Calculate the percentage content of sesquiterpenic acids, expressed as valeric acid, using the following expression:

$$\frac{(A_1 + A_2) \times m_2 \times p \times 5}{A_3 \times m_1}$$

- $A_1$  = area of the peak due to acetoxyvaleric acid in the chromatogram obtained with the test solution;  
 $A_2$  = area of the peak due to valeric acid in the chromatogram obtained with the test solution;  
 $A_3$  = area of the peak due to valeric acid in the chromatogram obtained with the reference solution;  
 $m_1$  = mass of the tincture to be examined used to prepare the test solution, in grams;  
 $m_2$  = mass of valerian dry extract HRS used to prepare the reference solution, in grams;  
 $p$  = percentage content of valeric acid in valerian dry extract HRS.

Ph Eur

**Verbena Herb**

(Ph. Eur. monograph 1854)

Ph Eur

**DEFINITION**

Whole or fragmented, dried aerial parts of *Verbena officinalis* L. collected during flowering.

**Content**

Minimum 1.5 per cent of verbenalin ( $C_{17}H_{24}O_{10}$ ;  $M_r$  388.4) (dried drug).

**IDENTIFICATION**

A. The stem is greenish-brown, quadrangular, longitudinally grooved and roughly hairy, especially on the angles.

The larger leaves are petiolate and deeply pinnately lobed, with bluntly dentate margins, the smaller leaves are sessile, not lobed, with crenate or dentate margins; the surfaces are rough and covered with bristly hairs, particularly over the veins, which are prominent on the lower surface. The flowers are numerous, arranged in a slender spike in the axils of leaf-like bracts; the tubular calyx has 5 acutely pointed lobes with the pale pink or lilac corolla forming a tube about twice as long as the calyx.

B. Microscopic examination (2.8.23). The powder is greenish-brown. Examine under a microscope using chloral hydrate solution R. The powder shows the following diagnostic characters (Figure 1854.-1): fragments of the leaves, which in surface view [C] show sinuous-walled epidermal cells [Ca] with anisocytic [Cb] or anomocytic [Cc] stomata (2.8.3), more numerous on the lower epidermis; fragments of stem epidermis [A] consisting of long, polygonal or rectangular epidermal cells [Aa] with thickened walls and stomata [Ab]; covering trichomes, unicellular, thick-walled, up to 500 µm long, wide at the base and arising from the centre of a single ring of domed, spherical epidermal cells (surface view [B],

side view [D]); occasional glandular trichomes of 2 types: (a) long stalk with a flattened head about 35 µm in diameter and consisting of 4-8 radiating cells in side view [E] or in surface view of the head [G], and (b) short unicellular stalk and an enlarged ovate head composed of 4 radiating cells (surface view [Cd], transverse section [K]); triangular-ovoid or rounded pollen grains about 30 µm in diameter, with 3 pores and a smooth exine [J]; many fragments of stems [F] consisting of groups of fibres [Fb], vessels [Fa] and fragments of parenchyma [Fc]; isolated fragments of fibres [H].

Figure 1854-1. – Illustration for identification test B of powdered herbal drug of verbena herb

C. Examine the chromatograms obtained in test B for *Aloysia citrodora*.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Arbutin: a blue or brown zone	A brown or green zone
Rutoside: a dark brownish-yellow zone	An intense brownish-grey zone
Reference solution	Test solution

## TESTS

### *Aloysia citrodora*

A. A lemon-like odour indicates the presence of *Aloysia citrodora*.

B. Thin-layer chromatography (2.2.27).

**Test solution** To 0.5 g of the powdered herbal drug (710) (2.9.12) add 5 mL of *methanol R*. Heat in a water-bath at 60 °C for 10 min. Cool and filter.

**Reference solution** Dissolve 10 mg of *arbutin R* and 10 mg of *rutoside trihydrate R* in *methanol R* and dilute to 10 mL with the same solvent.

**Plate** TLC silica gel plate R (5-40 µm) [or TLC silica gel plate R (2-10 µm)].

**Mobile phase** *anhydrous formic acid R*, *glacial acetic acid R*, *water R*, *ethyl acetate R* (11:11:27:100 V/V/V/V).

**Application** 20 µL [or 5 µL] as bands of 10 mm [or 8 mm].

**Development** Over a path of 12 cm [or 6 cm].

**Drying** In air.

**Detection** Spray with *anisaldehyde solution R* and heat at 100-105 °C for about 10 min; examine in daylight.

**Results** The chromatogram obtained with the test solution shows no intense blue or violet zone approximately at the position of rutoside in the chromatogram obtained with the reference solution.

**Loss on drying** (2.2.32)

Maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (710) (2.9.12) by drying in an oven at 105 °C for 2 h.

**Total ash** (2.4.16)

Maximum 10.0 per cent.

**Ash insoluble in hydrochloric acid** (2.8.1)

Maximum 2.0 per cent.

## ASSAY

Liquid chromatography (2.2.29).

**Internal standard solution** Dissolve 10.0 mg of *ferulic acid R* in *ethanol (60 per cent V/V) R* and dilute to 100.0 mL with the same solvent.

**Test solution** To 1.00 g of the powdered herbal drug (710) (2.9.12) add 50.0 mL of the internal standard solution and stir with a magnetic stirrer for 2 h. Centrifuge for 15 min and filter the supernatant using a membrane filter (nominal pore size 0.45 µm).

**Reference solution** Dissolve the contents of a vial of *verbena* in *CRS* in the internal standard solution and dilute to 5.0 mL with the same solution.

**Precolumn:**

— size:  $l = 0.01$  m,  $\varnothing = 4.0$  mm;

— stationary phase: *octadecylsilyl silica gel for chromatography R* (5 µm).

**Column:**

— size:  $l = 0.25$  m,  $\varnothing = 4.0$  mm;

— stationary phase: *octadecylsilyl silica gel for chromatography R* (5 µm);

— temperature: 20 °C.

**Mobile phase:**

— mobile phase A: 0.3 per cent V/V solution of *phosphoric acid R*;

— mobile phase B: *acetonitrile R*;

Figure 1854.-2. – Chromatogram for the assay of verbena herb: test solution

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 20	93 → 83	7 → 17
20 - 30	83	17
30 - 35	83 → 75	17 → 25

Flow rate 1.0 mL/min.

Detection Spectrophotometer at 240 nm.

Injection 20 µL.

System suitability Test solution:

- the chromatogram obtained is similar to the chromatogram shown in Figure 1854.-2;
- resolution: minimum 3.5 between the peaks due to ferulic acid and acteoside.

Calculate the percentage content of verbenalin using the following expression:

$$\frac{A_1 \times A_4 \times m_2 \times 1000}{A_2 \times A_3 \times m_1}$$

- $A_1$  = area of the peak due to verbenalin in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to verbenalin in the chromatogram obtained with the reference solution;
- $A_3$  = area of the peak due to ferulic acid in the chromatogram obtained with the test solution;
- $A_4$  = area of the peak due to ferulic acid in the chromatogram obtained with the reference solution;
- $m_1$  = mass of the herbal drug used to prepare the test solution, in grams;
- $m_2$  = mass of verbenalin in the reference solution, in grams.

Ph Eur

## Vitex Negundo Leaf

### DEFINITION

Vitex Negundo Leaf is the dried leaf of *Vitex negundo* L.

### IDENTIFICATION

A. Leaf usually broken coriaceous, compound, palmate, usually with 5 lanceolate leaflets but occasionally 3, leaf margins vary from entire to serrate or dentate, petiole 2.5-3.5 cm long. The middle leaflet is longer than the others, up to 10 cm. In the pentafoolate leaf, the inner 3 leaflets are petiolulate up to 1 cm, and in the trifoliate leaf, only the inner leaflet is petiolate; in both the two outer leaflets are subsessile. The upper surface of the leaf is glabrous whereas the lower surface is densely tomentose.

B. Reduce to a powder. Examine under a microscope using chloral hydrate solution. Leaf epidermal cells cubical to ovoid, those on the upper surface slightly larger than on the lower, generally elongated over the veins, with straight to slightly wavy anticlinal walls. Paracytic stomata are present on the lower surface of the leaf only, which is also densely covered with trichomes. Uni to tricellular covering trichomes abundant, the bi-cellular type being the most frequent. Glandular trichomes have a uni-, bi- or tricellular stalk and spherical unicellular head. Petiole epidermis similar to that of the leaf, with few stomata; glandular and non-glandular trichomes are common. Chlorenchyma of the hypodermis and thick walled parenchyma cells from the cortex of the petiole may be present.

C. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Reduce to a powder (425). To 0.5 g of powdered sample add 5 mL of *methanol*. Mix thoroughly and heat using a water bath at 58° for 10 minutes and centrifuge or filter, use the supernatant or filtrate.

(2) 0.05% w/v each of *hyperoside* and *rosmarinic acid* in *methanol*.

(3) Dilute 1 volume of solution (2) to 4 volumes with *methanol*.

(4) 0.05% w/v of *hyperoside* and 0.02% *chlorogenic acid* in *methanol*.

#### CHROMATOGRAPHIC CONDITIONS

- (a) Use high-performance silica gel 60 F<sub>254</sub> plates (Merck silica gel 60 F<sub>254</sub> HPTLC plates are suitable).  
 (b) Use the mobile phase as described below.  
 (c) Apply 2 µL of each solution as 8 mm bands.  
 (d) Develop the plate to 7 cm.  
 (e) After the removal of the plate, dry in air for 5 minutes and examine under UV light at 254 nm. Heat the plate to 100° for 3 minutes and dip the plate in a 0.5% w/v solution of *2-aminoethyl diphenylborinate* in *ethyl acetate*. Dry the plate and dip the plate in a 5% w/v solution of *polyethylene glycol 400* in *dichloromethane*. Examine under UV light at 366nm.

#### MOBILE PHASE

1 volume of *water*, 1 volume of *formic acid* and 8 volumes of *ethyl acetate*.

#### SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (4) shows two clearly separated bands.

Visualisation at 254nm

Top of the plate		
A quenching zone or intense quenching zone	Rosmarinic Acid (A quenching zone)	
A quenching zone or faint quenching zone	Hyperoside (A quenching zone)	Hyperoside (A quenching zone)
A quenching zone or intense quenching zone		Chlorogenic Acid (A very faint quenching zone)
Solution (1)	Solutions (2) and (3)	Solution (4)

Visualisation at 366nm

Top of the plate		
2 red or faint red fluorescent zones	Rosmarinic Acid (A light blue fluorescent zone)	
A faint light blue fluorescent zone		
A faint or very faint yellow fluorescent zone	Hyperoside (An orange fluorescent zone)	Hyperoside (An orange fluorescent zone)
A faint or very faint light blue fluorescent zone		Chlorogenic Acid (A faint blue fluorescent zone)
A faint light blue fluorescent zone		
A yellow fluorescent zone		
Solution (1)	Solutions (2) and (3)	Solution (4)

#### CONFIRMATION

When examined under UV light at 254 nm the chromatogram obtained with solution (1) shows two quenching zones visible at a similar R<sub>f</sub> to the quenching zone due to hyperoside in the chromatogram obtained with solution (2), the upper of the two quenching zones may be faint, the lower of the zones may be intense. Another

quenching zone which may be intense, is present as seen in the table and further quenching zones may be present.

When examined under UV light at 366 nm the chromatogram obtained with solution (1) shows the fluorescent zones as shown in the table. Other fluorescent zones may be present.

#### TESTS

##### Loss on drying

When dried for 2 hours at 105°, loses not more than 10.0% of its weight, Appendix IX D. Use 1 g.

##### Total Ash

Not more than 8.0%, Appendix XI J, Method II.

##### Foreign Matter

Not more than 2%, Appendix XI D.

## Willow Bark

(Ph. Eur. monograph 1583)

#### Preparation

Willow Bark Dry Extract

Ph Eur

#### DEFINITION

Whole or fragmented dried bark of young branches or whole dried pieces of current-year twigs of various species of genus *Salix* including *S. purpurea* L., *S. daphnoides* Vill. and *S. fragilis* L.

#### Content

Minimum 1.5 per cent of total salicylic derivatives, expressed as salicin (C<sub>13</sub>H<sub>18</sub>O<sub>7</sub>; M<sub>r</sub> 286.3) (dried drug).

#### IDENTIFICATION

A. The bark is 1-2 mm thick and occurs in flexible, elongated, quilled or curved pieces. The outer surface is smooth or slightly wrinkled longitudinally and greenish-yellow or brownish-grey. The inner surface is smooth or finely striated longitudinally and white, pale yellow or reddish-brown, depending on the species. The fracture is short in the outer part and coarsely fibrous in the inner region. The diameter of current-year twigs is not greater than 10 mm. The wood is white or pale yellow.

B. Microscopic examination (2.8.23). The powder is pale yellow, greenish-yellow or light brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 1583.-1): bundles [B, C] of narrow fibres [Ba, Ca], up to about 600 µm long, with very thick walls and surrounded by a crystal sheath containing prisms of calcium oxalate [Bb, Cb]; parenchymatous cells of the cortex [D, J], with thick, pitted and deeply beaded walls [Da], and containing large cluster crystals of calcium oxalate [Ga, Ja]; some parenchyma cells are collenchymatous [G]; uniseriate medullary rays (tangential section [Db]); thickened cork cells (surface view [F]); numerous scattered prism crystals [E] and cluster crystals [A] of calcium oxalate; fragments of brownish collenchyma from the buds may also be present. Twigs show, additionally, wood fragments [H] composed of lignified fibres [Ha] and vessels [Hb], sometimes accompanied by medullary rays [Hc].

C. Thin-layer chromatography (2.2.27).

*Test solution (a)* To 1.0 g of the powdered herbal drug (355) (2.9.12) add 10 mL of *methanol R*. Heat on a water-bath at about 50 °C, with frequent shaking, for 10 min. Cool and filter.

Figure 1583.-1. – Illustration for identification test B of powdered herbal drug of willow bark

**Test solution (b)** To 5.0 mL of test solution (a) add 1.0 mL of a 50 g/L solution of *anhydrous sodium carbonate R* and heat in a water-bath at about 60 °C for 10 min. Cool and filter if necessary.

**Reference solution** Dissolve 2 mg of *salicin R* and 2 mg of *chlorogenic acid R* in 1.0 mL of *methanol R*.

**Plate** TLC silica gel plate R (5–40 µm) [or TLC silica gel plate R (2–10 µm)].

**Mobile phase** *water R*, *methanol R*, *ethyl acetate R* (8:15:77 V/V/V).

**Application** 10 µL [or 2 µL] as bands.

**Development** Over a path of 15 cm [or 6 cm].

**Drying** In a current of warm air.

**Detection** Treat with a mixture of 5 volumes of *sulfuric acid R* and 95 volumes of *methanol R*. Heat at 100–105 °C for 5 min and examine in daylight.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and test solutions (a) and (b). Furthermore, other zones may be present in the chromatograms obtained with test solutions (a) and (b).

Top of the plate		
Salicin: a reddish-violet zone	Several reddish-violet zones may be present	A reddish-violet zone (salicin)
Chlorogenic acid: a brown zone	A weak reddish-violet zone (salicin)	
Reference solution	Test solution (a)	Test solution (b)

### TESTS

#### Foreign matter (2.8.2)

Maximum 3 per cent of twigs with a diameter greater than 10 mm and maximum 2 per cent of other foreign matter.

#### Cadmium (2.4.27)

Maximum 2.0 ppm.

#### Loss on drying (2.2.32)

Maximum 11 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

#### Total ash (2.4.16)

Maximum 10 per cent.

### ASSAY

#### Liquid chromatography (2.2.29).

**Test solution** To 1.000 g of the powdered herbal drug (355) (2.9.12) add 40 mL of *methanol R* and 40.0 mL of a 4.2 g/L solution of *sodium hydroxide R*. Heat in a water-bath at about 60 °C under a reflux condenser, with frequent shaking, for about 1 h. After cooling, add 4.0 mL of a 103.0 g/L solution of *hydrochloric acid R*. Filter the suspension into a 100 mL volumetric flask, wash and dilute to 100.0 mL with a mixture of equal volumes of *methanol R* and *water R*. Filter through a membrane filter (nominal pore size 0.45 µm).

**Reference solution** Dissolve 5.0 mg of *piccin R* in 25.0 mL of a mixture of 20 volumes of *water R* and 80 volumes of *methanol R* (solution A). Dissolve 15.0 mg of *salicin CRS* in 25 mL of a mixture of 20 volumes of *water R* and 80 volumes of *methanol R*; add 5.0 mL of solution A and dilute to 50.0 mL with *water R*.

#### Column:

— size:  $l = 0.10$  m,  $\varnothing = 4.6$  mm;

— stationary phase: octadecylsilyl silica gel for chromatography R (3 µm).

#### Mobile phase:

— mobile phase A: *tetrahydrofuran R*, 0.5 per cent V/V solution of *phosphoric acid R* (1.8:98.2 V/V);

— mobile phase B: *tetrahydrofuran R*;

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 15	100	0
15 - 17	100 → 90	0 → 10
17 - 23	90	10

**Flow rate** 1.0 mL/min.

**Detection** Spectrophotometer at 270 nm.

**Injection** 10 µL.

**Retention time** Salicin = about 6.4 min; piccin = about 7.7 min.

**System suitability** Reference solution:

— **resolution:** minimum 1.5 between the peaks due to salicin and picein.

Calculate the percentage content of total salicylic derivatives, expressed as salicin, using the following expression:

$$\frac{A_1 \times m_2 \times p \times 2}{A_2 \times m_1}$$

- $A_1$  = area of the peak due to salicin in the chromatogram obtained with the test solution;  
 $A_2$  = area of the peak due to salicin in the chromatogram obtained with the reference solution;  
 $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;  
 $m_2$  = mass of *salicin CRS* used to prepare the reference solution, in grams;  
 $p$  = percentage content of salicin in *salicin CRS*.

Ph Eur

## Willow Bark Dry Extract

(Ph. Eur. monograph 2312)

Ph Eur

### DEFINITION

Dry extract produced from *Willow bark* (1583).

### Content

Minimum 5.0 per cent of total salicylic derivatives, expressed as salicin ( $C_{13}H_{18}O_7$ ;  $M_r$  286.3) (dried extract).

### PRODUCTION

The extract is produced from the herbal drug by a suitable procedure using either water or a hydroalcoholic solvent equivalent in strength to a maximum of 80 per cent *V/V* ethanol.

### CHARACTERS

#### Appearance

Yellowish-brown amorphous powder.

### IDENTIFICATION

Thin-layer chromatography (2.2.27).

**Test solution (a)** To 0.200 g of the extract to be examined add 5 mL of *methanol R*. Sonicate for 5 min, filter and dilute to 10 mL with *methanol R*.

**Test solution (b)** To 5.0 mL of test solution (a) add 1.0 mL of a 50 g/L solution of *anhydrous sodium carbonate R* and heat in a water-bath at about 60 °C for 10 min. Cool and filter if necessary.

**Reference solution** Dissolve 2.0 mg of *salicin R* and 2.0 mg of *chlorogenic acid R* in 1.0 mL of *methanol R*.

**Plate** *TLC silica gel plate R* (5–40 µm) [or *TLC silica gel plate R* (2–10 µm)].

**Mobile phase** *water R*, *methanol R*, *ethyl acetate R* (8:15:77 *V/V/V*).

**Application** 10 µL [or 2 µL] as bands.

**Development** Over a path of 15 cm [or 6 cm].

**Drying** In a current of warm air.

**Detection** Spray with a mixture of 5 volumes of *sulfuric acid R* and 95 volumes of *methanol R*. Heat at 100–105 °C for 5 min and examine in daylight.

**Results** See below the sequence of the zones present in the chromatograms obtained with the reference solution and test solutions (a) and (b). Furthermore, other zones may be

present in the chromatogram obtained with test solutions (a) and (b).

Top of the plate		
	Several reddish-violet zones may be present	
Salicin: a reddish-violet zone	A weak reddish-violet zone (salicin)	A reddish-violet zone (salicin)
Chlorogenic acid: a brown zone		
Reference solution	Test solution (a)	Test solution (b)

### ASSAY

Liquid chromatography (2.2.29).

**Test solution** To 0.300 g of the extract to be examined add 40 mL of *methanol R* and 40.0 mL of 0.1 M *sodium hydroxide*. Heat in a water-bath at about 60 °C under a reflux condenser, with frequent shaking, for about 1 h. After cooling, add 4.0 mL of 1 M *hydrochloric acid*. Filter the suspension into a 100 mL volumetric flask, then wash and dilute to 100.0 mL with a mixture of equal volumes of *water R* and *methanol R*. Filter through a membrane filter (nominal pore size 0.45 µm).

**Reference solution** Dissolve 5.0 mg of *picein R* in 25.0 mL of a mixture of 20 volumes of *water R* and 80 volumes of *methanol R* (solution A). Dissolve 15.0 mg of *salicin CRS* in 25 mL of a mixture of 20 volumes of *water R* and 80 volumes of *methanol R*. Add 5.0 mL of solution A and dilute to 50.0 mL with *water R*.

#### Column:

— size:  $l = 0.10$  m,  $\varnothing = 4.6$  mm;

— stationary phase: *octadecylsilyl silica gel for chromatography R* (3 µm).

#### Mobile phase:

— mobile phase A: *tetrahydrofuran R*, 0.5 per cent *V/V* solution of *phosphoric acid R* (1.8:98.2 *V/V*);

— mobile phase B: *tetrahydrofuran R*;

Time (min)	Mobile phase A (per cent <i>V/V</i> )	Mobile phase B (per cent <i>V/V</i> )
0 - 15	100	0
15 - 17	100 → 90	0 → 10
17 - 23	90	10
23 - 25	90 → 100	10 → 0
25 - 40	100	0

**Flow rate** 1.0 mL/min.

**Detection** Spectrophotometer at 270 nm.

**Injection** 10 µL.

**Retention time** Salicin = about 6.4 min;

picein = about 7.7 min.

**System suitability** Reference solution:

— **resolution:** minimum 1.5 between the peaks due to salicin and picein.

Calculate the percentage content of total salicylic derivatives, expressed as salicin, from the following expression:

$$\frac{A_1 \times m_2 \times p \times 2}{A_2 \times m_1}$$

$A_1$	=	area of the peak due to salicin in the chromatogram obtained with the test solution;
$A_2$	=	area of the peak due to salicin in the chromatogram obtained with the reference solution;
$m_1$	=	mass of the extract to be examined used to prepare the test solution, in grams;
$m_2$	=	mass of salicin CRS used to prepare the reference solution, in grams;
$p$	=	percentage content of salicin in salicin CRS.

Ph Eur

## Withania Somnifera Root

### DEFINITION

Withania Somnifera Root consists of the dried mature roots of *Withania somnifera* (L.) Dunal.

It contains not less than 0.01% withaferin A ( $C_{28}H_{38}O_6$ ) and not less than 0.01% withanolide A ( $C_{29}H_{42}O_7$ ).

### PRODUCTION

It is collected in winter, washed, dried and cut into short pieces.

### IDENTIFICATION

A. Pieces of root, cut into lengths of up to 8 cm, varying in diameter from 2 mm to 1 cm, with some narrower pieces of rhizome, often cut at the transition zone. Outer surface pale greyish-brown, somewhat darker brown in larger specimens. Fracture short, showing a whitish interior. The cut surface of the root may show a distinction between the xylem and other tissues marked by a faint yellow-green cambial ring.

B. Reduce to a powder (355). Examine under a microscope using *chloral hydrate solution*. Cork cells in surface view polygonal, in sectional view rectangular, thin-walled, yellowish brown, often broken. Parenchymatous cells in groups, elongated, rectangular, or oval to round, filled with starch; some pitted, lightly lignified, found alongside vascular fragments; parenchyma of the medullary rays, one or two cells wide shown crossing xylem elements at right angles; Occasional fragments of spiral, scalariform or pitted vessels with broad lumen; tracheids and vessels usually heavily lignified, reticulate or bordered pitted, single or in small groups. Fibres often accompanying vessels, thick walled, heavily pitted, and lignified; others less pitted and lignified, thin walled, either found singly or in groups of two or three. Microcrystals of calcium oxalate scattered or occasionally in idioblasts. Examine under a microscope using a 50% v/v solution of *glycerol*. Starch granules abundant, simple or 2 to 4 compound, round to oval, with a point, stellate or cleft hilum.

C. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Shake 0.5 g of freshly powdered (355) drug with 1 mL of *dilute ammonia R4*, add 10 mL of *methanol*, sonicate for 10 seconds, heat on a water-bath for 3 minutes, cool, filter, evaporate the filtrate to dryness at 60° and dissolve the dried residue in 1 mL of *methanol*. Filter through a 0.45 µm filter.

(2) 0.1% w/v each of *withaferin A CRS*, *withanolide B CRS* and *β-sitosterol* in *methanol*.

### CHROMATOGRAPHIC CONDITIONS

- Use a *silica gel F<sub>254</sub>* precoated high performance plate (Merck silica gel F<sub>254</sub> HPTLC plates are suitable).
- Use the mobile phase described below.
- Apply 2 µL of each of solution, as 6 mm bands.

(d) Develop the plate to 8 cm.

(e) After removal of the plate, dry in air and examine under *ultraviolet light (254 nm)*. Immerse the plate in 5% v/v of *methanolic sulfuric acid* for 1 second, allow to dry in air, heat at 110° for 2 minutes and examine immediately in daylight. Examine the derivatised plate under *ultraviolet light (366 nm)*.

### MOBILE PHASE

5 volumes of *anhydrous formic acid*, 15 volumes of *ethyl acetate* and 50 volumes of *toluene*.

### SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (2) shows three clearly separated bands.

### CONFIRMATION

The bands with Rf values of approximately 0.1 (withaferin A), 0.26 (withanolide B) and 0.57 (*β-sitosterol*) in the chromatogram obtained with solution (1) correspond in colour and position to those in the chromatogram obtained with solution (2).

### TESTS

#### Absence of *Withania coagulans*

In Identification test C, the derivatised plate under *ultraviolet light (366 nm)* shows no orange band with an Rf of approximately 0.2 in the chromatogram obtained with solution (1).

#### Ash

Not more than 7.0%, Appendix XI J.

#### Acid-insoluble ash

Not more than 1.0%, Appendix XI K.

#### Loss on drying

When dried for 2 hours at 105°, loses not more than 12.0% of its weight. Use 1 g.

### ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Extract 1 g of the powdered drug with 3.0 mL of *methanol* with the aid of ultrasound for 10 minutes, centrifuge at 3000 rpm for 5 minutes and retain the supernatant extract. The extraction is repeated twice as described. Combine the three supernatant extracts, adjust the total volume of the combined extracts to 20.0 ml with *methanol* and filter through a 0.45-µm filter.

(2) 0.02% w/v each of *withaferin A CRS* and *withanolide A CRS* and 0.01% w/v of *withanolide B CRS* in *methanol*.

### CHROMATOGRAPHIC CONDITIONS

- Use a stainless steel column (15 cm × 4.6 mm) packed with *dodecylsilyl silica gel for chromatography (4 µm)* (Phenomenex Synergi Max-RP 80Å is suitable).
- Use gradient elution and the mobile phases described below. Equilibrate the column with a mixture of 65% mobile phase A and 35% mobile phase B for at least 15 minutes.
- Use a flow rate of 1 mL per minute.
- Use a column temperature of 50°.
- Use a detection wavelength of 230 nm.
- Inject 20 µL of each solution.

### MOBILE PHASE

*Mobile phase A* water.

*Mobile phase B* Equal volumes of *ethanol (96%)* and *methanol*.

Time (Minutes)	Mobile phase A % v/v	Mobile phase B % v/v	Comments
0-5	65	35	isocratic
5-30	65→55	35→45	linear gradient
30-31	55→0	45→100	linear gradient
31-36	0	100	isocratic
36-37	0→65	100→35	linear gradient
37-45	65	35	re-equilibration

## SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the *resolution factor* between the first two main peaks, of withaferin A and withanolide A is at least 5.0 and the *symmetry factor* for both peaks is less than 1.3.

## DETERMINATION OF CONTENT

**Withaferin A** Using the retention time and peak area of the peak due to withaferin A in the chromatogram obtained with solution (2), locate and integrate the peak due to withaferin A in the chromatogram obtained with solution (1).

Calculate the content of withaferin A in the sample using the declared content withaferin A (C<sub>28</sub>H<sub>38</sub>O<sub>6</sub>) in *withaferin A CRS* and the following expression:

$$\frac{A_1}{A_2} \times \frac{m_2}{V_2} \times \frac{V_1}{m_1} \times p \times \frac{100}{100-d}$$

- A<sub>1</sub> = Area of the peak due to withaferin A in the chromatogram obtained with solution (1).  
 A<sub>2</sub> = Area of the peak due to withaferin A in the chromatogram obtained with solution (2).  
 m<sub>1</sub> = Weight of the drug being examined in mg.  
 m<sub>2</sub> = Weight of *withaferin A CRS* in mg.  
 V<sub>1</sub> = Dilution volume of solution (1) in mL.  
 V<sub>2</sub> = Dilution volume of solution (2) in mL.  
 p = Percentage content of withaferin A in *withaferin A CRS*.  
 d = Percentage loss on drying of the herbal drug being examined.

**Withanolide A** Using the retention time and peak area of the peak due to withanolide A in the chromatogram obtained with solution (2), locate and integrate the peak due to withanolide A in the chromatogram obtained with solution (1).

Calculate the content of withanolide A in the sample using the declared content of withanolide A (C<sub>29</sub>H<sub>42</sub>O<sub>7</sub>) in *withanolide A CRS* and the following expression:

$$\frac{A_1}{A_2} \times \frac{m_2}{V_2} \times \frac{V_1}{m_1} \times p \times \frac{100}{100-d}$$

- A<sub>1</sub> = Area of the peak due to withanolide A in the chromatogram obtained with solution (1).  
 A<sub>2</sub> = Area of the peak due to withanolide A in the chromatogram obtained with solution (2).  
 m<sub>1</sub> = Weight of the drug in mg.  
 m<sub>2</sub> = Weight of *withanolide A CRS* in mg.  
 V<sub>1</sub> = Dilution volume of solution (1) in mL.  
 V<sub>2</sub> = Dilution volume of solution (2) in mL.  
 p = Percentage content withanolide A in *withanolide A CRS*.  
 d = Percentage loss on drying of the herbal drug being examined.

## STORAGE

*Withania Somnifera* Root should be protected from moisture.

## Wormwood

(Ph. Eur. monograph 1380)

Ph Eur

## DEFINITION

Basal leaves or slightly leafy, flowering tops, or mixture of these dried, whole or cut organs of *A Artemisia absinthium* L.

## Content

Minimum 2 mL/kg of essential oil (dried drug).

## IDENTIFICATION

A. The leaves are greyish or greenish, densely tomentose on both surfaces. The basal leaves, with long petioles, have triangular or oval bipinnatisect or tripinnatisect lamina, with rounded or lanceolate segments. The cauline leaves are less segmented and the apical leaves are lanceolate. The stem of the flower-bearing region is greenish-grey, tomentose, up to 2.5 mm in diameter and usually with 5 flattened longitudinal grooves. The capitula are arranged as loose, axillary panicles, inserted at the level of the lanceolate or slightly pinnatisect leaves; they are spherical or flattened hemispherical, 2-4 mm in diameter and consist of a grey, tomentose involucre, the outer bracts linear, inner layer ovate, blunt at the apices with scarious margins, a receptacle with very long paleae up to 1 mm or more long, numerous yellow, tubular, hermaphroditic florets about 2 mm long and few yellow, ray florets.

B. Microscopic examination (2.8.23). The powder is greenish-grey. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 1380.-1.): many T-shaped trichomes [A] with a short uniseriate stalk consisting of 1-5 small cells, perpendicularly capped by a very long, undulating terminal cell tapering at the ends; fragments of epidermises (surface view [D]) with sinuous or wavy walls, anomocytic stomata (2.8.3) [Da], covering trichomes [Db] and glandular trichomes containing oil [Dc] or not containing oil [Dd], each with a short, biseriate, 2-celled stalk and a biseriate head with 2-4 cells; free glandular trichomes (side view [C]); fragments of the corollas of the tubular and ray florets, some containing small cluster crystals of calcium oxalate [H]; numerous paleae each composed of a small cell forming a stalk and a very long, cylindrical and thin-walled terminal cell about 1-1.5 mm long, either whole [E] or limited to the distal part [B]; spheroidal pollen grains, about 30 µm in diameter, with 3 pores and a finely warty exine [G]; fragments of vascular tissue from the leaves [F] or the stems [J] consisting of vessels with spiral or annular thickenings [Fa], or with bordered pits [Ja], fibres [Fb, Jb] and parenchymatous cells with pitted, moderately thickened walls [Fc, Jc].

C. Thin-layer chromatography (2.2.27).

**Test solution** Place 2 g of the powdered herbal drug (355) (2.9.12) in 50 mL of boiling *water R* and allow to stand for 5 min, shaking the flask several times. After cooling, add 5 mL of a 100 g/L solution of *lead acetate R*. Mix and filter. Rinse the flask and the residue on the filter with 20 mL of *water R*. Shake the filter with 50 mL of *methylene chloride R*. Separate the organic layer, dry over *anhydrous sodium sulfate R*, filter and evaporate the filtrate to dryness on a water-bath. Dissolve the residue in 0.5 mL of *ethanol (96 per cent) R*.

**Reference solution** Dissolve 2 mg of *methyl red R* and 2 mg of *resorcinol R* in 10.0 mL of *methanol R*.

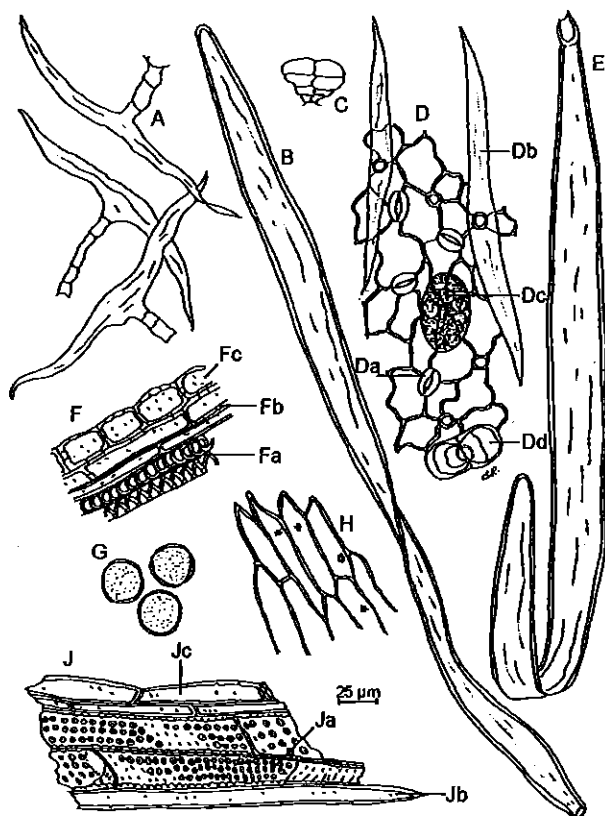

Figure 1380.-1. – Illustration for identification test B of powdered herbal drug of wormwood

Plate TLC silica gel plate R.

Mobile phase acetone R, glacial acetic acid R, toluene R, methylene chloride R (10:10:30:50 V/V/V/V).

Application 10 µL as bands.

Development Over a path of 15 cm.

Drying In air.

Detection A Spray with acetic anhydride - sulfuric acid solution R and examine in daylight.

Results A The chromatogram obtained with the test solution shows a blue zone due to artabsin shortly above a red zone due to methyl red in the chromatogram obtained with the reference solution.

Detection B Examine in daylight while heating at 100–105 °C for 5 min.

Results B The chromatogram obtained with the reference solution shows in the middle third a red zone due to methyl red and below it a light pink zone due to resorcinol.

The chromatogram obtained with the test solution shows an intense red or brownish-red zone due to absinthin with a similar  $R_f$  value to that of the zone due to resorcinol in the chromatogram obtained with the reference solution. Other zones are visible, but less intense than that due to absinthin.

#### TESTS

Foreign matter (2.8.2)

Maximum 5 per cent of stems with a diameter greater than 4 mm and maximum 2 per cent of other foreign matter.

Bitterness value (2.8.15)

Minimum 10 000.

Loss on drying (2.2.32)

Maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

Total ash (2.4.16)

Maximum 12.0 per cent.

Ash insoluble in hydrochloric acid (2.8.1)

Maximum 1.0 per cent.

#### ASSAY

Essential oil (2.8.12)

Use 50.0 g of the cut drug, a 1000 mL round-bottomed flask and 500 mL of water R as the distillation liquid. Add 0.5 mL of xylene R in the graduated tube. Distil at a rate of 2–3 mL/min for not less than 3 h.

Ph Eur

## Yarrow

(Ph. Eur. monograph 1382)

Ph Eur

#### DEFINITION

Whole or cut, dried flowering tops of *Achillea millefolium* L.

#### Content

— essential oil: minimum 2 mL/kg (dried drug);

— proazulenes, expressed as chamazulene ( $C_{14}H_{16}$ ;  $M_r$  184.3): minimum 0.02 per cent (dried drug).

#### IDENTIFICATION

A. The leaves are green or greyish-green, faintly pubescent on the upper surface and more pubescent on the lower surface, 2–3 pinnately divided with linear lobes and a finely pointed whitish tip. The capitula are arranged in a corymb at the end of the stem. Each capitulum, 3–5 mm in diameter, consists of the receptacle, usually 4–5 ligulate ray-florets and 3–20 tubular disk-florets. The involucre consists of 3 rows of imbricate lanceolate, pubescent green bracts arranged with a brownish or whitish, membranous margin. The receptacle is slightly convex and, in the axillae of paleae, bears ligulate ray-florets with a three-lobed, whitish or reddish ligule and tubular disk-florets with a radial, five-lobed, yellowish or light brownish corolla. The pubescent green, partly brown or violet stems are longitudinally furrowed, up to 3 mm thick with a light-coloured medulla.

B. Microscopic examination (2.8.23). The powder is green or greyish-green. Examine under a microscope using chloral hydrate solution R. The powder shows the following diagnostic characters (Figure 1382.-1): fragments of the stem epidermis (surface view [K]), with cells having a smooth cuticle and anomocytic stomata (2.8.3); fragments of leaf and bract epidermises (surface view [B]), with cells having wavy and irregularly thickened walls, a finely striated cuticle and anomocytic stomata (2.8.3); very rare glandular trichomes with a short stalk and a head formed of 2 rows of 3–5 cells enclosed in a bladder-like membrane [H]; uniseriate, whole or fragmented covering trichomes [A] consisting of 4–6 small, more or less isodiametric cells at the base and a thick-walled, often somewhat tortuous terminal cell, about 400 µm to greater than 1000 µm long; fragments of the ligulate corolla with papillary epidermal cells [D]; fragments of the corolla tubes, with sinuous epidermal cells, covered by a thin striated cuticle (surface view [F]); small-celled parenchyma from the corolla tubes containing cluster crystals of calcium oxalate [E]; groups of lignified and pitted cells from the bracts [G]; spherical pollen grains, about 30 µm in diameter, with 3 germinal pores and a spiny exine [C]; groups of sclerenchymatous fibres and small vessels with spiral or annular thickening, from the stem [J].

Figure 1382.-1. – Illustration for identification test B of powdered herbal drug of yarrow

C. To 2.0 g of the powdered herbal drug (710) (2.9.12) add 25 mL of *ethyl acetate R*, shake for 5 min and filter. Evaporate to dryness on a water-bath and dissolve the residue in 0.5 mL of *toluene R* (solution A). To 0.1 mL of this solution add 2.5 mL of *dimethylaminobenzaldehyde solution R8* and heat on a water-bath for 2 min. Allow to cool. Add 5 mL of *light petroleum R* and shake the mixture vigorously. The aqueous layer shows a blue or greenish-blue colour.

D. Thin-layer chromatography (2.2.27).

**Test solution** Use solution A prepared in identification test C.

**Reference solution** Dissolve 10 mg of *cineole R* and 10 mg of *guaiazulene R* in 20 mL of *toluene R*.

**Plate** TLC silica gel plate R.

**Mobile phase** *ethyl acetate R*, *toluene R* (5:95 V/V).

**Application** 20 µL as bands.

**Development** Over a path of 10 cm.

**Drying** In air.

**Detection** Treat with *anisaldehyde solution R*, heat at 100–105 °C for 5–10 min and examine in daylight.

**Results** The chromatogram obtained with the reference solution shows in the upper part a red zone (*guaiazulene*) and in the middle part a blue or greyish-blue zone (*cineole*). The chromatogram obtained with the test solution shows a violet zone a little above the zone due to *guaiazulene* in the chromatogram obtained with the reference solution; below this zone a reddish-violet zone; below which, 1–2 not clearly separated greyish-violet or greyish zones (which changes to greenish-grey after a few hours) and a reddish-violet zone a little above the zone due to *cineole* in the chromatogram

obtained with the reference solution. Furthermore, other faint zones may be present.

#### TESTS

##### Foreign matter (2.8.2)

Maximum 5 per cent of stems with a diameter greater than 3 mm and maximum 2 per cent of other foreign matter.

##### Loss on drying (2.2.32)

Maximum 12.0 per cent, determined on 0.500 g of the powdered herbal drug (355) (2.9.12) by drying in an oven at 105 °C for 2 h.

##### Total ash (2.4.16)

Maximum 10.0 per cent.

##### Ash insoluble in hydrochloric acid (2.8.1)

Maximum 2.5 per cent.

#### ASSAY

##### Essential oil (2.8.12)

Use 20.0 g of cut herbal drug, a 1000 mL round-bottomed flask and 500 mL of a mixture of 1 volume of *water R* and 9 volumes of *ethylene glycol R* as the distillation liquid.

Add 0.50 mL of *1,2,4-trimethylbenzene R* in the graduated tube. Distil at a rate of 3–4 mL/min for 4 h.

Stop cooling at the end of distillation and continue distilling until the blue, steam-volatile components have reached the lower end of the cooler. Immediately start cooling again, to avoid warming the separation space. Stop the distillation after 10 min.

##### Proazulenes

To ensure that as little water as possible is transferred, transfer the blue mixture of essential oil and 1,2,4-trimethylbenzene obtained in the assay of essential oil into a 50 mL volumetric flask with the aid of small portions of *xylene R*, rinsing the graduated tube of the apparatus with *xylene R*, and dilute to 50.0 mL with the same solvent. Measure the absorbance (2.2.25) at 608 nm using *xylene R* as the compensation liquid.

Calculate the percentage content of proazulenes, expressed as chamazulene, using the following expression:

$$\frac{A \times 2.1}{m}$$

i.e. taking the specific absorbance of chamazulene to be 23.8.

*A* = absorbance at 608 nm;  
*m* = mass of the herbal drug to be examined, in grams.

Ph Eur

## Zanthoxylum Bungeanum Pericarp

(Ph. Eur. monograph 2656)

Ph Eur

#### DEFINITION

Dried pericarp of the ripe fruit, with seeds removed, of *Zanthoxylum bungeanum* Maxim.

#### Content

Minimum 15 mL/kg of essential oil (anhydrous drug).

#### IDENTIFICATION

A. Mostly single, dehisced spherical follicles, split along the ventral suture; the dehisced fruit is 4–6 mm in diameter, one half-follicle is 3.0–4.5 mm in diameter; 1–3 smaller, aborted

fruits are often present near the base of the dehisced, ripe fruit(s); the outer surface is dark red or brownish-red, with numerous convex, translucent, often yellowish-brown verrucose oil dots; the inner surface is light yellow and smooth; the endocarp is mostly separated from the mesocarp at the base and is rolled up. Remains of the narrow pedicel are often present.

**B. Microscopic examination (2.8.23).** The powder is yellowish-brown or reddish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2656.-1): fragments of the epicarp [A], covered by a striated cuticle, consisting of polygonal cells with rigid walls (surface view [Aa], transverse section [Ba, Ga]) and anomocytic stomata (2.8.3) with 5-7 subsidiary cells [Ab], some cells of the epicarp contain orange-yellow granular contents; fragments of the mesocarp (surface view [F]) and of the mesocarp associated with epicarp cells covered with a striated cuticle (transverse section [B, G]), consisting of parenchymatous cells [Bb, Fa, Gb] with some cells containing one [Bc, Fb, Gc] or more [Fc] calcium oxalate cluster crystals; rare fragments of oil glands with elongated cells containing droplets of essential oil [Bd]; vascular bundles with spiral vessels [C, E] accompanied by fibres with thickened, pitted walls and pointed ends [Ca, Ea], sometimes bifurcated [Cb]; occasional prisms of calcium oxalate [Eb]; fragments of endocarp consisting of several layers of narrow, elongated, thick-walled, pitted cells in a parquetry arrangement [D], in transverse section the inner cell layers are perpendicular to the outer cell layers.

Figure 2656.-1. – Illustration for identification test B of powdered herbal drug of *Zanthoxylum bungeanum* pericarp

**C. Thin-layer chromatography (2.2.27).**

**Test solution** To 0.5 g of the powdered herbal drug (355) (2.9.12) add 5 mL of *methanol R*. Sonicate for 10 min. Centrifuge or filter. Use the supernatant or filtrate.

**Reference solution** Dissolve 1 mg of *chlorogenic acid R* and 1 mg of *emodin R* in 1 mL of *methanol R*.

**Plate** TLC silica gel plate R (2-10 µm).

**Mobile phase** *water R*, *methanol R*, *ethyl acetate R* (10:20:80 V/V/V).

**Application** 5 µL as bands of 8 mm.

**Development** Over a path of 6 cm.

**Drying** In air.

**Detection** Examine in ultraviolet light at 366 nm.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint fluorescent zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Emodin: a yellow fluorescent zone	A red fluorescent zone A green fluorescent zone
	A red fluorescent zone may be present A faint green fluorescent zone

	A green fluorescent zone A green fluorescent zone
Reference solution	Test solution

### TESTS

#### Foreign matter (2.8.2)

Maximum 5 per cent of seeds and maximum 2 per cent of other foreign matter.

#### Water (2.2.13)

Maximum 100 mL/kg, determined on 20.0 g of the powdered herbal drug (710) (2.9.12).

#### Total ash (2.4.16)

Maximum 8.0 per cent.

#### Ash insoluble in hydrochloric acid (2.8.1)

Maximum 1.5 per cent.

### ASSAY

#### Essential oil (2.8.12)

Use 15.0 g of the freshly powdered herbal drug (710) (2.9.12), a 500 mL round-bottomed flask, 250 mL of *water R* as the distillation liquid and 0.50 mL of *xylene R* in the graduated tube. Distil at a rate of 2-3 mL/min for 2 h.

## **Materials for use in the Manufacture of Homoeopathic Preparations**

## Homoeopathic Preparations

(Ph. Eur. monograph 1038)

Ph Eur

### DEFINITION

Homoeopathic preparations are prepared from substances, products or preparations called stocks, in accordance with a homoeopathic manufacturing procedure. A homoeopathic preparation is usually designated by the Latin name of the stock, followed by an indication of the degree of dilution and/or potentiation, if applicable.

### Raw materials

Raw materials for the production of homoeopathic preparations may be of natural or synthetic origin.

For raw materials of zoological or human origin, adequate measures are taken to minimise the risk of agents of infection, including viruses (5.1.7), in the homoeopathic preparations. For this purpose, it is demonstrated that:

- the method of production includes a step or steps that have been shown to remove or inactivate agents of infection;
- where applicable, raw materials of zoological origin comply with the monograph *Products with risk of transmitting agents of animal spongiform encephalopathies (1483)*;
- where applicable, the animals and the tissues used to obtain the raw materials comply with the health requirements of the competent authorities for animals for human consumption;
- for materials of human origin, the donor follows the recommendations applicable to human blood donors and to donated blood (see *Human plasma for fractionation (0853)*), unless otherwise justified and authorised.

A raw material of botanical, zoological or human origin may be used either in the fresh state or in the dried state. Where appropriate, fresh material may be kept deep-frozen.

Raw materials of botanical origin comply with the requirements of the monograph *Herbal drugs for homoeopathic preparations (2045)*.

Where justified and authorised for transportation or storage purposes, fresh plant material may be kept in ethanol (96 per cent) or in ethanol of a suitable concentration, provided the whole material including the storage medium is used for processing.

Raw materials comply with any requirements of the relevant monographs of the European Pharmacopoeia.

### Vehicles

Vehicles are excipients used for the preparation of certain stocks or for the potentiation process. They may include, for example: purified water, ethanol of a suitable concentration, glycerol and lactose.

Vehicles comply with any requirements of the relevant monographs of the European Pharmacopoeia.

### Stocks

Stocks are substances, products or preparations used as starting materials for the production of homoeopathic preparations. A stock is usually one of the following: a mother tincture or a glycerol macerate, for raw materials of botanical, zoological or human origin, or the substance itself, for raw materials of chemical or mineral origin.

Mother tinctures comply with the requirements of the monograph *Mother tinctures for homoeopathic preparations (2029)*.

Glycerol macerates are liquid preparations obtained from raw materials of botanical, zoological or human origin by using glycerol or a mixture of glycerol and either ethanol of a suitable concentration or a solution of sodium chloride of a suitable concentration.

### Potentiation

Dilutions and triturations are obtained from stocks by a process of potentiation in accordance with a homoeopathic manufacturing procedure: this means successive dilutions and succussions, or successive appropriate triturations, or a combination of the 2 processes.

The potentiation steps are usually one of the following:

- 1 part of the stock plus 9 parts of the vehicle; they may be designated as 'D', 'DH' or 'X' (decimal);
- 1 part of the stock plus 99 parts of the vehicle; they may be designated as 'C' or 'CH' (centesimal).

The number of potentiation steps defines the degree of dilution; for example, 'D3', '3 DH' or '3X' means 3 decimal potentiation steps, and 'C3', '3 CH' or '3C' means 3 centesimal potentiation steps.

'LM' potencies are manufactured according to a specific procedure with a 50 000 dilution factor by alternate steps of liquid dilution and impregnation of pillules. The number of potentiation steps defines the degree of dilution, for example, 3<sup>rd</sup> LM means 3 successive LM dilutions.

### Dosage forms

A dosage form of a homoeopathic preparation complies with any relevant dosage form monograph in the European Pharmacopoeia, and with the following:

- for the purpose of dosage forms for homoeopathic use, 'active substances' are considered to be 'dilutions or triturations of homoeopathic stocks' or 'homoeopathic stocks' (in case of a mother tincture or a glycerol macerate);
- these dosage forms can contain one or more 'active substances';
- they are prepared using appropriate excipients.

#### Homoeopathic dosage form 'pillule'

Pillules for homoeopathic use are solid preparations obtained from sucrose, lactose or other suitable excipients. *Pillules for homoeopathic preparations (2153)* are intended for impregnation or coating with one or more homoeopathic preparations. The impregnated pillules comply with the requirements of the monograph *Homoeopathic pillules, impregnated (2079)*. The coated pillules comply with the requirements of the monograph *Homoeopathic pillules, coated (2786)*. Both are intended for sublingual or oral use.

#### Homoeopathic dosage form 'tablet'

Tablets for homoeopathic use are solid preparations obtained from sucrose, lactose or other suitable excipients according to the monograph *Tablets (0478)*. They may be prepared either by compressing one or more 'active substances' with the excipients or by impregnating preformed tablets with one or more liquid 'active substances'. The preformed tablets for impregnation are obtained from sucrose, lactose or other suitable excipients according to the monograph *Tablets (0478)*. Tablets for homoeopathic use are intended for sublingual or oral use.

*Homoeopathic dosage forms 'parenteral preparation', 'eye preparation', 'nasal preparation'*

For the last potentisation step(s), an ethanol-free vehicle is used to minimise the content of ethanol in the final preparation.

The residual ethanol content (2.9.10) is not greater than 1 per cent *V/V* unless otherwise justified and authorised.

*Homoeopathic dosage form 'liquid preparation for oral use'*

If necessary, for the last potentisation step(s), purified water is used to minimise the content of ethanol in the final preparation.

#### Manufacturing methods

Homoeopathic preparations are produced using the methods described in the monograph *Methods of preparation of homoeopathic stocks and potentisation (2371)*. The preparations obtained using the manufacturing methods listed in Table 1038.-1 are restricted to the production of the corresponding dosage forms indicated in the right-hand column of the table.

The competent authority has the right to accept or reject particular combinations of manufacturing method and substance.

Table 1038.-1.

Manufacturing methods	Dosage forms
1.4.1, 1.4.2, 1.4.3, 1.4.4	Eye drops Coated homoeopathic pillules Solutions for injection
2.1.2	Eye drops Solutions for injection Nasal preparations
2.2.1, 2.2.2, 2.2.3	Eye drops Coated homoeopathic pillules Solutions for injection Nasal preparations Ointments, creams and gels Oral powders (triturations) Suppositories
2.2.4	Solutions for injection
3.1.2, 3.2.2	Eye drops Coated homoeopathic pillules Solutions for injection Nasal preparations Ointments, creams and gels Suppositories

## Herbal Drugs for Homoeopathic Preparations

Herbal Drugs for Homoeopathic Use

(Ph. Eur. monograph 2045)

Ph Eur

### DEFINITION

Herbal drugs for homoeopathic preparations are mainly whole plants or parts of plants, fragmented or broken, and include algae, fungi or lichens, in an unprocessed state, usually in fresh form. The state, fresh or dried, in which the drug is used, is defined in the individual monograph of the European Pharmacopoeia or, in its absence, in the individual monograph of an official national pharmacopoeia of a member state. In the absence of such a monograph, the state in which the herbal drug is used has to be defined. Certain

exudates that have not been subjected to a specific treatment are also considered to be herbal drugs for homoeopathic preparations. Herbal drugs for homoeopathic preparations are precisely defined by the botanical scientific name of the source species according to the binomial system (genus, species, variety and author).

*Whole* Describes a herbal drug for homoeopathic preparations that has not been reduced in size and is presented, dried or undried, as harvested.

*Fragmented* Describes a herbal drug for homoeopathic preparations that has been reduced in size after harvesting to permit ease of handling, drying and/or packaging.

*Broken* Describes a herbal drug for homoeopathic preparations in which the more fragile parts of the plant have broken during drying, packaging or transportation.

For dried herbal drugs for homoeopathic preparations, *cut* describes size reduction, other than powdering, that reduces the particle size below that which is described in the macroscopic identity of the herbal drug for homoeopathic preparations.

### PRODUCTION

Herbal drugs for homoeopathic preparations are obtained from cultivated or wild plants. Suitable collection, cultivation, harvesting, sorting, drying, fragmentation and storage conditions are essential to guarantee the quality of herbal drugs for homoeopathic preparations.

Herbal drugs for homoeopathic preparations are, as far as possible, free from impurities such as soil, dust, dirt and other contaminants such as fungal, insect and other animal contaminants. They do not present signs of decay.

If a decontaminating treatment has been used, it is necessary to demonstrate that the constituents of the plant are not affected and that no harmful residues remain. The use of ethylene oxide is prohibited for the decontamination of herbal drugs for homoeopathic preparations.

Fresh herbal drugs are processed as rapidly as possible after harvesting. Where justified and authorised for transportation or storage purposes, fresh plant material may be deep-frozen; it may also be kept in ethanol (96 per cent) or in ethanol of a suitable concentration, provided the whole material including the storage medium is used for processing.

Adequate measures have to be taken in order to ensure that the microbiological quality of homoeopathic preparations containing 1 or more herbal drugs comply with the recommendations given in general chapter 5.1.4.

*Microbiological quality of non-sterile pharmaceutical preparations and substances for pharmaceutical use.*

### IDENTIFICATION

Herbal drugs for homoeopathic preparations are identified using their macroscopic and, where necessary, microscopic descriptions and any further tests that may be required (for example, thin-layer chromatography).

### TESTS

The tests for foreign matter and loss on drying should be performed before any further processing of the fresh plant.

#### Foreign matter (2.8.2)

Where a fresh plant is used as a starting material for the manufacture of homoeopathic preparations, the content of foreign matter is as low as possible; if necessary, the maximum content of foreign matter is indicated in the individual monograph.

Where a dried plant is used as a starting material for the manufacture of homoeopathic preparations, carry out a test

for foreign matter, unless otherwise prescribed in the individual monograph. The content of foreign matter is not more than 2 per cent *m/m*, unless otherwise prescribed or justified and authorised.

#### Adulteration

A specific appropriate test may apply to herbal drugs for homoeopathic preparations liable to be falsified.

#### Loss on drying (2.2.32)

Carry out a test for loss on drying on dried herbal drugs for homoeopathic preparations.

If a fresh plant is processed more than 24 h after harvesting, a test for loss on drying should be carried out. The minimum limit is indicated in the individual monograph.

#### Water (2.2.13)

A determination of water is carried out on herbal drugs for homoeopathic preparations with a high essential oil content.

#### Pesticides (2.8.13)

Herbal drugs for homoeopathic preparations comply with the requirements for pesticide residues. The requirements take into account the origin and the nature of the plant, where necessary the preparation in which the plant might be used and, where available, knowledge of the complete record of treatment of the batch of the plant. Where justified, the test for pesticides may be performed on the mother tincture according to the requirements of the general monograph *Mother tinctures for homoeopathic preparations (2029)*.

If appropriate, herbal drugs for homoeopathic preparations comply with other tests, such as the following, for example.

#### Total ash (2.4.16)

#### Bitterness value (2.8.15)

#### Heavy metals (2.4.27)

Unless otherwise stated in an individual monograph or unless otherwise justified and authorised:

- *cadmium*: maximum 1.0 ppm;
- *lead*: maximum 5.0 ppm;
- *mercury*: maximum 0.1 ppm.

If justified by the nature or origin of the herbal drug or if required by the competent authority, suitable limits for the content of other heavy metals such as arsenic or nickel are defined.

Where justified, the test for heavy metals may be performed on the mother tincture according to the requirements of the general monograph *Mother tinctures for homoeopathic preparations (2029)*.

#### Aflatoxin B<sub>1</sub> (2.8.18)

Where appropriate, limits for aflatoxins may be required.

#### Ochratoxin A (2.8.22)

Where appropriate, a limit for ochratoxin A may be required.

#### Radioactive contamination

In some specific circumstances, the risk of radioactive contamination is to be considered.

#### ASSAY

Where applicable, herbal drugs for homoeopathic preparations are assayed by an appropriate method.

#### STORAGE

Store dried herbal drugs protected from light.

Ph Eur

## Methods of Preparation of Homoeopathic Stocks and Potentisation

(Ph. Eur. monograph 2371)

Ph Eur

Homoeopathic stocks are prepared, using suitable methods, from raw materials that comply with the requirements of the monograph *Homoeopathic preparations (1038)*. The methods described below, combined with established methods for potentisation, are examples of methods, but other methods described in an official national pharmacopoeia of a Member State may equally be used.

Where material of animal or human origin is to be used, particular reference is made to the requirements concerning the use of such raw material of zoological or human origin in the monograph *Homoeopathic preparations (1038)*.

In the preparation of liquid dilutions, the ethanol of the concentration prescribed in the method may, if necessary, be replaced by ethanol (36 per cent *V/V*) or ethanol (18 per cent *V/V*).

When the individual monograph allows that the mother tincture be prepared from more than one plant species, the mother tincture can be prepared from the specified parts of an individual plant species or from any mixture thereof. If for the preparation of a mother tincture the loss on drying has to be determined, the herbal drug or mixture of herbal drug with ethanol has to be processed immediately after the value of the loss on drying has been determined.

Unless otherwise stated, mother tinctures are prepared by maceration lasting 10-30 days.

Maceration may be replaced by long maceration (maximum 60 days) or very long maceration (maximum 180 days), provided it is demonstrated that the quality of the resulting mother tincture is the same as that of the mother tincture prepared by maceration.

Unless otherwise stated in the individual monograph, the term 'part(s)' denotes 'mass part(s)'. Unless otherwise stated in the method, the maximum temperature for the preparation is 25 °C.

### 1. MOTHER TINCTURES AND LIQUID POTENTISATIONS

#### METHOD 1.1. HYDROALCOHOLIC MOTHER TINCTURES PREPARED WITHOUT HEATING

METHOD 1.1.1 (HOMŌOPATHISCHES ARZNEIBUCH (HAB) 1A: MOTHER TINCTURES AND LIQUID DILUTIONS)

Method 1.1.1 is used for fresh herbal drugs containing generally more than 70 per cent of expressed juice and no essential oil or resin or mucilage. Mother tinctures prepared according to Method 1.1.1 are mixtures of equal parts of expressed juices and ethanol (90 per cent *V/V*).

Express the comminuted herbal drug. Immediately mix the expressed juice with an equal mass of ethanol (90 per cent *V/V*). Allow to stand in a closed container for not less than 5 days, then filter.

#### Adjustment to any value specified in the individual monograph

Determine the percentage dry residue (2.8.16) or, where prescribed, the percentage assay content of the above-mentioned filtrate. Calculate the amount ( $A_1$ ), in kilograms, of ethanol (50 per cent *V/V*) required, using the following expression:

$$\frac{m \times (N_x - N_0)}{N_0}$$

- $m$  = mass of filtrate, in kilograms;
- $N_0$  = percentage dry residue or percentage assay content as required in the individual monograph;
- $N_x$  = percentage dry residue or percentage assay content of the filtrate.

Mix the filtrate with the calculated amount of ethanol (50 per cent *V/V*). Allow to stand for not less than 5 days, then filter if necessary.

**Potentiation**

The 1<sup>st</sup> 'decimal' dilution (D1) is made from:

- 2 parts of the mother tincture;
- 8 parts of ethanol (50 per cent *V/V*).

The 2<sup>nd</sup> decimal dilution (D2) is made from:

- 1 part of the 1<sup>st</sup> 'decimal' dilution;
- 9 parts of ethanol (50 per cent *V/V*).

Subsequent decimal dilutions are produced as stated for D2.

The 1<sup>st</sup> 'centesimal' dilution (C1) is made from:

- 2 parts of the mother tincture;
- 98 parts of ethanol (50 per cent *V/V*).

The 2<sup>nd</sup> centesimal dilution (C2) is made from:

- 1 part of the 1<sup>st</sup> 'centesimal' dilution;
- 99 parts of ethanol (50 per cent *V/V*).

Subsequent centesimal dilutions are produced as stated for C2.

**METHOD 1.1.2 (HAB 1B: MOTHER TINCTURES AND LIQUID DILUTIONS)**

Method 1.1.2 is used where the latex of a herbal drug is to be processed.

Mother tinctures prepared according to Method 1.1.2 are mixtures of fresh plant latex with ethanol (36 per cent *V/V*). Mix the fresh latex with 2 parts by mass of ethanol (36 per cent *V/V*) and filter.

**Adjustment to any value specified in the individual monograph**

Determine the percentage dry residue (2.8.16) or, where prescribed, the percentage assay content of the above-mentioned filtrate. Calculate the amount ( $A_1$ ), in kilograms, of ethanol (36 per cent *V/V*) required, using the following expression:

$$\frac{m \times (N_x - N_0)}{N_0}$$

- $m$  = mass of filtrate, in kilograms;
- $N_0$  = percentage dry residue or percentage assay content as required in the individual monograph;
- $N_x$  = percentage dry residue or percentage assay content of the filtrate.

Mix the filtrate with the calculated amount of ethanol (36 per cent *V/V*). Allow to stand for not less than 5 days, then filter if necessary.

**Potentiation**

The 1<sup>st</sup> 'decimal' dilution (D1) is made from:

- 3 parts of the mother tincture;
- 7 parts of ethanol (36 per cent *V/V*).

The 2<sup>nd</sup> decimal dilution (D2) is made from:

- 1 part of the 1<sup>st</sup> 'decimal' dilution;
- 9 parts of ethanol (18 per cent *V/V*).

Subsequent decimal dilutions are produced as stated for D2.

**METHOD 1.1.3 (HAB 2A: MOTHER TINCTURES AND LIQUID DILUTIONS)**

Method 1.1.3 is used for fresh herbal drugs containing generally less than 70 per cent of expressed juice and more than 60 per cent moisture (loss on drying) and no essential oil or resin.

Mother tinctures prepared according to Method 1.1.3 (ethanol content approximately 50 per cent *V/V*) are prepared by maceration as described below.

Comminute appropriately the herbal drug.

Take a sample and determine the loss on drying (2.2.32).

Unless otherwise prescribed, determine the loss on drying on 2.00-5.00 g of the comminuted herbal drug and dry at 105 °C for 2 h.

To the comminuted herbal drug immediately add not less than half the mass of ethanol (90 per cent *V/V*) and allow to stand in well-closed containers.

Use the following expression to calculate the amount ( $A_2$ ), in kilograms, of ethanol (90 per cent *V/V*) required for the mass ( $m$ ) of raw material, then subtract the amount of ethanol (90 per cent *V/V*) already added and add the difference to the mixture.

$$\frac{m \times T}{100}$$

- $m$  = mass of raw material, in kilograms;
- $T$  = percentage loss on drying of the sample.

Allow to stand for not less than 10 days, swirling from time to time, then express the mixture and filter the resulting liquid.

**Adjustment to any value specified in the individual monograph**

Determine the percentage dry residue (2.8.16) or, where prescribed, the percentage assay content of the above-mentioned filtrate. Calculate the amount ( $A_1$ ), in kilograms, of ethanol (50 per cent *V/V*) required, using the following expression:

$$\frac{m \times (N_x - N_0)}{N_0}$$

- $m$  = mass of filtrate, in kilograms;
- $N_0$  = percentage dry residue or percentage assay content as required in the individual monograph;
- $N_x$  = percentage dry residue or percentage assay content of the filtrate.

Mix the filtrate with the calculated amount of ethanol (50 per cent *V/V*). Allow to stand for not less than 5 days, then filter if necessary.

**Potentiation**

The 1<sup>st</sup> 'decimal' dilution (D1) is made from:

- 2 parts of the mother tincture;
- 8 parts of ethanol (50 per cent *V/V*).

The 2<sup>nd</sup> decimal dilution (D2) is made from:

- 1 part of the 1<sup>st</sup> 'decimal' dilution;
- 9 parts of ethanol (50 per cent *V/V*).

Subsequent decimal dilutions are produced as stated for D2.

The 1<sup>st</sup> 'centesimal' dilution (C1) is made from:

- 2 parts of the mother tincture;
- 98 parts of ethanol (50 per cent *V/V*).

The 2<sup>nd</sup> centesimal dilution (C2) is made from:

- 1 part of the 1<sup>st</sup> 'centesimal' dilution;
- 99 parts of ethanol (50 per cent *V/V*).

Subsequent centesimal dilutions are produced as stated for C2.

**METHOD 1.1.4 (HAB 2B: MOTHER TINCTURES AND LIQUID DILUTIONS)**

Method 1.1.4 is used for fresh herbal drugs containing generally less than 70 per cent of expressed juice and more than 60 per cent moisture (loss on drying) and no essential oil or resin.

Mother tinctures prepared according to Method 1.1.4 (ethanol content approximately 36 per cent *V/V*) are prepared by maceration as described below.

Comminute appropriately the herbal drug.

Take a sample and determine the loss on drying (2.2.32). Unless otherwise prescribed, determine the loss on drying on 2.00-5.00 g of the comminuted herbal drug and dry at 105 °C for 2 h.

To the comminuted herbal drug immediately add not less than half the mass of ethanol (70 per cent *V/V*) and allow to stand in well-closed containers.

Use the following expression to calculate the amount ( $A_2$ ), in kilograms, of ethanol (70 per cent *V/V*) required for the mass ( $m$ ) of raw material, then subtract the amount of ethanol (70 per cent *V/V*) already added and add the difference to the mixture.

$$\frac{m \times T}{100}$$

$m$  = mass of raw material, in kilograms;  
 $T$  = percentage loss on drying of the sample.

Allow to stand for not less than 10 days, swirling from time to time, then express the mixture and filter the resulting liquid.

**Adjustment to any value specified in the individual monograph**

Determine the percentage dry residue (2.8.16) or, where prescribed, the percentage assay content of the above-mentioned filtrate. Calculate the amount ( $A_1$ ), in kilograms, of ethanol (36 per cent *V/V*) required, using the following expression:

$$\frac{m \times (N_x - N_0)}{N_0}$$

$m$  = mass of filtrate, in kilograms;  
 $N_0$  = percentage dry residue or percentage assay content as required in the individual monograph;  
 $N_x$  = percentage dry residue or percentage assay content of the filtrate.

Mix the filtrate with the calculated amount of ethanol (36 per cent *V/V*). Allow to stand for not less than 5 days, then filter if necessary.

**Potentiation**

The 1<sup>st</sup> 'decimal' dilution (D1) is made from:

- 2 parts of the mother tincture;
- 8 parts of ethanol (36 per cent *V/V*).

The 2<sup>nd</sup> decimal dilution (D2) is made from:

- 1 part of the 1<sup>st</sup> 'decimal' dilution;
- 9 parts of ethanol (18 per cent *V/V*).

Subsequent decimal dilutions are produced as stated for D2.

**METHOD 1.1.5 (HAB 3A: MOTHER TINCTURES AND LIQUID DILUTIONS)**

Method 1.1.5 is used for fresh herbal drugs containing essential oil or resin, or generally less than 60 per cent moisture.

Mother tinctures prepared according to Method 1.1.5 (ethanol content approximately 65 per cent *V/V*) are prepared by maceration as described below.

Comminute appropriately the herbal drug.

Determine the water content (2.2.13) or loss on drying (2.2.32). Unless otherwise prescribed, determine the loss on drying on 2.00-5.00 g of the comminuted herbal drug and dry at 105 °C for 2 h.

To the comminuted herbal drug immediately add not less than half the mass of ethanol (90 per cent *V/V*) and allow to stand in well-closed containers.

Use the following expression to calculate the amount ( $A_3$ ), in kilograms, of ethanol (90 per cent *V/V*) required for the mass ( $m$ ) of raw material, then subtract the amount of ethanol (90 per cent *V/V*) already added and add the difference to the mixture.

$$\frac{2 \times m \times T}{100}$$

$m$  = mass of raw material, in kilograms;  
 $T$  = percentage loss on drying of the sample.

Allow to stand for not less than 10 days, swirling from time to time, then express the mixture and filter the resulting liquid.

**Adjustment to any value specified in the individual monograph**

Determine the percentage dry residue (2.8.16) or, where prescribed, the percentage assay content of the above-mentioned filtrate. Calculate the amount ( $A_1$ ), in kilograms, of ethanol (70 per cent *V/V*) required, using the following expression:

$$\frac{m \times (N_x - N_0)}{N_0}$$

$m$  = mass of filtrate, in kilograms;  
 $N_0$  = percentage dry residue or percentage assay content as required in the individual monograph;  
 $N_x$  = percentage dry residue or percentage assay content of the filtrate.

Mix the filtrate with the calculated amount of ethanol (70 per cent *V/V*). Allow to stand for not less than 5 days, then filter if necessary.

**Potentiation**

The 1<sup>st</sup> 'decimal' dilution (D1) is made from:

- 3 parts of the mother tincture;
- 7 parts of ethanol (70 per cent *V/V*).

The 2<sup>nd</sup> decimal dilution (D2) is made from:

- 1 part of the 1<sup>st</sup> 'decimal' dilution;
- 9 parts of ethanol (70 per cent *V/V*).

Subsequent decimal dilutions are produced as stated for D2. Use ethanol (50 per cent *V/V*) for dilutions from D4 onwards.

The 1<sup>st</sup> 'centesimal' dilution (C1) is made from:

- 3 parts of the mother tincture;
- 97 parts of ethanol (70 per cent *V/V*).

The 2<sup>nd</sup> centesimal dilution (C2) is made from:

- 1 part of the 1<sup>st</sup> 'centesimal' dilution;
- 99 parts of ethanol (50 per cent *V/V*).

Subsequent centesimal dilutions are produced as stated for C2.

**METHOD 1.1.6 (HAB 3B: MOTHER TINCTURES AND LIQUID DILUTIONS)**

Method 1.1.6 is used for fresh herbal drugs containing essential oils or resins or generally less than 60 per cent moisture.

Mother tinctures prepared according to Method 1.1.6 (ethanol content approximately 57 per cent V/V) are prepared by maceration as described below.

Comminute appropriately the herbal drug.

Determine the water content (2.2.13) or loss on drying (2.2.32). Unless otherwise prescribed, determine the loss on drying on 2.00-5.00 g of the comminuted herbal drug and dry at 105 °C for 2 h.

To the comminuted herbal drug immediately add not less than half the mass of ethanol (80 per cent V/V) and allow to stand in well-closed containers.

Use the following expression to calculate the amount ( $A_3$ ), in kilograms, of ethanol (80 per cent V/V) required for the mass ( $m$ ) of raw material, then subtract the amount of ethanol (80 per cent V/V) already added and add the difference to the mixture.

$$\frac{2 \times m \times T}{100}$$

$m$  = mass of raw material, in kilograms;  
 $T$  = percentage loss on drying of the sample.

Allow to stand for not less than 10 days, swirling from time to time, then express the mixture and filter the resulting liquid.

**Adjustment to any value specified in the individual monograph**

Determine the percentage dry residue (2.8.16) or, where prescribed, the percentage assay content of the above-mentioned filtrate. Calculate the amount ( $A_1$ ), in kilograms, of ethanol (50 per cent V/V) required, using the following expression:

$$\frac{m \times (N_x - N_0)}{N_0}$$

$m$  = mass of filtrate, in kilograms;  
 $N_0$  = percentage dry residue or percentage assay content as required in the individual monograph;  
 $N_x$  = percentage dry residue or percentage assay content of the filtrate.

Mix the filtrate with the calculated amount of ethanol (50 per cent V/V). Allow to stand for not less than 5 days, then filter if necessary.

**Potentiation**

The 1<sup>st</sup> 'decimal' dilution (D1) is made from:

- 3 parts of the mother tincture;
- 7 parts of ethanol (50 per cent V/V).

The 2<sup>nd</sup> decimal dilution (D2) is made from:

- 1 part of the 1<sup>st</sup> 'decimal' dilution;
- 9 parts of ethanol (36 per cent V/V).

The 3<sup>rd</sup> decimal dilution (D3) is made from:

- 1 part of the 2<sup>nd</sup> decimal dilution;
- 9 parts of ethanol (18 per cent V/V).

Subsequent decimal dilutions are produced as stated for D3.

**METHOD 1.1.7 (HAB 3C: MOTHER TINCTURES AND LIQUID DILUTIONS)**

Method 1.1.7 is used for fresh herbal drugs containing generally less than 60 per cent moisture (loss on drying).

Mother tinctures prepared according to Method 1.1.7 (ethanol content approximately 35 per cent V/V) are prepared by maceration as described below.

Comminute appropriately the herbal drug.

Take a sample and determine the loss on drying (2.2.32). Unless otherwise prescribed, determine the loss on drying on 2.00-5.00 g of the comminuted herbal drug and dry at 105 °C for 2 h.

To the comminuted herbal drug immediately add not less than half the mass of ethanol (50 per cent V/V) and allow to stand in well-closed containers.

Use the following expression to calculate the amount ( $A_3$ ), in kilograms, of ethanol (50 per cent V/V) required for the mass ( $m$ ) of raw material, then subtract the amount of ethanol (50 per cent V/V) already added and add the difference to the mixture.

$$\frac{2 \times m \times T}{100}$$

$m$  = mass of raw material, in kilograms;  
 $T$  = percentage loss on drying of the sample.

Allow to stand for not less than 10 days, swirling from time to time, then express the mixture and filter the resulting liquid.

**Adjustment to any value specified in the individual monograph**

Determine the percentage dry residue (2.8.16) or, where prescribed, the percentage assay content of the above-mentioned filtrate. Calculate the amount ( $A_1$ ), in kilograms, of ethanol (36 per cent V/V) required, using the following expression:

$$\frac{m \times (N_x - N_0)}{N_0}$$

$m$  = mass of filtrate, in kilograms;  
 $N_0$  = percentage dry residue or percentage assay content as required in the individual monograph;  
 $N_x$  = percentage dry residue or percentage assay content of the filtrate.

Mix the filtrate with the calculated amount of ethanol (36 per cent V/V). Allow to stand for not less than 5 days, then filter if necessary.

**Potentiation**

The 1<sup>st</sup> 'decimal' dilution (D1) is made from:

- 3 parts of the mother tincture;
- 7 parts of ethanol (36 per cent V/V).

The 2<sup>nd</sup> decimal dilution (D2) is made from:

- 1 part of the 1<sup>st</sup> 'decimal' dilution;
- 9 parts of ethanol (18 per cent V/V).

Subsequent decimal dilutions are produced as stated for D2.

**METHOD 1.1.8 (HAB 4A: MOTHER TINCTURES AND LIQUID DILUTIONS)**

Method 1.1.8 is generally used for dried herbal drugs.

Mother tinctures prepared according to Method 1.1.8 are prepared by maceration or percolation as described below, using 1 part of dried herbal drug and 10 parts of ethanol of the appropriate concentration (anhydrous, 96 per cent V/V, 90 per cent V/V, 80 per cent V/V, 70 per cent V/V, 50 per cent V/V, 36 per cent V/V, 18 per cent V/V), unless otherwise prescribed in the individual monograph.

*Production by maceration* Unless otherwise prescribed, comminute the herbal drug, mix thoroughly with ethanol of the appropriate concentration and allow to stand in a closed

container for an appropriate time. Separate the residue from the ethanol and, if necessary, press out. In the latter case, combine the 2 liquids obtained.

**Production by percolation** If necessary, comminute the herbal drug. Mix thoroughly with a portion of ethanol of the appropriate concentration and allow to stand for an appropriate time. Transfer to a percolator and allow the percolate to flow slowly, at room temperature, making sure that the herbal drug to be extracted is always covered with the remaining ethanol. The residue may be pressed out and the expressed liquid combined with the percolate.

If adjustment to a given concentration is necessary, calculate the amount ( $A_1$ ), in kilograms, of ethanol of the appropriate concentration required to obtain the concentration specified or used for production, using the following expression:

$$\frac{m \times (N_x - N_0)}{N_0}$$

- $m$  = mass of percolate or macerate, in kilograms;  
 $N_0$  = percentage dry residue or percentage assay content as required in the individual monograph;  
 $N_x$  = percentage dry residue or percentage assay content of the percolate or macerate.

Mix the macerate or percolate with the calculated amount of ethanol of the appropriate concentration. Allow to stand for not less than 5 days, then filter if necessary.

#### Potentiation

The mother tincture corresponds to the 1<sup>st</sup> 'decimal' dilution ( $\emptyset = D1$ ).

The 2<sup>nd</sup> decimal dilution (D2) is made from:

- 1 part of the mother tincture (D1);
- 9 parts of ethanol of the same concentration.

The 3<sup>rd</sup> decimal dilution (D3) is made from:

- 1 part of the 2<sup>nd</sup> decimal dilution;
- 9 parts of ethanol of the same concentration.

Unless a different ethanol concentration is specified, use ethanol (50 per cent *V/V*) for subsequent decimal dilutions from D4 onwards and proceed as stated for D3.

The 1<sup>st</sup> 'centesimal' dilution (C1) is made from:

- 10 parts of the mother tincture (D1);
- 90 parts of ethanol of the same concentration.

The 2<sup>nd</sup> centesimal dilution (C2) is made from:

- 1 part of the 1<sup>st</sup> 'centesimal' dilution;
- 99 parts of ethanol (50 per cent *V/V*), unless a different ethanol concentration is specified.

Subsequent centesimal dilutions are produced as stated for C2.

#### METHOD 1.1.9 (HAB 4B: MOTHER TINCTURES AND LIQUID DILUTIONS)

Method 1.1.9 is generally used for animal matter.

Mother tinctures prepared according to Method 1.1.9 are prepared by maceration or percolation as described below, using 1 part of animal matter and 10 parts of ethanol of the appropriate concentration (anhydrous, 96 per cent *V/V*, 90 per cent *V/V*, 80 per cent *V/V*, 70 per cent *V/V*, 50 per cent *V/V*, 36 per cent *V/V*, 18 per cent *V/V*), unless otherwise prescribed in the individual monograph.

**Production by maceration** Unless otherwise prescribed, comminute the animal matter, mix thoroughly with ethanol of the appropriate concentration and allow to stand in a closed container for an appropriate time. Separate the residue from the ethanol and, if necessary, press out. In the latter case, combine the 2 liquids obtained.

**Production by percolation** If necessary, comminute the animal matter. Mix thoroughly with a portion of ethanol of the appropriate concentration and allow to stand for an appropriate time. Transfer to a percolator and allow the percolate to flow slowly at room temperature, making sure that the animal matter to be extracted is always covered with the remaining ethanol. The residue may be pressed out and the expressed liquid combined with the percolate.

If adjustment to a given concentration is necessary, calculate the amount ( $A_1$ ), in kilograms, of ethanol of the appropriate concentration required to obtain the concentration specified or used for production, using the following expression:

$$\frac{m \times (N_x - N_0)}{N_0}$$

- $m$  = mass of percolate or macerate, in kilograms;  
 $N_0$  = percentage dry residue or percentage assay content as required in the individual monograph;  
 $N_x$  = percentage dry residue or percentage assay content of the percolate or macerate.

Mix the macerate or percolate with the calculated amount of ethanol of the appropriate concentration. Allow to stand for not less than 5 days, then filter if necessary.

#### Potentiation

The mother tincture corresponds to the 1<sup>st</sup> 'decimal' dilution ( $\emptyset = D1$ ).

The 2<sup>nd</sup> decimal dilution (D2) is made from:

- 1 part of the mother tincture (D1);
- 9 parts of ethanol of the same concentration.

The 3<sup>rd</sup> decimal dilution (D3) is made from:

- 1 part of the 2<sup>nd</sup> decimal dilution;
- 9 parts of ethanol of the same concentration.

Unless a different ethanol concentration is specified, use ethanol (50 per cent *V/V*) for subsequent decimal dilutions from D4 onwards and proceed as stated for D3.

The 1<sup>st</sup> 'centesimal' dilution (C1) is made from:

- 10 parts of the mother tincture (D1);
- 90 parts of ethanol of the same concentration.

The 2<sup>nd</sup> centesimal dilution (C2) is made from:

- 1 part of the 1<sup>st</sup> 'centesimal' dilution;
- 99 parts of ethanol (50 per cent *V/V*), unless a different ethanol concentration is specified.

Subsequent centesimal dilutions are produced as stated for C2.

#### METHOD 1.1.10 (FRENCH PHARMACOPOEIA)

Method 1.1.10 is generally used for herbal drugs. The state of the herbal drug, fresh or dried, is specified in the individual monograph.

Mother tinctures prepared according to Method 1.1.10 are prepared by maceration.

Comminute appropriately the herbal drug. Take a sample and determine the loss on drying at 105 °C for 2 h (2.2.32) or the water content (2.2.13). Taking this value into account, calculate and add to the herbal drug the quantities of ethanol of the appropriate concentration required to produce, unless otherwise prescribed, a 1 in 10 mother tincture (1:10 mother tincture) with a suitable ethanol content. Allow to macerate for at least 10 days, with sufficient shaking.

Separate the residue from the ethanol and strain under pressure if necessary. Allow the combined liquids to stand for 48 h and filter. For mother tinctures with a required assay content, adjustment may be carried out, if necessary, by

adding ethanol of the same concentration as used for the preparation of the tincture.

#### Potentiation

The 1<sup>st</sup> decimal dilution (D1) is made from:

- 1 part of the mother tincture;
- 9 parts of ethanol of the appropriate concentration.

The 2<sup>nd</sup> decimal dilution (D2) is made from:

- 1 part of the 1<sup>st</sup> decimal dilution;
- 9 parts of ethanol of the appropriate concentration.

Subsequent decimal dilutions are produced as stated for D2, using ethanol of the appropriate concentration.

The 1<sup>st</sup> centesimal dilution (C1) is made from:

- 1 part of the mother tincture;
- 99 parts of ethanol of the appropriate concentration.

The 2<sup>nd</sup> centesimal dilution (C2) is made from:

- 1 part of the 1<sup>st</sup> centesimal dilution;
- 99 parts of ethanol of the appropriate concentration.

Subsequent centesimal dilutions are produced as stated for C2, using ethanol of the appropriate concentration.

#### METHOD 1.1.11 (FRENCH PHARMACOPOEIA)

Method 1.1.11 is generally used for animal matter.

Mother tinctures prepared according to Method 1.1.11 are prepared by maceration.

The mass ratio of raw material to mother tincture is usually 1 to 20. To the raw material, appropriately comminuted, add the quantity of ethanol of the appropriate concentration required to produce a 1 in 20 mother tincture. Allow to macerate for at least 10 days, with sufficient shaking. Decant and filter. Allow to stand for 48 h and filter again.

For mother tinctures with a required assay content, adjustment may be carried out, if necessary, by adding ethanol of the same concentration as used for the preparation of the tincture.

#### Potentiation

The 1<sup>st</sup> decimal dilution (D1) is made from:

- 1 part of the mother tincture;
- 9 parts of ethanol of the appropriate concentration.

The 2<sup>nd</sup> decimal dilution (D2) is made from:

- 1 part of the 1<sup>st</sup> decimal dilution;
- 9 parts of ethanol of the appropriate concentration.

Subsequent decimal dilutions are produced as stated for D2, using ethanol of the appropriate concentration.

The 1<sup>st</sup> centesimal dilution (C1) is made from:

- 1 part of the mother tincture;
- 99 parts of ethanol of the appropriate concentration.

The 2<sup>nd</sup> centesimal dilution (C2) is made from:

- 1 part of the 1<sup>st</sup> centesimal dilution;
- 99 parts of ethanol of the appropriate concentration.

Subsequent centesimal dilutions are produced as stated for C2, using ethanol of the appropriate concentration.

#### METHOD 1.2. HYDROALCOHOLIC MOTHER TINCTURES PREPARED WITH HEATING

##### METHODS 1.2.1, 1.2.2. ETHANOLIC DIGESTIONS (HAB 18A, 18B: HEAT-TREATED MOTHER TINCTURES)

Methods 1.2.1 and 1.2.2 are used for fresh herbal drugs containing generally less than 70 per cent of expressed juice and more than 60 per cent moisture (loss on drying) and no essential oil or resin.

Mother tinctures prepared according to Methods 1.2.1 (ethanol content approximately 50 per cent *V/V*) and 1.2.2 (ethanol content approximately 36 per cent *V/V*) are

ethanolic digestions prepared by heat treatment and additional maceration as described below.

Comminute appropriately the herbal drug.

Take a sample and determine the loss on drying (2.2.32).

Unless otherwise prescribed, determine the loss on drying on 2.00-5.00 g of the comminuted herbal drug and dry at 105 °C for 2 h.

To the comminuted herbal drug immediately add not less than half the mass of ethanol of the concentration prescribed below and allow to stand in well-closed containers:

- Method 1.2.1: ethanol (90 per cent *V/V*);
- Method 1.2.2: ethanol (70 per cent *V/V*).

Use the following expression to calculate the amount ( $A_2$ ), in kilograms, of ethanol of the appropriate concentration required for the mass ( $m$ ) of raw material, then subtract the amount of ethanol of the appropriate concentration already added and add the difference to the mixture.

$$\frac{m \times T}{100}$$

- $m$  = mass of raw material, in kilograms;  
 $T$  = percentage loss on drying of the sample.

Warm the mixture containing the total amount of ethanol of the appropriate concentration to 37 °C in a covered container and maintain at this temperature for 1 h, swirling from time to time. Cool, allow to stand for not less than 10 days, swirling from time to time, then express the mixture and filter the resulting liquid.

#### Adjustment to any value as specified in the individual monograph

Determine the percentage dry residue (2.8.16) or, where prescribed, the percentage assay content of the above-mentioned filtrate. Calculate the amount ( $A_1$ ), in kilograms, of ethanol of the appropriate concentration required, using the following expression:

$$\frac{m \times (N_x - N_0)}{N_0}$$

- $m$  = mass of filtrate, in kilograms;  
 $N_0$  = percentage dry residue or percentage assay content as required in the individual monograph;  
 $N_x$  = percentage dry residue or percentage assay content of the filtrate.

Mix the filtrate with the required amount of ethanol of the concentration prescribed below:

- Method 1.2.1: ethanol (50 per cent *V/V*);
- Method 1.2.2: ethanol (36 per cent *V/V*).

Allow to stand for not less than 5 days, then filter if necessary.

#### Potentiation

The 1<sup>st</sup> 'decimal' dilution (D1) is made from:

- 2 parts of the mother tincture;
- 8 parts of ethanol (50 per cent *V/V*) (Method 1.2.1) or ethanol (36 per cent *V/V*) (Method 1.2.2).

The 2<sup>nd</sup> decimal dilution (D2) is made from:

- 1 part of the 1<sup>st</sup> 'decimal' dilution;
- 9 parts of ethanol (36 per cent *V/V*) (Method 1.2.1) or ethanol (18 per cent *V/V*) (Method 1.2.2).

The 3<sup>rd</sup> decimal dilution (D3) is made from:

- 1 part of the 2<sup>nd</sup> decimal dilution;
- 9 parts of ethanol (18 per cent *V/V*).

Subsequent decimal dilutions are produced as stated for D3.

**METHODS 1.2.3, 1.2.4, 1.2.5. ETHANOLIC DIGESTIONS (HAB 18C, 18D, 18E: HEAT-TREATED MOTHER TINCTURES)**

Methods 1.2.3, 1.2.4 and 1.2.5 are used for fresh herbal drugs containing essential oil or resin or generally less than 60 per cent moisture.

Mother tinctures prepared according to Methods 1.2.3 (ethanol content approximately 65 per cent *V/V*), 1.2.4 (ethanol content approximately 57 per cent *V/V*) and 1.2.5 (ethanol content approximately 35 per cent *V/V*) are ethanolic digestions prepared by heat treatment and additional maceration as described below.

Comminute appropriately the herbal drug.

Determine the water content (2.2.13) or loss on drying (2.2.32). Unless otherwise prescribed, determine the loss on drying on 2.00-5.00 g of the comminuted herbal drug and dry at 105 °C for 2 h.

To the comminuted herbal drug immediately add not less than half the mass of ethanol of the concentration prescribed below and allow to stand in well-closed containers:

- Method 1.2.3: ethanol (90 per cent *V/V*);
- Method 1.2.4: ethanol (80 per cent *V/V*);
- Method 1.2.5: ethanol (50 per cent *V/V*).

Use the following expression to calculate the amount ( $A_2$ ), in kilograms, of ethanol of the appropriate concentration required for the mass ( $m$ ) of raw material, then subtract the amount of ethanol of the appropriate concentration already added and add the difference to the mixture.

$$\frac{2 \times m \times T}{100}$$

- $m$  = mass of raw material, in kilograms;  
 $T$  = percentage loss on drying of the sample.

Warm the mixture containing the total amount of ethanol of the appropriate concentration to 37 °C in a covered container and maintain at this temperature for 1 h, swirling from time to time. Cool, allow to stand for not less than 10 days, swirling from time to time, then express the mixture and filter the resulting liquid.

**Adjustment to any value as specified in the individual monograph**

Determine the percentage dry residue (2.8.16) or, where prescribed, the percentage assay content of the above-mentioned filtrate. Calculate the amount ( $A_1$ ), in kilograms, of ethanol of the appropriate concentration required, using the following expression:

$$\frac{m \times (N_x - N_0)}{N_0}$$

- $m$  = mass of filtrate, in kilograms;  
 $N_0$  = percentage dry residue or percentage assay content as required in the individual monograph;  
 $N_x$  = percentage dry residue or percentage assay content of the filtrate.

Mix the filtrate with the required amount of ethanol of the concentration prescribed below:

- Method 1.2.3: ethanol (70 per cent *V/V*);
- Method 1.2.4: ethanol (50 per cent *V/V*);
- Method 1.2.5: ethanol (36 per cent *V/V*).

Allow to stand for not less than 5 days, then filter if necessary.

**Potentiation**

The 1<sup>st</sup> 'decimal' dilution (D1) is made from:

- 3 parts of the mother tincture;

- 7 parts of ethanol (70 per cent *V/V*) (Method 1.2.3), ethanol (50 per cent *V/V*) (Method 1.2.4) or ethanol (36 per cent *V/V*) (Method 1.2.5).

The 2<sup>nd</sup> decimal dilution (D2) is made from:

- 1 part of the 1<sup>st</sup> 'decimal' dilution;
- 9 parts of ethanol (50 per cent *V/V*) (Method 1.2.3), ethanol (36 per cent *V/V*) (Method 1.2.4) or ethanol (18 per cent *V/V*) (Method 1.2.5).

Subsequent decimal dilutions are produced accordingly. In this process the ethanol concentration is reduced with each step, according to the sequence 70 per cent *V/V* - 50 per cent *V/V* - 36 per cent *V/V* - 18 per cent *V/V*.

**METHOD 1.2.6. ETHANOLIC DIGESTIONS (HAB 18F: HEAT-TREATED MOTHER TINCTURES)**

Method 1.2.6 is used for dried herbal drugs.

Mother tinctures prepared according to Method 1.2.6 are ethanolic digestions prepared by heat treatment and additional maceration as described below, using 1 part of dried herbal drug and 10 parts of ethanol of the appropriate concentration (96 per cent *V/V*, 90 per cent *V/V*, 80 per cent *V/V*, 70 per cent *V/V*, 50 per cent *V/V*, 36 per cent *V/V*, 18 per cent *V/V*), unless otherwise prescribed in the individual monograph.

Unless otherwise prescribed, comminute appropriately the herbal drug, mix thoroughly with the total amount of ethanol of the appropriate concentration, warm the mixture to 37 °C in a covered container and maintain at this temperature for 1 h, swirling from time to time. Cool, then allow to stand in a closed container for an appropriate time. After sedimentation, decant the supernatant and, if necessary, press out. In the latter case, combine the 2 liquids obtained. Filter the resulting liquid.

**Adjustment to any value as specified in the individual monograph**

Determine the percentage dry residue (2.8.16) or, where prescribed, the percentage assay content of the above-mentioned filtrate. Calculate the amount ( $A_1$ ), in kilograms, of ethanol of the appropriate concentration required to obtain the concentration specified or used for production, using the following expression:

$$\frac{m \times (N_x - N_0)}{N_0}$$

- $m$  = mass of the filtrate, in kilograms;  
 $N_0$  = percentage dry residue or percentage assay content as required in the individual monograph;  
 $N_x$  = percentage dry residue or percentage assay content of the filtrate.

Mix the filtrate with the calculated amount of ethanol of the appropriate concentration. Allow to stand for not less than 5 days, then filter if necessary.

**Potentiation**

The mother tincture corresponds to the 1<sup>st</sup> 'decimal' dilution ( $\emptyset = D1$ ).

The 2<sup>nd</sup> decimal dilution (D2) is made from:

- 1 part of the mother tincture (D1);
- 9 parts of ethanol of the same concentration.

Subsequent decimal dilutions are produced accordingly. In this process the ethanol concentration is reduced with each step, according to the sequence 96 per cent *V/V* - 90 per cent *V/V* - 80 per cent *V/V* - 70 per cent *V/V* - 50 per cent *V/V* - 36 per cent *V/V* - 18 per cent *V/V*.

**METHODS 1.2.7, 1.2.8. ETHANOLIC DECOCTIONS (HAB 19A, 19B; HEAT-TREATED MOTHER TINCTURES)**

Methods 1.2.7 and 1.2.8 are used for fresh herbal drugs containing generally less than 70 per cent of expressed juice and more than 60 per cent moisture (loss on drying) and no essential oil or resin.

Mother tinctures prepared according to Methods 1.2.7 (ethanol content approximately 50 per cent *V/V*) and 1.2.8 (ethanol content approximately 36 per cent *V/V*) are ethanolic decoctions prepared by heat treatment and additional maceration as described below.

Comminute appropriately the herbal drug.

Take a sample and determine the loss on drying (2.2.32). Unless otherwise prescribed, determine the loss on drying on 2.00-5.00 g of the comminuted herbal drug and dry at 105 °C for 2 h.

To the comminuted herbal drug immediately add not less than half the mass of ethanol of the concentration prescribed below and allow to stand in well-closed containers:

- Method 1.2.7: ethanol (90 per cent *V/V*);
- Method 1.2.8: ethanol (70 per cent *V/V*).

Use the following expression to calculate the amount ( $A_2$ ), in kilograms, of ethanol of the appropriate concentration required for the mass of raw material, then subtract the amount of ethanol of the appropriate concentration already added and add the difference to the mixture.

$$\frac{m \times T}{100}$$

- $m$  = mass of raw material, in kilograms;  
 $T$  = percentage loss on drying of the sample.

Heat the mixture containing the total amount of ethanol of the appropriate concentration to boiling under reflux, and maintain for 30 min, unless otherwise specified in the individual monograph. Cool or allow to cool, allow to stand in a closed container for 12-36 h, then express the mixture and filter the resulting liquid.

**Adjustment to any value as specified in the individual monograph**

Determine the percentage dry residue (2.8.16) or, where prescribed, the percentage assay content of the above-mentioned filtrate. Calculate the amount ( $A_1$ ), in kilograms, of ethanol of the appropriate concentration required, using the following expression:

$$\frac{m \times (N_x - N_0)}{N_0}$$

- $m$  = mass of filtrate, in kilograms;  
 $N_0$  = percentage dry residue or percentage assay content as required in the individual monograph;  
 $N_x$  = percentage dry residue or percentage assay content of the filtrate.

Mix the filtrate with the required amount of ethanol of the concentration prescribed below:

- Method 1.2.7: ethanol (50 per cent *V/V*);
- Method 1.2.8: ethanol (36 per cent *V/V*).

Allow to stand for not less than 5 days, then filter if necessary.

**Potentisation**

The 1<sup>st</sup> 'decimal' dilution (D1) is made from:

- 2 parts of the mother tincture;
- 8 parts of ethanol (50 per cent *V/V*) (Method 1.2.7) or ethanol (36 per cent *V/V*) (Method 1.2.8).

The 2<sup>nd</sup> decimal dilution (D2) is made from:

- 1 part of the 1<sup>st</sup> 'decimal' dilution;
- 9 parts of ethanol (36 per cent *V/V*) (Method 1.2.7) or ethanol (18 per cent *V/V*) (Method 1.2.8).

The 3<sup>rd</sup> decimal dilution (D3) is made from:

- 1 part of the 2<sup>nd</sup> decimal dilution;
- 9 parts of ethanol (18 per cent *V/V*).

Subsequent decimal dilutions are produced as stated for D3.

**METHODS 1.2.9, 1.2.10, 1.2.11. ETHANOLIC DECOCTIONS (HAB 19C, 19D, 19E; HEAT-TREATED MOTHER TINCTURES)**

Methods 1.2.9, 1.2.10 and 1.2.11 are used for fresh herbal drugs containing essential oil or resin or generally less than 65 per cent moisture.

Mother tinctures prepared according to Methods 1.2.9 (ethanol content approximately 65 per cent *V/V*), 1.2.10 (ethanol content approximately 57 per cent *V/V*) and 1.2.11 (ethanol content approximately 35 per cent *V/V*) are ethanolic decoctions prepared by heat treatment and additional maceration as described below.

Comminute appropriately the herbal drug.

Determine the water content (2.2.13) or loss on drying (2.2.32). Unless otherwise prescribed, determine the loss on drying on 2.00-5.00 g of the comminuted herbal drug and dry at 105 °C for 2 h.

To the comminuted herbal drug immediately add not less than half the mass of ethanol of the concentration prescribed below and allow to stand in well-closed containers:

- Method 1.2.9: ethanol (90 per cent *V/V*);
- Method 1.2.10: ethanol (80 per cent *V/V*);
- Method 1.2.11: ethanol (50 per cent *V/V*).

Use the following expression to calculate the amount ( $A_2$ ), in kilograms, of ethanol of the appropriate concentration required for the mass of raw material, then subtract the amount of ethanol of the appropriate concentration already added and add the difference to the mixture.

$$\frac{2 \times m \times T}{100}$$

- $m$  = mass of raw material, in kilograms;  
 $T$  = percentage loss on drying of the sample.

Heat the mixture containing the total amount of ethanol of the appropriate concentration to boiling under reflux, and maintain for 30 min, unless otherwise specified in the individual monograph. Cool or allow to cool, then allow to stand in a closed container for 12-36 h, express the mixture and filter the resulting liquid.

**Adjustment to any value as specified in the individual monograph**

Determine the percentage dry residue (2.8.16) or, where prescribed, the percentage assay content of the above-mentioned filtrate. Calculate the amount ( $A_1$ ), in kilograms, of ethanol of the appropriate concentration required, using the following expression:

$$\frac{m \times (N_x - N_0)}{N_0}$$

- $m$  = mass of filtrate, in kilograms;  
 $N_0$  = percentage dry residue or percentage assay content as required in the individual monograph;  
 $N_x$  = percentage dry residue or percentage assay content of the filtrate.

Mix the filtrate with the required amount of ethanol of the concentration prescribed below:

- Method 1.2.9: ethanol (70 per cent *V/V*);
- Method 1.2.10: ethanol (50 per cent *V/V*);
- Method 1.2.11: ethanol (36 per cent *V/V*).

Allow to stand for not less than 5 days, then filter if necessary.

#### Potentisation

The 1<sup>st</sup> 'decimal' dilution (D1) is made from:

- 3 parts of the mother tincture;
- 7 parts of ethanol (70 per cent *V/V*) (Method 1.2.9), ethanol (50 per cent *V/V*) (Method 1.2.10) or ethanol (36 per cent *V/V*) (Method 1.2.11).

The 2<sup>nd</sup> decimal dilution (D2) is made from:

- 1 part of the 1<sup>st</sup> 'decimal' dilution;
- 9 parts of ethanol (50 per cent *V/V*) (Method 1.2.9), ethanol (36 per cent *V/V*) (Method 1.2.10) or ethanol (18 per cent *V/V*) (Method 1.2.11).

Subsequent decimal dilutions are produced accordingly. In this process the ethanol concentration is reduced with each step, according to the sequence 70 per cent *V/V* - 50 per cent *V/V* - 36 per cent *V/V* - 18 per cent *V/V*.

#### METHOD 1.2.12. ETHANOLIC DECOCTIONS (HAB 19F: HEAT-TREATED MOTHER TINCTURES)

Method 1.2.12 is used for dried herbal drugs.

Mother tinctures prepared according to Method 1.2.12 are ethanolic decoctions prepared by heat treatment and additional maceration as described below, using 1 part of dried herbal drug and 10 parts of ethanol of the appropriate concentration (96 per cent *V/V*, 90 per cent *V/V*, 80 per cent *V/V*, 70 per cent *V/V*, 50 per cent *V/V*, 36 per cent *V/V*, 18 per cent *V/V*), unless otherwise prescribed in the individual monograph.

Unless otherwise prescribed, comminute appropriately the herbal drug, mix thoroughly with the total amount of ethanol of the appropriate concentration, heat to boiling under reflux and maintain for 30 min. Cool or allow to cool, then allow to stand in a closed container for 12-36 h. After sedimentation, decant the supernatant and, if necessary, press out. In the latter case, combine the 2 liquids obtained. Filter the resulting liquid.

#### Adjustment to any value as specified in the individual monograph

Determine the percentage dry residue (2.8.16) or, where prescribed, the percentage assay content of the above-mentioned filtrate. Calculate the amount ( $A_1$ ), in kilograms, of ethanol of the appropriate concentration required to obtain the concentration specified or used for production, using the following expression:

$$\frac{m \times (N_x - N_0)}{N_0}$$

- $m$  = mass of filtrate, in kilograms;  
 $N_0$  = percentage dry residue or percentage assay content as required in the individual monograph;  
 $N_x$  = percentage dry residue or percentage assay content of the filtrate.

Mix the filtrate with the required amount of ethanol of the appropriate concentration. Allow to stand for not less than 5 days, then filter if necessary.

#### Potentisation

The mother tincture corresponds to the 1<sup>st</sup> 'decimal' dilution ( $\emptyset = D1$ ).

The 2<sup>nd</sup> decimal dilution (D2) is made from:

- 1 part of the mother tincture (D1);
- 9 parts of ethanol of the same concentration.

Subsequent decimal dilutions are produced accordingly. In this process the ethanol concentration is reduced with each step, according to the sequence 96 per cent *V/V* - 90 per cent *V/V* - 80 per cent *V/V* - 70 per cent *V/V* - 50 per cent *V/V* - 36 per cent *V/V* - 18 per cent *V/V*.

#### METHOD 1.2.13. ETHANOLIC INFUSIONS (HAB 20: HEAT-TREATED MOTHER TINCTURES)

Method 1.2.13 is used for dried herbal drugs.

Mother tinctures prepared according to Method 1.2.13 are ethanolic infusions prepared by heat treatment and additional maceration as described below using 1 part of dried herbal drug and 10 parts of ethanol of the appropriate concentration (90 per cent *V/V*, 80 per cent *V/V*, 70 per cent *V/V*, 50 per cent *V/V*, 36 per cent *V/V*, 18 per cent *V/V*), unless otherwise prescribed in the individual monograph.

The quantities of ethanol (96 per cent *V/V*) and purified water required to achieve the specified ethanol concentration are added separately as described below.

Unless otherwise prescribed, comminute appropriately the herbal drug, mix thoroughly with the total amount of ethanol (96 per cent *V/V*), cover and allow to stand for 15 min. Add the purified water (heated to boiling) and heat the mixture to boiling under reflux for 5 min. Cool, or allow to cool, then allow to stand in a closed container for 12-36 h. After sedimentation, decant the supernatant and, if necessary, press out. In the latter case, combine the 2 liquids obtained. Filter the resulting liquid.

#### Adjustment to any value as specified in the individual monograph

Determine the percentage dry residue (2.8.16) or, where prescribed, the percentage assay content of the above-mentioned filtrate. Calculate the amount ( $A_1$ ), in kilograms, of ethanol of the appropriate concentration required to obtain the concentration specified or used for production, using the following expression:

$$\frac{m \times (N_x - N_0)}{N_0}$$

- $m$  = mass of filtrate, in kilograms;  
 $N_0$  = percentage dry residue or percentage assay content as required in the individual monograph;  
 $N_x$  = percentage dry residue or percentage assay content of the filtrate.

Mix the filtrate with the required amount of ethanol of the appropriate concentration. Allow to stand for not less than 5 days, then filter if necessary.

#### Potentisation

The mother tincture corresponds to the 1<sup>st</sup> 'decimal' dilution ( $\emptyset = D1$ ).

The 2<sup>nd</sup> decimal dilution (D2) is made from:

- 1 part of the mother tincture (D1);
- 9 parts of ethanol of the same concentration.

Subsequent decimal dilutions are produced accordingly. In this process the ethanol concentration is reduced with each step, according to the sequence 90 per cent *V/V* - 80 per cent *V/V* - 70 per cent *V/V* - 50 per cent *V/V* - 36 per cent *V/V* - 18 per cent *V/V*.

#### METHOD 1.3. AQUEOUS MOTHER TINCTURES PREPARED WITHOUT HEATING

##### METHOD 1.3.1. AQUEOUS MACERATES (HAB 49: AQUEOUS MOTHER TINCTURES)

Method 1.3.1 is used for fresh herbal drugs.

Mother tinctures prepared according to Method 1.3.1 are aqueous macerates prepared by short maceration with water as described below. This method is used solely in the manufacture of injections and eye preparations.

Comminute appropriately the herbal drug.

Take a sample and determine the loss on drying (2.2.32). Unless otherwise prescribed, determine the loss on drying on 2.00-5.00 g of the comminuted herbal drug and dry at 105 °C for 2 h.

Use the following expression to calculate the amount, in kilograms, of water required for the mass of raw material:

$$\frac{m \times (300 - T)}{100}$$

$m$  = mass of raw material, in kilograms;  
 $T$  = percentage loss on drying of the sample.

Add the comminuted herbal drug to the calculated amount of water. Allow to stand for 2 h, then express the mixture and filter the resulting liquid. The mother tincture is used immediately, unless otherwise justified.

#### Potentiation

The 1<sup>st</sup> 'decimal' dilution (D1) is made from:

- 3 parts of the mother tincture;
- 7 parts of water for injection.

The 2<sup>nd</sup> decimal dilution (D2) is made from:

- 1 part of the 1<sup>st</sup> 'decimal' dilution;
- 9 parts of water for injection.

Subsequent decimal dilutions are produced as stated for D2.

#### METHOD 1.4. AQUEOUS MOTHER TINCTURES PREPARED WITH HEATING

##### METHOD 1.4.1. AQUEOUS DIGESTIONS (HAB 24B: HEAT-TREATED AQUEOUS MOTHER TINCTURES)

Method 1.4.1 is used for fresh herbal drugs.

Mother tinctures prepared according to Method 1.4.1 are aqueous digestions prepared by heat treatment with water as described below. This method is solely used in the preparation of injections, eye preparations and coated homoeopathic pillules.

Comminute appropriately the herbal drug.

Take a sample and determine the loss on drying (2.2.32). Unless otherwise prescribed, determine the loss on drying on 2.00-5.00 g of the comminuted herbal drug and dry at 105 °C for 2 h.

Use the following expression to calculate the amount, in kilograms, of water required for the mass of raw material:

$$\frac{m \times (400 - T)}{100}$$

$m$  = mass of raw material, in kilograms;  
 $T$  = percentage loss on drying of the sample.

Heat the mixture containing the total amount of water in a covered container to 37 °C and maintain at this temperature for 1 h, swirling from time to time. Express the mixture and filter the resulting liquid. The mother tincture is used immediately, unless otherwise justified.

#### Potentiation

The 1<sup>st</sup> 'decimal' dilution (D1) is made from:

- 4 parts of the mother tincture;
- 6 parts of water for injection.

The 2<sup>nd</sup> decimal dilution (D2) is made from:

- 1 part of the 1<sup>st</sup> 'decimal' dilution;
- 9 parts of water for injection.

Subsequent decimal dilutions are produced as stated for D2.

##### METHOD 1.4.2. AQUEOUS DECOCTIONS (HAB 23B: HEAT-TREATED AQUEOUS MOTHER TINCTURES)

Method 1.4.2 is used for fresh herbal drugs.

Mother tinctures prepared according to Method 1.4.2 are aqueous decoctions prepared by heat treatment with water as described below. This method is solely used in the preparation of injections, eye preparations and coated homoeopathic pillules.

Comminute appropriately the herbal drug.

Take a sample and determine the loss on drying (2.2.32).

Unless otherwise prescribed, determine the loss on drying on 2.00-5.00 g of the comminuted herbal drug and dry at 105 °C for 2 h.

Use the following expression to calculate the amount, in kilograms, of water required for the mass of raw material:

$$\frac{m \times (300 - T)}{100}$$

$m$  = mass of raw material, in kilograms;  
 $T$  = percentage loss on drying of the sample.

Heat the calculated amount of water to above 90 °C and add the comminuted herbal drug. Maintain the mixture at this temperature under reflux for 30 min, then express the mixture and filter the resulting liquid. The mother tincture is used immediately, unless otherwise justified.

#### Potentiation

The 1<sup>st</sup> 'decimal' dilution (D1) is made from:

- 3 parts of the mother tincture;
- 7 parts of water for injection.

The 2<sup>nd</sup> decimal dilution (D2) is made from:

- 1 part of the 1<sup>st</sup> 'decimal' dilution;
- 9 parts of water for injection.

Subsequent decimal dilutions are produced as stated for D2.

##### METHOD 1.4.3. AQUEOUS DECOCTIONS (HAB 23A: HEAT-TREATED AQUEOUS MOTHER TINCTURES)

Method 1.4.3 is used for dried herbal drugs.

Mother tinctures prepared according to Method 1.4.3 are aqueous decoctions prepared by heat treatment with water as described below. This method is solely used in the preparation of injections, eye preparations and coated homoeopathic pillules.

Comminute appropriately the herbal drug.

Mix 1 part of the comminuted dried herbal drug with 10 parts of boiling water and boil under reflux for 30 min, unless otherwise specified in the individual monograph. Filter while hot. If gentle pressure applied to the residue does not achieve a final mass of mother tincture equal to 10 parts, pour a sufficient amount of boiling water over the residue and express gently. Use the resulting extract to make the mother tincture up to 10 parts. Filter the combined liquid. The filtrate is the mother tincture. The mother tincture is used immediately, unless otherwise justified.

For starch-containing material process 1 part of herbal drug with 100 parts of water. In that case the mother tincture corresponds to the 2<sup>nd</sup> decimal dilution ( $\emptyset = D2$ ).

#### Potentiation

The mother tincture corresponds to the 1<sup>st</sup> 'decimal' dilution ( $\emptyset = D1$ ).

The 2<sup>nd</sup> decimal dilution (D2) is made from:

- 1 part of the mother tincture (D1);
- 9 parts of water for injection.

Subsequent decimal dilutions are produced as stated for D2.  
**METHOD 1.4.4. AQUEOUS INFUSIONS (HAB 24A: HEAT-TREATED AQUEOUS MOTHER TINCTURES)**

Method 1.4.4 is used for dried herbal drugs.

Mother tinctures prepared according to Method 1.4.4 are aqueous infusions prepared by heat treatment with water and additional maceration as described below. This method is solely used in the preparation of injections, eye preparations and coated homoeopathic pillules.

Comminute appropriately the herbal drug.

1 part of dried herbal drug is extracted with 10 parts of water.

Grind 1 part of the comminuted herbal drug in a mortar thoroughly with 3-5 parts of water, allow to stand for 15 min, then add the remainder of the water, which has been heated to boiling point. Place the mixture in a water-bath and maintain at a temperature above 90 °C for 5 min, swirling from time to time. Cover, allow to cool, then separate the residue from the liquid. If gentle pressure applied to the residue does not achieve a final mass of mother tincture equal to 10 parts, pour a sufficient amount of cold water over the residue and express gently. Use the resulting extract to make the mother tincture up to 10 parts. Filter the combined liquid. The filtrate is the mother tincture. The mother tincture is used immediately, unless otherwise justified.

#### Potentiation

The mother tincture corresponds to the 1<sup>st</sup> 'decimal' dilution ( $\emptyset = D1$ ).

The 2<sup>nd</sup> decimal dilution (D2) is made from:

- 1 part of the mother tincture (D1);
- 9 parts of water for injection.

Subsequent decimal dilutions are produced as stated for D2.

## 2. GLYCEROL MACERATES

### METHOD 2.1

Method 2.1 is used for maceration of raw materials of animal or herbal origin in glycerol (85 per cent) or glycerol/ethanol mixtures of appropriate concentration. Pathological material is excluded.

The raw materials are finely minced before use, where appropriate.

#### METHODS 2.1.1, 2.1.2 (HAB 42A AND 42B: MOTHER TINCTURES AND LIQUID DILUTIONS THEREOF)

Raw materials of animal origin - freshly killed animals or parts thereof - are used. Animals are processed immediately after being killed.

#### Maceration

Disperse 1 part of finely minced animal material in:

- 9 parts (decimal dilutions) or 99 parts (centesimal dilutions) of glycerol (85 per cent) for Method 2.1.1; or
- 2.1 parts of glycerol (85 per cent) for Method 2.1.2.

Allow to macerate for at least 2 h, then succuss. Filter when necessary.

Where justified, 1 part of glycerol (85 per cent) may be added to 1 part of animal material before mincing. Where very small amounts of animal material are used, the dilution may be prepared by dispersing 1 part of finely minced animal material in 99 parts of glycerol (85 per cent) (C1 or 'D2' if to be used for further decimal dilutions).

#### Potentiation

##### Method 2.1.1

The 2<sup>nd</sup> decimal dilution (D2) is made from:

- 1 part of the glycerol macerate D1;
- 9 parts of glycerol (85 per cent) or ethanol (18 per cent *V/V*).

Subsequent decimal dilutions are produced as stated for D2 but with ethanol (18 per cent *V/V*) as the vehicle.

The 2<sup>nd</sup> centesimal dilution (C2) is made from:

- 1 part of the glycerol macerate C1;
- 99 parts of ethanol (18 per cent *V/V*).

Subsequent centesimal dilutions are produced as stated for C2.

##### Method 2.1.2

The 1<sup>st</sup> 'decimal' dilution (D1) is made from:

- 3 parts of the glycerol macerate;
- 7 parts of water for injections.

The 2<sup>nd</sup> decimal dilution (D2) is made from:

- 1 part of D1;
- 9 parts of water for injections.

Subsequent decimal dilutions are produced as stated for D2.

#### METHOD 2.1.3 (FRENCH PHARMACOPOEIA)

Raw materials of herbal or animal origin are used.

#### Maceration

Comminute the raw material appropriately. Take a sample and determine the loss on drying at 105 °C for 2 h (2.2.32) or the water content (2.2.13). Taking this value into account, calculate and add to the raw material the quantity of the ethanol/glycerol mixture of the appropriate concentration to produce, unless otherwise prescribed, a 1 in 20 glycerol macerate. Allow to macerate for at least 21 days, with sufficient shaking. Decant and strain under pressure if necessary. Allow the combined liquids to stand for 48 h and filter.

#### Potentiation

The 1<sup>st</sup> decimal dilution (D1) is made from:

- 1 part of the glycerol macerate;
- 9 parts of a water/ethanol/glycerol mixture of appropriate concentration.

The 2<sup>nd</sup> decimal dilution (D2) is made from:

- 1 part of the 1<sup>st</sup> decimal dilution;
- 9 parts of a water/ethanol/glycerol mixture of appropriate concentration.

Subsequent decimal dilutions are produced as stated for D2 or using another appropriate vehicle.

The 1<sup>st</sup> centesimal dilution (C1) is made from:

- 1 part of the glycerol macerate;
- 99 parts of a water/ethanol/glycerol mixture of appropriate concentration.

The 2<sup>nd</sup> centesimal dilution (C2) is made from:

- 1 part of the 1<sup>st</sup> centesimal dilution;
- 99 parts of a water/ethanol/glycerol mixture of appropriate concentration.

Subsequent centesimal dilutions are produced as stated for C2 or using another appropriate vehicle.

### METHOD 2.2

#### METHODS 2.2.1, 2.2.2, 2.2.3, 2.2.4 (HAB 41A, 41B, 41C AND 41D: GLYCEROL MOTHER TINCTURES AND LIQUID DILUTIONS THEREOF)

Method 2.2 is used for maceration of raw materials of animal origin in a glycerol solution containing sodium chloride. Pathological material is excluded.

Raw materials from freshly killed animals, parts or secretions thereof are used in Methods 2.2.1, 2.2.2 and 2.2.3. Lower

animals are killed with carbon dioxide in a covered vessel. All animals are processed immediately after being killed. Blood components from live horses are used in method 2.2.4.

**Sample collection and/or pre-treatment**

The raw materials used in Methods 2.2.1, 2.2.2 and 2.2.3 are finely minced before use, where appropriate.

The blood used in Method 2.2.4 is collected by a veterinarian. Blood obtained from animals killed by bleeding must not be used. Take 200 mL of this blood and add 15 IU of heparin sodium and 0.625 mL of a 9 g/kg solution of sodium chloride per millilitre. Separate the blood components by fractional centrifugation and resuspend each individual cell sediment in 1.1 mL of a 9 g/kg solution of sodium chloride. These cell suspensions are processed into the glycerol macerate.

**Maceration**

Mix 1 part of finely minced animal material, secretions or blood cell suspensions, according to the method used, with 5 parts of a sodium chloride solution of the appropriate concentration (see Table 2371.-1) and 95 parts of glycerol. Allow to stand protected from light for at least 7 days, then decant. If necessary for Methods 2.2.1, 2.2.2 and 2.2.3, centrifuge before decanting, then filter the supernatant if necessary. The decanted liquid or the filtrate respectively is the glycerol macerate.

Any sediment present must be resuspended before processing the glycerol macerate.

Table 2371.-1

Methods 2.2.1 and 2.2.4	Method 2.2.2	Method 2.2.3
15 g/kg solution of sodium chloride in purified water	40 g/kg solution of sodium chloride in purified water	80 g/kg solution of sodium chloride in purified water

**Vehicle**

0.2 parts of sodium hydrogen carbonate and 8.8 parts of sodium chloride in 991 parts of water for injections or purified water as appropriate.

**Potentisation**

The glycerol macerate corresponds to the 2<sup>nd</sup> decimal dilution ('D2') or the 1<sup>st</sup> centesimal dilution (C1).

The 3<sup>rd</sup> decimal dilution (D3) is made from:

- 1 part of the 2<sup>nd</sup> decimal dilution;
- 9 parts of the appropriate vehicle.

Subsequent decimal dilutions are produced as stated for D3.

Where appropriate, the 4<sup>th</sup> decimal dilution (D4) is made from 1 part of the 3<sup>rd</sup> decimal dilution, 5.6 parts of the vehicle and 3.4 parts of water for injections.

The 2<sup>nd</sup> centesimal dilution (C2) is made from:

- 1 part of the 1<sup>st</sup> centesimal dilution;
- 99 parts of the appropriate vehicle.

Subsequent centesimal dilutions are produced as stated for C2.

**3. LIQUID DILUTIONS**

**METHOD 3.1**

Methods 3.1.1, 3.1.2 and 3.1.3 are used for dissolution of any suitable inorganic or organic starting material, for example minerals or venoms.

Unless otherwise specified, dissolve 1 part of the starting material in 9 parts (D1) or 99 parts (C1) of the liquid vehicle and succuss.

Where justified and authorised, in case of insufficient solubility of the starting material in the specified vehicle, directly produce the first possible dilution. For example, if the starting material is slightly soluble, dissolve 1 part of the starting material in 99 parts of the vehicle (C1 or 'D2' if to be used for further decimal dilutions).

**METHODS 3.1.1, 3.1.2 (HAB 5A, 5B: SOLUTIONS, AQUEOUS SOLUTIONS)**

**Vehicles**

The vehicles in Table 2371.-2 may be used.

Table 2371.-2

Method 3.1.1	Method 3.1.2
Anhydrous ethanol	Water for injections
Ethanol (96 per cent V/V)	Purified water
Ethanol (90 per cent V/V)	
Ethanol (80 per cent V/V)	
Ethanol (70 per cent V/V)	
Ethanol (50 per cent V/V)	
Ethanol (36 per cent V/V)	
Ethanol (18 per cent V/V)	
Purified water	
Glycerol (85 per cent)	

For Method 3.1.1, if ethanol (18 per cent V/V) is used, the starting material may be dissolved in 7.58 parts of purified water and the ethanol concentration adjusted by adding 1.42 parts of ethanol (96 per cent V/V) to the solution, for decimal dilutions. For centesimal dilutions, use 83.4 parts of purified water for 15.6 parts of ethanol (96 per cent V/V).

For Method 3.1.2, if the starting material is not stable and/or soluble in water, glycerol (85 per cent) may be added at a concentration of not more than 35 per cent of the vehicle, for potentisation up to D4.

**Potentisation**

Unless otherwise specified, the 2<sup>nd</sup> decimal dilution (D2) is made from:

- 1 part of the 1<sup>st</sup> decimal dilution (D1);
- 9 parts of ethanol (50 per cent V/V) for Method 3.1.1 or 9 parts of water for injections (or purified water, as appropriate) for Method 3.1.2.

Subsequent decimal dilutions are produced as stated for D2.

Unless otherwise specified, the 2<sup>nd</sup> centesimal dilution (C2) is made from:

- 1 part of the 1<sup>st</sup> centesimal dilution (C1);
- 99 parts of ethanol (50 per cent V/V) for Method 3.1.1 or 99 parts of water for injections (or purified water, as appropriate) for Method 3.1.2.

Subsequent centesimal dilutions are produced as stated for C2.

**Additives**

For Method 3.1.1, if a reaction such as precipitation is observed in the final dilution, the following additives may be used to enhance stability and/or solubility, unless otherwise specified:

- glacial acetic acid;
- concentrated hydrochloric acid;
- lactic acid;
- sodium hydroxide.

Where solutions or dilutions have been pH-adjusted, they must not be potentised further.

**METHOD 3.1.3**

**Vehicles**

Suitable vehicles, for example, ethanol of an appropriate concentration, glycerol or purified water may be used alone or combined.

**Potentisation**

Unless otherwise specified, the 2<sup>nd</sup> decimal dilution (D2) is made from:

- 1 part of the 1<sup>st</sup> decimal dilution (D1);
- 9 parts of the appropriate vehicle.

Subsequent decimal dilutions are produced as stated for D2.

Unless otherwise specified, the 2<sup>nd</sup> centesimal dilution (C2) is made from:

- 1 part of the 1<sup>st</sup> centesimal dilution (C1);
- 99 parts of the appropriate vehicle.

Subsequent centesimal dilutions are produced as stated for C2.

**METHOD 3.2**

Method 3.2 is generally used to produce liquid dilutions of triturations of substances that for the most part are sparingly soluble to practically insoluble.

**METHODS 3.2.1, 3.2.2 (HAB 8A, 8B: LIQUID PREPARATIONS MADE FROM TRITURATIONS, AQUEOUS PREPARATIONS MADE FROM TRITURATIONS)**

Preparations made according to Method 3.2.1 and Method 3.2.2 are produced from triturations D4, D5 and D6 or from triturations C4, C5 and C6, prepared according to method 4.1.1 by at least 2 potentisation steps.

**Vehicles**

The vehicles in Table 2371.-3 may be used.

Table 2371.-3

Method 3.2.1	Method 3.2.2
1 <sup>st</sup> potentisation: Purified water	All potentisations: Water for injections Purified water
2 <sup>nd</sup> potentisation: Ethanol (36 per cent V/V)	
Further potentisations: Ethanol (50 per cent V/V)	

**Potentisation**

For the first liquid potentisation, dissolve 1 part of the trituration in 9 parts (decimal dilutions) or 99 parts (centesimal dilutions) of the specified vehicle (see Table 2371.-3) and succuss. For further potentisations, proceed in the same manner with 1 part of the previous dilution.

The D6, D7, C6 and C7 dilutions produced by the above method are not to be used for the preparation of further dilutions. For the preparation of higher dilutions use the D8 or C8 dilution.

**METHOD 3.2.3**

Preparations made according to Method 3.2.3 are produced from triturations D2 onwards and from triturations C1, C2, C3 and C4, prepared according to method 4.1.2.

**Vehicles**

Suitable vehicles such as ethanol of an appropriate concentration or purified water may be used.

**Potentisation**

Unless otherwise specified, the first liquid decimal dilution (Dn-1) is made from:

- 1 part of the decimal trituration Dn-2;
- 9 parts of purified water or of another suitable vehicle in appropriate proportions.

The following decimal dilution (Dn) is made from:

- 1 part of the first liquid decimal dilution Dn-1;
- 9 parts of a suitable vehicle.

Subsequent decimal dilutions are produced as stated for Dn.

Unless otherwise specified, the first liquid centesimal dilution (Cn-1) is made from:

- 1 part of the centesimal trituration Cn-2;
- 99 parts of purified water or of another suitable vehicle in appropriate proportions.

The following centesimal dilution (Cn) is made from:

- 1 part of the first liquid centesimal dilution Cn-1;
- 99 parts of a suitable vehicle.

Subsequent centesimal dilutions are produced as stated for Cn.

**4. TRITURATIONS**

**METHOD 4.1**

Method 4.1 is used for triturations, that is solid dilutions, of raw materials or of triturations prepared according to Methods 4.2.1 or 4.2.2. The duration and intensity of the trituration are such that homogeneity and potentisation are achieved.

**Vehicle**

Unless otherwise specified, lactose monohydrate is used.

**METHOD 4.1.1 (HAB 6: TRITURATIONS)**

Triturations are prepared manually or mechanically. Mechanical trituration must be used for quantities exceeding 1 kg. The resulting particle size of the raw material in the first decimal or centesimal dilution does not exceed 100 µm, unless otherwise prescribed in the individual monograph.

**Ratios of raw material to vehicle**

Decimal triturations	Centesimal triturations
The 1 <sup>st</sup> decimal trituration (D1) is made from:	The 1 <sup>st</sup> centesimal trituration (C1) is made from:
1 part of the raw material	1 part of the raw material
9 parts of the vehicle	99 parts of the vehicle
Subsequent decimal triturations (Dn) are produced as stated for D1, using 1 part of the previous trituration (Dn-1).	Subsequent centesimal triturations (Cn) are produced as stated for C1, using 1 part of the previous trituration (Cn-1).

Where fresh plant material is used, the quantity of vehicle added is such so as to obtain 10 parts of the trituration (decimal trituration) or 100 parts of the trituration (centesimal trituration) from 1 part of the raw material (replace the mass of water lost from the fresh plant by an equivalent amount of the vehicle). A suitable gentle drying process may need to be applied to the solid dilution.

Where justified and authorised, it may be necessary to directly produce a C1 or 'D2' if to be used for further decimal triturations as the first solid trituration, made from 1 part of raw material and 99 parts of vehicle.

**Trituration**

Unless otherwise justified and authorised, the method consists of dividing the vehicle into 3 equal parts and adding the raw material to the first part, then adding the second and

third part of the vehicle, thoroughly triturating after each addition.

For mechanical trituration, use a machine allowing the requirements for particle size of the first decimal or centesimal solid trituration to be met. A machine fitted with a scraping device may be used to ensure even trituration. The time required to prepare one trituration is at least 1 h, unless otherwise justified and authorised.

For manual trituration, divide the vehicle into 3 equal parts and briefly triturate the first part in a porcelain mortar. Add the raw material, triturate the mixture for 6 min, scrape down for 4 min with an appropriate non-metallic device (for example, a porcelain spatula). Triturate for a further 6 min, scrape down again for a further 4 min, then add the second part of the vehicle and continue as above. Proceed in the same manner with the rest of the vehicle. The minimum time required for the whole process is thus 1 h. Carry out the whole process again for each subsequent solid dilution.

Triturations from D5 or C5 onwards may also be prepared by intense mechanical treatment by a suitable mixing machine as follows: add the solid trituration to one third of the vehicle and mix. Add the second third of the vehicle, mix and proceed in the same manner with the last third of the vehicle. The whole process lasts minimum 1 hour, unless otherwise justified and authorised.

It is possible to change to a liquid medium from the 4<sup>th</sup>, 5<sup>th</sup> and 6<sup>th</sup> decimal or centesimal triturations, as described in Methods 3.2.1 and 3.2.2.

**METHOD 4.1.2 (FRENCH PHARMACOPOEIA)**

**Trituration**

Triturations are prepared as follows:

*Decimal triturations*

Reduce 1 part of the homoeopathic stock to a powder. Triturate carefully with a small quantity of the vehicle. Add the vehicle in small quantities until 9 parts of this vehicle have been used. The resulting trituration is the 1<sup>st</sup> decimal trituration (D1).

Triturate as described above 1 part of this trituration with 9 parts of the vehicle. The resulting trituration is the 2<sup>nd</sup> decimal trituration (D2).

In all cases, it is possible to change to a liquid medium after the 7<sup>th</sup> decimal trituration (D7) as described in Method 3.2.3.

*Centesimal triturations*

Proceed in the same manner but following a centesimal series.

In all cases, it is possible to change to a liquid medium after the 3<sup>rd</sup> centesimal trituration (C3) as described in Method 3.2.3.

**METHOD 4.2**

Method 4.2 is used for triturations, that is solid dilutions, of liquid preparations such as mother tinctures and solutions, their dilutions, mixtures and co-potentised mixtures.

Gradually impregnate the total amount of vehicle, gently dry the moist mixture, mill and sieve if necessary, then mix and triturate until homogeneity and potentisation are achieved. Trituration is further carried out as described for Method 4.1.1 or Method 4.1.2.

**Vehicle**

Unless otherwise specified, lactose monohydrate is used.

**METHOD 4.2.1 (HAB 7: TRITURATIONS)**

**Ratios of starting material to vehicle**

The quantity of vehicle added must always be such so as to obtain 10 parts of the trituration (decimal trituration) or 100 parts of the trituration (centesimal trituration) from the required number of parts of the liquid preparation (see Table 2371.-4), taking the mass of the dry residue into consideration. Where the dry residue is considered negligible, the quantity of vehicle added is 10 parts (decimal trituration) or 100 parts (centesimal trituration), for 1 part of the liquid preparation.

Table 2371.-4

Decimal triturations	Centesimal triturations
<b>Mother tinctures prepared according to Methods 1.1.1, 1.1.3 and 1.1.4</b>	
The 1 <sup>st</sup> 'decimal' trituration (D1) is made from: 2 parts of the mother tincture maximum 10 parts of the vehicle, taking the mass of the dry residue into consideration	The 1 <sup>st</sup> 'centesimal' trituration (C1) is made from: 2 parts of the mother tincture maximum 100 parts of the vehicle, taking the mass of the dry residue into consideration
<b>Mother tinctures prepared according to Methods 1.1.2, 1.1.5, 1.1.6 and 1.1.7</b>	
The 1 <sup>st</sup> 'decimal' trituration (D1) is made from: 3 parts of the mother tincture maximum 10 parts of the vehicle, taking the mass of the dry residue into consideration	The 1 <sup>st</sup> 'centesimal' trituration (C1) is made from: 3 parts of the mother tincture maximum 100 parts of the vehicle, taking the mass of the dry residue into consideration
<b>Mother tinctures prepared according to Methods 1.1.8 and 1.1.9</b> <i>The mother tincture corresponds to the 1<sup>st</sup> decimal dilution (D1)</i>	
The 2 <sup>nd</sup> decimal trituration (D2) is made from: 1 part of the mother tincture maximum 10 parts of the vehicle, taking the mass of the dry residue into consideration	The 1 <sup>st</sup> 'centesimal' trituration (C1) is made from: 10 parts of the mother tincture maximum 100 parts of the vehicle, taking the mass of the dry residue into consideration
<b>Solutions prepared according to Method 3.1.1 or liquid dilutions, mixtures and co-potentised mixtures</b>	
Decimal trituration n+1 (Dn+1) is made from: 1 part of the dilution (Dn) maximum 10 parts of the vehicle, taking the mass of the dry residue into consideration	Centesimal trituration n+1 (Cn+1) is made from: 1 part of the dilution (Cn) maximum 100 parts of the vehicle, taking the mass of the dry residue into consideration

**METHOD 4.2.2**

**Ratios of starting material to vehicle**

<b>Mother tinctures prepared according to Methods 1.1.10 and 1.1.11</b>	
The 1 <sup>st</sup> decimal trituration (D1) is made from: 1 part of the mother tincture 10 parts of the vehicle	The 1 <sup>st</sup> centesimal trituration (C1) is made from: 1 part of the mother tincture 100 parts of the vehicle

## 5. OTHER PREPARATIONS

### METHOD 5.1

Method 5.1 is used for preparing homoeopathic preparations by co-potentising 2 or more stocks and/or dilutions thereof, where co-potentisation consists of mixing several stocks or dilutions of stocks then potentising them together in one or more potentisation steps.

METHODS 5.1.1, 5.1.2, 5.1.3 (HAB 40A, 40B, 40C: CO-POTENTISED MIXTURES)

The stocks and/or dilutions in Table 2371.-5 may be used.

Table 2371.-5

Method 5.1.1	Method 5.1.2	Method 5.1.3
Stocks	Aqueous preparations	Triturations
Solutions	Glycerol macerates and aqueous dilutions thereof	
Triturations	Triturations	
Liquid dilutions		
Mother tinctures whose method of production specifies a 1/10 (or 1/100) dilution		

### Vehicles

The choice of the vehicle is determined by and must comply with any special requirement for the particular stock as well as the dosage form (see table Table 2371.-6).

Table 2371.-6

Method 5.1.1	Method 5.1.2	Method 5.1.3
Ethanol (96 per cent V/V)	Water for injections	Lactose monohydrate
Ethanol (90 per cent V/V)	Purified water	
Ethanol (80 per cent V/V)	Sugar syrup (sucrose, purified water (64:36))	
Ethanol (70 per cent V/V)		
Ethanol (50 per cent V/V)		
Ethanol (36 per cent V/V)		
Ethanol (18 per cent V/V)		

For Method 5.1.1, when starting from a trituration and where justified, purified water is used for the 1<sup>st</sup> potentisation step.

For Method 5.1.2, when starting from a glycerol macerate containing sodium chloride, unless otherwise justified and authorised, the following vehicle is used: 0.2 parts of sodium hydrogen carbonate and 8.8 parts of sodium chloride in 991 parts of water for injections.

### Potentisation

For each potentisation step, combine and succuss or triturate 1 part of the given mixture with 9 parts (decimal dilutions) or 99 parts (centesimal dilutions) of the appropriate vehicle.

### METHOD 5.1.4

#### Vehicles

Ethanol of an appropriate concentration, purified water or lactose monohydrate may, for example, be used.

### Potentisation

Potentisation may be performed as prescribed for Methods 5.1.1, 5.1.2 and 5.1.3, either on the last step or on several successive steps.

### METHOD 5.1.5

#### Vehicle

Ethanol of an appropriate concentration, purified water or lactose monohydrate may, for example, be used.

### Potentisation

For a co-potentisation of centesimal dilutions, each dilution (Cn-1) represents 1 per cent of the final product and the proportion of vehicle to be added is reduced by the proportion of the active substances

[i.e. 100 per cent - (1 per cent × the number of active substances)]. The same procedure applies, in the appropriate proportions, when co-potentising decimal dilutions.

### METHOD 5.2

Method 5.2 is used to prepare potencies with a 50 000 dilution factor (LM) by alternate steps of liquid dilution and impregnation of sucrose pillules (category 1, unless otherwise authorised).

### Solid and liquid potencies

Use a dropper (2.1.1).

To prepare pillules of 1<sup>st</sup> LM potency, a C3 trituration of the substance to be potentised is processed as follows: dissolve 60 mg of the C3 trituration in a volume of ethanol (18 per cent V/V) or another authorised concentration, corresponding to 500 drops. To 1 drop of this solution add a volume of ethanol (90 per cent V/V) or another authorised concentration, corresponding to 100 drops and succuss at least 100 times. Use all of this solution to impregnate a mass of pillules corresponding to 50 000 pillules, then allow to dry in air.

To prepare pillules of 2<sup>nd</sup> LM potency, process pillules of 1<sup>st</sup> LM potency as follows: dissolve 1 pillule of 1<sup>st</sup> LM potency in 1 drop of purified water, add a volume of ethanol (90 per cent V/V) or another authorised concentration, corresponding to 100 drops and succuss at least 100 times. Use all of this solution to impregnate a mass of pillules corresponding to 50 000 pillules, then allow to dry in air. Subsequent solid potencies are prepared as for the 2<sup>nd</sup> LM potency.

### Liquid potencies (HAB 17)

To prepare a liquid LM potency, dissolve 1 pillule of the required potency in 10.0 mL of ethanol (18 per cent V/V) or another authorised concentration. The potency of the solution corresponds to the potency of the pillule dissolved therein.

Ph Eur

## Mother Tinctures for Homoeopathic Preparations

(Ph. Eur. monograph 2029)

Ph Eur

### DEFINITION

Mother tinctures for homoeopathic preparations are liquid preparations obtained by the solvent action of a suitable vehicle upon raw materials. The raw materials are usually in the fresh form but may be dried. Mother tinctures for homoeopathic preparations may also be obtained from plant

juices, with or without the addition of a vehicle. For some preparations, the matter to be extracted may undergo a preliminary treatment.

#### PRODUCTION

Mother tinctures for homoeopathic preparations are prepared by maceration, percolation, digestion, infusion, decoction, fermentation or as described in the individual monographs, usually using ethanol of suitable concentration.

Mother tinctures for homoeopathic preparations are obtained using a fixed proportion of raw material to solvent, taking the moisture content of the raw material into account, unless otherwise justified and authorised.

If fresh plants are used, suitable procedures are used to ensure freshness. The competent authorities may require that the freshness is demonstrated by means of a suitable test.

Where the mother tincture contains ethanol, it is tested for 2-propanol (2.9.11), with a maximum limit of 0.05 per cent *V/V*, unless assurance of compliance with this limit is provided by a detailed knowledge of the ethanol supply chain and the mother tincture manufacturing process.

Mother tinctures for homoeopathic preparations are usually clear. A slight sediment may form on standing and that is acceptable as long as the composition of the tincture is not changed significantly.

The manufacturing process is defined so that it is reproducible.

#### Production by maceration

Unless otherwise prescribed, reduce the matter to be extracted to pieces of suitable size, mix thoroughly and extract according to the prescribed extraction method with the prescribed extraction solvent. Allow to stand in a closed vessel for the prescribed time. The residue is separated from the extraction solvent and, if necessary, pressed out. In the latter case, the 2 liquids obtained are combined.

#### Adjustment of the contents

Adjustment of the content of constituents may be carried out if necessary, either by adding the extraction solvent of suitable concentration, or by adding another mother tincture for homoeopathic preparations of the vegetable or animal matter used for the preparation.

#### CHARACTERS

Where appropriate, the appearance and odour of the mother tincture are determined.

#### IDENTIFICATION

Where applicable, at least 1 chromatographic identification test is carried out.

#### TESTS

The limits in an individual monograph are set to include official methods of production. Specific limits will apply to each defined method of production.

*If the test for relative density is carried out, the test for ethanol need not be carried out, and vice versa.*

#### Relative density (2.2.5)

The mother tincture for homoeopathic preparations complies with the limits prescribed in the monograph.

#### Ethanol (2.9.10)

The ethanol content complies with that prescribed in the monograph.

#### Methanol (2.9.11)

Maximum 0.05 per cent *V/V*, unless otherwise prescribed or justified and authorised.

#### Dry residue (2.8.16)

Where applicable, the mother tincture for homoeopathic preparations complies with the limits prescribed in the monograph.

#### Pesticides (2.8.13)

Where applicable, the mother tincture for homoeopathic preparations complies with the test. This requirement is met if the herbal drug has been shown to comply with the test.

Justification is provided in cases where the test for pesticides is performed on the mother tincture, instead of on the herbal drug according to the requirements of the general monograph *Herbal drugs for homoeopathic preparations (2045)*. Limits are set, taking into consideration the nature and the origin of the herbal drug. The dilution factor of the mother tincture and the limit of quantification of the method are also taken into account when setting these limits.

#### Heavy metals (2.4.27)

Justification is provided in cases where the test for heavy metals is performed on the mother tincture, instead of on the herbal drug according to the requirements of the general monograph *Herbal drugs for homoeopathic preparations (2045)*. Limits are set, taking into consideration the nature and the origin of the herbal drug. The dilution factor of the mother tincture and the limit of quantification of the method are also taken into account when setting these limits.

If required by the competent authority, suitable limits for the content of other heavy metals such as arsenic or nickel may be defined.

#### Aflatoxin B<sub>1</sub> (2.8.18)

Where appropriate, limits for aflatoxins may be required. Justification is provided in cases where the test for aflatoxin B<sub>1</sub> is performed on the mother tincture, instead of on the herbal drug. Limits are set, taking into consideration the nature and the origin of the herbal drug. The dilution factor of the mother tincture and the limit of quantification of the method are also taken into account when setting these limits.

#### ASSAY

Where applicable, an assay with quantitative limits is performed.

#### STORAGE

Protected from light. A maximum storage temperature may be specified.

#### LABELLING

*The label states:*

- that the product is a mother tincture for homoeopathic preparations (designated as 'TM' or 'Ø');
- the name of the raw material using the Latin title of the European Pharmacopoeia monograph where one exists;
- the method of preparation;
- the ethanol content or other solvent content, in per cent *V/V*, in the mother tincture;
- the ratio of raw material to mother tincture;
- where applicable, the storage conditions.

Ph Eur

## Coated Homoeopathic Pillules

(Ph. Eur. monograph 2786)

Ph Eur

### DEFINITION

Solid preparations prepared from sucrose *Pillules for homoeopathic preparations* (2153) (category 5), by coating with a syrup made from homoeopathic preparations either potentised or mixed with sucrose syrup. Triturations can be incorporated separately. Coated homoeopathic pillules possess a suitable mechanical strength to resist handling without crumbling or breaking. They are intended for sublingual or oral use. Coated homoeopathic pillules may also be called 'globuli velati'.

### PRODUCTION

In the manufacture, packaging, storage and distribution of coated homoeopathic pillules, suitable measures are taken to ensure their microbiological quality; recommendations on this aspect are provided in general chapter 5.1.4. *Microbiological quality of non-sterile pharmaceutical preparations and substances for pharmaceutical use.*

For coating, use homoeopathic stocks (in case of a mother tincture or a glycerol macerate) and/or decimal dilutions thereof or decimal triturations and a syrup made from 64 parts of sucrose and 36 parts of purified water. The homoeopathic preparations used are prepared according to the general monograph *Methods of preparation of homoeopathic stocks and potentisation* (2371).

To prepare 100 parts of coated homoeopathic pillules, the pillules are coated with the syrup using one of the following procedures, depending upon the type of homoeopathic preparation used.

#### Aqueous dilutions

Mix 1 part of an aqueous preparation with 9 parts of the syrup and potentise by succussion; evenly apply the mixture to  $(100 - x)$  parts of pillules (where  $x$  is the mass of sucrose in the syrup). The potency of the coated homoeopathic pillules corresponds to the potency of the liquid preparation used for coating.

#### Triturations

Mix 10 parts of a trituration with 20 parts of the syrup; evenly apply the mixture to  $(100 - x - y)$  parts of pillules (where  $x$  is the mass of sucrose in the syrup and  $y$  is the mass of lactose monohydrate in the incorporated trituration). The potency of the coated homoeopathic pillules corresponds to the potency of the trituration used.

#### Mixtures

Unless otherwise justified and authorised, prepare a mixture obtained from 10 parts of a liquid preparation (obtained from aqueous preparations, triturations or aqueous dilutions of glycerol macerates) and 90 parts of the syrup, adding sufficient purified water to evenly apply the mixture to  $(100 - x - y)$  parts of pillules (where  $x$  is the mass of sucrose in the syrup and  $y$  is the mass of lactose monohydrate in the incorporated triturations). The potency/potencies of the coated homoeopathic pillules correspond to the potency/potencies of the individual preparations used in the mixture.

### TESTS

#### Uniformity of mass.

Carry out the test using 20 coated homoeopathic pillules to constitute 1 unit. Weigh individually 20 units taken at random and determine the individual and average masses.

Not more than 2 of the individual masses deviate from the average mass by more than 10 per cent and none deviate by more than 20 per cent.

#### Microbial contamination.

Unless otherwise justified, authorised and labelled, coated homoeopathic pillules are intended for sublingual administration and the following acceptance criteria apply.

TAMC: acceptance criterion  $10^2$  CFU/g (2.6.12).

TYMC: acceptance criterion  $10^1$  CFU/g (2.6.12).

Absence of *Staphylococcus aureus* (2.6.13).

Absence of *Pseudomonas aeruginosa* (2.6.13).

Ph Eur

## Impregnated Homoeopathic Pillules

(Ph. Eur. monograph 2079)

Ph Eur

### DEFINITION

Solid preparations obtained from sucrose, lactose or other suitable excipients. They possess a suitable mechanical strength to resist handling without crumbling or breaking. Impregnated homoeopathic pillules are prepared by impregnation of *Pillules for homoeopathic preparations* (2153) with one or more liquid homoeopathic preparations. They are intended for sublingual or oral use.

### PRODUCTION

The impregnation process takes place using liquid preparations containing ethanol usually at a concentration of at least 68 per cent *V/V* according to either of the following approaches:

- in proportions of 1 mass part of liquid to 100 mass parts of pillules;
- in proportions of 1 volume part of liquid to 100 mass parts of pillules.

In the manufacture, packaging, storage and distribution of homoeopathic pillules, suitable measures are taken to ensure their microbiological quality; recommendations on this aspect are provided in general chapter 5.1.4. *Microbiological quality of non-sterile pharmaceutical preparations and substances for pharmaceutical use.*

### CHARACTERS

#### Appearance

White, almost white or slightly coloured spheroids.

#### Solubility

Usually freely soluble in water.

### TESTS

#### Microbial contamination

Unless otherwise justified, authorised and labelled, the pillules are intended for sublingual administration and the following acceptance criteria apply.

TAMC: acceptance criterion  $10^2$  CFU/g (2.6.12).

TYMC: acceptance criterion  $10^1$  CFU/g (2.6.12).

Absence of *Staphylococcus aureus* (2.6.13).

Absence of *Pseudomonas aeruginosa* (2.6.13).

Ph Eur

## Pillules for Homoeopathic Preparations

(Ph. Eur. monograph 2153)

Ph Eur

### DEFINITION

Solid preparations obtained from sucrose, lactose or other suitable excipients. They possess a suitable mechanical strength to resist handling without crumbling or breaking. They are intended for impregnation or coating with one or more homoeopathic preparations. The impregnated pillules comply with the requirements of the monograph *Homoeopathic pillules, impregnated* (2079). The coated pillules comply with the requirements of the monograph *Homoeopathic pillules, coated* (2786).

### PRODUCTION

In the manufacture, packaging, storage and distribution of pillules for homoeopathic preparations, suitable measures are taken to ensure their microbiological quality; recommendations on this aspect are provided in general chapter 5.1.4. *Microbiological quality of non-sterile pharmaceutical preparations and substances for pharmaceutical use*.

If a system of sizing is used, the indications in Table 2153.-1 are used.

Table 2153.-1. – Classification of pillules according to their mass and size

Category	Number of pillules for homoeopathic preparations	Mass (g)	Fineness (µm)
1	470 - 530	1.0	1000 - 1600
2	160 - 333	1.0	1400 - 2000
3	110 - 130	1.0	1800 - 2500
4	70 - 90	1.0	2000 - 2800
5	40 - 50	1.0	2500 - 3350
6	16 - 30	1.0	3150 - 4500
7	10	0.9 - 1.1	4000 - 5600
8	5	0.9 - 1.1	5600 - 6700
9	3	0.9 - 1.1	7100 - 8000
10	2	0.9 - 1.1	8000 - 9500

NOTE: for categories 7-10, the mass is obtained by weighing the specified number of pillules.

### CHARACTERS

#### Appearance

White or almost white spheroids.

#### Solubility

Usually freely soluble in water.

### IDENTIFICATION

The excipients used for the manufacture of pillules for homoeopathic preparations are identified by one or more suitable test(s).

### TESTS

If the test for fineness is carried out, the test for uniformity of mass need not be carried out, and vice versa.

#### Uniformity of mass

Carry out the test using 20 pillules to constitute 1 unit. Weigh individually 20 units taken at random and determine the individual and average masses. Not more than 2 of the individual masses deviate from the average mass by more than 10 per cent and none deviate by more than 20 per cent.

#### Fineness (2.9.35)

Not less than 90 per cent *m/m* of the pillules are between the lower and upper limits of the corresponding category as indicated in Table 2153.-1.

#### Uniformity of impregnation

None of the individual values deviate by more than 10 per cent relative from the average of 10 determinations.

Determine the uniformity of impregnation using either method A or method B. Carry out 10 individual determinations.

#### METHOD A – METHYLENE BLUE

*Methylene blue impregnation solution* Use a freshly prepared solution. Dissolve 1.000 g of methylene blue R in 50 mL of ethanol (70 per cent V/V) R and dilute to 1000.0 mL with the same solvent.

*Impregnation* Impregnate a suitable quantity of pillules for homoeopathic preparations with a suitable quantity of the methylene blue impregnation solution to achieve a content of 10 µL of impregnation solution per gram of pillules.

*Test solution* Dissolve 5.00 g of the impregnated pillules in water R and dilute to 25.0 mL with the same solvent.

*Reference solution* Dilute 1.0 mL of the methylene blue impregnation solution to 100.0 mL with water R. To 5.0 mL of this solution add 5.00 g of pillules for homoeopathic preparations, dissolve in water R and dilute to 25.0 mL with the same solvent.

Measure the absorbance (2.2.25) of the test solution and the reference solution at 665 nm. Calculate the percentage of impregnation of the pillules for homoeopathic preparations using the following expression:

$$\frac{A_1 \times 500}{A_2 \times m}$$

$A_1$  = absorbance of the test solution;  
 $A_2$  = absorbance of the reference solution;  
 $m$  = mass of the impregnated pillules used to prepare the test solution, in grams.

#### METHOD B – CAFFEINE

As the test results are particularly influenced by the procedures for impregnation and drying of the pillules, the parameters of these procedures are defined and stated with the result.

*Caffeine impregnation solution* Prepare a 15 g/L solution of caffeine R in ethanol (70 per cent V/V) R.

*Impregnation* Impregnate a suitable quantity of pillules for homoeopathic preparations with a suitable quantity of the caffeine impregnation solution to achieve a content of 10 µL of impregnation solution per gram of pillules.

*During the preparation of the following solutions, if the pillules are not fully dissolved, sonicate the dispersion for 30 min and cool to 20 °C. Before measuring the absorbance, centrifuge the dispersion and filter the supernatant through a membrane filter (nominal pore size 0.45 µm).*

*Test solution* To 5.00 g of the impregnated pillules add 30 mL of water R. Shake manually then sonicate until complete dissolution of the pillules. Dilute to 50.0 mL with water R.

*Reference solution* Dilute 1.0 mL of the caffeine impregnation solution to 100.0 mL with water R. To 5.0 mL of this solution add 5.00 g of pillules for homoeopathic preparations and 30 mL of water R. Shake manually then sonicate until complete dissolution of the pillules. Dilute to 50.0 mL with water R.

**Compensation liquid** To 5.00 g of pillules for homoeopathic preparations add 30 mL of *water R*. Shake manually then sonicate until complete dissolution of the pillules. Dilute to 50.0 mL with *water R*.

Measure the absorbance (2.2.25) of the test solution and the reference solution at 273 nm by comparison with the compensation liquid. Calculate the percentage of impregnation of the pillules for homeopathic preparations using the following expression:

$$\frac{A_1 \times 500}{A_2 \times m}$$

- $A_1$  = absorbance of the test solution;  
 $A_2$  = absorbance of the reference solution;  
 $m$  = mass of the impregnated pillules used to prepare the test solution, in grams.

#### Microbial contamination

TAMC: acceptance criterion  $10^2$  CFU/g (2.6.12).

TYMC: acceptance criterion  $10^1$  CFU/g (2.6.12).

Absence of *Staphylococcus aureus* (2.6.13).

Absence of *Pseudomonas aeruginosa* (2.6.13).

#### LABELLING

The label states:

- the composition of the pillules;
- where applicable, the size of the pillules.

Ph Eur

## Acidum Picricum for Homoeopathic Preparations

(Ph. Eur. monograph 2695)

 $C_6H_3N_3O_7$ 

229.1

88-89-1

Ph Eur

#### DEFINITION

2,4,6-Trinitrophenol (picric acid).

#### Content

98.5 per cent to 101.5 per cent.

The commercial substance is supplied immersed in water.

**CAUTION:** dry picric acid may explode if subjected to shock or excessive heat. Appropriate precautions must be taken and only very small quantities handled.

#### CHARACTERS

Appearance of picric acid Light yellow.

#### IDENTIFICATION

A. Melting point (2.2.14): 121 °C to 123 °C, determined on the moistened substance to be examined dried in a desiccator to constant mass.

B. Suspend 0.1 g of the moistened substance to be examined in 1 mL of *water R*. Add 1 mL of *sodium sulfide solution R*. A red colour is produced.

#### TESTS

Dry 5.0 g of the moistened substance to be examined in a desiccator to constant mass and use it to prepare solution S and to carry out the tests and the assay.

#### Solution S

To 1.5 g of the dried substance to be examined add 30 mL of *distilled water R*, heat to boiling, allow to cool and filter. Dilute to 30 mL with *distilled water R*.

#### Appearance of solution

The solution is not more opalescent than reference suspension II (2.2.1).

Dissolve 0.1 g of the dried substance to be examined in 10 mL of *distilled water R* and heat to 50 °C.

#### Chlorides (2.4.4)

Maximum 100 ppm.

Dilute 10 mL of solution S to 15 mL with *water R* and filter if necessary.

#### Sulfates (2.4.13)

Maximum 0.1 per cent.

Dilute 3 mL of solution S to 15 mL with *distilled water R* and filter if necessary.

#### ASSAY

Dissolve 0.200 g of the dried substance to be examined in 100 mL of *water R*. Titrate with 0.1 M *sodium hydroxide*, using 0.2 mL of *phenol red solution R* as indicator.

1 mL of 0.1 M *sodium hydroxide* is equivalent to 22.91 mg of  $C_6H_3N_3O_7$ .

Ph Eur

## Acidum Succinicum for Homoeopathic Preparations

(Ph. Eur. monograph 2824)

 $C_4H_6O_4$ 

118.1

110-15-6

Ph Eur

#### DEFINITION

Butanedioic acid (succinic acid).

#### Content

99.0 per cent to 101.0 per cent.

#### CHARACTERS

##### Appearance

White or almost white, crystalline powder or colourless crystals.

##### Solubility

Soluble in water and in ethanol (96 per cent), sparingly soluble in acetone.

#### IDENTIFICATION

First identification C.

Second identification A, B, D.

A. Solution S (see Tests) is strongly acid (2.2.4).

B. Melting point (2.2.14): 184 °C to 189 °C.

C. Infrared absorption spectrophotometry (2.2.24).

Comparison succinic acid CRS.

D. Neutralise 3 mL of solution S with 1 M sodium hydroxide, then add 1 mL of silver nitrate solution R2. A white precipitate is formed.

**TESTS****Solution S**

Dissolve 5.0 g in distilled water R and dilute to 100 mL with the same solvent.

**Chlorides (2.4.4)**

Maximum 100 ppm.

Dilute 10 mL of solution S to 15 mL with water R.

**Sulfates (2.4.13)**

Maximum 200 ppm, determined on solution S.

**Oxalates**

Neutralise 5 mL of solution S with dilute ammonia R1, using 0.1 mL of phenolphthalein solution R as indicator. Add 0.1 mL of acetic acid R and 5 mL of calcium sulfate solution R.

The solution remains clear for at least 20 min.

**ASSAY**

Dissolve 0.500 g in 50 mL of water R. Titrate with 1 M sodium hydroxide, determining the end-point potentiometrically (2.2.20) or using 0.2 mL of phenolphthalein solution R as indicator.

1 mL of 1 M sodium hydroxide is equivalent to 59.05 mg of C<sub>4</sub>H<sub>6</sub>O<sub>4</sub>.

Ph Eur

## Adonis Vernalis for Homoeopathic Preparations

(Ph Eur. monograph 2832)

Ph Eur

**DEFINITION**

Fresh aerial parts of *Adonis vernalis* L., collected during flowering.

**IDENTIFICATION**

The pithy, light green stem grows to a height of 10-40 cm, very occasionally up to 60 cm, and is up to 5 mm in diameter, erect, usually unbranched, round, often flattened towards the top, with longitudinal furrows. Younger shoots are slightly hairy but soon become completely glabrous.

The alternate and sessile leaves sheath the stem and are closer together in the upper part of the stem. They are glabrous or sparsely haired, 2- to 4-pinnate, and narrowly linear to filiform with entire margins, with downward-turned tips that are approximately 1 mm across. Brownish-black scale-like leaves are present at the base of the stem.

The single, erect or slightly overhanging, terminal flowers are normally 40-70 mm in size. The calyx has 5 greenish sepals with a covering of fine hairs on the outside. The sepals are broadly oval, half as long as the petals and pressed to the latter. The corolla consists of 10-20, normally 12, distinctly lustrous, deep yellow petals that are 20-40 mm in length, 6-10 mm wide with entire margins, elongated and tapering to a finely toothed point, and glabrous with clearly visible venation. The numerous stamens are an intense yellow. The numerous, rounded, apocarpous ovaries are covered all over with hairs; they are attached to a conical, convex receptacle and have a short, hooked style.

**TESTS****Foreign matter (2.8.2)**

Maximum 5 per cent.

**Loss on drying (2.2.32)**

Minimum 60.0 per cent, determined on 5.0 g of the comminuted herbal drug by drying in an oven at 105 °C for 2 h.

**MOTHER TINCTURE**

The mother tincture complies with the requirements of the general monograph *Mother tinctures for homoeopathic preparations (2029)*.

**DEFINITION**

The mother tincture is prepared from the fresh aerial parts of *Adonis vernalis* L., collected during flowering.

**Content**

0.01 per cent *m/m* to 0.05 per cent *m/m* of total cardenolic glycosides, expressed as cymarin (C<sub>30</sub>H<sub>44</sub>O<sub>9</sub>; *M<sub>r</sub>* 548.7).

**PRODUCTION**

The mother tincture is prepared from the fresh flowering aerial parts of *Adonis vernalis* L. according to the following methods as prescribed in the monograph *Methods of preparation of homoeopathic stocks and potentisation (2371)*:

- method 1.1.3;
- method 1.1.10, using ethanol (45 per cent *V/V*) and a maceration time of about 3 weeks.

**CHARACTERS****Appearance**

Brown liquid.

**IDENTIFICATION**

Thin-layer chromatography (2.2.27).

*Solvent mixture* ethyl acetate R, methanol R (50:50 *V/V*).

*Test solution* To 10 mL of the mother tincture to be examined add 10 mL of ethanol (50 per cent *V/V*) R and 10 mL of lead acetate solution R. Boil for 2 min, then cool and centrifuge. Collect the supernatant and shake with 2 quantities, each of 15 mL of ethyl acetate R, centrifuging if an emulsion forms. Dry the combined organic phases over anhydrous sodium sulfate R and filter. Evaporate the filtrate to dryness and dissolve the residue in 0.5 mL of the solvent mixture.

*Reference solution* Dissolve 10 mg of convallatoxin R and 10 mg of cymarin R in the solvent mixture and dilute to 10 mL with the solvent mixture.

*Plate* TLC silica gel plate R (5-40 μm) [or TLC silica gel plate R (2-10 μm)].

*Mobile phase* water R, methanol R, ethyl acetate R (8:11:81 *V/V/V*).

*Application* 25 μL [or 20 μL] as bands of 20 mm [or 10 mm].

*Development* Over a path of 10 cm [or 6 cm].

*Drying* In air until the solvents have evaporated.

*Detection* Treat with a mixture of equal volumes of dilute sodium hydroxide solution R and dinitrobenzoic acid solution R; examine in daylight.

*Results* See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Cymarin: a violet zone	A violet zone A violet zone A violet zone
Convallatoxin: a violet zone	A yellow or violet zone
Reference solution	Test solution

**TESTS****Relative density (2.2.5)**

0.930 to 0.956, where method 1.1.3 is used.

**Ethanol (2.9.10)**

40 per cent *V/V* to 50 per cent *V/V*, where method 1.1.10 is used.

**Dry residue (2.8.16)**

Minimum 3.6 per cent (where method 1.1.3 is used), minimum 1.0 per cent (where method 1.1.10 is used).

**ASSAY**

**Test solution** To 20.00 g of the mother tincture to be examined, add 12 mL of *lead subacetate solution R*. Shake and centrifuge. Collect the supernatant. Repeat the centrifugation twice using 5 mL of *water R* each time and collect the supernatant, then dilute to 50.0 mL with *water R*.

To 10.0 mL of this solution add 10.0 mL of a 100 g/L solution of *anhydrous sodium sulfate R*. Filter. To 10.0 mL of the filtrate add 2.0 mL of *dinitrobenzoic acid solution R* and 1.0 mL of 1 M *sodium hydroxide*.

**Reference solution** Dissolve 10.0 mg of *cymarin R* in 20 mL of *ethanol (96 per cent) R* and dilute to 100.0 mL with *water R*. Dilute 5.0 mL of the solution to 20.0 mL with *water R*. To 10.0 mL of this solution, add 2.0 mL of *dinitrobenzoic acid solution R* and 1.0 mL of 1 M *sodium hydroxide*.

Measure the absorbance (2.2.25) of the test solution and the reference solution at 540 nm several times during the first 12 min following the end of solution preparation until the maximum absorbance is reached, using a mixture of 10.0 mL of *water R*, 2.0 mL of *dinitrobenzoic acid solution R* and 1.0 mL of 1 M *sodium hydroxide* as the compensation liquid. Calculate the percentage content *m/m* of total cardenolic glycosides, expressed as *cymarin*, using the following expression:

$$\frac{A_1 \times m_2 \times p \times 0.25}{A_2 \times m_1}$$

$A_1$  = maximum absorbance of the test solution;

$A_2$  = maximum absorbance of the reference solution;  
 $m_1$  = mass of the mother tincture to be examined used to prepare the test solution, in grams;  
 $m_2$  = mass of *cymarin R* used to prepare the reference solution, in grams;  
 $p$  = percentage content of *cymarin* in *cymarin R*.

Ph Eur

## Agaricus Phalloides for Homoeopathic Preparation

(Ph. Eur. monograph 2290)

Ph Eur

**DEFINITION**

Whole, fresh mushroom (fruiting body) *Amanita phalloides* (Vaill. ex Fr.) Link.

**IDENTIFICATION**

**A.** In young specimens, the cap, 50-150 mm in diameter, is hemispherical to campanulate with margins rolled inwards and is still covered by the white universal veil; in mature specimens, the cap is expanded, umbrella-like, convex to nearly plane and occasionally depressed; its colour is pale green along the margin and elsewhere greyish-green to yellowish-green, typically with fine grey streaks growing thicker towards the centre; the cuticle is peelable up to the middle of the cap as a fine membrane; the underlying flesh appears greenish-yellow, becoming more intense towards the centre of the cap, while in the other parts of the mushroom the flesh is uniformly whitish; lamellae are free, closely packed, white with a slight yellowish tinge; lamellulae are truncate; the stipe, about 10 cm high and 2 cm in diameter, is thin and solid, with a whitish, membranous, striate annulus and an enlarged and bulbous base that almost always shows a tough, white, membranous sac-like volva torn into irregular lobes at the top. In old specimens, the stipe is hollow, whitish and often covered with small greenish scales around the annulus. The spores are white.

**B.** Examined under a lens (x10), the upper surface is shiny, dry, appearing somewhat uneven, with no remains of the veil.

**C.** Examine under a microscope using a solution containing 1.5 g of *iodine R*, 5 g of *potassium iodide R* and 100 g of *chloral hydrate R* in 100 mL of *water R*. The spores are blackish-blue (starch reaction), short elliptical to subspherical, 8-11 µm long and 7-9 µm in diameter.

**TESTS****Foreign matter (2.8.2)**

Maximum 5 per cent.

**Loss on drying (2.2.32)**

Minimum 85.0 per cent, determined on 5.0 g of the finely cut drug by drying in an oven at 105 °C for 2 h.

**Other *Amanita* species**

Veil remnants on caps are typical for most *Amanita* species, but not for *A. phalloides*. Therefore all mushrooms with veil remnants on the cap have to be discarded. The presence of veil remnants (patches) on the cap indicates adulteration with *A. citrina* (Schaeff.) Pers. (whitish-yellow cap with whitish to brownish patches) or with *A. muscaria* (L.: Fr.) Lamarck, *A. caesarea* (Scop.: Fr.) Pers., or *A. rubescens* Pers. (orange to bright red cap with white patches); a brownish cap indicates adulteration with *A. pantherina* (DC.) Krombh.; a greenish-white cap and a white stipe with a labile annulus indicates adulteration with *A. verna* (Bull.: Fr.) Lamarck.

## MOTHER TINCTURE

The mother tincture complies with the requirements of the general monograph *Mother tinctures for homoeopathic preparations* (2029).

### DEFINITION

#### Content

0.001 per cent *m/m* to 0.010 per cent *m/m* for the sum of  $\alpha$ -amanitine and  $\beta$ -amanitine ( $C_{39}H_{54}N_{10}O_{14}S$ ;  $M_r$  919).

### PRODUCTION

The mother tincture is prepared according to the following methods as prescribed in the monograph *Methods of preparation of homoeopathic stocks and potentisation* (2371):

- method 1.1.5;
- method 1.1.10, using 5 parts of the cut drug for 100 parts of ethanol (45 per cent *V/V*) and maceration for 3 weeks.

### CHARACTERS

#### Appearance

Brownish-yellow, yellowish or green liquid.

### IDENTIFICATION

Carry out test A when method 1.1.5 is used and carry out test B when method 1.1.10 is used.

#### A. Thin-layer chromatography (2.2.27).

**Test solution** Evaporate to dryness 20 mL of the mother tincture under vacuum at about 40 °C. Dissolve the residue in 1 mL of *water R* and add 1 mL of *methanol R*. Filter immediately.

**Reference solution** Dissolve 10 mg of *rutoside trihydrate R* and 10 mg of *sennoside B R* in *methanol R* and dilute to 40 mL with the same solvent.

**Plate** TLC silica gel  $F_{254}$  plate *R* (5-40  $\mu\text{m}$ ) [or TLC silica gel  $F_{254}$  plate *R* (2-10  $\mu\text{m}$ )].

**Mobile phase** glacial acetic acid *R*, *water R*, *butanol R* (17:17:66 *V/V/V*).

**Application** 40  $\mu\text{L}$  [or 10  $\mu\text{L}$ ] as bands.

**Development** Over a path of 10 cm [or 6 cm].

**Drying** In a current of warm air.

**Detection A** Examine in ultraviolet light at 254 nm.

**Results A** Locate a quenching zone (sennoside B) in the lower third and a quenching zone (rutoside) in the middle third of the chromatogram obtained with the reference solution.

**Detection B** Treat immediately with a 1 per cent *V/V* solution of *cinnamic aldehyde R* in *methanol R* and allow to dry; treat with *hydrochloric acid R*; examine in daylight.

**Results B** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Top of the plate		
Rutoside: a quenching zone	Rutoside: a yellow zone	A violet zone
Sennoside B: a quenching zone		A violet zone
		A violet zone
		2 faint greyish-violet zones may be present
Reference solution (detection A)	Reference solution (detection B)	Test solution (detection B)

#### B. Thin-layer chromatography (2.2.27).

**Test solution** The mother tincture to be examined.

**Reference solution** Dissolve 2 mg of *gramine R* and 2 mg of *rutoside trihydrate R* in *methanol R* and dilute to 10 mL with the same solvent.

**Plate** TLC silica gel plate *R* (5-40  $\mu\text{m}$ ) [or TLC silica gel  $F_{254}$  plate *R* (2-10  $\mu\text{m}$ )].

**Mobile phase** glacial acetic acid *R*, *water R*, *methanol R*, *methylene chloride R* (4:6:30:60 *V/V/V/V*).

**Application** 40  $\mu\text{L}$  [or 10  $\mu\text{L}$ ] as bands.

**Development** Over a path of 10 cm [or 6 cm].

**Drying** In a current of warm air.

**Detection** Treat with a 5 per cent *V/V* solution of *cinnamic aldehyde R* in *methanol R* and expose to *hydrochloric acid R* vapour for 30 min; examine in daylight.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Gramine: a yellow zone	
Rutoside: a yellow zone	A pink zone
	A pink zone
	An orange-yellow zone
Reference solution	Test solution

### TESTS

#### Relative density (2.2.5)

0.895 to 0.915 when method 1.1.5 is used.

#### Ethanol (2.9.10)

40 per cent *V/V* to 50 per cent *V/V* when method 1.1.10 is used.

**Dry residue (2.8.16)**  
Minimum 0.8 per cent.

**Mother tincture of Agaricus muscarius**  
Thin-layer chromatography (2.2.27).

**Test solution** The mother tincture to be examined.

**Reference solution** Dissolve 10 mg of *leucine R* and 10 mg of *threonine R* in 5 mL of *water R* and dilute to 20 mL with *ethanol (96 per cent) R*.

**Plate** TLC silica gel plate *R* (5-40 µm) [or TLC silica gel plate *R* (2-10 µm)].

**Mobile phase** glacial acetic acid *R*, *water R*, *acetone R*, *butanol R* (10:20:35:35 V/V/V/V).

**Application** 20 µL [or 10 µL] as bands.

**Development** Over a path of 10 cm [or 6 cm].

**Drying** In a current of warm air.

**Detection** Treat with a 1 g/L solution of *ninhydrin R* in *butanol R* and heat at 105 °C for 5-10 min; examine in daylight.

**Results** The presence of noticeable zones in the chromatogram obtained with the test solution, in the same position as the zones due to *leucine* and *threonine* in the chromatogram obtained with the reference solution, indicates adulteration with mother tincture of *Agaricus muscarius*.

#### ASSAY

Liquid chromatography (2.2.29).

**Test solution** Evaporate 2.000 g of the mother tincture to be examined to dryness. Dissolve the residue in 2.0 mL of *water for chromatography R*. Filter through a membrane filter (nominal pore size 0.45 µm).

**Reference solution** Dissolve 10.0 mg of *tryptophan CRS* in mobile phase A and dilute to 20.0 mL with mobile phase A.

**Column:**

- size:  $l = 0.10$  m,  $\varnothing = 4.6$  mm;
- stationary phase: end-capped solid core octadecylsilyl silica gel for chromatography *R* (2.6 µm);
- temperature: 35 °C.

**Mobile phase:**

- mobile phase A: dissolve 1.54 g of *ammonium acetate R* in 900 mL of *water for chromatography R*, adjust to pH 5.0 with *glacial acetic acid R* and dilute to 1 L with *water for chromatography R*;
- mobile phase B: *acetonitrile for chromatography R*;

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 2	95	5
2 - 17	95 → 80	5 → 20
17 - 22	80 → 50	20 → 50

**Flow rate** 1.0 mL/min.

**Detection** Spectrophotometer at 303 nm.

**Injection** 10 µL.

**Relative retention** With reference to *tryptophan* (retention time = about 3 min):  $\beta$ -amanitine = about 2.9;  $\alpha$ -amanitine = about 3.2.

**System suitability** Test solution:

- resolution: minimum 2.0 between the peaks due to  $\beta$ -amanitine and  $\alpha$ -amanitine.

Calculate the percentage content *m/m* of  $\alpha$ -amanitine and  $\beta$ -amanitine using the following expression:

$$\frac{(A_2 + A_3) \times m_1}{A_1 \times m_2} \times p \times K \times 0.1$$

- $A_1$  = area of the peak due to *tryptophan* in the chromatogram obtained with the reference solution;
- $A_2$  = area of the peak due to  $\alpha$ -amanitine in the chromatogram obtained with the test solution;
- $A_3$  = area of the peak due to  $\beta$ -amanitine in the chromatogram obtained with the test solution;
- $m_1$  = mass of *tryptophan CRS* used to prepare the reference solution, in grams;
- $m_2$  = mass of the mother tincture to be examined used to prepare the test solution, in grams;
- $p$  = percentage content of *tryptophan* in *tryptophan CRS*;
- $K$  = correction factor between  $\alpha$ -amanitine,  $\beta$ -amanitine and *tryptophan* (0.1).

Ph Eur

## Allium Sativum for Homoeopathic Preparations

Garlic for Homoeopathic Preparations

(Ph. Eur. monograph 2023)

Ph Eur

#### DEFINITION

Fresh bulb of *Allium sativum L.*

#### CHARACTERS

It has a characteristic odour after cutting.

#### IDENTIFICATION

The bulb is generally 3 cm to 5 cm broad and almost spherical; the flat base bears the remnants of numerous short greyish-brown adventitious roots. The bulb consists of about 10 daughter bulbs (cloves) arranged roughly in a circle around a central axis. Individual daughter bulbs are 1 cm to 3 cm long, laterally compressed and convex on the dorsal side. Each daughter bulb has a tough, white or reddish skin around a fleshy tubular leaf, investing a more or less rounded elongated cone of leaf primordia and vegetative apex.

#### TESTS

**Water (2.2.13)**

Minimum 55.0 per cent, determined on 10.0 g of the finely cut drug, if performed to demonstrate the freshness of the drug.

#### MOTHER TINCTURE

The mother tincture complies with the requirements of the general monograph *Mother tinctures for homoeopathic preparations (2029)*.

#### PRODUCTION

The mother tincture of *Allium sativum L.* is prepared by maceration of the cut drug using alcohol of a suitable concentration.

#### CHARACTERS

**Appearance**

Brownish-yellow liquid.

It has a peculiar and unpleasant aromatic odour.

#### IDENTIFICATION

A. To 2 mL of the mother tincture to be examined, add 0.2 mL of *dilute sodium hydroxide solution R*. A yellowish-white precipitate develops.

B. Thin-layer chromatography (2.2.27).

**Test solution** Extract 5 mL of the mother tincture to be examined with 2 quantities, each of 10 mL, of *ether R*. Combine the ether layers and dry over *anhydrous sodium sulfate R*. Filter and evaporate the filtrate in a water-bath at low temperature. Dissolve the residue in 0.4 mL of *methanol R*.

**Reference solution** Dissolve 10 mg of *resorcinol R*, 10 mg of *thymol R* and 30 mg of *gallic acid R* in 10 mL of *methanol R*.  
**Plate** TLC silica gel  $F_{254}$  plate *R*.

**Mobile phase** *anhydrous formic acid R*, *toluene R*, *di-isopropyl ether R* (10:40:50 *V/V/V*).

**Application** 40  $\mu$ L of the test solution and 10  $\mu$ L of the reference solution.

**Development** Over a path of 10 cm.

**Drying** In air.

**Detection** Examine in ultraviolet light at 254 nm and identify gallic acid; spray with *anisaldehyde solution R*, heat to 105-110 °C for 5-10 min. Examine in daylight within 10 min.

**Results** See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Other zones may also be visible in the chromatogram obtained with the test solution.

Top of the plate	
Thymol: an orange-red zone	An intense reddish-violet zone An intense reddish-violet zone A violet zone A yellowish or greenish zone
Resorcinol: an intense orange-red zone	
Gallic acid: a yellow zone (UV at 254 nm: a fluorescent quenching zone)	A violet zone A greenish-yellow zone A violet zone may be present
Reference solution	Test solution

## TESTS

**Relative density (2.2.5)**  
0.885 to 0.960.

**Ethanol (2.9.10)**  
50 per cent *V/V* to 70 per cent *V/V*.

**Dry residue (2.8.16)**  
Minimum 4.0 per cent.

## STORAGE

In an airtight container.

## Ammonium Carbonicum for Homoeopathic Preparations

(Ph. Eur. monograph 2916)

Ph Eur

### DEFINITION

Mixture of varying proportions of diammonium carbonate ( $(\text{NH}_4)_2\text{CO}_3$ ;  $M_r$  96.1), ammonium hydrogen carbonate ( $\text{NH}_4\text{HCO}_3$ ;  $M_r$  79.1) and ammonium carbamate ( $\text{NH}_2\text{COONH}_4$ ;  $M_r$  78.1).

### Content

30.0 per cent to 37.0 per cent of  $\text{NH}_3$  ( $M_r$  17.03).

### CHARACTERS

#### Appearance

White or almost white, translucent masses or white or almost white, crystalline powder, with a strong smell of ammonia.

#### Solubility

Freely soluble in water, practically insoluble in ethanol (96 per cent).

### IDENTIFICATION

A. Dissolve 1 g in *water R* and dilute to 20 mL with the same solvent. The solution is slightly alkaline (2.2.4).

B. It gives the reaction of carbonates and bicarbonates (2.3.1).

C. It gives the reaction of ammonium salts and salts of volatile bases (2.3.1).

### TESTS

#### Solution S

Dissolve 10.0 g in 100 mL of *distilled water R*. Boil until the volume is reduced to about 10 mL. Verify that the emitted vapours no longer make *barium hydroxide solution R* cloudy. Cool and dilute to 50 mL with *distilled water R*.

#### Appearance of solution

Solution S is clear (2.2.1) and colourless (2.2.2, Method I).

#### Chlorides (2.4.4)

Maximum 20 ppm.

Dissolve 2.5 g by gradually adding a mixture of 5 mL of *nitric acid R* and 10 mL of *water R*.

#### Sulfates (2.4.13)

Maximum 60 ppm, determined on solution S.

### ASSAY

Dissolve 2.5 g in *water R* and dilute to 100 mL with the same solvent. To 10.0 mL of the solution add 10.0 mL of 1 M *hydrochloric acid*. Shake continuously until the effervescence ceases. Add 40 mL of *water R*. Titrate the excess of acid with 1 M *sodium hydroxide*, determining the end-point potentiometrically (2.2.20).

1 mL of 1 M *hydrochloric acid* is equivalent to 17.03 mg of  $\text{NH}_3$ .

### STORAGE

In an airtight container.

Ph Eur

Ph Eur

## Anacardium for Homoeopathic Preparations

Oriental Cashew for Homoeopathic Preparations

(Ph. Eur. monograph 2094)

Ph Eur

### DEFINITION

Dried fruit of *Semecarpus anacardium* L.f. (*Anacardium orientale* L.).

### Content

Minimum 6.0 per cent *m/m* of total phenol derivatives expressed as eugenol (C<sub>10</sub>H<sub>12</sub>O<sub>2</sub>; M<sub>r</sub> 164.2) (dried drug).

### IDENTIFICATION

A. The dried fruit is oval and more or less cordate; about 2 cm long, nearly 2 cm wide and 0.5 cm thick. Its surface is smooth, shiny and blackish. A transverse section shows a rather well developed, tough pericarp riddled with rather wide lacunae containing an abundant thick reddish-brown juice. The pericarp covers a white kernel under a reddish skin. The fruit may include the blackish, fleshy, wrinkled, cupuliferous receptacle.

B. Thin-layer chromatography (2.2.27).

**Test solution** To 1.0 g of the suitably cut herbal drug, add 10 mL of ethanol (90 per cent V/V) R. Heat under reflux on a water-bath at 60 °C for 15 min. Allow to cool and filter.

**Reference solution** Dissolve 5 mg of resorcinol R and 10 mg of β-naphthol R in methanol R and dilute to 10 mL with the same solvent.

**Plate** TLC silica gel plate R (5-40 μm) [or TLC silica gel plate R (2-10 μm)].

**Mobile phase** methanol R, toluene R (15:85 V/V).

**Application** 10 μL [or 5 μL], as bands of 20 mm [or 8 mm].

**Development** Over a path of 15 cm [or 6 cm].

**Drying** In air.

**Detection** Treat with anisaldehyde solution R, heat at 100-105 °C for 5-10 min and examine in daylight within 10 min.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other fainter zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
β-naphthol: a violet zone	A broad, intense violet zone (at the same level or slightly higher than β-naphthol) 1-2 violet zones, sometimes faint
Resorcinol: an orange zone	A violet zone, sometimes faint  An orange zone, sometimes faint
Reference solution	Test solution

HOMOEOPATHIC PREPARATIONS

### TESTS

#### *Anacardium occidentale* L

Fruits of *Anacardium occidentale* L. are not present. These are up to 35 mm long, 30 mm wide, 20 mm thick, light brown and distinctly kidney-shaped. The pericarp is smooth or slightly crinkled with dark marbling in places.

#### Loss on drying (2.2.32)

Maximum 12.0 per cent, determined on 1.00 g of the finely cut herbal drug by drying in an oven at 105 °C for 2 h.

#### Total ash (2.4.16)

Maximum 5.0 per cent.

### ASSAY

#### Total phenol derivatives

Ultraviolet and visible absorption spectrophotometry (2.2.25).

**Stock solution** Place 4.50 g of the crushed herbal drug in a flask. Add 200 mL of ethanol (90 per cent V/V) R. Boil in a water-bath under reflux for 4 h. Cool the flask. Quantitatively transfer into a volumetric flask. Dilute to 250.0 mL with ethanol (90 per cent V/V) R. Filter the liquid through a paper filter 125 mm in diameter. Discard the first 50 mL of the filtrate. Dilute 5.0 mL of filtrate to 50.0 mL with ethanol (90 per cent V/V) R and shake. Dilute 5.0 mL of this solution to 10.0 mL with ethanol (90 per cent V/V) R and shake.

**Test solution** To 2.0 mL of the stock solution add 1.0 mL of phosphomolybdungstic reagent R and 10 mL of water R, mix and dilute to 25.0 mL with a 290 g/L solution of sodium carbonate R. Wait exactly 3 min then filter the solution through a fibre-glass filter with a 1 μm mesh aperture, discarding the first 5 mL.

**Reference solution** Dissolve 80.0 mg of eugenol R in ethanol (90 per cent V/V) R and dilute to 250.0 mL with the same solvent. Dilute 5.0 mL of the solution to 25.0 mL with ethanol (90 per cent V/V) R. To 2.0 mL of this solution add 1.0 mL of phosphomolybdungstic reagent R and 10 mL of water R, mix and dilute to 25.0 mL with a 290 g/L solution of sodium carbonate R. Wait exactly 3 min then filter the

solution through a fibre-glass filter with a 1 µm mesh aperture, discarding the first 5 mL.

Measure the absorbance (2.2.25) of the test solution and the reference solution at 755 nm after 30 min using *water R* as the compensation liquid.

Calculate the percentage content *m/m* of total phenol derivatives, expressed as eugenol, using the following expression:

$$\frac{A_1 \times m_2 \times 400}{A_2 \times m_1}$$

- $A_1$  = absorbance of the test solution;  
 $A_2$  = absorbance of the reference solution;  
 $m_1$  = mass of the herbal drug to be examined, in milligrams;  
 $m_2$  = mass of eugenol in the reference solution, in milligrams.

## MOTHER TINCTURE

The mother tincture complies with the requirements of the general monograph *Mother tinctures for homoeopathic preparations (2029)*.

### DEFINITION

The mother tincture of *Anacardium* is prepared from the dried fruit of *Semecarpus anacardium* L.f. (*Anacardium orientale* L.).

### Content

0.5 per cent *m/m* to 1.0 per cent *m/m* of total phenol derivatives, expressed as eugenol.

### PRODUCTION

The mother tincture is prepared according to the following methods prescribed in the general monograph *Methods of preparation of homoeopathic stocks and potentiation (2371)*:  
 — method 1.1.8, using the crushed drug (2000) (2.9.12) and ethanol (90 per cent *V/V*); use ethanol (70 per cent *V/V*) to prepare the 4<sup>th</sup> decimal dilution, and use ethanol (50 per cent *V/V*) for subsequent dilutions;  
 — method 1.1.10, using ethanol (90 per cent *V/V*).

### CHARACTERS

#### Appearance

Yellowish-brown or reddish-brown liquid.

### IDENTIFICATION

Thin-layer chromatography (2.2.27) as described in identification test B for the herbal drug with the following modification.

*Test solution* The mother tincture to be examined.

*Results* See identification test B for the herbal drug.

### TESTS

**Relative density (2.2.5)**  
0.815 to 0.845.

**Ethanol (2.9.10)**  
85 per cent *V/V* to 95 per cent *V/V*.

**Dry residue (2.8.16)**  
Minimum 1.50 per cent.

### ASSAY

#### Total phenol derivatives

Absorption spectrophotometry (2.2.25) as described in the assay of the herbal drug with the following modification.

*Stock solution* Place 8.00 g of the mother tincture to be examined in a volumetric flask and dilute to 250.0 mL with ethanol (90 per cent *V/V*) *R*. Dilute 5.0 mL of this solution to 20.0 mL with ethanol (90 per cent *V/V*) *R*.

Calculate the percentage content *m/m* of total phenol derivatives expressed as eugenol, using the following expression:

$$\frac{A_1 \times m_2 \times 80}{A_2 \times m_1}$$

- $A_1$  = absorbance of the test solution;  
 $A_2$  = absorbance of the reference solution;  
 $m_1$  = mass of the mother tincture to be examined, in milligrams;  
 $m_2$  = mass of eugenol in the reference solution, in milligrams.

Ph Eur

## Apis for Homoeopathic Preparations

Honey Bee for Homoeopathic Preparations

(Ph. Eur. monograph 2024)

Ph Eur

### DEFINITION

Live worker honey bee (*Apis mellifera* L.).

### CHARACTERS

Characters described under Identification.

### PRODUCTION

If the bee has been exposed to treatment to prevent or cure diseases, appropriate measures are taken to ensure that the levels of residues are as low as possible.

### IDENTIFICATION

The body is about 15 mm long, black, with a silky sheen, and covered with red hairs with a touch of grey. The broad tibiae are without spines. The posterior margins of the segments and legs are brown, with gradual transition to orange-red. The claws are two-membered, the maxillary palps single-membered. On the hind legs are baskets or scoops invested with bristles. The wings have 3 complete cubital cells, with the radial cell twice as long as it is wide; the 3 cells on the lower margin and the 3 middle cells are closed. A duct connects the barbed sting with the poison sac.

## MOTHER TINCTURE

The mother tincture complies with the requirements of the general monograph *Mother tinctures for homoeopathic preparations (2029)*.

### PRODUCTION

The mother tincture of *Apis mellifera* L. is prepared by maceration using alcohol of a suitable concentration.

### CHARACTERS

Pale yellow liquid that may darken on storage.

### IDENTIFICATION

Thin-layer chromatography (2.2.27).

*Test solution* The mother tincture to be examined.

*Reference solution* Dissolve 12 mg of 4-aminobutanoic acid *R*, 12 mg of *leucine R* and 12 mg of *proline R* in 5 mL of *water R* and dilute to 50 mL with *alcohol R*.

*Plate* TLC silica gel plate *R*.

*Mobile phase* *water R*, *ethanol R* (17:63 *V/V*).

*Application* 20 µL, as bands.

*Development* Over a path of 10 cm.

*Drying* In air.

**Detection** Spray with *ninhydrin solution R* and heat at 100-105 °C for 10 min; examine in daylight.

**Results** See below the sequence of the zones present in the chromatograms obtained with the reference and test solutions. Other zones may also be visible.

Top of the plate	
Leucine: a pink zone	A pink zone A pink zone A pink zone A pink zone
Proline: an orange-yellow zone	An orange-yellow zone
4-Aminobutanoic acid: a pink zone	A pink zone
Reference solution	Test solution

#### TESTS

**Relative density** (2.2.5)  
0.890 to 0.910.

**Ethanol** (2.9.10)  
60 per cent *V/V* to 70 per cent *V/V*.

**Dry residue** (2.8.16)  
Minimum 0.30 per cent.

*Ph Eur*

## Apomorphine Hydrochloride for Homoeopathic Preparations

Apomorphinum Muriaticum for Homoeopathic Preparations

#### DEFINITION

Apomorphine Hydrochloride for Homoeopathic Preparations contains Apomorphine Hydrochloride Hemihydrate.

#### PRODUCTION OF STOCK

The first trituration of Apomorphine Hydrochloride for Homoeopathic Preparations is prepared using a suitable quantity of Lactose Monohydrate or Lactose as the vehicle and a validated trituration method that ensures homogeneity is achieved. The vehicle complies with the statement under Vehicles in the monograph for Homoeopathic Preparations.

**Content of apomorphine hydrochloride, C<sub>17</sub>H<sub>17</sub>NO<sub>2</sub>, HCl**

The first decimal trituration contains 9.5% to 10.5% of C<sub>17</sub>H<sub>17</sub>NO<sub>2</sub>,HCl (dried substance).

#### CHARACTERS

The first decimal trituration is a white powder.

#### IDENTIFICATION

Dissolve 2.5 g of the substance being examined without heating in *water* and dilute to 25 mL with the same solvent (solution S).

A. To 5 mL of solution S add a few millilitres of *sodium hydrogen carbonate solution* until a permanent, white precipitate is formed. The precipitate slowly becomes a

greenish colour. Add 0.25 mL of 0.05M *iodine* and shake. The precipitate becomes a greyish-green colour. Collect the precipitate. The precipitate dissolves in *ether* giving a purple solution, dissolves in *dichloromethane* giving a violet-blue solution and dissolves in *alcohol* giving a blue solution.

B. To 2 mL of solution S add 0.1 mL of *nitric acid*, mix and filter. The filtrate yields reaction A characteristic of *chlorides*, Appendix VI.

C. Dissolve 0.25 g of the substance being examined in 5 mL of *water*. Add 5 mL of *ammonia* and heat in a water-bath at 80° for 10 minutes. A red colour develops.

#### ASSAY

Disperse 2.5 g of the substance being examined in a mixture of 5.0 mL of 0.01M *hydrochloric acid* and 50 mL of *ethanol* (96%). Carry out the method for *potentiometric titration*, Appendix VIII B, using 0.1M *sodium hydroxide*. Measure the titrant between the first 2 points of inflexion. Each mL of 0.1M *sodium hydroxide* is equivalent to 30.38 mg of C<sub>17</sub>H<sub>17</sub>NO<sub>2</sub>,HCl.

## Arsenious Trioxide for Homoeopathic Preparations

(*Arsenicum Album* for Homoeopathic Preparations, *Ph. Eur. monograph 1599*)

As<sub>2</sub>O<sub>3</sub> 197.8 1327-53-3  
*Ph Eur*

#### DEFINITION

##### Content

99.5 per cent to 100.5 per cent of As<sub>2</sub>O<sub>3</sub>.

#### CHARACTERS

##### Appearance

White or almost white powder.

##### Solubility

Practically insoluble to sparingly soluble in *water*. It dissolves in solutions of alkali hydroxides and carbonates.

#### IDENTIFICATION

A. Dissolve 20 mg in 1 mL of *dilute hydrochloric acid R*, add 4 mL of *water R* and 0.1 mL of *sodium sulfide solution R*. The resulting yellow precipitate is soluble in *dilute ammonia R1*.

B. Dissolve 20 mg in 1 mL of *hydrochloric acid R1*, add 5 mL of *hypophosphorous reagent R* and heat for 15 min on a water-bath. A black precipitate develops.

#### TESTS

##### Appearance of solution

The solution is clear (2.2.1) and colourless (2.2.2, *Method II*).

Prepare a 100 g/L solution in *dilute ammonia R1*, heating if necessary.

##### Sulfides

Maximum 20 ppm.

Dissolve 1.0 g in 10.0 mL of *dilute sodium hydroxide solution R*. Add 0.05 mL of *lead acetate solution R*. Any colour in the test solution is not more intense than that in a standard prepared at the same time and in the same manner using a mixture of 10.0 mL of a 0.015 g/L solution of *sodium sulfide R* in *dilute sodium hydroxide solution R* and 0.05 mL of *lead acetate solution R*.

**ASSAY**

Dissolve 40.0 mg in a mixture of 10 mL of *dilute sodium hydroxide solution R* and 10 mL of *water R*. Add 10 mL of *dilute hydrochloric acid R* and 3 g of *sodium hydrogen carbonate R* and mix. Add 1 mL of *starch solution R* and titrate with 0.05 M iodine.

1 mL of 0.05 M iodine is equivalent to 4.946 mg of  $As_2O_3$ .

Ph Eur

## Artemisia Cina for Homoeopathic Preparations

**DEFINITION**

Artemisia Cina for Homoeopathic Preparations is the dried, unexpanded flower heads of *Seriphidium cinum* (Berg ex Poljakov) Poljakov (Syn *Artemisia cina* Berg ex Poljakov) *Artemisia cina* O.C.Berg et C.F. Schmidt.

It contains not less than 1.0% of santonin ( $C_{15}H_{18}O_3$ ) calculated with reference to the dried material.

**IDENTIFICATION**

A. The dried, slightly shiny capitula are conical to elongated-ovoid, 2 to 4 mm long and 1 to 2 mm wide, yellow-green to brownish and composed of 3 to 6 hermaphrodite florets enclosed in an involucre of 14 to 20 imbricated ovate to lanceolate bracts. Each bract has a distinct keel which is most pronounced in the ovate outer bracts near the base; the keel forms the midrib and it branches freely, the veinlets becoming contorted and frequently anastomosing. The outer surface of the bracts is covered with glistening glandular hairs. The florets are about 1 mm long and 0.5 mm wide; the corolla is contracted at the base and divides at the apex into 5 short, triangular teeth.

B. Reduce to a powder and examine under a microscope using *chloral hydrate solution*. Abundant fragments of the involucre bracts in surface view are seen. Fragments from the margins are usually only one or two cells thick and are composed of very thin-walled, elongated cells; fragments from the central region of the bracts show polygonal, isodiametric epidermal cells with thickened and beaded walls; fairly numerous anomocytic stomata are present on the outer surface only. Very small cluster crystals of calcium oxalate may be present in the parenchymatous cells underlying the epidermis.

Groups of sclereids from the central region of the bracts show: individual cells varying in shape but usually considerably elongated; the ends are square or bluntly tapering or, occasionally, somewhat enlarged; the walls are strongly thickened and have scattered pits. Small groups of these sclereids are occasionally found attached to fragments of the epidermis of the bracts.

The unicellular covering trichomes are nearly always found detached; they are usually very thin-walled although slight thickening may occur in the basal region; some of these trichomes are very long and can be found in groups forming loosely felted, cottony masses. The typically labiate glandular trichomes are abundant on the bracts and are also found detached; each has a short, biseriate stalk, and a biseriate head of two or four cells around which the cuticle is raised to form a bladder-like covering.

The abundant pollen grains are fairly small, spherical, with three pores and three furrows; the exine is finely warted.

A large number of immature pollen grains are present, forming elongated, closely packed masses.

C. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Add 10 mL of *ethanol* (90%) to 1 g of the coarsely powdered drug, stir for one hour and filter.

(2) 0.1% w/v each of *santonin* and *cineole* in *methanol*.

**CHROMATOGRAPHIC CONDITIONS**

(a) Use as the coating *silica gel H*.

(b) Use the mobile phase as described below.

(c) Apply 10  $\mu$ L of each solution.

(d) Develop the plate to 10 cm.

(e) After removal of the plate, allow to dry in air, spray with *ethanolic phosphomolybdic acid solution*, heat at 100° to 105° for about 5 minutes and examine in daylight.

**MOBILE PHASE**

5 volumes of *glacial acetic acid*, 45 volumes of *hexane* and 50 volumes *ethyl acetate*.

**SYSTEM SUITABILITY**

The test is not valid unless the chromatogram obtained with solution (2) shows the grey-blue santonin band just between the lower third and middle third and the grey-blue cineole band in the upper third.

**CONFIRMATION**

The chromatogram obtained with solution (1) shows a grey-blue band below the band obtained for santonin in solution (2), a strong grey-blue band level with that of santonin in solution (2) and one or two grey-blue bands just above santonin; one or two grey-blue bands between the bands obtained for santonin and cineole in solution (2) and a strong grey-blue band level with the band obtained with cineole.

Top of the plate	
A grey-blue band	Cineole: a grey-blue band
1 or 2 a grey-blue bands	
1 or 2 grey-blue bands a grey-blue band a grey-blue band	Santonin: a grey-blue band
<b>Solution (1)</b>	<b>Solution (2)</b>

**TESTS****Foreign matter**

Not more than 5% of sections of stem and pieces of narrow-linear hairy leaves; not more than 2% of other foreign matter, Appendix XI D.

**Ash**

Not more than 11.0%, Appendix XI J, Method II.

**Loss on drying**

Not more than 10.0%, Appendix IX D.

**ASSAY**

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) To 1.0 g of the powdered herbal drug add 50 mL of *methanol* and stir for 2 hours. Filter the solution using a dry

filter paper into a 100 mL volumetric flask, wash the filtrate with *methanol*, add the washings to the filtrate and dilute to 100 mL with *methanol* and mix. Weigh approximately 5 g (6.5 mL) of the solution and add 20 mL of *methanol* in a 50 mL volumetric flask and dilute to volume with *water*.

(2) 0.005% w/v of *santonin BPCRS* prepared by dissolving 100 mg *santonin BPCRS* in 100 ml *methanol* and diluting 5 mL of the resulting solution to 100 mL with the mobile phase.

(3) 0.005% w/v each of *santonin BPCRS* and *methyl 4-hydroxybenzoate* in the mobile phase.

#### CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 μm) (*Kromasil C18* is suitable) fitted with a stainless steel guard column packed with the same material.

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.0 mL per minute.

(d) Use a column temperature of 25°.

(e) Use a detection wavelength of 236 nm.

(f) Inject 10 μL of each solution.

#### MOBILE PHASE

Equal volumes of *methanol* and *water*.

#### SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to *methyl 4-hydroxybenzoate* and *santonin* is not less than 2.0.

#### DETERMINATION OF CONTENT

Calculate the content of  $C_{15}H_{18}O_3$  in the herbal drug using the declared content of  $C_{15}H_{18}O_3$  in *santonin BPCRS* using the following expression:

$$\frac{A_1}{A_2} \times \frac{m_2}{V_2} \times \frac{V_1}{m_1} \times p \times \frac{100}{100 - d}$$

$A_1$	=	area of the peak due to <i>santonin</i> in the chromatogram obtained with solution (1);
$A_2$	=	area of the peak due to <i>santonin</i> in the chromatogram obtained with solution (2);
$m_1$	=	weight of the herbal drug being examined in mg;
$m_2$	=	weight of <i>santonin BPCRS</i> in mg;
$V_1$	=	dilution volume of solution (1) in mL;
$V_2$	=	dilution volume of solution (2) in mL;
$p$	=	percentage content of <i>santonin</i> ( $C_{15}H_{18}O_3$ ) in <i>santonin BPCRS</i> ;
$d$	=	percentage loss on drying of the herbal drug being examined.

1

## MOTHER TINCTURE

The mother tincture complies with the requirements stated under *Mother Tinctures for Homoeopathic Preparations* and with the following requirements.

#### DEFINITION

It contains not less than 0.1% of *santonin* ( $C_{15}H_{18}O_3$ ).

#### PRODUCTION

The mother tincture of *Artemisia cina* is prepared from the powdered drug using *Method 1.1.8* described in the monograph for *Methods of Preparation of Homoeopathic Stocks and Potentisation*. Use 86% w/w (90% v/v) of *ethanol*.

#### CHARACTERISTICS

The mother tincture is a golden yellow to greenish liquid.

#### IDENTIFICATION

The mother tincture complies with Identification test C above using the mother tincture as solution (1).

#### TESTS

##### Ethanol

40% to 46% w/w (47% to 54% v/v), Appendix VIII F.

##### Dry residue

Not less than 1.8% w/w, Appendix XI P.

##### Relative density

0.835 to 0.855, Appendix V G.

#### ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, as described for the herbal drug using as solution (1) the mother tincture.

#### DETERMINATION OF CONTENT

Calculate the content of  $C_{15}H_{18}O_3$  in the mother tincture using the declared content of  $C_{15}H_{18}O_3$  in *santonin BPCRS* using the following expression:

$$\frac{A_1}{A_2} \times \frac{m_2}{V_2} \times \frac{V_1}{m_1} \times p$$

$A_1$	=	area of the peak due to <i>santonin</i> in the chromatogram obtained with solution (1);
$A_2$	=	area of the peak due to <i>santonin</i> in the chromatogram obtained with solution (2);
$m_1$	=	weight of the herbal drug being examined in mg;
$m_2$	=	weight of <i>santonin BPCRS</i> in mg;
$V_1$	=	dilution volume of solution (1) in mL;
$V_2$	=	dilution volume of solution (2) in mL;
$p$	=	percentage content of <i>santonin</i> ( $C_{15}H_{18}O_3$ ) in <i>santonin BPCRS</i> .

## Barium Chloride Dihydrate for Homoeopathic Preparations

(*Barium Chloratum for Homoeopathic Preparations*, *Ph. Eur. monograph 2142*)

$BaCl_2 \cdot 2H_2O$

244.3

10326-27-9

*Ph Eur*

#### DEFINITION

##### Content

99.0 per cent to 101.0 per cent of  $BaCl_2 \cdot 2H_2O$ .

#### CHARACTERS

##### Appearance

White or almost white, crystalline powder or colourless crystals.

##### Solubility

Freely soluble in water, very slightly soluble or practically insoluble in ethanol (96 per cent).

#### IDENTIFICATION

A. Dissolve 0.1 g in 1 mL of *water R*. Add 0.3 mL of *dilute sulfuric acid R*. A white precipitate is formed; it is insoluble in *dilute hydrochloric acid R* and in *dilute nitric acid R*.

B. It gives reaction (a) of chlorides (2.3.1).

**TESTS****Solution S**

Dissolve 10.0 g in water R and dilute to 100 mL with the same solvent.

**Appearance of solution**

Solution S is clear (2.2.1) and colourless (2.2.2, Method II).

**Acidity or alkalinity**

To 10 mL of solution S add 0.1 mL of phenolphthalein solution R. Not more than 0.2 mL of 0.01 M hydrochloric acid or 0.01 M sodium hydroxide is required to change the colour of the indicator.

**ASSAY**

Dissolve 0.200 g in 100 mL of water R. Add 100 mL of methanol R, 10 mL of concentrated ammonia R and 2 mg of phthalein purple R. Titrate with 0.1 M sodium edetate until the colour changes from violet to colourless.

1 mL of 0.1 M sodium edetate is equivalent to 24.43 mg of BaCl<sub>2</sub>·2H<sub>2</sub>O.

Ph Eur

## Belladonna for Homoeopathic Preparations

(Ph. Eur. monograph 2489)

Ph Eur

**DEFINITION**

Whole, fresh, flowering plant of *Atropa belladonna* L., harvested at the end of flowering, with the ligneous base of the stems removed.

**IDENTIFICATION**

The root crown is short, thick, cylindrical, with one or more heads, and with many branching roots extending from it; these are grey or brown, fleshy, cylindrical or fusiform, very rarely twisted. The erect stem of the youngest part is cylindrical and pubescent. The petiolate leaves are alternate, simple, oval, attenuated at both ends, lacking stipules, with pinnate venation, up to 20 cm long and 10 cm wide; on the flowering stems they are paired and unequal in size.

The drooping, pedunculate, solitary flowers appear between the petioles of the paired leaves; they are actinomorphic, pentamerous, with superior ovaries; they have a gamosepalous, glandular, green calyx, which grows larger after flowering.

The corolla, 2-3 cm long, is campanulate, gamopetalous, greenish-yellow with violet veins in the upper part; it is hairy and deciduous, divided into 5 narrow, rounded lobes. The 5 alternipetalous stamens, attached at the base of the corolla, have long filaments which are hairy in the lower part; they bear bilocular, introrse anthers which dehisce longitudinally. The superior ovary consists of 2 carpels with axile placentation. The style is simple, ending in a slightly cordiform stigma, extending beyond the stamens. The fruit is a spherical, fleshy berry, the size of a cherry, green then black and shiny when ripe. The seeds are numerous, reniform with a testa showing markings.

**TESTS****Foreign matter (2.8.2)**

Maximum 5 per cent.

**Loss on drying (2.2.32)**

Minimum 75.0 per cent, determined on 5.0 g of the finely cut drug by drying in an oven at 105 °C for 2 h.

**MOTHER TINCTURE**

The mother tincture complies with the requirements of the general monograph *Mother tinctures for homoeopathic preparations (2029)*.

**DEFINITION****Content**

0.020 per cent *m/m* to 0.050 per cent *m/m* of hyoscyamine (C<sub>17</sub>H<sub>23</sub>NO<sub>3</sub>; M<sub>r</sub> 289.4).

**PRODUCTION**

The mother tincture is prepared from the comminuted herbal drug according to the following methods prescribed in the monograph *Methods of preparation of homoeopathic stocks and potentisation (2371)*:

- method 1.1.3;
- method 1.1.10, using ethanol (45 per cent *V/V*) and a maceration time of 3-5 weeks.

**CHARACTERS****Appearance**

Brown liquid.

**IDENTIFICATION**

Examine the chromatograms obtained in the test for atropine.

**Detection A** Spray with potassium iodobismuthate solution R2 until orange or brown zones become visible against a yellow background. Examine in daylight.

**Results A** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present, in particular in the middle of the chromatogram obtained with the test solution.

Top of the plate	
Hyoscyine: an orange or brown zone	An orange or brown zone, sometimes very faint or absent (hyoscyine)
Hyoscyamine: an orange or brown zone	An orange or brown zone (hyoscyamine)
Reference solution	Test solution

The zone due to hyoscyine in the chromatogram obtained with the reference solution and that with the same *R<sub>F</sub>* in the chromatogram obtained with the test solution are located at the limit between the middle third and the upper third and they may therefore appear in either part of the chromatogram.

**TESTS****Relative density (2.2.5)**

0.932 to 0.947 when method 1.1.3 is used.

**Ethanol (2.9.10)**

40 per cent *V/V* to 50 per cent *V/V* when method 1.1.10 is used.

**Dry residue (2.8.16)**

Minimum 1.4 per cent.

**Mother tincture of *Hyoscyamus niger* – mother tincture of *Datura stramonium*.**

Concentrate 10 mL of the mother tincture to be examined on a water bath until a volume of 5 mL is obtained.

Add 10 mL of *water R* and filter. Shake the filtrate with 5 mL of *methylene chloride R* and collect the organic layer. Filter and evaporate the filtrate to dryness under reduced pressure. Take up the residue with 10 mL of hot *water R*, and add 0.1 mL of *dilute ammonia R1*. A greenish-blue fluorescence appears when examined under ultraviolet light at 365 nm.

The absence of greenish-blue fluorescence indicates substitution by the mother tincture of *Hyoscyamus niger* and/or by the mother tincture of *Datura stramonium*.

#### Atropine

Thin-layer chromatography (2.2.27).

**Test solution** Evaporate 10 mL of the mother tincture to be examined on a water-bath. Take up the residue with 5 mL of *dilute sulfuric acid R1* and filter. Make alkaline with *concentrated ammonia R* and extract with 15 mL of *1,1-dimethylethyl methyl ether R*. Dry the ether layer over *anhydrous sodium sulfate R* and filter. Evaporate to dryness on a water-bath and dissolve the residue in 1 mL of *methanol R*.

**Reference solution** Dissolve 50 mg of *hyoscyamine sulfate R* in 9 mL of *methanol R* (solution A). Dissolve 15 mg of *hyoscine hydrobromide R* in 10 mL of *methanol R* (solution B). To 8 mL of solution A add 1.8 mL of solution B and dilute to 10 mL with *methanol R*.

**Plate** TLC silica gel plate R (5-40 µm) [or TLC silica gel plate R (2-10 µm)].

**Mobile phase** *concentrated ammonia R, water R, acetone R* (3:7:90 V/V/V).

**Application** 20 µL [or 5 µL] as bands.

**Development** Over a path of 10 cm [or 6 cm].

**Drying** At 105 °C for 15 min; allow to cool.

**Detection B** After detection A (see Identification), spray with *sodium nitrite solution R* until the yellow background disappears. Examine in daylight.

**Result B** No greyish-blue zone (atropine) appears in place of the brown or reddish-brown zone due to *hyoscyamine* in the chromatogram obtained with the test solution.

#### ASSAY

Liquid chromatography (2.2.29).

**Test solution** Introduce 1.500 g of the mother tincture to be examined into a volumetric flask and dilute to 10.0 mL with *water for chromatography R*. Apply the mixture to a cartridge filled with a cation-exchange material (60 µm; 60 mg), pre-conditioned with 2 mL of *methanol R2* and then 2 mL of *water for chromatography R*. Rinse the volumetric flask with 1 mL of a mixture of 2 volumes of *anhydrous formic acid R* and 98 volumes of *water for chromatography R*, and apply the rinsings to the cartridge. Wash the cartridge with 2 mL of a mixture of 2 volumes of *anhydrous formic acid R* and 98 volumes of *water for chromatography R* and then with 2 mL of *methanol R2*. Dry the cartridge with the aid of a vacuum and elute with 3.5 mL of a mixture of 2 volumes of *concentrated ammonia R* and 98 volumes of *methanol R2*. Expel the solvent remaining in the cartridge into the eluate, add 40 µL of *glacial acetic acid R* and dilute to 5.0 mL with *water for chromatography R*.

**Reference solution (a)** Dissolve 10.0 mg of *hyoscyamine sulfate CRS* in *methanol R2* and dilute to 10.0 mL with the same solvent.

**Reference solution (b)** Dissolve 10.0 mg of *hyoscine hydrobromide R* in *methanol R2* and dilute to 10.0 mL with the same solvent.

**Reference solution (c)** Mix 3.0 mL of reference solution (a) and 2.5 mL of reference solution (b) and dilute to 25.0 mL with mobile phase A.

**Column:**

— *size*:  $l = 0.15 \text{ m}$ ,  $\varnothing = 4.6 \text{ mm}$ ;

— *stationary phase*: end-capped octadecylsilyl silica gel for chromatography R (3 µm);

— *temperature*: 30 °C.

**Mobile phase:**

— *mobile phase A*: *triethylamine R, acetonitrile for chromatography R, phosphate buffer solution pH 7.0 R6* (0.01:5:95 V/V/V);

— *mobile phase B*: *triethylamine R, phosphate buffer solution pH 7.0 R6, acetonitrile for chromatography R* (0.01:40:60 V/V/V);

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 5	90	10
5 - 20	90 → 10	10 → 90

**Flow rate** 1.0 mL/min.

**Detection** Spectrophotometer at 210 nm.

**Injection** 20 µL of the test solution and reference solution (c).

**Retention time** *Hyoscyamine* = about 12 min; *hyoscine* = about 13.5 min.

**System suitability** Reference solution (c):

— *resolution*: minimum 5 between the peaks due to *hyoscyamine* and *hyoscine*;

— *symmetry factor*: maximum 2.0 for the peak due to *hyoscyamine*.

Calculate the percentage content *m/m* of *hyoscyamine* using the following expression:

$$\frac{A_1 \times m_2 \times p}{A_2 \times m_1 \times 16.667}$$

- $A_1$  = area of the peak due to *hyoscyamine* in the chromatogram obtained with the test solution;  
 $A_2$  = area of the peak due to *hyoscyamine* in the chromatogram obtained with reference solution (c);  
 $m_1$  = mass of the mother tincture to be examined used to prepare the test solution, in grams;  
 $m_2$  = mass of *hyoscyamine sulfate CRS* used to prepare the reference solution, in grams;  
 $p$  = assigned percentage content of anhydrous *hyoscyamine* in *hyoscyamine sulfate CRS*.

Ph Eur

## Cadmium Sulfate Hydrate for Homoeopathic Preparations

(*Cadmium Sulfuricum* for Homoeopathic Preparations, Ph. Eur. monograph 2143)

$\text{CdSO}_4 \cdot 8/3\text{H}_2\text{O}$  256.5

Ph Eur

#### DEFINITION

##### Content

98.0 per cent to 102.0 per cent (anhydrous substance).

#### CHARACTERS

##### Appearance

White or almost white, crystalline powder.

**Solubility**

Freely soluble in water, practically insoluble in ethanol (96 per cent).

**IDENTIFICATION**

A. It gives reaction (a) of sulfates (2.3.1).

B. To 2 mL of solution S (see Tests) add 2 mL of sodium sulfide solution R. A yellow precipitate is formed.

**TESTS****Solution S**

Dissolve 5.0 g in carbon dioxide-free water R and dilute to 50 mL with the same solvent.

**Appearance of solution**

Solution S is clear (2.2.1) and colourless (2.2.2, Method II).

**Acidity or alkalinity**

To 10 mL of solution S add 0.3 mL of methyl orange solution R. Not more than 0.5 mL of 0.01 M hydrochloric acid or 0.01 M sodium hydroxide is required to change the colour of the indicator.

**Nitrates**

Maximum 100 ppm.

Dissolve 1.0 g in water R and dilute to 20.0 mL with the same solvent. To 1.0 mL of this solution add 0.2 mL of a 10 g/L solution of sulfanilic acid R in acetic acid R and 0.2 mL of a recently prepared 3 g/L solution of naphthylamine R in acetic acid R. Add a turning of zinc R. A pink colour is produced within 5 min. It is not more intense than that of a mixture of 0.5 mL of nitrate standard solution (10 ppm NO<sub>3</sub>) R and 0.5 mL of water R, prepared at the same time.

**Zinc sulfate, alkaline-earth sulfates, rare-earth sulfates**

Dissolve 1.0 g in 17 mL of water R. Add 0.5 mL of hydrochloric acid R and 1 g of thioacetamide R. Heat in a water-bath for 10 min. Dilute to 20.0 mL with water R and filter. Evaporate 10.0 mL of this solution to dryness in an oven. Ignite the residue at about 800 ± 50 °C to constant mass. The residue weighs a maximum of 2 mg.

**Arsenic (2.4.2, Method A)**

Maximum 2 ppm, determined on 5 mL of solution S.

**Water (2.5.12)**

16.0 per cent to 20.0 per cent, determined on 80 mg. Shake for 10 min before carrying out the determination.

**ASSAY**

Dissolve 0.200 g in 50 mL of water R. Add 10 mL of ammonium chloride buffer solution pH 10.0 R and 50 mg of mordant black 11 triturate R1. Titrate with 0.1 M sodium edetate until the colour changes from red to green.

1 mL of 0.1 M sodium edetate is equivalent to 20.85 mg of CdSO<sub>4</sub>.

Ph Eur

## Calcium Fluoratum for Homoeopathic Preparations

(Ph. Eur. monograph 2996)

CaF<sub>2</sub>

78.1

7789-75-5

Ph Eur

**DEFINITION****Content**

98.0 per cent to 102.0 per cent of CaF<sub>2</sub>.

**CHARACTERS****Appearance**

Fine, white or almost white powder.

**Solubility**

Practically insoluble in water, slightly soluble in mineral acids.

**IDENTIFICATION**

A. To 0.80 g add 20 mL of hydrochloric acid R and heat to boiling under a reflux condenser until complete dissolution (about 30 min). After cooling, add 0.1 mL of phenolphthalein solution R, and then concentrated ammonia R until a pink colour is obtained. Add glacial acetic acid R until the solution is decolourised, then add 1 mL in excess. Filter and dilute to 40 mL with water R. Dilute 1 mL of the solution obtained to 5 mL with distilled water R and add 2 mL of ammonium oxalate solution R. A white precipitate is formed which dissolves in 2 mL of dilute hydrochloric acid R.

B. In a lead or platinum crucible, mix 10 mg with 20 mg of anhydrous colloidal silica R and a few drops of sulfuric acid R, with the aid of a copper wire, in order to give a thin slurry. Cover the crucible with a thin, transparent plate of plastic under which a drop of water R is suspended, and warm gently. A white ring is rapidly formed around the drop of water.

**TESTS****Free acid**

Shake 5.0 g with 2 g of calcium chloride R and 100 mL of water R for 5 min. Heat to 70 °C and filter. To 40 mL of the filtrate, maintained at 70 °C, add 0.1 mL of methyl red solution R. Not more than 1.0 mL of 0.1 M sodium hydroxide is required to change the colour of the indicator to yellow.

**ASSAY**

Introduce 0.150 g into a 500 mL conical flask and add 8 mL of hydrochloric acid R. Boil for 3-4 min on a preheated hot plate and allow to cool. Add 300 mL of water R, followed by strong sodium hydroxide solution R until the first appearance of persistent opalescence (about pH 14). Add 0.13 g of calcinecarboxylic acid triturate R and titrate with 0.1 M sodium edetate until the colour changes from red-violet to pure blue. The opalescence caused by the strong sodium hydroxide solution disappears during the course of the titration. If still visible at the end of the titration, it can be dissolved by adding a few drops of hydrochloric acid R.

1 mL of 0.1 M sodium edetate is equivalent to 7.81 mg of CaF<sub>2</sub>.

## Calcium Iodide Tetrahydrate for Homoeopathic Preparations

(Calcium Iodatatum for Homoeopathic Preparations, Ph. Eur. monograph 2144)

CaI<sub>2</sub>·4H<sub>2</sub>O

366.0

13640-62-5

Ph Eur

### DEFINITION

#### Content

97.0 per cent to 102.0 per cent of CaI<sub>2</sub> (anhydrous substance).

### CHARACTERS

#### Appearance

White or almost white, very hygroscopic powder.

#### Solubility

Very soluble or freely soluble in water and in ethanol (96 per cent).

### IDENTIFICATION

A. Solution S (see Tests) gives reaction (a) of calcium (2.3.1).

B. Solution S (see Tests) gives reaction (b) of iodides (2.3.1).

### TESTS

#### Solution S

Dissolve 10.0 g in distilled water R and dilute to 100.0 mL with the same solvent.

#### Appearance of solution

Solution S is clear (2.2.1) and not more intensely coloured than reference solution GY<sub>5</sub> (2.2.2, Method II).

#### Free iodine, iodates

To 5 mL of solution S add 2 mL of methylene chloride R. Shake and allow to stand. The organic layer is colourless (2.2.2, Method I) (free iodine). Add 0.2 mL of dilute sulfuric acid R. Shake and allow to stand. The organic layer remains colourless (2.2.2, Method I) (iodates).

#### Sulfates (2.4.13)

Maximum 150 ppm.

Dilute 10 mL of solution S to 15 mL with distilled water R.

#### Iron (2.4.9)

Maximum 10 ppm, determined on 10 mL of solution S.

#### Water (2.5.12)

18.0 per cent to 22.0 per cent, determined on 0.100 g.

### ASSAY

Dissolve 0.300 g in 50 mL of water R. Add 5 mL of dilute nitric acid R and 25.0 mL of 0.1 M silver nitrate. Shake. Add 2 mL of ferric ammonium sulfate solution R2 and titrate with 0.1 M ammonium thiocyanate until the colour changes to reddish-yellow.

1 mL of 0.1 M silver nitrate is equivalent to 14.70 mg of CaI<sub>2</sub>.

### STORAGE

In an airtight container.

Ph Eur

## Calcium Phosphate for Homoeopathic Preparations

Calcium Phosphoricum for Homoeopathic Preparations

### DEFINITION

Calcium Phosphate for Homoeopathic Preparations contains Calcium Phosphate.

### PRODUCTION OF STOCK

The first trituration of Calcium Phosphate for Homoeopathic Preparations is prepared using a suitable quantity of a vehicle, such as Lactose Monohydrate, Lactose or Sucrose, and a validated method for trituration that ensures homogeneity is achieved. The vehicle complies with the statement under Vehicles in the monograph for Homoeopathic Preparations.

#### Content of calcium Ca

The first decimal trituration contains 3.5% to 4.0% of Ca.

### CHARACTERISTICS

The first decimal trituration is a white powder.

### IDENTIFICATION

Wash 5 g of the first decimal trituration of the substance being examined with three 10-mL quantities of water.

The dried residue complies with the following tests.

A. Dissolve 0.1 g of the dried residue in 5 mL of a 25% v/v solution of nitric acid. The resulting solution yields reaction B of phosphates, Appendix VI.

B. The dried residue yields reaction B characteristic of calcium salts, Appendix VI. Filter before adding potassium ferrocyanide solution.

C. The dried residue complies with the limits of the Assay.

D. If the preparation includes Lactose Monohydrate as the vehicle, it complies with the following test. Dissolve 0.25 g in 5 mL of water. Add 5 mL of ammonia and heat in a water-bath at 80° for 10 minutes. A red colour develops.

E. If the preparation includes Sucrose as the vehicle, it complies with the following test. Dissolve 5.0 g in carbon dioxide-free water and dilute to 10 mL with the same solvent. Dilute 1 mL of the solution to 100 mL with water. To 5 mL of the solution add 0.15 mL of freshly prepared copper sulfate solution and 2 mL of freshly prepared dilute sodium hydroxide solution. The solution is blue and clear and remains so after boiling. To the hot solution add 4 mL of dilute hydrochloric acid and boil for 1 minute. Add 4 mL of dilute sodium hydroxide solution. An orange precipitate is formed immediately.

### ASSAY

Dissolve 0.2 g of the residue in a mixture of 1.0 mL of hydrochloric acid R1 and 5 mL of water. Add 25.0 mL of 0.1M disodium edetate and dilute to 200 mL with water.

Adjust to about pH 10 with concentrated ammonia.

Add 10 mL of ammonia buffer pH 10.0 and a few milligrams of mordant black 11 triturate. Titrate the excess disodium edetate with 0.1M zinc sulfate until the colour changes from blue to violet. Each mL of 0.1M sodium hydroxide is equivalent to 4.008 mg of Ca.

## Cineraria Maritima for Homoeopathic Preparations

### DEFINITION

Cineraria Maritima for Homoeopathic Preparations is the fresh aerial parts of *Cineraria maritima* L. harvested before flowering.

### IDENTIFICATION

**Plant** Low growing, woody-based perennial 25 to 30 cm occasionally up to 100 cm high, with strong, white tomentose shoots up to 20 mm in diameter. The shoots are much branched and those bearing the flowers are elongated with some smaller leaves in the upper part; the shorter, non-flowering shoots remain compressed with the leaves forming a rosette at the top.

**Leaves** The leaves are alternate, up to 25 cm long and 12 cm wide, ovate or oblong-ovate, the lowest coarsely toothed, the upper ones deeply pinnatifid or pinnate with 4 to 6 oblong to blunt, often 3 to 5 lobed, unequal segments. The under surface is covered with a dense white felt, the upper surface is green with scattered cottony hairs.

### MOTHER TINCTURE

The mother tincture complies with the requirements stated under Mother Tinctures for Homoeopathic Preparations and with the following requirements.

### PRODUCTION

The mother tincture of *Cineraria maritima* L. is prepared from the cut drug using Method 1.1.7 described in the monograph for Methods of Preparation of Homoeopathic Stocks and Potentisation. Use 43% w/w (50% v/v) of ethanol.

### CHARACTERISTICS

The mother tincture is a dark yellow, clear to slightly turbid liquid.

### IDENTIFICATION

A. Carry out the method for thin-layer chromatography, Appendix III A, using the following solutions.

(1) Dilute 5 mL of the mother tincture with 15 mL of water and transfer to a cartridge containing octadecyl-bonded silica sorbent (a Sep-pak C18 cartridge is suitable) previously washed with 10 mL of methanol followed by 10 mL of water. Elute with 10 mL of methanol, evaporate the eluant and dissolve the residue in 0.5 mL of methanol.

(2) 0.05% w/v each of hyperoside and rutin and 0.01% w/v of scopoletin in methanol.

### CHROMATOGRAPHIC CONDITIONS

- Use as the coating silica gel F<sub>254</sub>.
- Use the mobile phase described below.
- Apply 30 µL of solution (1) and 10 µL of solution (2) as 10 mm bands.
- Develop the plate to 15 cm.
- After removal of the plate, dry in air and spray the plate with a 1% w/v solution of diphenylboric acid aminoethyl ester in methanol and then spray with a 5% w/v solution of polyethylene glycol 400 in methanol. Heat at 100° to 105° for 5 minutes, allow to dry in air and examine immediately in ultraviolet light (365 nm).

### MOBILE PHASE

10 volumes of water, 10 volumes of formic acid and 80 volumes of ethyl acetate.

### SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (2) shows three fluorescent bands: an orange fluorescent band with a low R<sub>f</sub> value (rutin), an orange fluorescent band with an R<sub>f</sub> value in the middle region (hyperoside) and a blue fluorescent band with an R<sub>f</sub> value in the upper region (scopoletin).

### CONFIRMATION

The chromatogram obtained with solution (1) shows an orange fluorescent band in a similar position to rutin, another fluorescent band above this orange band, another orange fluorescent band in a similar position to hyperoside with a green fluorescent band just below, one or two green fluorescent bands between the bands in similar positions to hyperoside and scopoletin, one blue-green fluorescent band in a similar position to scopoletin and one yellow-green to orange fluorescent band above the blue-green fluorescent band.

An orange fluorescent band	Hyperoside: an orange fluorescent band
A green fluorescent band	
A fluorescent band	
An orange fluorescent band	Rutin: an orange fluorescent band
Solution (1)	Solution (2)

B. Carry out the method for thin-layer chromatography, Appendix III A, using the following solutions.

(1) Evaporate off the ethanol from 50 mL of the mother tincture. Make the residue alkaline with dilute ammonia R1 and extract with three 20-mL quantities of chloroform. Evaporate the combined chloroform extracts to dryness and dissolve the residue in 1 mL of ethanol (60%).

(2) 0.1% w/v of reserpine in acetone.

### CHROMATOGRAPHIC CONDITIONS

- Use as the coating silica gel F<sub>254</sub>.
- Use the mobile phase described below.
- Apply 30 µL of solution (1) and 20 µL of solution (2) as 10 mm bands.
- Develop the plate to 10 cm.
- After removal of the plate, dry in air and spray the plate with a 2% w/v solution of dimethylaminobenzaldehyde in ethanol and then spray with a solution of sulfuric acid. Heat at 100° to 105° for 5 minutes and examine in daylight.

### MOBILE PHASE

10 volumes of methanol and 90 volumes of chloroform.

### SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (2) shows one blue band with an R<sub>f</sub> value of 0.80.

**CONFIRMATION**

The chromatogram obtained with solution (1) shows a series of violet bands between the line of application and Rf value 0.65, one pink band at Rf value 0.75 and one red band at Rf value 0.90.

Top of the plate	
A red band	Reserpine: a blue band
A pink band

Solution (1)	Solution (2)

**TESTS**

**Ethanol**

25 to 35% w/w (31 to 42% v/v), Appendix VIII F.

**Dry residue**

Not less than 1.0%, determined on 2 mL, Appendix XI P.

**Relative density**

0.957 to 0.977, Appendix V G.

**STORAGE**

Cineraria Maritima for Homoeopathic Preparations should be protected from light.

**Citrullus Colocynthis Fruit for Homoeopathic Preparations**

**DEFINITION**

Citrullus Colocynthis Fruit for Homoeopathic Preparations is the dried, peeled fruits of *Citrullus colocynthis* (L.) Schrad. with the seeds removed.

**IDENTIFICATION**

A. The peeled fruits are spherical with a diameter of 5 to 10 cm, white to pale yellow and very light in texture, consisting mainly of soft, spongy tissue from the inner cupule and the placentae. The external surface is marked by spiral, flattish, knife marks where the peel has been removed. In cross section, three conspicuous fissures can be seen radiating from the centre and dividing the fruit into three parts. Each part contains two groups of seeds near the periphery, the remaining space being filled with pithy parenchyma. Each fruit contains 200 to 300 seeds. The inferior ovary is initially tripartite but as the placentae grow out from the centre towards the circumference, each divides into two, half curving backwards, and giving the appearance of a hexapartite ovary.

B. Reduce to a powder. The powder is pale yellowish-buff. Examine under a microscope using *chloral hydrate solution*. The powder shows abundant, large, partly lignified, thin-walled, finely pitted, usually fragmented parenchyma; smaller cells with slightly collenchymatous thickening and more

distinct pitted circular to oval areas, lignified, spirally or annularly thickened vessels.

C. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Add 30 mL of 86% v/v ethanol to 3 g of the coarsely powdered drug and heat under reflux for 2 hours. Allow to cool and filter. Evaporate 20 mL of the filtrate to about 5 mL.

(2) 0.1% w/v each of *caffeine, coumarin* and *resorcinol* in *methanol*.

**CHROMATOGRAPHIC CONDITIONS**

(a) Use as the coating *silica gel F<sub>254</sub>*.

(b) Use the mobile phase described below.

(c) Apply 20 µL of each solution.

(d) Develop the plate to 10 cm.

(e) Remove the plate, dry it in air and examine under *ultraviolet light (254 nm)*.

**MOBILE PHASE**

1 volume of 13.5M *ammonia*, 9 volumes of *methanol* and 90 volumes of *dichloromethane*.

**SYSTEM SUITABILITY**

The test is not valid unless the chromatogram obtained with solution (2) shows three clearly separated bands (approximate Rf values: *resorcinol* 0.31, *caffeine* 0.67 and *coumarin* 0.87).

**CONFIRMATION**

The chromatogram obtained with solution (1) shows two dark bands at Rf values of 0.08 and 0.1 respectively between the line of application and the band due to *resorcinol*, one dark band at an Rf value of 0.56 positioned between the band due to *resorcinol* and that due to *caffeine*, and one dark band at approximately Rf value of 0.78 positioned between the band due to *caffeine* and that due to *coumarin*. Other bands may be present.

Top of the plate	
A dark band	Coumarin: a dark band
A dark band	Caffeine: a dark band
A dark band	Resorcinol: a dark band
A dark band	
Solution (1)	Solution (2)

**TESTS****Foreign matter**

Not more than 2.0% of the outer part of the pericarp; not more than 5.0% of seeds; not more than 2.0% of other foreign matter, Appendix XI D.

**Loss on drying**

When dried at 100° to 105° for 2 hours, loses not more than 22.0% of its weight. Use 1 g.

**Total ash**

Not more than 13.0%, Appendix XI J, Method II.

**MOTHER TINCTURE**

The mother tincture complies with the requirements stated under Mother Tinctures for Homoeopathic Preparations and with the following requirements.

**PRODUCTION**

The mother tincture of *Citrullus colocynthis* (L.) Schrad. is prepared from the powdered drug using Method 4a described in the monograph for Methods of Preparation of Homoeopathic Stocks and Potentisation. Use 86% w/w (90% v/v) ethanol.

**CHARACTERISTICS**

The mother tincture is a light yellow to yellow liquid.

**IDENTIFICATION**

The mother tincture complies with Identification test C above using the mother tincture as solution (1).

**TESTS****Ethanol**

81% to 91% w/w (86% to 94% v/v), Appendix VIII F.

**Dry residue**

1.0% to 2.5% w/w, Appendix XI P.

**Relative density**

0.830 to 0.850, Appendix V G.

## Cocculus Indicus for Homoeopathic Preparations

(*Cocculus for Homoeopathic Preparations, Ph. Eur. monograph 2486*)

Ph Eur

**DEFINITION**

Dried, ripe fruit of *Anamirta cocculus* (L.) Wight & Arn. (syn. *A. paniculata* Colebr.).

**Content**

Minimum 0.80 per cent of picrotoxinin (C<sub>15</sub>H<sub>16</sub>O<sub>6</sub>; M<sub>r</sub> 292.3) (dried drug).

**IDENTIFICATION**

First identification: A, B, D.

Second identification: A, B, C.

A. The fruits are dark greyish-brown or black, reniform or sub-spherical, about 6-10 mm in diameter and 9-12 mm long; the outer surface is irregularly wrinkled with a ridge about 4-6 mm long running between the pale, circular scar left by the stalk and the small beak of the remains of the stigma. The pericarp is hard, about 1 mm thick and the inner surface is brownish-grey, hard and woody. Cut transversely, the fruit shows a single, cup-shaped seed into the hollow of which an ingrowth of the mesocarp and

endocarp projects. Cut longitudinally, the endosperm shows the presence of 2 narrow cavities in each of which is enclosed 1 of the foliaceous cotyledons.

B. Microscopic examination (2.8.23). Reduce to a powder (710) (2.9.12). The powder is brown. Examine under a microscope using chloral hydrate solution R.

The powder shows the following diagnostic characters (Figure 2486.-1): fragments of the epicarp (surface view [D]) consisting of thin-walled, polygonal cells, about 30-50 µm in diameter [Da], anomocytic stomata (2.8.3) [Db], and cells in a pattern consisting of a cell with slightly thickened walls, pitted at the centre, surrounded by 4-6 cells [Dc]; fragments of the epicarp and outer layers of the mesocarp (transverse section [C]) showing the epicarp covered by a fine cuticle [Ca] and cells of the mesocarp, ovoid or rounded, some containing prisms of calcium oxalate [Cb]; numerous fragments of the inner layers of the mesocarp and of the endocarp [A] consisting of sclereids [Aa] and short fibres with pitted walls [Ab]; fragments of the endocarp consisting of layers of variously oriented fibres (surface view [E]); sclereids and isolated fibres [B]; vascular bundles (longitudinal section [F]), accompanied by fibres [Fa]; fragments of the endosperm [G, H] containing very numerous small acicular crystals.

C. Thin-layer chromatography (2.2.27).

**Test solution** To 2.00 g of the powdered herbal drug (710) (2.9.12) add 20 mL of ethanol (90 per cent V/V) R, shake for 2 h and then centrifuge (1000 g). Use the supernatant.

**Reference solution** Dissolve 10 mg of picrotin R and 10 mg of picrotoxinin R in ethanol (96 per cent) R and dilute to 10 mL with the same solvent.

**Plate** TLC silica gel plate R (5-40 µm) [or TLC silica gel plate R (2-10 µm)].

**Mobile phase** methanol R, ethyl acetate R, heptane R (10:40:50 V/V/V).

**Application** 40 µL [or 10 µL] as bands of 20 mm [or 10 mm].

**Development** Over a path of 10 cm [or 6 cm].

**Drying** In air.

**Detection** Spray with anisaldehyde solution R, heat at 100-105 °C for 5-10 min and examine immediately in daylight.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Above the zone due to picrotoxinin, several pink or violet zones may also be visible in the chromatogram obtained with the test solution.

Top of the plate	
Picrotoxinin: a blue zone	A blue zone (picrotoxinin)
Picrotin: a blue zone	A blue zone (picrotin)
Reference solution	Test solution

D. Examine the chromatograms obtained in the assay.

**Results** The peaks due to picrotoxinin and picrotin in the chromatogram obtained with the test solution are similar in retention time to the corresponding peaks in the chromatogram obtained with the reference solution.

Figure 2486.-1. – Illustration for identification test B of powdered herbal drug of *Cocculus*

#### TESTS

##### Loss on drying (2.2.32)

Maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (710) (2.9.12) by drying in an oven at 105 °C for 2 h.

##### Total ash (2.4.16)

Maximum 6.0 per cent.

#### ASSAY

Liquid chromatography (2.2.29).

**Test solution** To 2.000 g of the powdered herbal drug (710) (2.9.12) add 20.0 mL of ethanol (90 per cent V/V) R, shake for 2 h and then centrifuge at 1000 g for 5 min. Dilute 2.0 mL of the supernatant to 20.0 mL with the mobile phase and filter through a membrane filter (nominal pore size 0.45 µm).

**Reference solution** Dissolve 5.0 mg of picotoin CRS and 5.0 mg of picrotoxinin CRS in 10.0 mL of acetonitrile R. Dilute 2.0 mL of the solution to 20.0 mL with the mobile phase.

##### Column:

- size:  $l = 0.125$  m,  $\varnothing = 4.0$  mm;
- stationary phase: octadecylsilyl silica gel for chromatography R (5 µm).

**Mobile phase** acetonitrile R1, water R (30:70 V/V).

**Flow rate** 0.5 mL/min.

**Detection** Spectrophotometer at 200 nm.

**Injection** 10 µL.

**Run time** Twice the retention time of picrotoxinin CRS.

**Retention time** Picotoin = about 6 min;  
picrotoxinin = about 9.5 min.

**System suitability** Reference solution:

- resolution: minimum 2.0 between the peaks due to picotoin and picrotoxinin.

Calculate the percentage content of picrotoxinin using the following expression:

$$\frac{A_1 \times m_2 \times \rho \times 2}{A_2 \times m_1}$$

- $A_1$  = area of the peak due to picrotoxinin in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to picrotoxinin in the chromatogram obtained with the reference solution;
- $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;
- $m_2$  = mass of picrotoxinin CRS used to prepare the reference solution, in grams;
- $\rho$  = assigned percentage content of picrotoxinin in picrotoxinin CRS.

#### MOTHER TINCTURE

The mother tincture complies with the requirements of the general monograph *Mother tinctures for homoeopathic preparations* (2029).

#### DEFINITION

##### Content

0.07 per cent *m/m* to 0.15 per cent *m/m* of picrotoxinin ( $C_{15}H_{16}O_6$ ).

#### PRODUCTION

The mother tincture is prepared from the dried, ripe fruit of *A. cocculus* (L.) Wight & Arn. according to the following methods prescribed in the monograph *Methods of preparation of homoeopathic stocks and potentisation* (2371):

- method 1.1.8 using the powdered herbal drug (710) (2.9.12) and ethanol (90 per cent V/V); use ethanol (70 per cent V/V) to prepare the 4<sup>th</sup> decimal dilution and ethanol (50 per cent V/V) for subsequent dilutions;
- method 1.1.10 using the crushed drug in fragments of about 2-3 mm, ethanol (90 per cent V/V) and a maceration time of about 3 weeks.

#### CHARACTERS

##### Appearance

Yellow or dark yellow liquid.

#### IDENTIFICATION

A. Thin-layer chromatography (2.2.27) as described in identification test C for the herbal drug with the following modification.

**Test solution** The mother tincture to be examined.

B. Examine the chromatograms obtained in the assay.

**Results** The peaks due to picrotoxinin and picotoin in the chromatogram obtained with the test solution are similar in retention time to the corresponding peaks in the chromatogram obtained with the reference solution.

#### TESTS

##### Relative density (2.2.5)

0.830 to 0.845 when method 1.1.8 is used.

##### Ethanol (2.9.10)

85 per cent V/V to 95 per cent V/V when method 1.1.10 is used.

##### Dry residue (2.8.16)

Minimum 0.7 per cent.

#### ASSAY

Liquid chromatography (2.2.29) as described in the assay of the herbal drug with the following modification.

**Test solution** Dilute 0.500 g of the mother tincture to be examined to 10.0 mL with the mobile phase and filter using a membrane filter (nominal pore size 0.45 µm).

Calculate the percentage content of picrotoxinin using the following expression:

$$\frac{A_1 \times m_2 \times p}{A_2 \times m_1 \times 10}$$

- $A_1$  = area of the peak due to picrotoxinin in the chromatogram obtained with the test solution;  
 $A_2$  = area of the peak due to picrotoxinin in the chromatogram obtained with the reference solution;  
 $m_1$  = mass of the mother tincture to be examined used to prepare the test solution, in grams;  
 $m_2$  = mass of picrotoxinin CRS used to prepare the reference solution, in grams;  
 $p$  = assigned percentage content of picrotoxinin in picrotoxinin CRS.

Ph Eur

## Copper for Homoeopathic Preparations

Copper for Homoeopathic Use

(Cuprum Metallicum for Homoeopathic Preparations, Ph. Eur. monograph 1610)

Cu 63.5 7440-50-8

Ph Eur

### DEFINITION

#### Content

98.0 per cent to 102.0 per cent of Cu.

### CHARACTERS

#### Appearance

Reddish-brown powder.

#### Solubility

Practically insoluble in water, soluble in nitric acid, practically insoluble in ethanol (96 per cent).

### IDENTIFICATION

A. To 2 mL of solution S (see Tests) add 0.5 mL of potassium ferrocyanide solution R. A reddish-brown precipitate is formed.

B. To 5 mL of solution S add 0.6 mL of ammonia R. A blue precipitate is formed. Add 2 mL of ammonia R.

The precipitate disappears; the solution has an intense blue colour.

### TESTS

#### Solution S

Dissolve 2.0 g in 10 mL of nitric acid R. After nitrous fumes are no longer evolved, dilute to 60 mL with distilled water R.

#### Acidity or alkalinity

To 5.0 g add 20 mL of carbon dioxide-free water R. Boil for 1 min. Cool. Filter and dilute to 25.0 mL with carbon dioxide-free water R. To 10 mL of the solution add 0.1 mL of bromothymol blue solution R1. Not more than 0.5 mL of 0.01 M hydrochloric acid or 0.01 M sodium hydroxide is required to change the colour of the indicator.

#### Chlorides (2.4.4)

Maximum 100 ppm, determined on solution S.

#### Sulfates (2.4.13)

Maximum 300 ppm, determined on solution S.

#### Iron

Maximum 50 ppm.

Atomic absorption spectrometry (2.2.23, Method I).

**Test solution** Dissolve 1.00 g in 5 mL of nitric acid R and dilute to 50.0 mL with water R.

**Reference solutions** Prepare the reference solutions using iron standard solution (20 ppm Fe) R, diluted as necessary with a 1 per cent V/V solution of nitric acid R.

**Source** Iron hollow-cathode lamp.

**Wavelength** 248.3 nm.

**Flame** Air-acetylene.

### Lead

Maximum 100 ppm.

Atomic absorption spectrometry (2.2.23, Method I).

**Test solution** Use the test solution prepared for the test for iron.

**Reference solutions** Prepare the reference solutions using lead standard solution (0.1 per cent Pb) R, diluted as necessary with a 1 per cent V/V solution of nitric acid R.

**Source** Lead hollow-cathode lamp.

**Wavelength** 283.3 nm.

**Flame** Air-acetylene.

### Zinc

Maximum 50 ppm.

Atomic absorption spectrometry (2.2.23, Method I).

**Test solution** Use the test solution prepared for the test for iron.

**Reference solutions** Prepare the reference solutions using zinc standard solution (100 ppm Zn) R, diluted as necessary with a 1 per cent V/V solution of nitric acid R.

**Source** Zinc hollow-cathode lamp.

**Wavelength** 213.9 nm.

**Flame** Air-acetylene.

### ASSAY

Dissolve 0.100 g in 5 mL of nitric acid R. Heat to expel the nitrous fumes. Add 200 mL of water R and neutralise (2.2.3) with dilute ammonia R1. Add 1 g of ammonium chloride R and 3 mg of murexide R. Titrate with 0.1 M sodium edetate until the colour changes from green to violet.

1 mL of 0.1 M sodium edetate is equivalent to 6.354 mg of Cu.

Ph Eur

## Copper Acetate Monohydrate for Homoeopathic Preparations

(Cuprum Aceticum for Homoeopathic Preparations, Ph. Eur. monograph 2146)

Cu(C<sub>2</sub>H<sub>3</sub>O<sub>2</sub>)<sub>2</sub>·H<sub>2</sub>O 199.7 6046-93-1

Ph Eur

### DEFINITION

#### Content

99.0 per cent to 101.0 per cent of Cu(C<sub>2</sub>H<sub>3</sub>O<sub>2</sub>)<sub>2</sub>·H<sub>2</sub>O.

### CHARACTERS

#### Appearance

Greenish-blue crystals or green powder.

#### Solubility

Soluble in water, slightly soluble or very slightly soluble in ethanol (96 per cent).

**IDENTIFICATION**

- A. It gives reaction (a) of acetates (2.3.1).  
 B. Dissolve 0.1 g in 10 mL of *water R* and add *dilute ammonia R1* dropwise. A dark blue colour is produced.

**TESTS****Solution S**

Dissolve 3.0 g in a mixture of 40 mL of *distilled water R* and 0.6 mL of *glacial acetic acid R*, with heating at 70 °C. Cool and dilute to 45 mL with *distilled water R*.

**Appearance of solution**

Solution S is clear (2.2.1).

**Impurities not precipitating with hydrogen sulfide**  
 Maximum 0.1 per cent, calculated as sulfates.

To 2.000 g add 92 mL of *water R* and 8.0 mL of *dilute sulfuric acid R*. Heat to 70 °C. Pass a current of *hydrogen sulfide R* until there is no longer precipitation of copper sulfide. Allow to cool and stand, then filter. Evaporate to dryness 50.0 mL of the filtrate in a crucible. Ignite the residue at about 600 ± 50 °C to constant mass.

**Chlorides (2.4.4)**

Maximum 50 ppm, determined on solution S.

**Sulfates (2.4.13)**

Maximum 150 ppm, determined on solution S.

**Iron (2.4.9)**

Maximum 20 ppm.

Dissolve 0.500 g in 10 mL of *water R*. Transfer to a separating funnel. Add 20 mL of *hydrochloric acid R1* and 10 mL of *methyl isobutyl ketone R*. Shake vigorously for 3 min. Allow to stand. Transfer the organic layer to a second separating funnel and add 10 mL of *water R*. Shake vigorously for 3 min. Allow to stand. The aqueous layer complies with the limit test for iron.

**Nickel**

Maximum 10 ppm.

To the residue obtained in the test for impurities not precipitating with hydrogen sulfide, add 2.0 mL of *hydrochloric acid R* and 1.0 mL of *sulfuric acid R*. Evaporate to dryness. Dissolve the residue in a mixture of 3.0 mL of *dilute sulfuric acid R* and 17.0 mL of *water R*. To 4.0 mL of this solution add 4.0 mL of *water R*, 5.0 mL of *bromine water R*, 7.0 mL of *dilute ammonia R1* and 3.0 mL of a 10 g/L solution of *dimethylglyoxime R* in *ethanol (90 per cent V/V) R*. This solution is not more intensely coloured within 1 min than a solution prepared as follows: mix 4.0 mL of a 1 ppm solution of nickel (Ni) prepared from *nickel standard solution (10 ppm Ni) R*, 4.0 mL of *water R* and 5.0 mL of *bromine water R*; carefully add 7.0 mL of *dilute ammonia R1* and 3.0 mL of a 10 g/L solution of *dimethylglyoxime R* in *ethanol (90 per cent V/V) R*.

**ASSAY**

Dissolve 0.400 g in *water R* and dilute to 50 mL with the same solvent. Add 6.0 mL of *glacial acetic acid R*, 10.0 g of *potassium iodide R* and 1 mL of *starch solution R*. Titrate with 0.1 M *sodium thiosulfate*.

1 mL of 0.1 M *sodium thiosulfate* is equivalent to 19.97 mg of  $\text{Cu}(\text{C}_2\text{H}_3\text{O}_2)_2 \cdot \text{H}_2\text{O}$ .

Ph Eur

## Crocus for Homoeopathic Preparations

Saffron for Homoeopathic Use

Saffron for Homoeopathic Preparations

(Ph. Eur. monograph 1624)

Ph Eur

**DEFINITION**

Dried stigmas of *Crocus sativus* L. usually joined by the base to a short style.

**CHARACTERS**

Characteristic, aromatic odour.

**IDENTIFICATION**

A. The dark brick-red stigmas, when dry, are 20 mm to 40 mm long and after soaking with water, about 35 mm to 50 mm long. The tubes, gradually widening at the top, are incised on one side, the upper margin is open and finely crenated. The style connecting the 3 stigmas is pale yellow and not more than 5 mm long.

B. Examine under a microscope using *chloral hydrate solution R*. It shows the following diagnostic characters: elongated epidermal cells, frequently with a short, central papilla; in water they release a yellow colouring matter; the upper border of the stigma has finger-shaped papillae, up to 150 µm long; between them are single, globular pollen grains, about 100 µm wide, with a finely pitted exine, vascular bundles with small spirally thickened vessels and no fibres.

C. Carefully crush pieces of the herbal drug to coarse particles and moisten with 0.2 mL of *phosphomolybdic acid solution R*. The particles turn blue within 1-2 min or they have a blue areole around them.

D. Thin-layer chromatography (2.2.27).

**Test solution** Carefully crush 0.1 g of the herbal drug with a glass rod and moisten with 0.2 mL of *water R*. After 3 min add 5 mL of *methanol R*, allow to stand for 20 min, protected from light, and filter through a plug of glass wool.

**Reference solution** Dissolve 5 mg of *naphthol yellow R* in 5 mL of *methanol R* and add a solution of 5 mg of *Sudan red G R* in 5 mL of *methylene chloride R*.

**Plate** TLC silica gel F<sub>254</sub> plate R.

**Mobile phase** *water R*, *2-propanol R*, *ethyl acetate R* (10:25:65 V/V/V).

**Application** 10 µL of the test solution and 5 µL of the reference solution as bands.

**Development** Over a path of 10 cm.

**Drying** In air.

**Detection A** Examine in daylight.

**Results A** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution.

Top of the plate	
A red zone	
A yellow zone	2 yellow zones An intense yellow zone (crocin)
Reference solution	Test solution

**Detection B** Examine in ultraviolet light at 254 nm.

**Results B** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution.

Top of the plate	
A red zone	1 or 2 quenching zones
A yellow zone	A quenching zone
Reference solution	Test solution

**Detection C** Treat with *anisaldehyde solution R* and examine in daylight while heating at 100-105 °C for 5-10 min.

**Results C** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution.

Top of the plate	
A red zone	1 or 2 red to reddish-violet zones
A blue to bluish-green zone	A red to reddish-violet zone 2 blue to bluish-green zones An intense blue to bluish-green zone (crocin)
Reference solution	Test solution

E. Dilute 0.1 mL of the test solution (see Identification D) with 1 mL of *methanol R*. Deposit 0.1 mL of this solution on a filter paper, allow to dry and spray with a 10 g/L solution of *diphenylboric acid aminoethyl ester R* in *methanol R*. Examine in ultraviolet light at 365 nm. The spot shows an intense orange-yellow fluorescence.

#### TESTS

##### Colouring intensity

Introduce 0.10 g into a 5 mL volumetric flask and dilute to 5.0 mL with *distilled water R*. Close the flask and shake every 30 min for 8 h. Then allow to stand for 16 h. Dilute 1.0 mL to 500.0 mL with *distilled water R*. The absorbance (2.2.25) measured at 440 nm using *distilled water R* as the compensation liquid, is not less than 0.44.

##### Foreign matter

Examine the herbal drug microscopically. No parts with rough walls, no crystals and no pollen grains containing 3 germinal pores are present.

##### Loss on drying (2.2.32)

Maximum 10.0 per cent, determined on 0.200 g by drying in an oven at 105 °C.

##### Total ash (2.4.16)

Maximum 7.0 per cent, determined on the residue obtained in the test for loss on drying.

Ph Eur

## Cydonia Oblonga for Homoeopathic Preparations

### DEFINITION

*Cydonia Oblonga* for Homoeopathic Preparations is the seeds of *Cydonia oblonga* Mill.

### IDENTIFICATION

The seeds are 6 to 7 mm long, reddish-brown to dark-brown, frequently cohering by a white mucilage appearing in flakes on the surface and in the spaces between the seeds; four-sided, one arched, one often distinctly ridged and two larger and flattened; pointed at one end, where the hilum occurs as a paler spot, obtuse at the other extremity, where the chalaza is situated. Cut transversely, the seed shows a very narrow endosperm surrounding two yellowish-white cotyledons.

### TESTS

#### Total ash

Not more than 5%, Appendix XI J, Method II.

### MOTHER TINCTURE

The mother tincture complies with the requirements stated under *Mother Tinctures for Homoeopathic Preparations* and with the following requirements.

### PRODUCTION

The mother tincture of *Cydonia oblonga* Mill. is prepared from the powdered drug using *Method 1.1.8* described in the monograph for *Methods of Preparation of Homoeopathic Stocks and Potentisation*. Use *glycerol*.

### CHARACTERISTICS

The mother tincture is a pale yellow, clear or slightly turbid viscous liquid.

### IDENTIFICATION

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Dilute 5 mL of the mother tincture with 5 mL of *water*, mix thoroughly and transfer the diluted tincture to a cartridge containing *octadecyl-bonded silica sorbent* (a Sep-pak C18 cartridge is suitable) previously washed with 10 mL of *methanol* followed by 10 mL of *water*. Wash the cartridge with 15 mL of *water* and elute with 10 mL of *methanol*. Evaporate the eluant to dryness using a rotary evaporator. Dissolve the residue in 0.5 mL of *methanol*.

(2) 0.1% w/v of *hyperoside*, 0.1% w/v of *rutin* and 0.01% w/v of *scopoletin* in *methanol*.

### CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel 60 F<sub>254</sub>*.

(b) Use the mobile phase as described below.

(c) Apply 40 µL of solution (1) and 10 µL of solution (2), as 12 mm bands.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air and spray the plate with a 1% w/v solution of *diphenylboric acid aminoethyl ester* in *methanol*, and then with a 5% w/v solution of *polyethylene glycol 400* in *methanol* and examine under ultraviolet light (365 nm).

### MOBILE PHASE

15 volumes of *anhydrous formic acid*, 15 volumes of *water* and 70 volumes of *ethyl acetate*.

## SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (2) shows two clearly separated orange fluorescent bands and one blue fluorescent band at a higher Rf value. In order of increasing Rf value the bands are: rutin, hyperoside and scopoletin.

## CONFIRMATION

The chromatogram obtained with solution (1) shows three yellow fluorescent bands in the lower third, a blue fluorescent band just below the rutin standard, a blue fluorescent band just below the hyperoside standard and a blue fluorescent band with the same Rf value of the scopoletin standard. Other bands may be present.

Top of the plate	
A blue fluorescent band	Scopoletin: a blue fluorescent band
A blue fluorescent band	Hyperoside: an orange fluorescent band
A blue fluorescent band A yellow fluorescent band A yellow fluorescent band A yellow fluorescent band	Rutin: an orange fluorescent band
Solution (1)	Solution (2)

## TESTS

## Refractive index

1.468 to 1.475, Appendix V E.

## Digitalis for Homoeopathic Preparations

(Ph. Eur. monograph 2705)

Ph Eur

## DEFINITION

Fresh leaf of *Digitalis purpurea* L., collected just before or during flowering.

## IDENTIFICATION

A. The flower is light to dark violet. The leaf is variable in size, usually 10-50 cm long and 4-15 cm wide, simple, entire, lanceolate, oblong, and ending in a subacute apex. The margins of the lamina are crenate or dentate. It is thick with a velvety or rough texture. The lamina is decurrent, attenuated along the midrib, the whole forming a winged, triangular petiole, with purple-pink spots at the base. The venation is pinnate, with the lateral veins leaving the midrib at about 45°; they anastomose near the leaf margin forming arcs, and are connected to each other by an extensive network of tertiary veinlets. The upper surface is greyish-green and pubescent, but sometimes almost glabrous. The veins are sunken, forming depressed lines around bulging areas in the lamina. The lower surface is paler and very tomentose; the whitish veins are prominent giving the surface a honeycomb-like appearance.

B. From non-flowering plants, take a fragment of the lower epidermis of the leaf. Examine under a microscope using *chloral hydrate solution R*. The leaf has a smooth cuticle and shows the following diagnostic characters: epidermal cells 30-75 µm long, with distinctly sinuous anticlinal walls; numerous anomocytic stomata (2.8.3); covering trichomes often articulated and bent at right angles, uniseriate, usually with 3-5 cells, sometimes collapsed, and a terminal cell covered in a sometimes smooth but usually verrucose or slightly striated cuticle; glandular trichomes with unicellular stalks and globular bicellular heads; glandular trichomes with multicellular, uniseriate stalks and unicellular heads.

## TESTS

## Foreign matter (2.8.2)

Maximum 5 per cent.

*Digitalis lanata*

The presence of brownish-yellow flowers, of oval lanceolate, narrow leaves, with entire margins or with dentate margins only near the apex, the existence of a few glandular trichomes of epidermal cells with very characteristic beaded walls, and the absence of covering trichomes, indicates adulteration with *Digitalis lanata* Ehrh.

*Digitalis lutea*

The presence of brownish-yellow flowers, of sessile, lanceolate, denticulate, almost glabrous leaves and the scarcity of smooth covering trichomes, indicates adulteration with *Digitalis lutea* L.

*Digitalis grandiflora*

The presence of brownish-yellow flowers, of oblong or oval leaves with serrate margins, non-reticulate venation and veins bearing rare, very large covering trichomes with large pits, indicates adulteration with *Digitalis grandiflora* All.

## Loss on drying (2.2.32)

Minimum 70.0 per cent, determined on 5.0 g of the comminuted herbal drug by drying in an oven at 105 °C for 2 h.

## MOTHER TINCTURE

The mother tincture complies with the requirements of the general monograph *Mother tinctures for homoeopathic preparations* (2029).

## DEFINITION

The mother tincture is prepared from the fresh leaf of *Digitalis purpurea* L., collected just before or during flowering.

## Content

0.003 per cent *m/m* to 0.013 per cent *m/m* of digitoxin (C<sub>41</sub>H<sub>64</sub>O<sub>13</sub>; M<sub>r</sub> 765).

## PRODUCTION

The mother tincture is prepared from the comminuted herbal drug according to the following methods prescribed in the monograph *Methods of preparation of homoeopathic stocks and potentisation* (2371):

- method 1.1.3;
- method 1.1.10, using ethanol (65 per cent *V/V*) and a maceration time of 3-5 weeks.

## CHARACTERS

## Appearance

Light greenish-brown or brown liquid.

## IDENTIFICATION

Thin-layer chromatography (2.2.27).

*Test solution* Evaporate 10 mL of the mother tincture to be examined to dryness under reduced pressure. Take up the

residue in 1 mL of a mixture of equal volumes of *ethyl acetate R* and *methanol R*.

**Reference solution** Dissolve 5 mg of *digitoxin R* and 2 mg of *gitoxin R* in a mixture of equal volumes of *ethyl acetate R* and *methanol R*, and dilute to 10 mL with the same mixture of solvents.

**Plate** TLC silica gel plate R (5-40 µm) [or TLC silica gel plate R (2-10 µm)].

**Mobile phase** water R, *methanol R*, *ethyl acetate R* (7.5:10:75 V/V/V).

**Application** 20 µL [or 10 µL] as bands.

**Development** Over a path of 10 cm [or 6 cm].

**Drying** In air.

**Detection** Treat with a mixture of 2 volumes of a 10 g/L solution of *chloramine R* and 8 volumes of a 250 g/L solution of *trichloroacetic acid R* in *ethanol (96 per cent) R*, then heat at 100-105 °C for 10 min; examine in ultraviolet light at 365 nm.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Digitoxin: a bluish-green fluorescent zone	A bluish-green fluorescent zone (digitoxin)
Gitoxin: a light blue fluorescent zone	A light blue fluorescent zone (gitoxin)
	A faint brownish-yellow fluorescent zone may be present
	A faint light blue fluorescent zone may be present
Reference solution	Test solution

**TESTS**

**Relative density (2.2.5)**

0.935 to 0.955 when method 1.1.3 is used.

**Ethanol (2.9.10)**

60 per cent V/V to 70 per cent V/V when method 1.1.10 is used.

**Dry residue (2.8.16)**

Minimum 2.5 per cent.

**ASSAY**

Liquid chromatography (2.2.29).

**Test solution** Dilute 8.0 g of the mother tincture to be examined to 10.0 mL with water for chromatography R and filter through a membrane filter (nominal pore size 0.45 µm).

**Reference solution (a)** Dissolve 10.0 mg of *digitoxin for LC assay CRS* in *methanol R2* and dilute to 10.0 mL with the same solvent. Dilute 2.00 mL of the solution to 20.0 mL with a mixture of equal volumes of *methanol R2* and water for chromatography R.

**Reference solution (b)** Dissolve 10.0 mg of *lanatoside C R* and 10.0 mg of *digoxin R* in *methanol R2* and dilute to 20.0 mL with the same solvent. Dilute 1.0 mL of the solution to 20.0 mL with a mixture of equal volumes of *methanol R2* and water for chromatography R.

**Column:**

— size:  $l = 0.15$  m,  $\varnothing = 4.6$  mm;

— stationary phase: end-capped octadecylsilyl silica gel for chromatography R (3 µm);

— temperature: 30 °C.

**Mobile phase:**

— mobile phase A: water for chromatography R;

— mobile phase B: acetonitrile for chromatography R;

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 2	80	20
2 - 32	80 → 40	20 → 60
32 - 33	40 → 80	60 → 20
33 - 38	80	20

**Flow rate** 1.0 mL/min.

**Detection** Spectrophotometer at 220 nm.

**Injection** 10 µL.

**Retention time** Digitoxin = about 25 min.

**System suitability** Reference solution (b):

— resolution: minimum 1.5 between the peaks due to lanatoside C and digoxin.

Calculate the percentage content of digitoxin using the following expression:

$$\frac{A_1 \times m_2 \times p}{A_2 \times m_1 \times 10}$$

- $A_1$  = area of the peak due to digitoxin in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to digitoxin in the chromatogram obtained with reference solution (a);
- $m_1$  = mass of the mother tincture to be examined used to prepare the test solution, in grams;
- $m_2$  = mass of *digitoxin for LC assay CRS* used to prepare reference solution (a), in grams;
- $p$  = percentage content of *digitoxin for LC assay CRS*.

Ph Eur

**Hedera Helix for Homoeopathic Preparations**

(Ph. Eur. monograph 2092)

Ph Eur

**DEFINITION**

Fresh, young, fully developed but not yet lignified branch of *Hedera helix* L., harvested immediately before or at the beginning of flowering.

**IDENTIFICATION**

The fresh, young branches of *Hedera helix* L. are thin and flexible, climbing; they cling to their support by stem-roots. The leaves are alternate, simple and petiolate. The petiole shows a cylindrical section. The upper surface of the leaves is glabrous and shiny, darker than the lower surface. The lamina is usually divided into 3-5 more or less deeply cut lobes on sterile branches; it is oval, with a pointed apex on fertile branches. The inflorescences are arranged in a simple semi-globular corymb and grouped in terminal clusters. The pedicels of the umbel are covered in whitish hairs. Each flower shows 5 small teeth formed by the upper part of the sepals and 5 petals covered in very small inverted hairs.

**TESTS****Foreign matter (2.8.2)**

If required by the competent authority, maximum 5 per cent.

**Loss on drying (2.2.32)**

If required by the competent authority, minimum 50 per cent, determined on 5.0 g of the finely cut drug by drying in an oven at 105 °C for 2 h.

**MOTHER TINCTURE**

The mother tincture complies with the requirements of the general monograph *Mother tinctures for homoeopathic preparations (2029)*.

**PRODUCTION**

The mother tincture of *Hedera helix* L. is prepared by maceration using ethanol of a suitable concentration.

**Content**

Minimum 0.15 per cent *m/m* of hederacoside C (C<sub>59</sub>H<sub>96</sub>O<sub>26</sub>; M<sub>r</sub> 1221).

**CHARACTERS****Appearance**

Dark greenish-brown liquid.

**IDENTIFICATION**

Thin-layer chromatography (2.2.27).

**Test solution** The mother tincture to be examined.

**Reference solution** Dissolve 1 mg of *α*-hederin R and 1 mg of hederacoside C R in methanol R and dilute to 2 mL with the same solvent.

**Plate** TLC silica gel plate R.

**Mobile phase** glacial acetic acid R, water R, butanol R (1:1:4 V/V/V).

**Application** 20 µL as bands.

**Development** Over half of the plate.

**Drying** In air.

**Detection** Spray with a 10 per cent V/V solution of sulfuric acid R in methanol R and heat at 100-105 °C for 10 min. Examine in daylight.

**Results** See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Other faint zones may also be present in the chromatogram obtained with the test solution.

Top of the plate	
α-Hederin: a violet zone	A violet zone (α-hederin)
Hederacoside C: a brown zone	A brown zone (hederacoside C)
	A greyish-brown zone
	A yellow zone
Reference solution	Test solution

**TESTS****Relative density (2.2.5)**

0.890 to 0.925.

**Ethanol (2.9.10)**

60 per cent V/V to 70 per cent V/V.

**Dry residue (2.8.16)**

Minimum 2.0 per cent.

**ASSAY**

Liquid chromatography (2.2.29).

**Test solution** In a 20.0 mL volumetric flask, dilute 3.000 g of the mother tincture to be examined to 20.0 mL with the mobile phase.

**Reference solution** In a 50.0 mL volumetric flask, dissolve 20.0 mg of hederacoside C R in the mobile phase and dilute to 50.0 mL with the mobile phase.

**Column:**

— size:  $l = 0.25$  m,  $\varnothing = 4$  mm;

— stationary phase: octadecylsilyl silica gel for chromatography R (5 µm).

**Mobile phase** Mix 35 volumes of water R, adjusted to pH 3 with phosphoric acid R, and 65 volumes of methanol R.

**Flow rate** 1 mL/min.

**Detection** Spectrophotometer at 205 nm.

**Injection** 20 µL.

**Retention time** Hederacoside C = about 8 min.

Calculate the percentage content *m/m* of hederacoside C using the following expression:

$$\frac{A_1 \times m_2 \times C \times 0.4}{A_2 \times m_1}$$

- $A_1$  = area of the peak due to hederacoside C in the chromatogram obtained with the test solution;  
 $A_2$  = area of the peak due to hederacoside C in the chromatogram obtained with the reference solution;  
 $m_1$  = mass of the mother tincture in the test solution, in grams;  
 $m_2$  = mass of hederacoside C R in the reference solution, in grams;  
 $C$  = percentage content of hederacoside C R.

Ph Eur

(Ph. Eur. monograph 2671)

C<sub>5</sub>H<sub>9</sub>N<sub>3</sub>

111.1

51-45-6

Ph Eur

**DEFINITION**

2-(1*H*-Imidazol-4-yl)ethan-1-amine.

**Content**

97.0 per cent to 102.0 per cent (anhydrous substance).

**CHARACTERS****Appearance**

Slightly yellow, deliquescent crystals.

**Solubility**

Soluble in water and in ethanol (96 per cent).

**IDENTIFICATION**

A. Melting point (2.2.14): 82 °C to 85 °C.

B. Infrared absorption spectrophotometry (2.2.24).

**Comparison** histamine CRS.

**TESTS****Solution S**

Dissolve 0.3 g in 2.75 mL of 2 M hydrochloric acid R and dilute to 10 mL with distilled water R.

**Appearance of solution**

Solution S is clear (2.2.1) and not more intensely coloured than reference solution Y<sub>3</sub> (2.2.2, Method 1).

**Histidine**

Thin-layer chromatography (2.2.27).

*Test solution* Solution S.

*Reference solution (a)* Dissolve 25 mg of histidine hydrochloride monohydrate CRS in water R and dilute to 50 mL with the same solvent.

*Reference solution (b)* Mix 1 mL of the test solution and 1 mL of reference solution (a).

*Plate* TLC silica gel G plate R (5-40 µm) [or TLC silica gel plate R (2-10 µm)].

*Mobile phase* concentrated ammonia R, water R, acetonitrile R (5:20:75 V/V/V).

*Application* 1 µL of the test solution and reference solution (a); 2 µL of reference solution (b).

*Development* Over a path of 10 cm [or 7 cm].

*Drying* At 100-105 °C for 15 min.

*Detection* Spray with ninhydrin solution R1 and heat at 110 °C for 10 min.

*System suitability* Reference solution (b):

— the chromatogram shows 2 clearly separated spots.

**Limit:**

— *histidine*: any spot due to histidine in the chromatogram obtained with the test solution is not more intense than the corresponding spot in the chromatogram obtained with reference solution (a) (1.7 per cent).

**Sulfates (2.4.13)**

Maximum 0.1 per cent.

Dilute 5 mL of solution S to 15 mL with distilled water R.

**Water (2.5.12)**

Maximum 2.0 per cent, determined on 0.300 g.

**Sulfated ash (2.4.14)**

Maximum 0.2 per cent, determined on 0.5 g.

**ASSAY**

Dissolve 50.0 mg in 5 mL of anhydrous formic acid R and add 20 mL of anhydrous acetic acid R. Titrate with 0.1 M perchloric acid, determining the end-point potentiometrically (2.2.20). Carry out a blank titration.

1 mL of 0.1 M perchloric acid is equivalent to 5.557 mg of C<sub>5</sub>H<sub>9</sub>N<sub>3</sub>.

**STORAGE**

In an airtight container, protected from light, at a temperature of 2 °C to 8 °C.

Ph Eur

## Hydrastis Canadensis for Homoeopathic Preparations

(Ph. Eur. monograph 2500)

Ph Eur

The herbal drug complies with the requirements of the monograph *Goldenseal rhizome (1831)*.

**MOTHER TINCTURE**

The mother tincture complies with the requirements of the general monograph *Mother tinctures for homoeopathic preparations (2029)*.

**DEFINITION**

The mother tincture is prepared from the whole or cut, dried rhizome and roots of *Hydrastis canadensis* L.

**Content**

- *hydrastine* (C<sub>21</sub>H<sub>21</sub>NO<sub>6</sub>; M<sub>r</sub> 383.4): 0.10 per cent to 0.40 per cent;
- *berberine* (C<sub>20</sub>H<sub>18</sub>NO<sub>4</sub>; M<sub>r</sub> 336.4): 0.20 per cent to 0.50 per cent.

**PRODUCTION**

The mother tincture is prepared by the following methods prescribed in the monograph *Methods of preparation of homoeopathic stocks and potentisation (2371)*:

- Method 1.1.8, using the powdered herbal drug (710) (2.9.12) and ethanol (70 per cent V/V) [or ethanol (62 per cent *m/m*)];
- Method 1.1.10, using the fragmented herbal drug (pieces about 1 cm in diameter), ethanol (65 per cent V/V) and maceration for 3-5 weeks.

**CHARACTERS****Appearance**

Yellowish-brown liquid.

**IDENTIFICATION**

Thin-layer chromatography (2.2.27).

*Test solution* The mother tincture to be examined.

*Reference solution* Immediately before use, dissolve 5 mg of *hydrastine hydrochloride* R and 5 mg of *berberine chloride* R in 10 mL of *methanol* R.

*Plate* TLC silica gel plate R (5-40 µm) [or TLC silica gel plate R (2-10 µm)].

*Mobile phase* anhydrous formic acid R, water R, ethyl acetate R (10:10:80 V/V/V).

*Application* 20 µL [or 5 µL] as bands.

*Development* Over a path of 15 cm [or 6 cm].

*Drying* In air.

*Detection* Examine in ultraviolet light at 365 nm.

*Results* See below the sequence of fluorescent zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint fluorescent zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Berberine: a bright yellow fluorescent zone	A bright yellow fluorescent zone (berberine)
Hydrastine: a deep blue fluorescent zone	A deep blue fluorescent zone (hydrastine)
Reference solution	Test solution

**TESTS****Relative density (2.2.5)**

0.890 to 0.905 when method 1.1.8 is used.

**Ethanol (2.9.10)**

60 per cent *V/V* to 70 per cent *V/V* when method 1.1.10 is used.

**Dry residue (2.8.16)**

Minimum 1.2 per cent.

**ASSAY****Liquid chromatography (2.2.29).**

**Test solution** Dilute about 1.000 g, accurately weighed, of the mother tincture to be examined to 20.0 mL with the mobile phase.

**Reference solution** Immediately before use, dissolve 10.0 mg of *hydrastine hydrochloride CRS* and 10.0 mg of *berberine chloride CRS* in *methanol R* and dilute to 100.0 mL with the same solvent.

**Column:**

— *size*:  $l = 0.125$  m,  $\varnothing = 4$  mm;

— *stationary phase*: end-capped octadecylsilyl silica gel for chromatography *R* (5  $\mu$ m).

**Mobile phase** Dissolve 9.93 g of *potassium dihydrogen phosphate R* in 730 mL of *water R*, add 270 mL of *acetonitrile R* and mix.

**Flow rate** 1.2 mL/min.

**Detection** Spectrophotometer at 235 nm.

**Injection** 10  $\mu$ L.

**Elution order** Hydrastine, berberine.

**Identification of peaks** Use the chromatogram obtained with the reference solution to identify the peaks due to hydrastine and berberine.

**System suitability** Reference solution:

— *resolution*: minimum 1.5 between the peaks due to hydrastine and berberine.

Calculate the percentage content *m/m* of hydrastine using the following expression:

$$\frac{A_1 \times m_2 \times p \times 0.913}{A_2 \times m_1 \times 5}$$

Calculate the percentage content *m/m* of berberine using the following expression:

$$\frac{A_1 \times m_2 \times p \times 0.905}{A_2 \times m_1 \times 5}$$

- $A_1$  = area of the peak due to hydrastine or to berberine in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to hydrastine or to berberine in the chromatogram obtained with the reference solution;
- $m_1$  = mass of the mother tincture to be examined used to prepare the test solution, in grams;
- $m_2$  = mass of *hydrastine hydrochloride CRS* or mass of *berberine chloride CRS* used to prepare the reference solution, in grams;

$p$  = percentage content of *hydrastine hydrochloride CRS* or percentage content of *berberine chloride CRS*.

Ph Eur

## Hyoscyamus for Homoeopathic Preparations

(Ph. Eur. monograph 2091)

Ph Eur

**DEFINITION**

Whole, fresh flowering plant of *Hyoscyamus niger L.*

**IDENTIFICATION**

*Hyoscyamus* is an annual or biennial plant, with a well developed taproot. The robust, erect stem is hollow and subcylindrical and up to 80 cm long. The soft, viscid, dull dark-green leaves are densely pubescent on both surfaces, especially on the veins. The lower leaves are petiolate and are arranged in a rosette; the lower cauline leaves are semi-amplexicaul and the upper ones are completely amplexicaul. The lamina, up to 25 cm long, is oblong to ovate with 2 to 5 broadly dentate lobes on each side. The midrib is well developed. The secondary veins arise at a wide angle from the midrib and terminate in the apices of the lobes. The flowering tops are densely pubescent and form a short drooping cluster. Each flower arises in the axils of a large bract. The gamosepalous calyx is covered with dense cotton-like hairs and has 5 triangular-ovate lobes, each ending in a short point that becomes spiny. The gamopetalous corolla, with 5 nearly equal lobes, is yellowish and with a delicate, brown to blackish-violet venation. The fruit, sometimes present at the base of the inflorescences, is a pyxis distinctly swollen at the base.

**TESTS****Foreign matter (2.8.2)**

If required by the competent authority, maximum 5 per cent.

**Loss on drying (2.2.32)**

If required by the competent authority, minimum 50 per cent, determined on 5.0 g of the finely cut drug by drying in an oven at 105 °C for 2 h.

***Hyoscyamus albus L.***

The presence of middle and upper leaves with a petiole and of fruits barely swollen at the base indicates adulteration by *Hyoscyamus albus L.*

**MOTHER TINCTURE**

The mother tincture complies with the requirements of the general monograph *Mother tinctures for homoeopathic preparations (2029)*.

**PRODUCTION**

The mother tincture of *Hyoscyamus niger L.* is prepared by maceration of the drug, using ethanol of a suitable concentration.

**Content**

0.002 per cent *m/m* to 0.01 per cent *m/m* of total alkaloids, expressed as *hyoscyamine* ( $C_{17}H_{23}NO_3$ ;  $M_r$  289.4).

**CHARACTERS****Appearance**

Dark greenish-brown liquid.

**IDENTIFICATION**

Thin-layer chromatography (2.2.27).

**Test solution** Evaporate 10 mL of the mother tincture to be examined in a water-bath at 40 °C, under reduced pressure. Take up the residue with 1 mL of ammonia R, and shake with 2 quantities, each of 10 mL, of ether R. Combine the ether layers, dry over anhydrous sodium sulfate R and filter. Evaporate on a water-bath and dissolve the residue in 0.50 mL of methanol R.

**Reference solution (a)** Dissolve 50 mg of hyoscyamine sulfate R in 10 mL of methanol R (solution A). Dissolve 15 mg of hyoscine hydrobromide R in 10 mL of methanol R (solution B). Mix 4 mL of solution A and 2 mL of solution B and dilute to 10 mL with methanol R.

**Reference solution (b)** Dissolve 20 mg of atropine sulfate R in methanol R and dilute to 10 mL with the same solvent.

**Plate** TLC silica gel plate R.

**Mobile phase** concentrated ammonia R, water R, acetone R (3:7:90 V/V/V).

**Application** 20 µL, as bands.

**Development** Over a path of 10 cm.

**Drying** At 100-105 °C for 15 min.

**Detection A** Spray with dilute potassium iodobismuthate solution R until orange zones become visible. Examine in daylight.

**Results A** See below the sequence of the zones present in the chromatograms obtained with the reference solutions and the test solution. Other faint zones may be present in the chromatogram obtained with the test solution.

Top of the plate		
Hyoscine: an orange zone		An orange zone (hyoscine)
Hyoscyamine: an orange zone	Atropine: an orange zone	A orange zone (hyoscyamine/atropine)
		Faint orange zones (line of application)
Reference solution (a)	Reference solution (b)	Test solution

**Detection B** Subsequently spray with sodium nitrite solution R until the yellow background disappears. Examine in daylight after 15 min.

**Results B** See test for atropine.

**TESTS**

**Relative density (2.2.5)**

0.930 to 0.960.

**Atropine**

Examine the chromatograms obtained in the test for identification.

**Results** The zone due to hyoscyamine in the chromatogram obtained with the test solution changes from orange to reddish-brown but not to greyish-blue (atropine).

**Ethanol (2.9.10)**

40 per cent V/V to 50 per cent V/V.

**Dry residue (2.8.16)**

Minimum 1.2 per cent.

**ASSAY**

Evaporate 100.0 g of the mother tincture to be examined, at a low temperature under reduced pressure, until a residue of

about 10 g is obtained. Quantitatively transfer the residue to a separating funnel using a few millilitres of ethanol (70 per cent V/V) R. Add 5 mL of concentrated ammonia R and 25 mL of water R. Extract with successive fractions of a mixture of 1 volume of chloroform R and 3 volumes of peroxide-free ether R until the alkaloids are completely extracted. Evaporate to dryness a few millilitres of the last organic fraction. Take up the residue in 0.25 M sulfuric acid and verify the absence of alkaloids using potassium tetraiodomercurate solution R. Combine the organic layers and extract several times with 0.25 M sulfuric acid. Separate the layers by centrifugation if necessary and transfer the acid layers to a second separating funnel. Make the acid layer alkaline with ammonia R and shake with at least 3 quantities, each of 30 mL, of chloroform R. Combine the chloroform layers, add 4 g of anhydrous sodium sulfate R and allow to stand for 30 min with occasional shaking. Decant the chloroform and wash the anhydrous sodium sulfate with 3 quantities, each of 10 mL, of chloroform R. Combine the chloroform fractions, evaporate to dryness on a water-bath and dry in an oven at 100-105 °C for 15 min. Dissolve the residue in a few millilitres of chloroform R, add 10.0 mL of 0.005 M sulfuric acid and remove the chloroform by evaporation on a water-bath. Titrate the excess of acid with 0.01 M sodium hydroxide using methyl red mixed solution R as indicator.

Calculate the percentage content m/m of total alkaloids, expressed as hyoscyamine, from the expression:

$$\frac{0.2894(10 - n)}{m}$$

n = volume of 0.01 M sodium hydroxide used, in millilitres;  
m = mass of the mother tincture used, in grams.

Ph Eur

**Hypericum for Homoeopathic Preparations**

(Ph. Eur. monograph 2028)

Ph Eur

**DEFINITION**

Whole, fresh plant of *Hypericum perforatum* L., at the beginning of the flowering period.

**IDENTIFICATION**

The perennial plant consists of a spindle-shaped root and a branched rhizome, giving rise to long, decumbent runners. The cylindrical, erect stem is woody at the base, 0.2 m to 1 m long, branched in the upper part, with 2 raised longitudinal lines.

The leaves are opposite, sessile, exstipulate, oblong-oval and 15 mm to 30 mm long. The leaf margins show black glandular dots, and many small translucent oil glands are present on the entire surface and are visible by transmitted light.

The flowers are regular and form corymbose clusters at the apex of the stem. They have 5 green, lanceolate sepals with acuminate apices, and black oil glands near the entire margins; 5 orange-yellow petals, much longer than the sepals, with black oil glands near the terminal margins only; 3 staminal blades, each divided into many orange-yellow stamens and 3 carpels surmounted by red styles. Each petal

is asymmetrically linear-ovate in shape, with one of the margin entire and the other dentate.

#### TESTS

##### Foreign matter (2.8.2)

Maximum 4 per cent of fruits and maximum 1 per cent of other foreign matter.

##### Loss on drying (2.2.32)

If performed to demonstrate the freshness of the drug, minimum 55 per cent, determined on 5.0 g of finely cut drug by drying in an oven at 105 °C.

#### MOTHER TINCTURE

The mother tincture complies with the requirements of the general monograph *Mother tinctures for homoeopathic preparations (2029)*.

#### PRODUCTION

The mother tincture of *Hypericum perforatum* L. is prepared by maceration using alcohol of a suitable concentration.

#### CHARACTERS

Dark red to brownish red liquid.

#### IDENTIFICATION

Thin-layer chromatography (2.2.27).

*Test solution* The mother tincture to be examined.

*Reference solution* Dissolve 5 mg of *rutoside trihydrate R*, 1 mg of *hypericin R* and 5 mg of *hyperoside R* in *methanol R* and dilute to 5 mL with the same solvent.

*Plate* TLC silica gel plate R.

*Mobile phase* anhydrous formic acid R, water R, ethyl acetate R (6:9:90 V/V/V).

*Application* 10 µL of the test solution and 5 µL of the reference solution, as 10 mm bands.

*Development* Over a path of 10 cm.

*Drying* At 100-105 °C for 10 min.

*Detection* Spray with a 10 g/L solution of *diphenylboric acid aminoethyl ester R* in *methanol R* and then a 50 g/L solution of *macrogol 400 R* in *methanol R*. Examine the plates after 30 min in ultraviolet light at 365 nm.

*Results* See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. In the chromatogram obtained with the test solution, the zone due to rutoside may be weak or even absent. The chromatogram obtained with the test solution shows a group of zones that may be blue or yellow, with a  $R_F$  similar to that of the zone due to hyperoside in the chromatogram obtained with the reference solution. Other weak zones may also be visible.

Top of the plate	
Hypericin: a red zone	A yellow to blue zone 2 red zones
	Several zones
Hyperoside: a yellow to orange zone	Blue or yellow zones
Rutoside: a yellow to orange zone	A yellow to orange zone
Reference solution	Test solution

#### TESTS

##### Relative density (2.2.5)

0.900 to 0.920.

##### Ethanol (2.9.10)

60 per cent V/V to 75 per cent V/V.

##### Dry residue (2.8.16)

Minimum 1.3 per cent.

Ph Eur

## Ignatia for Homoeopathic Preparations

(Ph. Eur. monograph 2513)

Ph Eur

#### DEFINITION

Dried, ripe seed of *Strychnos ignatii* P.J.Bergius.

#### Content

Minimum 1.80 per cent for the sum of the contents of brucine (C<sub>23</sub>H<sub>26</sub>N<sub>2</sub>O<sub>4</sub>; M<sub>r</sub> 394.5) and strychnine (C<sub>21</sub>H<sub>22</sub>N<sub>2</sub>O<sub>2</sub>; M<sub>r</sub> 334.4), of which minimum 65 per cent consists of strychnine (dried drug).

#### IDENTIFICATION

A. The seed is grey, brown and dull, up to 3 cm long and 10-25 mm thick. It is irregular, with 3-5 distinct sides: one of these is usually wider, convex and glabrous; the others are angular and flattened and show the remains of testa hairs forming lighter zones in the depressions. The stony granular texture resembles that of pebbles from a river bed; the hilum is found on the most rounded end and forms a small, light brown depression. The fracture shows a compact, semi-translucent, horny endosperm; the embryo is located in the centre and is about 10-15 mm long, with a foliaceous cotyledon.

B. **CAUTION:** take all necessary handling precautions when reducing this toxic herbal drug to a powder.

Wash the herbal drug rapidly in cold water, then expose to steam; once sufficiently softened, cut into thin slices and crush in a suitable apparatus. Allow to dry, finish reducing to a powder (710) (2.9.12) and pass through a covered sieve.

Microscopic examination (2.8.23). The powder is light brown. Examine under a microscope using *chioral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2513.-1): oil droplets [D]; fragments of endosperm [B, C, F] consisting of thick-walled cells of various sizes, the smallest located at the periphery of the endosperm [Cb] and the largest towards the centre of the seed [F]; a few fragments of the outer layer of the endosperm (surface view [J], transverse section [Ca]), with polygonal cells sometimes associated with the inner layer of the testa, composed of cells with indistinct walls (surface view [E], transverse section [Cd]); sclerified covering trichomes [A, K], sheared off, not enlarged at the base [Aa] and with walls composed of small, oblique, sclerified strips, tightly fused longitudinally [Ab, Ka]; numerous fragments of strips [G, H] and rare rounded tips of covering trichomes [K].

C. Thin-layer chromatography (2.2.27).

*Test solution* To 2.0 g of the powdered herbal drug (710) (2.9.12) add 20 mL of *ethanol (70 per cent V/V) R*, allow to macerate for 15 min at room temperature, with stirring, and centrifuge. Use the supernatant.

HOMOEOPATHIC PREPARATIONS

Figure 2513.-1. - Illustration for identification test B of powdered herbal drug of Ignatia

**Reference solution** Dissolve 10 mg of brucine R and 10 mg of strychnine R in 10 mL of ethanol (96 per cent) R.

**Plate** TLC silica gel plate R (5-40 µm) [or TLC silica gel plate R (2-10 µm)].

**Mobile phase** concentrated ammonia R, methanol R, methylene chloride R (1:5:95 V/V/V); use the lower layer.

**Application** 10 µL [or 5 µL] as bands.

**Development** Over a path of 15 cm [or 6 cm].

**Drying** In air, then in an oven at 105-110 °C for 15 min; allow to cool.

**Detection** Spray with iodoplatinate reagent R and examine immediately in daylight.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
—	—
—	—
Strychnine: a violet zone	A violet zone (strychnine)
Brucine: a blue zone	A blue zone (brucine)
Reference solution	Test solution

**TESTS**

**CAUTION:** when the powdered herbal drug (710) (2.9.12) is used, take the necessary precautions as indicated under Identification B.

**Foreign matter (2.8.2)**  
Maximum 1.0 per cent.

**Strychnos nux-vomica L**

The presence of flattened discoid seeds and the presence in the powdered herbal drug, examined under a microscope, of testa cells transformed into hairs, with a sclerified base and a lignified tip, bent at a right angle and with 7-10 lignified ridges, and of numerous sclerified rods, indicate adulteration with *Strychnos nux-vomica* L.

**Loss on drying (2.2.32)**

Maximum 12.0 per cent, determined on 1.00 g of the powdered herbal drug (710) (2.9.12) by drying in an oven at 105 °C for 2 h.

**Total ash (2.4.16)**

Maximum 3.5 per cent.

**Aflatoxins (2.8.18)**

Maximum 2 µg/kg (aflatoxin B<sub>1</sub>) and maximum 4 µg/kg (sum of aflatoxins B<sub>1</sub>, B<sub>2</sub>, G<sub>1</sub> and G<sub>2</sub>).

**ASSAY**

Liquid chromatography (2.2.29).

**Test solution** To 1.000 g of the powdered herbal drug (710) (2.9.12) add 10.0 mL of ethanol (60 per cent V/V) R. Boil gently, with stirring, under a reflux condenser. After 30 min, cool and filter into a 20.0 mL volumetric flask. Wash the filter with ethanol (60 per cent V/V) R and dilute to 20.0 mL with the same solvent. Dilute 1.0 mL of the solution to 20.0 mL with mobile phase A.

**Reference solution** Dissolve 10.0 mg of brucine CRS and 10.0 mg of strychnine CRS in acetone R and dilute to 10.0 mL with the same solvent. Dilute 1.0 mL of the solution to 20.0 mL with mobile phase A.

**Column:**

- size: l = 0.15 m, Ø = 4.6 mm;
- stationary phase: end-capped ethylene-bridged octadecylsilyl silica gel for chromatography (hybrid material) R (3.5 µm);
- temperature: 35 °C.

**Mobile phase:**

- mobile phase A: triethylamine R, acetonitrile for chromatography R, methanol R2, tris(hydroxymethyl) aminomethane buffer solution pH 9.0 R (0.1:7.5:7.5:85 V/V/V/V);
- mobile phase B: triethylamine R, tris(hydroxymethyl) aminomethane buffer solution pH 9.0 R, acetonitrile for chromatography R, methanol R2 (0.1:15:42.5:42.5 V/V/V/V);

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 5	100	0
5 - 25	100 → 70	0 → 30
25 - 30	70 → 65	30 → 35
30 - 31	65 → 0	35 → 100
31 - 32	0	100

**Flow rate** 1.0 mL/min.

**Detection** Spectrophotometer at 260 nm.

**Injection** 10 µL.

**Elution order** Brucine, strychnine.

**System suitability** Reference solution:

— **resolution**: minimum 3.0 between the peaks due to brucine and strychnine.

Calculate the percentage contents of brucine and strychnine using the following expression:

$$\frac{A_1 \times m_2 \times p \times 2}{A_2 \times m_1}$$

- $A_1$  = area of the peak due to brucine or strychnine in the chromatogram obtained with the test solution;  
 $A_2$  = area of the peak due to brucine or strychnine in the chromatogram obtained with the reference solution;  
 $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;  
 $m_2$  = mass of *brucine CRS* or *strychnine CRS* used to prepare the reference solution, in grams;  
 $p$  = assigned percentage content of brucine in *brucine CRS* or strychnine in *strychnine CRS*.

## MOTHER TINCTURE

The mother tincture complies with the requirements of the general monograph *Mother tinctures for homoeopathic preparations* (2029).

### DEFINITION

The mother tincture is prepared from the dried, ripe seed of *Strychnos ignatii* P.J.Bergius.

### Content

0.18 per cent *m/m* to 0.36 per cent *m/m* for the sum of the contents of brucine ( $C_{23}H_{26}N_2O_4$ ;  $M_r$  394.5) and strychnine ( $C_{21}H_{22}N_2O_2$ ;  $M_r$  334.4); of which minimum 65 per cent is strychnine.

### PRODUCTION

The mother tincture is prepared by the following methods prescribed in the general monograph *Methods of preparation of homoeopathic stocks and potentisation* (2371):

- method 1.1.8, using the powdered herbal drug (710) (2.9.12) and ethanol (70 per cent *V/V*);
- method 1.1.10, using the powdered herbal drug, ethanol (65 per cent *V/V*) and a maceration time of 3-5 weeks.

### CHARACTERS

#### Appearance

Brownish-yellow liquid.

### IDENTIFICATION

Thin-layer chromatography (2.2.27) as described in identification test C for the herbal drug with the following modification.

**Test solution** The mother tincture to be examined.

### TESTS

#### Relative density (2.2.5)

0.890 to 0.904 when method 1.1.8 is used.

#### Ethanol (2.9.10)

60 per cent *V/V* to 70 per cent *V/V* when method 1.1.10 is used.

#### Dry residue (2.8.16)

Minimum 1.2 per cent.

### ASSAY

Liquid chromatography (2.2.29) as described in the assay of the herbal drug with the following modification.

**Test solution** Dilute 2.000 g of the mother tincture to be examined to 20.0 mL with ethanol (60 per cent *V/V*) *R*.

Calculate the percentage contents of brucine and strychnine using the following expression:

$$\frac{A_1 \times m_2 \times p}{A_2 \times m_1 \times 10}$$

- $A_1$  = area of the peak due to brucine or strychnine in the chromatogram obtained with the test solution;  
 $A_2$  = area of the peak due to brucine or strychnine in the chromatogram obtained with the reference solution;  
 $m_1$  = mass of the mother tincture to be examined used to prepare the test solution, in grams;  
 $m_2$  = mass of *brucine CRS* or *strychnine CRS* used to prepare the reference solution, in grams;  
 $p$  = assigned percentage content of brucine in *brucine CRS* or strychnine in *strychnine CRS*.

Ph Eur

## Iron for Homoeopathic Preparations

Iron for Homoeopathic Use

(*Ferrum Metallicum* for Homoeopathic Preparations, Ph. Eur. monograph 2026)

Fe 55.85 7439-89-6

Ph Eur

### DEFINITION

Iron obtained by reduction or sublimation as a fine blackish-grey powder.

### Content

97.5 per cent to 101.0 per cent.

### CHARACTERS

#### Appearance

Fine, blackish-grey powder, without metallic lustre.

#### Solubility

Practically insoluble in water and in ethanol (96 per cent). It dissolves with heating in dilute mineral acids.

### IDENTIFICATION

Dissolve 50 mg in 2 mL of *dilute sulfuric acid R* and dilute to 10 mL with *water R*. The solution gives reaction (a) of iron (2.3.1).

### TESTS

#### Solution S

To 10.0 g add 40 mL of *water R*. Boil for 1 min. Cool, filter and dilute to 50.0 mL with *water R*.

#### Alkalinity

To 10 mL of solution S add 0.1 mL of *bromothymol blue solution R1*. Not more than 0.1 mL of 0.01 M *hydrochloric acid* is required to change the colour of the indicator to yellow.

#### Substances insoluble in hydrochloric acid

Dissolve 2.00 g in 40 mL of *hydrochloric acid R*. Heat on a water-bath. As soon as fumes are no longer evolved, filter through a sintered-glass filter (16) (2.1.2). Rinse with *water R*. Dry the residue in an oven at 100-105 °C for 1 h. The residue weighs a maximum of 20 mg (1.0 per cent).

#### Substances soluble in water

Evaporate 10.0 mL of solution S on a water-bath and dry at 100-105 °C for 1 h. The residue weighs a maximum of 2 mg (0.1 per cent).

#### Chlorides (2.4.4)

Maximum 50 ppm.

Dilute 5 mL of solution S to 15 mL with *water R*.

**Sulfides and phosphides**

In a 100 mL conical flask carefully mix 1.0 g with 10 mL of *dilute hydrochloric acid R*. Within 30 s *lead acetate paper R* moistened with *water R* and placed over the mouth of the flask is not coloured more intensely than light brown by the resulting fumes.

**Arsenic (2.4.2)**

Maximum 5 ppm.

Boil 0.2 g in 25 mL of *dilute hydrochloric acid R* until completely dissolved. The solution complies with limit test A.

**Copper**

Maximum 50 ppm.

Atomic absorption spectrometry (2.2.23, Method I).

**Test solution** Dissolve 1.00 g in a mixture of 60 mL of *dilute hydrochloric acid R* and 10 mL of *dilute hydrogen peroxide solution R*. Reduce to a volume of 5 mL and dilute to 50.0 mL with *water R*.

**Reference solutions** Prepare the reference solutions using *copper standard solution (0.1 per cent Cu) R*, diluting with a 1 per cent *V/V* solution of *hydrochloric acid R*.

**Source** Copper hollow-cathode lamp.

**Wavelength** 324.8 nm.

**Flame** Air-acetylene.

**Lead**

Maximum 50 ppm.

Atomic absorption spectrometry (2.2.23, Method I).

**Test solution** In a separating funnel, place 20 mL of the test solution prepared for the test for copper. Add 25 mL of *lead-free hydrochloric acid R*. Stir with 3 quantities, each of 25 mL, of *di-isopropyl ether R*. Collect the aqueous layer. Add 0.10 g of *sodium sulfate decahydrate R*. Evaporate to dryness. Take up the residue with 1 mL of *lead-free nitric acid R* and dilute to 20 mL with *water R*.

**Reference solutions** Prepare the reference solutions using *lead standard solution (0.1 per cent Pb) R*, diluting with a 10 per cent *V/V* solution of *nitric acid R* containing 5 g/L of *sodium sulfate decahydrate R*.

**Source** Lead hollow-cathode lamp.

**Wavelength** 217 nm.

**Flame** Air-acetylene.

**ASSAY**

Stir for 10 min 0.100 g in a hot solution of 1.25 g of *copper sulfate pentahydrate R* in 20 mL of *water R* in a 100 mL conical flask with a ground-glass stopper. Filter rapidly and wash the filter. Combine the filtrate and the washings, acidify with *dilute sulfuric acid R* and titrate with 0.02 M *potassium permanganate* until a pink colour is obtained.

1 mL of 0.02 M *potassium permanganate* is equivalent to 5.585 mg of Fe.

**LABELLING**

The label indicates whether the substance is obtained by reduction or sublimation.

**Hydrated Iron(III) Phosphate for Homoeopathic Preparations**

222.8  
(anhydrous)

10045-86-0

**DEFINITION**

Hydrated Iron(III) Phosphate for Homoeopathic Preparations contains hydrated iron(III) phosphate. It contains not less than 96.0% and not more than 106.5% of  $\text{FePO}_4 \cdot 4\text{H}_2\text{O}$ .

**CHARACTERISTICS**

A yellow to pale ochre powder.

Insoluble in *water*; soluble in dilute mineral acids.

**IDENTIFICATION**

Dissolve 0.5 g of the substance being examined in 5 mL of *dilute hydrochloric acid*, with warming. Dilute the resulting solution to 35 mL with *water* and filter if necessary (solution S).

A. Solution S yields reactions B and C characteristic of *iron and iron salts*, Appendix VI.

B. Solution S yields reaction B characteristic of *phosphates*, Appendix VI.

**TESTS****Clarity of solution**

Solution S is *clear*, Appendix IV A, Method II.

**Chloride**

To 0.05 g of the substance being examined add 1 mL of *dilute nitric acid*. Heat, dilute with 14 mL of *water* and filter. The filtrate complies with the *limit test for chlorides*, Appendix VII (0.1%).

**Heavy metals**

Dissolve 1.0 g of the substance being examined in 20 mL of *hydrochloric acid* if necessary with heating. Extract the solution using five 20-mL quantities of a mixture of 100 mL of freshly distilled *methyl isobutyl ketone* and 1 mL of *hydrochloric acid R1*. Allow to stand, separate the aqueous layer and evaporate to half its volume, allow to cool and dilute to 35 mL with *water*. Neutralise 7.5 mL of this solution to *litmus paper* using *dilute ammonia R1* and dilute to 15 mL with *water*. 12 mL of the resulting solution complies with *limit test heavy metals*, Appendix VII, Method A (70 ppm). Use *lead standard solution (1 ppm Pb)* to prepare the standard.

**Loss on drying**

When dried to constant weight at 200°, loses not less than 28% and not more than 33% of its weight, Appendix IX D. Use 1 g.

**ASSAY**

Dissolve 0.45 g in 3 mL of *hydrochloric acid R1* in an iodine flask, add 10 mL of *water* and 6.0 g of *potassium iodide*, close the flask and allow to stand protected from light for 30 minutes. Add 100 mL of *water* and 1 mL of *starch solution* and titrate with 0.1M *sodium thiosulfate VS*. Each mL of 0.1M *sodium thiosulfate VS* is equivalent to 22.29 mg of  $\text{FePO}_4 \cdot 4\text{H}_2\text{O}$ .

**PRODUCTION OF STOCK**

The first decimal trituration of Hydrated Iron(III) Phosphate for Homoeopathic Preparations is prepared using a suitable quantity of Lactose Monohydrate or Lactose as the vehicle and a validated trituration method that ensures homogeneity is achieved. The vehicle complies with the statement under Vehicles in the monograph for Homoeopathic Preparations.

**Content of hydrated iron(III) phosphate  $\text{FePO}_4 \cdot 4\text{H}_2\text{O}$**   
The first decimal trituration contains 9.0% to 11.0% of  $\text{FePO}_4 \cdot 4\text{H}_2\text{O}$ .

#### CHARACTERISTICS

The first decimal trituration is a yellowish powder.

#### IDENTIFICATION

Dissolve, with warming, 1.5 g of the first decimal trituration in a mixture of 1.5 mL of *dilute hydrochloric acid* and 9 mL of *water* (solution S1).

A. Solution S1 yields reactions B and C characteristic of *iron and iron salts*, Appendix VI.

B. Solution S1 yields reaction B characteristic of *phosphates*, Appendix VI.

C. Dissolve 0.25 g of the substance being examined in 5 mL of *water*. Add 5 mL of *ammonia* and heat in a water-bath at 80° for 10 minutes. A red colour develops.

#### ASSAY

Dissolve 4.0 g of the first decimal trituration in 3 mL of *hydrochloric acid R1* in an iodine flask, add 10 mL of *water* and 8.0 g of *potassium iodide*, close the flask and allow to stand protected from light for 30 minutes. Add 100 mL of *water* and 1 mL of *starch solution* and titrate with 0.1M *sodium thiosulfate VS*. Each mL of 0.1M *sodium thiosulfate VS* is equivalent to 22.29 mg of  $\text{FePO}_4 \cdot 4\text{H}_2\text{O}$ .

#### STORAGE

Hydrated Iron(III) Phosphate for Homoeopathic Preparations should be protected from light.

## Hydrated Iron(II) and Iron(III) Phosphate for Homoeopathic Preparations

#### DEFINITION

Hydrated Iron(II) and Iron(III) Phosphate for Homoeopathic Preparations contains a mixture of hydrated iron(II) phosphate and iron(III) phosphate and some hydrated oxides of iron. It contains not less than 16.0% of  $\text{Fe}^{2+}$ , equivalent to not less than 47.9% of  $\text{Fe}_3(\text{PO}_4)_2 \cdot 8\text{H}_2\text{O}$ .

#### CHARACTERISTICS

A slate blue amorphous powder.

Insoluble in *water*; soluble in *hydrochloric acid*.

#### IDENTIFICATION

Dissolve 0.5 g in 5 mL of *dilute hydrochloric acid* with warming. Dilute the resulting solution to 35 mL with *water* and filter if necessary (solution S).

A. Solution S yields the reactions characteristic of *iron and iron salts*, Appendix VI.

B. Solution S yields the reactions characteristic of *phosphates*, Appendix VI.

#### TESTS

##### Heavy metals

Dissolve 1.0 g of the substance being examined in 20 mL of *hydrochloric acid*. Extract the solution using five 20-mL quantities of a mixture of 100 mL of freshly distilled *methyl isobutyl ketone* with 1 mL of *hydrochloric acid R1*. Allow to stand, separate the aqueous layer and evaporate to half its volume, allow to cool and dilute to 35 mL with *water*.

Neutralise 7.5 mL of this solution to *litmus paper* using *dilute ammonia R1* and dilute to 15 mL with *water*. 12 mL of the resulting solution complies with *limit test A for heavy metals*, Appendix VII (70 ppm). Use *lead standard solution (1 ppm Pb)* to prepare the standard.

#### Sulfates

Dissolve 0.25 g of the substance being examined in *water*. Add 3 mL of *dilute hydrochloric acid* and dilute to 15 mL with *water*. The resulting solution complies with the *limit test for sulfates*, Appendix VII.

#### ASSAY

Dissolve 0.3 g of the substance being examined in 3 mL of *orthophosphoric acid* and 10 mL of a 14% v/v solution of *sulfuric acid* in *water*. Add 100 mL of *water* and titrate with 0.1M *potassium permanganate*. Each mL of 0.1M *potassium permanganate VS* is equivalent to 27.925 mg of  $\text{Fe}^{2+}$ .

#### PRODUCTION OF STOCK

The first decimal trituration of Hydrated Iron(II) and Iron(III) Phosphate for Homoeopathic Preparations is prepared using a suitable quantity of Lactose Monohydrate or Lactose as the vehicle and a validated trituration method that ensures homogeneity is achieved. The vehicle complies with the statement under Vehicles in the monograph for Homoeopathic Preparations.

**Content of hydrated iron(II) and iron(III) phosphate**  
The first decimal trituration contains 4.5% to 5.0% of  $\text{Fe}_3(\text{PO}_4)_2 \cdot 8\text{H}_2\text{O}$ .

#### CHARACTERISTICS

The first decimal trituration is a light grey powder.

#### IDENTIFICATION

A. Yields the reactions characteristic of *iron and iron salts*, Appendix VI.

B. Yields the reactions characteristic of *phosphates*, Appendix VI.

C. Dissolve 0.25 g in 5 mL of *water*. Add 5 mL of *ammonia* and heat in a water-bath at 80° for 10 minutes. A red colour develops.

#### ASSAY

Dissolve 3.0 g of the first decimal trituration in 3 mL of *orthophosphoric acid* and 10 mL of a 14% v/v solution of *sulfuric acid* in *water*. Add 100 mL of *water* and titrate with 0.1M *potassium permanganate*. Each mL of 0.1M *potassium permanganate VS* is equivalent to 27.925 mg of  $\text{Fe}^{2+}$ .

#### STORAGE

Hydrated Iron(II) and Iron(III) Phosphate for Homoeopathic Preparations should be protected from light.

## Magnesium Fluoratum for Homoeopathic Preparations

(Ph. Eur. monograph 2676)

MgF<sub>2</sub>

62.3

7783-40-6

Ph Eur

#### DEFINITION

##### Content

98.5 per cent to 100.5 per cent of MgF<sub>2</sub>.

#### CHARACTERS

##### Appearance

White or almost white powder or crystals.

##### Solubility

Practically insoluble in *water*, very slightly soluble in *dilute nitric acid* and in concentrated *sulfuric acid*, practically insoluble in anhydrous *acetic acid*.

## IDENTIFICATION

A. Mix 0.2 g with 2 g of *potassium hydrogen sulfate R* in a platinum crucible and melt at 800 °C. Cool, carefully take up the melt in 20 mL of *water R* and boil briefly. Cool and filter. Dilute 0.5 mL of the filtrate to 2 mL with *water R*. The solution gives the reaction of magnesium (2.3.1).

B. Mix 0.2 g with 1 g of *anhydrous sodium carbonate R* in a platinum crucible and melt at 850 °C. Cool, take up the melt in 10 mL of *dilute acetic acid R* and boil briefly. Cool, filter and dilute the filtrate to 20 mL with *water R*. To 0.4 mL of this solution add dropwise a mixture of 0.1 mL of *alizarin S solution R* and 0.1 mL of *zirconyl nitrate solution R*. The colour changes from red to yellow.

## TESTS

## Solution S

Boil 5.0 g with 100.0 mL of *distilled water R* under a reflux condenser for about 5 min. Allow to cool, then filter through an ashless filter paper (nominal pore size not greater than 2 µm).

## Appearance of solution

Solution S is colourless (2.2.2, Method II).

## Carbonates

Suspend 0.5 g in 5 mL of *carbon dioxide-free water R* and add 5 mL of *dilute acetic acid R*. Quickly stopper the test tube with a stopper fitted with a glass tube bent twice through 90° and which dips at the other end in *barium hydroxide solution R*. Warm the mixture. The barium hydroxide solution remains clear.

## Chlorides (2.4.4)

Maximum 100 ppm.

Dilute 10 mL of solution S to 15 mL with *water R*.

## Sulfates (2.4.13)

Maximum 200 ppm, determined on solution S.

## Water-soluble matter

Maximum 0.5 per cent.

Boil 2.00 g with 100 mL of *water R* for 5 min. Filter the hot solution, then cool the filtrate and dilute to 100 mL with *water R*. Evaporate 50 mL of this solution to dryness in an evaporating dish and dry at 100-105 °C. The residue weighs a maximum of 5 mg.

## ASSAY

Thoroughly mix 0.100 g with 2 g of *potassium hydrogen sulfate R* in a platinum crucible and melt at 800 °C. Allow to cool, carefully take up the melt in 10 mL of *dilute hydrochloric acid R* and heat to dissolve. Dilute the solution to 100.0 mL with *water R*. Transfer 50.0 mL of this solution to a 500 mL conical flask and dilute to 300 mL with *water R*. Carry out the complexometric titration of magnesium (2.5.11).

1 mL of 0.1 M *sodium edetate* is equivalent to 6.23 mg of MgF<sub>2</sub>.

Ph Eur

## Magnesium Phosphate for Homoeopathic Preparations

(*Magnesium Phosphoricum for Homoeopathic Preparations, Ph. Eur. monograph 2505*)

MgHPO<sub>4</sub>·3H<sub>2</sub>O

174.3

7782-75-4

Ph Eur

## DEFINITION

## Content

98.0 per cent to 102.0 per cent of MgHPO<sub>4</sub>·3H<sub>2</sub>O.

## CHARACTERS

## Appearance

White or almost white powder.

## Solubility

Very slightly soluble in water, practically insoluble in ethanol (96 per cent). It dissolves in dilute acids.

## IDENTIFICATION

A. Dissolve 0.1 g in a mixture of 2 mL of *dilute nitric acid R* and 8 mL of *water R*. The solution gives reaction (b) of phosphates (2.3.1).

B. Dissolve 0.1 g in *dilute hydrochloric acid R* and dilute to 3 mL with the same acid. Add *ammonia R* until a precipitate is formed. Dissolve the precipitate by adding *dilute hydrochloric acid R* dropwise until complete dissolution and dilute to 10 mL with *distilled water R*. To 2 mL of the solution add a mixture of 0.5 mL of *uran yellow solution R* and 1.5 mL of *dilute sodium hydroxide solution R*. A red, flocculent precipitate is formed.

## TESTS

## Solution S

Dissolve 5.0 g in 30 mL of *dilute hydrochloric acid R* and dilute to 50.0 mL with the same acid.

## Arsenic (2.4.2, Method B)

Maximum 5 ppm, determined on 1.0 g.

## Chlorides (2.4.4)

Maximum 200 ppm.

Dissolve 0.25 g in 5 mL of *dilute nitric acid R* and dilute to 15 mL with *water R*.

## Magnesium dihydrogen phosphate and magnesium phosphate

Dissolve 2.00 g in 30.0 mL of 1 M *hydrochloric acid*. Add 20 mL of *water R* and 0.05 mL of *methyl orange solution R*. Titrate the excess of hydrochloric acid with 1 M *sodium hydroxide*. The volume of 1 M *hydrochloric acid* used is between 11.0 mL and 12.5 mL.

## Sulfates (2.4.13)

Maximum 300 ppm.

Dilute 5 mL of solution S to 15 mL with *distilled water R*.

## Iron (2.4.9)

Maximum 50 ppm.

Dilute 2 mL of solution S to 10 mL with *water R*.

## ASSAY

Dissolve 0.280 g in a mixture of 1 mL of *hydrochloric acid R1* and 5 mL of *water R*. Add 25.0 mL of 0.1 M *sodium edetate* and dilute to 200 mL with *water R*. Neutralise with *concentrated ammonia R*, add 10 mL of *ammonium chloride buffer solution pH 10.0 R* and about 50 mg of *mordant black 11 triturate R*. Titrate the excess of 0.1 M *sodium edetate* with

0.1 M zinc sulfate until the colour changes from pure blue to violet.

1 mL of 0.1 M sodium edetate is equivalent to 17.43 mg of  $MgHPO_4 \cdot 3H_2O$ .

Ph Eur

## Medicago Sativa for Homoeopathic Preparations

### DEFINITION

Medicago Sativa for Homoeopathic Preparations is the fresh whole flowering plant of *Medicago sativa* L.

### IDENTIFICATION

**Plant** A herbaceous perennial, reaching up to 100 cm.

**Leaves** Alternate, petiolate, trifoliolate, leaflets mucronate, approximately 2 cm long, 1 cm broad, typically oblanceolate or oblong, with a toothed or entire margin, glabrous on the upper surface and sparsely pubescent on the lower surface; stipules lanceolate, up to 1 cm long, toothed to entire.

**Stems** 4-angled, branching, glabrous to pubescent.

**Flowers** Compact, axillary, racemes of up to 40 flowers, peduncle up to 3 cm long, typically pubescent; corolla papilionaceous, up to 1 cm long, 5 mm broad, purple to whitish; calyx tube approximately 5 mm in length, 2 mm in diameter, 5-lobed, typically glabrous, lobes equal or subequal, up to 4 mm long.

### MOTHER TINCTURE

The mother tincture complies with the requirements stated under *Mother Tinctures for Homoeopathic Preparations* and with the following requirements.

### PRODUCTION

The mother tincture of *Medicago sativa* L. is prepared from the herbal drug using *method 1.1.5* described in the monograph for *Methods of Preparation of Homoeopathic Stocks and Potentisation*. Use 86% w/w (90% v/v) of *ethanol*.

### CHARACTERISTICS

The mother tincture is a greenish-brown liquid.

### IDENTIFICATION

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

- (1) The mother tincture.
- (2) 0.1% w/v coumarin BPCRS and 0.05% w/v of formononetin BPCRS in *methanol*.

### CHROMATOGRAPHIC CONDITIONS

- (a) Use as the coating *silica gel 60 F<sub>254</sub>* (Merck silica gel 60 pre-coated plates are suitable).
- (b) Use the mobile phase described below.
- (c) Apply 10 µL of each solution as 3 mm bands.
- (d) Develop the plate to 15 cm.
- (e) After removal of the plate dry in air and examine under *ultra-violet light (365 nm)*.
- (f) Spray the plate with *anisaldehyde solution* and heat at 105° for 5 minutes and examine under *ultra-violet light (365 nm)*.

### MOBILE PHASE

10 volumes of *methanol* and 90 volumes of *toluene*.

### SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), two clearly separated bands are observed under *ultra-violet light (365 nm)* before and after spraying with *anisaldehyde solution*.

### CONFIRMATION

Under ultra-violet light, the chromatogram obtained with solution (1) shows the following fluorescent bands: one blue or pink fluorescent band close to the origin, followed by a blue or pink fluorescent band and then a blue band below the band obtained for formononetin in solution (2), followed by one or two blue bands approximately level with formononetin and a red band between the bands obtained for formononetin and coumarin in solution (2). Other bands may be present in the chromatogram obtained with solution (1).

Top of the plate	
Red fluorescent band	Coumarin: a blue band
One or two blue fluorescent bands	Formononetin: a turquoise blue fluorescent band with slight tailing
Blue fluorescent band	
Blue or pink fluorescent band	
Blue or pink fluorescent band	
Solution (1)	Solution (2)

The chromatogram obtained with solution (1) sprayed with the *anisaldehyde solution* shows the following fluorescent bands: a faint blue band close to the origin, followed by a faint purple or blue fluorescent band and a blue band below the band obtained for formononetin in solution (2), followed by three yellow to orange bands between the bands obtained for formononetin and coumarin in solution (2) and an orange band between the band obtained for coumarin and the solvent front. Other bands may be present in the chromatogram obtained with solution (1).

<b>Solution (1)</b>	<b>Solution (2)</b>

**CHARACTERISTICS**

The mother tincture is a greenish-brown liquid.

**TESTS**

**Ethanol**

55% to 65% w/w (63% to 72% v/v), Appendix VIII F.

**Dry residue**

Not less than 1.0% w/w, Appendix XI P.

**Relative density**

0.880 to 0.950, Appendix V G.

**Nux-vomica for Homoeopathic Preparations**

(Ph. Eur. monograph 2514)

Ph Eur

**DEFINITION**

Dried, ripe seed of *Strychnos nux-vomica* L.

**Content**

Minimum 1.50 per cent for the sum of the contents of brucine (C<sub>23</sub>H<sub>26</sub>N<sub>2</sub>O<sub>4</sub>; M<sub>r</sub> 394.5) and strychnine (C<sub>21</sub>H<sub>22</sub>N<sub>2</sub>O<sub>2</sub>; M<sub>r</sub> 334.4), of which 43 per cent to 67 per cent is strychnine (dried drug).

**IDENTIFICATION**

A. The seed is discoid, with a slightly raised margin, 20-25 mm in diameter and about 5 mm thick. It is not quite flat, with one surface slightly convex and the other slightly concave. Some seeds are irregularly curved. The colour of the seed ranges from light grey to greenish-grey and its satiny appearance is due to a silky down, consisting of dense hairs radiating from a central point on each of the faces. One of the surfaces has a raised point at the centre (the hilum), from which extends a radial ridge ending in a slight protuberance on the edge of the seed (the micropyle). A grey horny endosperm makes up most of the seed. The embryo, which is

located in the central cavity, is small (about 6 mm long), with 2 cotyledons; the radicle is turned towards the micropyle.

B. **CAUTION:** take all necessary handling precautions when reducing this toxic herbal drug to a powder.

Wash the herbal drug rapidly in cold water, then expose to vapour from boiling water; once sufficiently softened, cut into thin slices and crush in a suitable apparatus. Allow to dry, finish reducing to a powder (710) (2.9.12) and pass through a covered sieve.

Microscopic examination (2.8.23). The powder is grey. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters (Figure 2514.-1): fragments of the outer testa (surface view [B], transverse section [C]), with cells with an enlarged, sclerified, strongly thickened and channelled base [Ba, Cb], transformed into curved or straight hairs, usually broken, with 7-10 lignified ridges [Bb, Ca] and a rounded lignified tip [D]; numerous rods or strips, highly variable in length and 5-15 µm wide, from the lignified ridges of the hairs [A]; numerous fragments of endosperm [F], consisting of very thick-walled polyhedral cells, some of which contain oil and aleurone grains; a few fragments of the outer layers of the endosperm (surface view [E], transverse section [C]); in surface view [E] the cells are polyhedral [Ea], sometimes associated with the brown pigmented layer of the testa formed of cells with indistinct walls [Eb]; in transverse section [C] the cells are elongated [Cc], sometimes associated with the pigmented layer [Cd] and the outer testa [Cb].

Figure 2514.-1. – Illustration for identification test B of powdered herbal drug of *Nux-vomica* for homoeopathic preparations

C. Thin-layer chromatography (2.2.27).

**Test solution** To 2.0 g of the powdered herbal drug (710) (2.9.12) add 20 mL of ethanol (70 per cent V/V) R, allow to macerate for 15 min at room temperature, with stirring, and centrifuge. Use the supernatant.

**Reference solution** Dissolve 10 mg of brucine R and 10 mg of strychnine R in 10 mL of ethanol (96 per cent) R.

**Plate** TLC silica gel plate R (5-40 µm) [or TLC silica gel plate R (2-10 µm)].

**Mobile phase** concentrated ammonia R, methanol R, methylene chloride R (1:5:95 V/V/V); use the lower layer.

**Application** 10 µL [or 5 µL] as bands.

**Development** Over a path of 15 cm [or 6 cm].

**Drying** In air, then in an oven at 105-110 °C for 15 min; allow to cool.

**Detection** Spray with iodoplatinate reagent R and examine immediately in daylight.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

## TESTS

When the powdered herbal drug (710) (2.9.12) is used, take the necessary precautions as indicated under Identification B.

### Foreign matter (2.8.2)

Maximum 1.0 per cent.

### *Strychnos ignatii* P.J. Bergius

The presence of irregularly shaped seeds that are neither discoid nor flattened and the presence in the powdered herbal drug, examined under a microscope, of sclerified hairs, usually sheared off, not thickened at the base and with walls composed of small, oblique, sclerified strips, tightly fused longitudinally, indicate adulteration with *Strychnos ignatii* P.J. Bergius.

### Loss on drying (2.2.32)

Maximum 10.0 per cent, determined on 1.00 g of the powdered herbal drug (710) (2.9.12) by drying in an oven at 105 °C for 2 h.

### Total ash (2.4.16)

Maximum 3.0 per cent.

### Aflatoxins (2.8.18)

Maximum 2 µg/kg (aflatoxin B<sub>1</sub>) and maximum 4 µg/kg (sum of aflatoxins B<sub>1</sub>, B<sub>2</sub>, G<sub>1</sub> and G<sub>2</sub>).

## ASSAY

Liquid chromatography (2.2.29).

**Test solution** To 1.000 g of the powdered herbal drug (710) (2.9.12) add 10.0 mL of ethanol (60 per cent V/V) R. Boil gently, under a reflux condenser, with stirring. After 30 min, cool and filter into a 20.0 mL volumetric flask. Wash the filter with ethanol (60 per cent V/V) R and dilute to 20.0 mL

with the same solvent. Dilute 1.0 mL of the solution to 20.0 mL with mobile phase A.

**Reference solution** Dissolve 10.0 mg of brucine CRS and 10.0 mg of strychnine CRS in acetonitrile R and dilute to 10.0 mL with the same solvent. Dilute 1.0 mL of the solution to 20.0 mL with mobile phase A.

**Column:**

— size:  $l = 0.15$  m,  $\varnothing = 4.6$  mm;

— stationary phase: end-capped ethylene-bridged octadecylsilyl silica gel for chromatography (hybrid material) R (3.5 µm);

— temperature: 35 °C.

**Mobile phase:**

— mobile phase A: triethylamine R, acetonitrile for chromatography R, methanol R2, tris(hydroxymethyl) aminomethane buffer solution pH 9.0 R (0.1:7.5:7.5:85 V/V/V/V);

— mobile phase B: triethylamine R, tris(hydroxymethyl) aminomethane buffer solution pH 9.0 R, acetonitrile for chromatography R, methanol R2 (0.1:15:42.5:42.5 V/V/V/V);

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 5	100	0
5 - 25	100 → 70	0 → 30
25 - 30	70 → 65	30 → 35
30 - 31	65 → 0	35 → 100
31 - 32	0	100

**Flow rate** 1.0 mL/min.

**Detection** Spectrophotometer at 260 nm.

**Injection** 10 µL.

**Elution order** Brucine, strychnine.

**System suitability** Reference solution:

— resolution: minimum 3.0 between the peaks due to brucine and strychnine.

Calculate the percentage content of brucine and strychnine using the following expression:

$$\frac{A_1 \times m_2 \times p \times 2}{A_2 \times m_1}$$

- $A_1$  = area of the peak due to brucine or to strychnine in the chromatogram obtained with the test solution;  
 $A_2$  = area of the peak due to brucine or to strychnine in the chromatogram obtained with the reference solution;  
 $m_1$  = mass of the herbal drug to be examined used to prepare the test solution, in grams;  
 $m_2$  = mass of brucine CRS or of strychnine CRS used to prepare the reference solution, in grams;  
 $p$  = assigned percentage content of brucine in brucine CRS, or strychnine in strychnine CRS.

## MOTHER TINCTURE

The mother tincture complies with the requirements of the general monograph *Mother tinctures for homoeopathic preparations* (2029).

## DEFINITION

The mother tincture is prepared from the dried ripe seed of *Strychnos nux-vomica* L.

## Content

0.15 per cent *m/m* to 0.30 per cent *m/m* for the sum of the contents of brucine (C<sub>23</sub>H<sub>26</sub>N<sub>2</sub>O<sub>4</sub>;  $M_r$  394.5) and strychnine (C<sub>21</sub>H<sub>22</sub>N<sub>2</sub>O<sub>2</sub>;  $M_r$  334.4), of which 43 per cent to 67 per cent is strychnine.

**PRODUCTION**

The mother tincture is prepared by the following methods prescribed in the general monograph *Methods of preparation of homoeopathic stocks and potentisation (2371)*:

- method 1.1.8, using the powdered herbal drug (710) (2.9.12) and ethanol (70 per cent *V/V*);
- method 1.1.10, using the powdered herbal drug, ethanol (65 per cent *V/V*) and a maceration time of 3-5 weeks.

**CHARACTERS****Appearance**

Yellow or light brown liquid.

**IDENTIFICATION**

Thin-layer chromatography (2.2.27) as described in identification test C for the herbal drug with the following modification.

*Test solution* The mother tincture to be examined.

**TESTS****Relative density (2.2.5)**

0.888 to 0.903 when method 1.1.8 is used.

**Ethanol (2.9.10)**

60 per cent *V/V* to 70 per cent *V/V* when method 1.1.10 is used.

**Dry residue (2.8.16)**

Minimum 1.0 per cent.

**ASSAY**

Liquid chromatography (2.2.29) as described in the assay of the herbal drug with the following modifications.

*Test solution* Dilute 2.000 g of the mother tincture to be examined to 20.0 mL with ethanol (60 per cent *V/V*) *R*.

Calculate the percentage content of brucine and strychnine using the following expression:

$$\frac{A_1 \times m_2 \times p}{A_2 \times m_1 \times 10}$$

- $A_1$  = area of the peak due to brucine or to strychnine in the chromatogram obtained with the test solution;
- $A_2$  = area of the peak due to brucine or to strychnine in the chromatogram obtained with the reference solution;
- $m_1$  = mass of the mother tincture to be examined used to prepare the test solution, in grams;
- $m_2$  = mass of brucine CRS or of strychnine CRS used to prepare the reference solution, in grams;
- $p$  = assigned percentage content of brucine in brucine CRS, or strychnine in strychnine CRS.

Ph Eur

**Petroleum Rectificatum for Homoeopathic Preparations**

(Ph. Eur. monograph 2683)

Ph Eur

**DEFINITION**

Petroleum spirit distilling between 180 °C and 220 °C obtained by rectification of crude oil.

**CHARACTERS****Appearance**

Clear, colourless, highly flammable liquid.

**Solubility**

Practically insoluble in water, freely soluble in acetone, sparingly soluble in ethanol (96 per cent).

**IDENTIFICATION**

A. Relative density (see Tests).

B. Refractive index (see Tests).

C. Distillation range (see Tests).

**TESTS****Solution S**

Dissolve 1 g in 99 g of ethanol (90 per cent *V/V*) *R*.

**Appearance of solution**

Solution S is clear (2.2.1) and colourless (2.2.2, Method II).

**Acidity or alkalinity**

To 10 mL of the substance to be examined, add 5 mL of carbon dioxide-free water *R* and 0.25 mL of phenol red solution *R* and shake. The aqueous phase is yellow.

Add 0.05 mL of 0.01 M sodium hydroxide and shake.

The aqueous phase is red.

**Relative density (2.2.5)**

0.752 to 0.762.

**Refractive index (2.2.6)**

1.422 to 1.426.

**Distillation range (2.2.11)**

Minimum 90 per cent *m/m* distils between 180 °C and 220 °C.

**Aromatic hydrocarbons**

The absorbance (2.2.25) of solution S between 250 nm and 400 nm is not greater than 0.100.

**Non-volatile matter**

Maximum 0.04 per cent.

Evaporate 5.000 g to dryness on a water-bath and dry the residue in an oven at 100-105 °C for 2 h. The residue weighs a maximum of 2.0 mg.

**STORAGE**

In an airtight container.

**LABELLING**

The label states that the substance is obtained by rectification.

Ph Eur

**Potassium Dichromate for Homoeopathic Preparations**

(*Kalium Bichromicum for Homoeopathic Preparations*, Ph. Eur. monograph 2501)

K<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub>

294.2

7778-50-9

Ph Eur

**DEFINITION****Content**

99.0 per cent to 101.0 per cent of K<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub>.

**CHARACTERS****Appearance**

Orange crystals.

**Solubility**

Freely soluble in water, practically insoluble in ethanol (96 per cent).

**IDENTIFICATION**

A. It gives reaction (b) of potassium (2.3.1).

B. Dissolve 10 mg in 5 mL of water *R*. Add 0.25 mL of dilute sulfuric acid *R*, 0.5 mL of strong hydrogen peroxide

solution R and 1 mL of ether R. Shake. The upper layer is blue.

#### TESTS

##### Solution S1

Dissolve 5.0 g in distilled water R and dilute to 50.0 mL with the same solvent.

##### Solution S2

To 20.0 mL of solution S1 add 20 mL of hydrochloric acid R and 50 mL of tributyl phosphate R. Stir for 2 min. Remove the lower layer and shake it with 10 mL of ether R. Evaporate the lower layer to dryness under reduced pressure. Dissolve the residue in 10 mL of distilled water R. Add dilute ammonia RI until the solution is neutral to blue litmus paper R and dilute to 20.0 mL with distilled water R.

#### Appearance of solution

Solution S1 is clear (2.2.1).

#### Calcium (2.4.3)

Maximum 500 ppm.

Dilute 2.0 mL of solution S2 to 15 mL with distilled water R.

#### Chlorides (2.4.4)

Maximum 50 ppm.

Dissolve 1.0 g in 15 mL of dilute nitric acid R. Use 1 mL of nitric acid R instead of the prescribed dilute nitric acid R.

#### Sulfates (2.4.13)

Maximum 150 ppm.

Dilute 10 mL of solution S2 to 15 mL with distilled water R.

#### ASSAY

Dissolve 0.100 g in 25 mL of water R. Add 2 g of potassium iodide R and 25 mL of dilute sulfuric acid R. Allow to stand in the dark for 10 min. Add 150 mL of water R. Titrate with 0.1 M sodium thiosulfate until the colour changes from blue to green, adding 1 mL of starch solution R near the end of the titration.

1 mL of 0.1 M sodium thiosulfate is equivalent to 4.903 mg of  $K_2Cr_2O_7$ .

Ph Eur

## Prunus Spinosa Fruit for Homoeopathic Preparations

#### DEFINITION

Prunus Spinosa Fruit for Homoeopathic Preparations is the fresh ripe fruit of *Prunus spinosa* L.

#### IDENTIFICATION

The ripe fruit is nearly a globose drupe, 8 to 15 mm in diameter, bluish-black with a blue-grey bloom. The dense green pulp surrounds a hard, spherical to ovoid and flattened stone, 6 to 9 mm long, 6 to 8 mm wide and 4 to 6 mm thick. The stone bulges slightly and has a sharp edge.

#### MOTHER TINCTURE

The mother tincture complies with the requirements stated under Mother Tinctures for Homoeopathic Preparations and with the following requirements.

#### PRODUCTION

The mother tincture of *Prunus spinosa* L. is prepared from the herbal drug using Method 1.1.7 described in the monograph for Methods of Preparation of Homoeopathic Stocks and Potentiation. Use 43% w/w (50% v/v) of ethanol.

#### CHARACTERISTICS

The mother tincture is a purple-red to red, clear to slightly turbid liquid.

#### IDENTIFICATION

Carry out the method for thin-layer chromatography, Appendix III A, using the following solutions.

(1) Centrifuge 10 mL of the mother tincture at about 3000 rpm for 5 minutes. Precondition a cartridge containing octadecyl-bonded silica sorbent (a Sep-pak C18 cartridge is suitable) with 10 mL of methanol followed by 10 mL of water. Apply 4.5 mL of the clear supernatant to the column, wash with 5 mL water and elute with 5 mL of methanol. Evaporate the eluant on a rotary evaporator at 50°. Dissolve the residue in 1 mL of methanol.

(2) 0.025% w/v of chlorogenic acid and 0.005% w/v of scopoletin in methanol.

#### CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating silica gel F<sub>254</sub>.

(b) Use the mobile phase described below.

(c) Apply 40 µL of each solution as 12 mm bands.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry it in air and spray with a 1% w/v solution of diphenylboric acid aminoethyl ester in methanol, followed by a 5% w/v solution of polyethylene glycol 400 in methanol and examine under ultraviolet light (365 nm).

#### MOBILE PHASE

15 volumes of anhydrous formic acid, 15 volumes of water and 70 volumes of ethyl acetate.

#### SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (2) shows a yellow-green fluorescent band (chlorogenic acid) in the middle third of the plate and a blue fluorescent band (scopoletin) in the upper third of the plate.

#### CONFIRMATION

The chromatogram obtained with solution (1) shows at least one orange fluorescent band below chlorogenic acid, one yellow-green fluorescent band with the R<sub>f</sub> of chlorogenic acid and one orange fluorescent band below scopoletin. In addition the following bands may be present: a blue fluorescent band with the same R<sub>f</sub> as scopoletin and an orange fluorescent band with an R<sub>f</sub> slightly higher than that of scopoletin. Two or more orange fluorescent bands may be present between the two standards.

Top of the plate	
An orange fluorescent band	Scopoletin: a blue fluorescent band
A yellow-green fluorescent band	Chlorogenic acid: a yellow-green fluorescent band
An orange fluorescent band	
Solution (1)	Solution (2)

#### TESTS

##### Ethanol

24 to 34% w/w (29.3 to 40.8% v/v), Appendix VIII F.

**Dry residue**

Not less than 3.5% w/w, Appendix XI P.

**Relative density**

0.955 to 0.995, Appendix V G.

**Selenium for Homoeopathic Preparations**

(Ph. Eur. monograph 2844)

Se

79.0

7782-49-2

Ph Eur

**DEFINITION**

Amorphous selenium.

**Content**

98.0 per cent to 101.0 per cent of Se (dried substance).

**CHARACTERS****Appearance**

Black, reddish-brown or red powder, softens at 50 °C to 60 °C.

**Solubility**

Practically insoluble in water, soluble in concentrated sulfuric acid giving a green solution.

**IDENTIFICATION**

A. Warm 5 mL of solution S1 (see Tests) on a water-bath and add 50 mg of *hydrazine sulfate R*. A red colour is produced.

B. To 5 mL of solution S1 add 0.5 mL of *dilute hydrochloric acid R* and 2 mL of a 100 g/L solution of *thiourea R*. A red precipitate is formed.

**TESTS****Solution S1**Dissolve 20 mg in 1 mL of *nitric acid R*, warming on a water-bath. Continue warming until the evolution of brown fumes has ceased, then cool and add 10 mL of *water R*.**Solution S2**To the residue obtained in the test for sulfated ash add 2 mL of *nitric acid R* and 3 mL of *hydrochloric acid R* and evaporate to dryness on a water-bath. Take up the residue in a mixture of 1 mL of *dilute hydrochloric acid R* and 25 mL of hot *water R*. Cool, filter and dilute to 50.0 mL by washing the filter with *water R*.**Appearance of solution**

Solution S2 is clear (2.2.1) and colourless (2.2.2, Method II).

**Sulfur**

Maximum 0.2 per cent.

To 0.100 g add 1 mL of *nitric acid R* dropwise, then add 2 mL of *hydrochloric acid R* and evaporate to dryness on a water-bath. Add 2 mL of *hydrochloric acid R* and evaporate again to dryness on a water-bath. Dissolve the residue in 6 mL of a mixture of 1 mL of *dilute hydrochloric acid R* and 30 mL of *distilled water R*, then filter and dilute the filtrate to 20 mL by washing the filter with *distilled water R*. Dilute 5 mL of this solution to 15 mL with *distilled water R*. The solution complies with the limit test for sulfates (2.4.13) (0.6 per cent of sulfate corresponds to 0.2 per cent of sulfur).

**Water-soluble selenium compounds**

Maximum 5 ppm.

**Test solution** Shake 1.0 g with 20 mL of *water R* for 30 min and filter, washing the filter with 2 quantities, each of 5 mL,

of *water R*. Adjust the filtrate to pH 2 with *dilute hydrochloric acid R*, and add 5.0 mL of a freshly prepared 1 g/L solution of 2,3-naphthalenediamine *R* in 0.1 M *hydrochloric acid*. Dilute to 50 mL with *water R* and allow to stand, protected from light, for 2 h. Shake the mixture with 10 mL of *toluene R* for 3 min and allow the layers to separate for 3 min. Isolate the organic layer and dilute to 10.0 mL with *toluene R*.

**Reference solution** Mix 5.0 mL of *selenium standard solution (1 ppm Se) R* and 25 mL of *water R*, and prepare in the same manner as for the filtrate in the test solution.

**Compensation liquid** Treat 30 mL of *water R* in the same manner as for the filtrate in the test solution.

Measure the absorbance (2.2.25) of the test solution and the reference solution at 380 nm by comparison with the compensation liquid.

The absorbance of the test solution is not greater than that of the reference solution.

**Iron (2.4.9)**

Maximum 100 ppm.

To 5 mL of solution S2 add 5 mL of *water R*.**Loss on drying (2.2.32)**

Maximum 1.0 per cent, determined on 1.000 g by drying in an oven at 105 °C for 1 h.

**Sulfated ash (2.4.14)**

Maximum 0.3 per cent, determined on 1.000 g.

**ASSAY**

Dissolve 0.2000 g in 10 mL of *nitric acid R*. Warm until the evolution of brown fumes has ceased and the solution is only slightly yellow. Cool, add 2 g of *sulfamic acid R* and dilute to 100.0 mL with *water R*. To 10.0 mL of this solution add 50 mL of *water R* and 2.0 g of *potassium iodide R*. Titrate with 0.1 M *sodium thiosulfate*, determining the end-point potentiometrically (2.2.20).

1 mL of 0.1 M *sodium thiosulfate* is equivalent to 1.974 mg of Se.

Ph Eur

**Sodium Tetrachloroaurate Dihydrate for Homoeopathic Preparations**

(Aurum Chloratum Natronatum for Homoeopathic Preparations, Ph. Eur. monograph 2141)

Na[AuCl<sub>4</sub>]<sub>2</sub>H<sub>2</sub>O

397.8

13874-02-7

Ph Eur

**DEFINITION**

Sodium tetrachloroaurate(1-) dihydrate.

**Content**97.0 per cent to 101.0 per cent of Na[AuCl<sub>4</sub>]<sub>2</sub>H<sub>2</sub>O.**CHARACTERS****Appearance**

Orange-yellow, hygroscopic powder or crystals.

**Solubility**

Very soluble or freely soluble in water and in ethanol (96 per cent).

**IDENTIFICATION**

A. Dissolve 20 mg in 2.0 mL of 0.1 M *nitric acid*. Add 0.1 g of *oxalic acid R* and boil in a water-bath for 1 h. A deposit of metallic gold is formed.

B. Solution S (see Tests) gives reaction (a) of chlorides (2.3.1).

C. Solution S gives reaction (b) of sodium (2.3.1).

#### TESTS

##### Solution S

Ignite 0.20 g in a porcelain crucible at  $600\text{ }^{\circ}\text{C} \pm 50\text{ }^{\circ}\text{C}$  for 30 min. Allow to cool and extract with 3 mL of water R, heating if necessary. Use the supernatant.

##### Free hydrochloric acid

When a glass rod impregnated with concentrated ammonia R is held close to the substance to be examined, no white fumes are produced.

##### Nitrates

Maximum 200 ppm.

Dissolve 0.20 g in 4.0 mL of nitrate-free water R. Add 0.6 g of zinc R and 10 mL of dilute sulfuric acid R. Heat the solution on a water-bath for 30 min, allow to cool and filter. Rinse the filter with nitrate-free water R and dilute the filtrate to 20.0 mL with the same solvent. To 5.0 mL of this solution add 0.4 mL of a 100 g/L solution of potassium chloride R, 0.1 mL of diphenylamine solution R and, dropwise with shaking, 5.0 mL of nitrogen-free sulfuric acid R. Heat in a water-bath at  $50\text{ }^{\circ}\text{C}$  for 15 min, centrifuge if necessary and use the clear supernatant. Any blue colour in the solution is not more intense than that in a reference solution prepared at the same time and in the same manner using a mixture of 1.0 mL of nitrate standard solution (10 ppm  $\text{NO}_2$ ) R and 3.0 mL of nitrate-free water R.

#### ASSAY

Dissolve 40.0 mg in 10 mL of potassium iodide solution R. Allow to stand for 5 min. Titrate with 0.01 M sodium thiosulfate until decolourised. Shortly before reaching the endpoint, add 0.5 mL of starch solution R.

1 mL of 0.01 M sodium thiosulfate is equivalent to 1.989 mg of  $\text{Na}[\text{AuCl}_4] \cdot 2\text{H}_2\text{O}$ .

#### STORAGE

In an airtight container, protected from light.

Ph Eur

## Staphysagria for Homoeopathic Preparations

(Ph. Eur. monograph 2289)

Ph Eur

#### DEFINITION

Dried, ripe seed of *Delphinium staphisagria* L.

#### Content

Minimum 1.5 per cent of total alkaloids, expressed as delphinine ( $\text{C}_{33}\text{H}_{45}\text{NO}_9$ ;  $M_r$  599.7) (dried drug).

#### IDENTIFICATION

A. The isolated seed has an irregular, flattened, tetrahedral shape, measuring 3–7 mm on each side; one of the sides is convex; the others are flat or concave. The surface is generally dark brown, rarely light brown, and shows a raised network defining alveoli; on the surface there are occasionally greyish spots. The seed coat is brittle and encloses an abundant endosperm, which is whitish to dark brown. The more or less wrinkled seeds are sometimes found as 5–6 seeds fitting together into an ovoid mass.

B. Microscopic examination (2.8.23). Reduce to a powder (710) (2.9.12). The powder consists of a mixture of dark brown and white particles with oily constituents. Examine under a microscope using chloral hydrate solution R.

The powder shows the following diagnostic characters (Figure 2289.-1): fragments of the epispERM consisting of a layer of large cells with regularly thickened walls and a wide lumen, elongated (surface view [A]), more or less isodiametric (transverse section [D]); the outside surface of the epispERM cells generally exhibits numerous short, unequal, irregularly bent, cylindrical papillae, often with a globoid head, that look like cuticular papillae but are the condiiophores of a fungus present in almost every seed [Aa, Da]; underlying the epispERM is an intermediate area, partly collapsed, composed of 5–6 layers of tangentially elongated, colourless, thin-walled cells [Cd, Db]; fragments of the inner testa, usually associated with the endosperm [B, C]; the inner testa comprises brown cells that, in transverse section, form a layer and are regular, 4–7  $\mu\text{m}$  wide, with numerous U-shaped thickenings [Ca], whereas in surface view [Ba] they are elongated and about 70–100  $\mu\text{m}$  long, with thin, finely striated walls; the endosperm consists of pentagonal or hexagonal cells, isodiametric or slightly elongated, with straight, thin walls [Bb, Cb], containing aleurone grains and oil droplets [Bc, Cc].

Figure 2289.-1. – Illustration for identification test B of powdered herbal drug of *Staphysagria* for homoeopathic preparations

C. Thin-layer chromatography (2.2.27).

**Test solution** To 1.0 g of the powdered herbal drug (710) (2.9.12) add 10 mL of ethanol (90 per cent V/V) R and boil under a reflux condenser for 15 min. Allow to cool and filter.

**Reference solution** Dissolve 10 mg of hyoscyne hydrobromide R and 10 mg of papaverine hydrochloride R in ethanol (90 per cent V/V) R and dilute to 50 mL with the same solvent.

**Plate** TLC silica gel plate R (5–40  $\mu\text{m}$ ) [or TLC silica gel plate R (2–10  $\mu\text{m}$ )].

**Mobile phase** concentrated ammonia R, anhydrous ethanol R, acetone R, toluene R (3:7:45:45 V/V/V/V).

**Application** 30  $\mu\text{L}$  [or 20  $\mu\text{L}$ ] as bands.

**Development** Over a path of 10 cm [or 6 cm].

**Drying** In air.

**Detection** Treat with *dilute potassium iodobismuthate solution R*, then with *sodium nitrite solution R* until the yellow background disappears; examine in daylight.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
	3-4 orange zones
Papaverine: an orange zone	
Hyoscine: an orange zone	
Reference solution	Test solution

#### TESTS

**Foreign matter (2.8.2)**

Maximum 1 per cent.

**Loss on drying (2.2.32)**

Maximum 10.0 per cent, determined on 1.000 g of the powdered herbal drug (710) (2.9.12) by drying in an oven at 105 °C for 2 h.

**Total ash (2.4.16)**

Maximum 7.0 per cent.

#### ASSAY

To 2.000 g of the powdered herbal drug (710) (2.9.12) add 20 mL of *ethanol (90 per cent V/V) R*, and boil under a reflux condenser for 15 min. Allow to cool and filter through a plug of absorbent cotton, rinsing the filter with *ethanol (90 per cent V/V) R*. Add 2 mL of *dilute hydrochloric acid R* and evaporate to about 5 mL under reduced pressure. Add 20 mL of *water R*. Shake with 4 quantities, each of 25 mL, of *light petroleum R*. Discard the organic layers. Add to the aqueous layer 3 mL of *dilute ammonia R1* and shake with 4 quantities, each of 25 mL, of *1,1-dimethylethyl methyl ether R*. Dry the combined organic layers over *anhydrous sodium sulfate R*, filter and evaporate to dryness under reduced pressure at about 40 °C. Dissolve the residue in 10 mL of *anhydrous acetic acid R*. Titrate with 0.02 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 mL of 0.02 M *perchloric acid* is equivalent to 11.99 mg of delphinine (C<sub>33</sub>H<sub>45</sub>NO<sub>9</sub>).

#### MOTHER TINCTURE

The mother tincture complies with the requirements of the general monograph *Mother tinctures for homoeopathic preparations (2029)*.

#### DEFINITION

##### Content

0.10 per cent *m/m* to 0.40 per cent *m/m* of total alkaloids, expressed as delphinine (C<sub>33</sub>H<sub>45</sub>NO<sub>9</sub>; M<sub>r</sub> 599.7).

#### PRODUCTION

The mother tincture is prepared from the dried seed of *Delphinium staphisagria* L. according to the following methods prescribed in the monograph *Methods of preparation of homoeopathic stocks and potentisation (2371)*:

- method 1.1.8 using the powdered herbal drug (710) (2.9.12) and *ethanol (90 per cent V/V) R*; use *ethanol (70 per cent V/V) R* to prepare the 4<sup>th</sup> decimal dilution, and use *ethanol (50 per cent V/V) R* for subsequent dilutions;
- method 1.1.10 using the fragmented herbal drug and *ethanol (65 per cent V/V) R*.

#### CHARACTERS

##### Appearance

Pale yellow liquid.

#### IDENTIFICATION

Thin-layer chromatography (2.2.27) as described in identification test C for the herbal drug with the following modification.

**Test solution** The mother tincture to be examined.

**Results** See below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
	2-4 orange zones
Papaverine: an orange zone	
Hyoscine: an orange zone	
Reference solution	Test solution

#### TESTS

**Relative density (2.2.5)**

0.830 to 0.840 when method 1.1.8 is used.

**Ethanol (2.9.10)**

60 per cent *V/V* to 70 per cent *V/V* when method 1.1.10 is used.

**Dry residue (2.8.16)**

Minimum 0.7 per cent.

#### ASSAY

Potentiometric titration (2.2.20) as described in the assay of the herbal drug with the following modifications.

To 20.00 g of the mother tincture to be examined add 2 mL of *dilute hydrochloric acid R* and evaporate to about 5 mL under reduced pressure. Continue as described in the assay of the herbal drug, beginning at the words "Add 20 mL of *water R*".

Ph Eur

## Sulfur for Homoeopathic Preparations

(Ph. Eur. monograph 2515)

S

32.07

7704-34-9

Ph Eur

### DEFINITION

Obtained by sublimation.

### Content

99.0 per cent to 101.0 per cent.

### CHARACTERS

#### Appearance

Yellow powder.

#### Solubility

Practically insoluble in water, soluble in carbon disulfide, slightly soluble in vegetable oils.

#### mp

About 120 °C.

### IDENTIFICATION

A. Heated in the presence of air, it burns with a blue flame, emitting sulfur dioxide, which changes the colour of moistened *blue litmus paper R* to red.

B. Heat 0.1 g with 0.5 mL of *bromine water R* until decolourised. Add 5 mL of *water R* and filter. The solution gives reaction (a) of sulfates (2.3.1).

### TESTS

#### Solution S

To 5.0 g add 50 mL of *carbon dioxide-free water R* prepared from *distilled water R*. Allow to stand for 30 min with frequent shaking and filter.

#### Appearance of solution

Solution S is colourless (2.2.2, Method II).

#### Odour (2.3.4)

It has no perceptible odour of hydrogen sulfide.

#### Acidity or alkalinity

To 5 mL of solution S add 0.1 mL of *phenolphthalein solution R1*. The solution is colourless. Add 0.2 mL of *0.01 M sodium hydroxide*. The solution is red. Add 0.3 mL of *0.01 M hydrochloric acid*. The solution is colourless. Add 0.15 mL of *methyl red solution R*. The solution is orange-red.

#### Chlorides (2.4.4)

Maximum 100 ppm.

Dilute 5 mL of solution S to 15 mL with *water R*.

#### Sulfates (2.4.13)

Maximum 100 ppm, determined on solution S.

#### Sulfides

To 10 mL of solution S add 2 mL of *buffer solution pH 3.5 R* and 1 mL of a freshly prepared 1.6 g/L solution of lead nitrate R in *carbon dioxide-free water R*. Shake. After 1 min any colour in the solution is not more intense than that in a reference solution prepared at the same time using 1 mL of *lead standard solution (10 ppm Pb) R*, 9 mL of *carbon dioxide-free water R*, 2 mL of *buffer solution pH 3.5 R* and 1.2 mL of *thioacetamide reagent R*.

#### Arsenic (2.4.2, Method B)

Maximum 8 ppm.

Shake 2.5 g with 50 mL of *dilute ammonia R1* for 1 h and filter. Evaporate 25 mL of the filtrate to dryness. Add 2 mL of *water R* and 3 mL of *nitric acid R* to the residue and evaporate to dryness. The residue complies with the test.

Prepare the standard using 1 mL of *arsenic standard solution (10 ppm As) R*.

#### Sulfated ash (2.4.14)

Maximum 0.2 per cent, determined on 1.0 g.

### ASSAY

Carry out the oxygen-flask method (2.5.10), using 60.0 mg in a 1000 mL combustion flask with a polytetrafluoroethylene joint. Absorb the combustion products in a mixture of 5 mL of *dilute hydrogen peroxide solution R* and 10 mL of *water R*. Heat to boiling, boil gently for 2 min and cool. Using 0.2 mL of *phenolphthalein solution R* as indicator, titrate with *0.1 M sodium hydroxide* until the colour changes from colourless to red. Carry out a blank titration under the same conditions.

1 mL of *0.1 M sodium hydroxide* is equivalent to 1.603 mg of S.

### STORAGE

Protected from light.

Ph Eur

## Symphytum Officinale Root for Homoeopathic Preparations

### DEFINITION

Symphytum Officinale Root for Homoeopathic Preparations is the fresh root of *Symphytum officinale* L.

### IDENTIFICATION

The strong, spirally-formed rootstock with a smooth, black-brown cortex, subdivides at the base. It is about 5 to 8 cm in diameter and 17 to 30 cm long, surmounted by several tops, close together, consisting of the black residues of the previous year's rosettes of leaves between the current year's new growths. A ring of 10 to 15 horizontally-running, secondary, glabrous smooth roots grows from the base of the rosettes, the roots often reaching a length of more than 50 cm and a diameter of approximately 1.5 cm. The middle portion of the rootstock, which is more or less glabrous, branches at the lower end into several clearly separated, straight downwards pointing, smooth roots, each about 1.5 cm thick and bearing a few secondary rootlets 1 to 2 cm long.

The rootstock and the thick secondary roots are non-lignified, succulent and break off easily. In the yellowish-white, glassy, slightly differentiated cross section, there is a very thin, black rhizodermis, and an easily detachable layer of cortex, 5-8 mm thick. Within this is a single dark pigmented vascular ring. The cut surface and particularly the richly exuding mucilaginous substance turn yellow to red-brown on exposure.

### TESTS

#### Foreign matter

Not more than 2%, Appendix XI D.

### MOTHER TINCTURE

The mother tincture complies with the requirements stated under *Mother Tinctures for Homoeopathic Preparations* and with the following requirements.

### PRODUCTION

The mother tincture of *Symphytum officinale* L., is prepared from the herbal drug using *Method 1.1.3* described in the monograph for *Methods of Preparation of Homoeopathic Stocks and Potentisation*. Use 86% w/w (90% v/v) of *ethanol*.

**CHARACTERISTICS**

The mother tincture is a brown liquid.

**IDENTIFICATION**

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

- (1) The mother tincture.
- (2) 0.1% w/v of *allantoin* in *ethanol* (45%).

**CHROMATOGRAPHIC CONDITIONS**

- (a) Use as the coating *silica gel*.
- (b) Use the mobile phase as described below.
- (c) Apply 20  $\mu$ L of solution (1) and 10  $\mu$ L of solution (2) as 10 mm bands.
- (d) Develop the plate to 10 cm.
- (e) After removal of the plate, dry in air and examine under *ultraviolet light* (365 nm).
- (f) Spray the plate with a 5% w/v solution of *dimethylaminobenzaldehyde* in *hydrochloric acid* and examine in daylight.

**MOBILE PHASE**

10 volumes of *anhydrous formic acid*, 10 volumes of *water* and 80 volumes of *ethyl acetate*.

**SYSTEM SUITABILITY**

The test is not valid unless under *ultraviolet light* (365 nm) the chromatogram of solution (1) shows two bluish fluorescent bands at Rf 0.25 and Rf 0.55 and one light-green fluorescent band at the solvent front.

**CONFIRMATION**

After spraying, the chromatogram obtained with solution (2) shows the yellow allantoin band at Rf 0.35. The chromatogram obtained with solution (1) shows one yellow band with the same Rf of 0.35 as that for allantoin.

**TESTS****Ethanol**

35 to 45% w/w (42 to 53% v/v), Appendix VIII F.

**Dry residue**

Not less than 1.5% w/w, Appendix XI P.

**Relative density**

0.920 to 0.970, Appendix V G.

## Symphytum Officinale Root for Ethanol Decoction for Homoeopathic Preparations

**DEFINITION**

*Symphytum Officinale* Root for Ethanol Decoction for Homoeopathic Preparations is the fresh root of *Symphytum officinale* L.

**IDENTIFICATION**

The strong, spirally-formed rootstock with a smooth, black-brown cortex, subdivides at the base. It is about 5 to 8 cm in diameter and 17 to 30 cm long, surmounted by several tops, close together, consisting of the black residues of the previous year's rosettes of leaves between the current year's new growths. A ring of 10 to 15 horizontally-running, secondary, glabrous smooth roots, grows from the base of the rosettes, the roots often reaching a length of more than 50 cm and a diameter of approximately 1.5 cm. The middle portion of the rootstock, which is more or less glabrous, branches at the

lower end into several clearly separated, straight downwards pointing, smooth roots, each about 1.5 cm thick and bearing a few secondary rootlets 1 to 2 cm long.

The rootstock and the thick secondary roots are non-lignified, succulent and break off easily. In the yellowish-white, glassy, slightly differentiated cross section, there is a very thin, black rhizodermis, and an easily detachable layer of cortex, 5-8 mm thick. Within this is a single dark pigmented vascular ring. The cut surface and particularly the richly exuding mucilaginous substance turn yellow to red-brown on exposure.

**MOTHER TINCTURE**

The mother tincture complies with the requirements stated under *Mother Tinctures for Homoeopathic Preparations* and with the following requirements.

**PRODUCTION**

The mother tincture of *Symphytum officinale* L. is prepared by decoction of the herbal drug using 43% w/w (50% v/v) of *ethanol*.

**CHARACTERISTICS**

The mother tincture is a brown liquid.

**IDENTIFICATION**

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

- (1) The mother tincture.
- (2) 0.1% w/v of *allantoin* in *ethanol* (45%).

**CHROMATOGRAPHIC CONDITIONS**

- (a) Use as the coating *silica gel*.
- (b) Use the mobile phase as described below.
- (c) Apply 20  $\mu$ L of solution (1) and 10  $\mu$ L of solution (2) as 10 mm bands.
- (d) Develop the plate to 10 cm.
- (e) After removal of the plate, dry it in air and examine under *ultraviolet light* (365 nm).
- (f) Spray the plate with a 5% w/v solution of *dimethylaminobenzaldehyde* in *hydrochloric acid* and examine in daylight.

**MOBILE PHASE**

10 volumes of *anhydrous formic acid*, 10 volumes of *water* and 80 volumes of *ethyl acetate*.

**SYSTEM SUITABILITY**

The test is not valid unless under *ultraviolet light* (365 nm), the chromatogram obtained with solution (1) shows two bluish fluorescent bands at Rf value of 0.25 and Rf value of 0.55 and one light-green fluorescent band at the solvent front.

**CONFIRMATION**

After spraying, the chromatogram obtained with solution (1) shows a yellow band at Rf value of 0.35 corresponding in position and colour to that obtained with solution (2).

**TESTS****Ethanol**

25 to 35% w/w (31 to 42% v/v), Appendix VIII F.

**Dry residue**

Not less than 3.0% w/w, Appendix XI P.

**Relative density**

0.973 to 0.982, Appendix V G.

## Toxicodendron Quercifolium for Homoeopathic Preparations

Rhus Toxicodendron for Homoeopathic Preparations

### DEFINITION

Toxicodendron Quercifolium for Homoeopathic Preparations is the fresh, young, not yet lignified shoots, with leaves, of *Toxicodendron quercifolium* (Michx.) Greene.

**CAUTION** The shoots contain a yellowish-white milky sap that is a strong cutaneous irritant and darkens the skin. Contact with the skin and mucous membranes is to be avoided.

### IDENTIFICATION

**Shoots** The thin shoots have a downy to cottony indumentum and may bear at their ends, and in the axils of the alternate leaves, pointed buds covered in brown, woolly hairs.

**Leaves** Dark green on the upper surface, lighter green on the lower surface and have scattered hairs, more numerous on the veins; they are tripinnate with petioles 15 to 20 cm long. The leaflets are ovate to slightly rhombic and of varying size, the middle leaflet being the largest, up to 20 cm long and 11 cm wide with long petiolule; the two lateral leaflets are smaller, up to 16 cm long and 9 cm wide with short petiolules. The margins of the laminae may be entire or broadly dentate with up to 3 or more short triangular lobes on each side, particularly in the apical region of the middle leaflets; on the lateral leaflets the margin is frequently asymmetrical with the lobes on one side only; all the leaflets are cuneate at the base and acute at the apex.

### MOTHER TINCTURE

The mother tincture complies with the requirements stated under *Mother Tinctures for Homoeopathic Preparations* and with the following requirements.

### DEFINITION

It contains not less than 0.1% w/w of total flavonoids expressed as quercitrin (C<sub>21</sub>H<sub>20</sub>O<sub>11</sub>).

### PRODUCTION

The mother tincture of *Toxicodendron quercifolium* (Michx.) Greene is prepared from the herbal drug using *Method 1.1.3* described in the monograph for *Methods of Preparation of Homoeopathic Stocks and Potentisation*. Use 86% w/w (90% v/v) of ethanol.

### CHARACTERISTICS

The mother tincture is a yellowish-brown to reddish-brown liquid.

### IDENTIFICATION

A. To 1 mL of the mother tincture add 1 granule of zinc, a few turnings of magnesium and 1 mL of hydrochloric acid. A dark red colour is produced which can be extracted with *tert-pentyl alcohol*.

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

- (1) Use the mother tincture.
- (2) Dissolve 20 mg of *arbutin* and 10 mg of *gallic acid* in 10 mL of *methanol*.

### CHROMATOGRAPHIC CONDITIONS

- (a) Use as the coating *silica gel*.
- (b) Use the mobile phase as described below.
- (c) Apply 10 µL of each solution as bands.

(d) Develop the plate to 10 cm.

(e) Remove the plate, dry in air, spray with a 0.5% w/v solution of *fast blue B salt* in *water*, dry briefly and spray with 0.1M *alcoholic sodium hydroxide*. Examine in daylight.

### MOBILE PHASE

10 volumes of *anhydrous formic acid*, 10 volumes of *water* and 80 volumes of *ethyl acetate*.

### SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (2) shows two well separated bands.

### CONFIRMATION

The chromatogram obtained with solution (1) shows the following reddish-brown bands: two or three bands, which lie close together at a position between those obtained for *arbutin* and *gallic acid* in solution (2) and two further pronounced bands at about the same level as that obtained for *gallic acid* in solution (2). Other bands may be present in the chromatogram obtained with solution (1).

Top of the plate	
A reddish-brown band A reddish-brown band	Gallic acid: a reddish-brown band
2 or 3 closely positioned reddish-brown bands	Arbutin: a reddish-brown band
Solution (1)	Solution (2)

### TESTS

#### Ethanol

36% to 46% w/w (43% to 54% v/v), Appendix VIII F.

#### Dry residue

Not less than 3.5% w/w, Appendix XI P.

#### Relative density

0.945 to 0.965, Appendix V G.

#### Urushiols

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Evaporate 10.00 g of the mother tincture to dryness using a rotary evaporator at a temperature not exceeding 40°. Add 10 mL *water* to the residue and mix with the aid of ultrasound for 20 minutes. Add 10 mL of *heptane* and shake vigorously for 15 minutes. Allow to separate, remove and retain the heptane layer avoiding any suspended particles. Perform the extraction twice more on the aqueous phase, then discard the remaining aqueous layer and rinse the flask with 10 mL of *heptane*. Combine the extracts and washings and filter through *anhydrous sodium sulfate* and evaporate the filtrate to dryness using a rotary evaporator at a temperature not exceeding 40°. Dissolve the residue in 2.0 mL of *methanol*.

(2) To 0.5 mL of a 0.175% w/v solution of *4-dodecylresorcinol* in *methanol* add 0.5 mL of a solution containing 0.1% w/v each of *urushiol I* and *urushiol II* in *methanol* and dilute to 5 mL with *methanol*.

(3) Dilute 1 volume of solution (2) to 20 volumes with methanol.

(4) 0.00025% w/v of 4-dodecylresorcinol in methanol.

**CHROMATOGRAPHIC CONDITIONS**

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with octadecylsilyl silica gel for chromatography (5 μm) (Waters Symmetry C18 is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use a column temperature of 30°.

(e) Use a detection wavelength of 276 nm.

(f) Inject 20 μL of each solution.

**MOBILE PHASE**

Mobile phase A 0.2% v/v orthophosphoric acid.

Mobile phase B methanol.

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-2	20	80	isocratic
2-82	20→0	80→100	linear gradient
82-83	0→20	100→80	linear gradient
83-100	20	80	re-equilibration

When the chromatograms are recorded under the prescribed conditions the relative retentions with reference to 4-dodecylresorcinol (retention time about 27 minutes) are urushiol I about 2.0 and urushiol II about 2.4. The relative retention of urushiol I to urushiol II is about 0.8.

**SYSTEM SUITABILITY**

The test is not valid unless, in the chromatogram obtained with solution (2), the column efficiency, determined using the peak due to 4-dodecyl resorcinol, is not less than 20,000 theoretical plates, and

in the chromatogram obtained with solution (3) the signal-to-noise ratio of the peaks due to urushiol I and urushiol II is at least 10.

**LIMITS**

Calculate the percentage w/w content of urushiols in solution (1), expressed as 4-dodecylresorcinol, using the following expression:

$$\frac{A_1 \times m_2 \times p \times 1.13}{A_2 \times m_1 \times 100}$$

- A<sub>1</sub> = sum of the peak areas due to urushiols in the chromatogram obtained with solution (1);
- A<sub>2</sub> = area of the peak due to 4-dodecylresorcinol in the chromatogram obtained with solution (2);
- c<sub>1</sub> = concentration of the mother tincture sample in solution (1) in % w/v;
- c<sub>2</sub> = concentration of 4-dodecylresorcinol in solution (2) in % w/v;
- p = percentage content of 4-dodecylresorcinol in 4-dodecylresorcinol;
- 1.20 = average molar mass ratio of urushiol I and II to 4-dodecylresorcinol.

In the chromatogram obtained with solution (1):

The total content of urushiols, expressed as 4-dodecylresorcinol, is not more than 0.05%.

Disregard any peak:

with an area less than the area of the peak due to 4-dodecyl resorcinol in solution (4) (0.00005%);

with a retention time less than 0.25 times that of the peak due to 4-dodecylresorcinol, or with a retention time greater than the peak due to urushiol II in the chromatogram obtained with solution (2).

**ASSAY**

Carry out the method for liquid chromatography, Appendix III D, using the following solutions in 50 volumes of methanol and 50 volumes of water.

(1) 10% w/v of the mother tincture.

(2) 0.018% w/v each of isoquercitrin and quercitrin BPCRS.

(3) 0.0000018% w/v of quercitrin BPCRS.

**CHROMATOGRAPHIC CONDITIONS**

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with octadecylsilyl silica gel for chromatography (5 μm) (Waters Symmetry C18 is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 340 nm.

(f) Inject 20 μL of each solution.

**MOBILE PHASE**

Mobile phase A water adjusted to pH to 2.3 with orthophosphoric acid.

Mobile phase B acetonitrile.

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-2	95	5	isocratic
2-18	95→87	5→13	linear gradient
18-32	87→74	13→26	linear gradient
32-42	74	26	isocratic
42-43	74→95	26→5	linear gradient
43-60	95	5	re-equilibration

When the chromatograms are recorded using the prescribed conditions, the retention time of isoquercitrin is about 31 minutes and that of quercitrin is about 34 minutes, the relative retention is about 0.9.

**SYSTEM SUITABILITY**

The test is not valid unless, in the chromatogram obtained with solution (2):

the symmetry factor for both isoquercitrin and quercitrin is not less than 0.8 and not more than 1.2;

the number of theoretical plates with respect to isoquercitrin is at least 200,000.

**DETERMINATION OF CONTENT**

Calculate the content of total flavonoids, expressed as quercitrin from the chromatograms obtained and using the declared content of C<sub>21</sub>H<sub>20</sub>O<sub>11</sub> in quercitrin BPCRS and the following expression. Disregard any peak with an area less than that in solution (3).

$$\frac{A_1 \times m_2 \times p}{A_2 \times m_1}$$

HOMOEOPATHIC PREPARATIONS

$A_1$	=	Sum of the peak areas due to quercitrin and flavonoids in the chromatogram obtained with solution (1);
$A_2$	=	area of the peak due to quercitrin in the chromatogram obtained with solution (2);
$c_1$	=	concentration of the mother tincture sample in solution (1) in % w/v;
$c_2$	=	concentration of quercitrin BPCRS in solution (2) in % w/v;
$p$	=	percentage content of quercitrin in quercitrin BPCRS.

## Urtica Dioica for Homoeopathic Preparations

Common Stinging Nettle for Homoeopathic Preparations

(Ph. Eur. monograph 2030)

Ph Eur

### DEFINITION

Whole, fresh, flowering plant of *Urtica dioica* L.

### CHARACTERS

The plant causes an itching, burning sensation on the skin.

### IDENTIFICATION

A. The perennial plant has a taproot that sends out creeping subterranean rhizomes, more or less 4-angled in transverse section, from which extend adventitious secondary roots and very numerous brownish hairy rootlets. The stipes are erect, generally unbranched, 3-5 mm in diameter and 0.3-1.5 m high, rarely up to 2.5 m high, 4-angled, greyish-green and covered in short hairs and stinging hairs.

The decussate leaves are 30-150 mm long and 20-80 mm wide. The petiole is hispid and usually slightly less than one-third the length of the lamina. The leaf blade is ovate, acuminate, cordate or rounded at the base, and coarsely dentate; the apical tooth is distinctly larger than the lateral teeth. The upper side of the leaves is dark green and usually matt, both sides bear short serrated hairs intermingled with long stinging hairs. The 2 stipules are linear-subulate and free. The inflorescences growing from the leaf axils are complex, the flowers unisexual, and, particularly in male plants, generally distinctly longer than the petiole. After shedding their pollen, male inflorescences are erect at an oblique angle or horizontal; female inflorescences are pendent when the fruit is ripe. All flowers have long stalks. The perianth of the male flowers is divided half-way down into equal green lobes, widest at their base, with short bristles and stinging hairs at the margins. The stamens are equal and opposite to the perianth segments, each with a long, whitish filament that curves inwards before pollen is shed and spreads out afterwards. The ovary is rudimentary, button or cup-shaped. The perianth of the female flowers is downy or bristly on the outside and consists of outer, and 2 inner segments; the inner segments are about twice the length of the outer ones. The hypogynous, ovate, unilocular ovary bears a large capitate stigma with a brush-like shock of hair. As the one-seeded fruit grows ripe, the 2 inner segments of the perianth fold around it like wings.

B. It complies with the test for *Urtica urens* (see Tests).

### TESTS

#### *Urtica urens*

The margin of the lamina is not serrate with teeth twice as long as wide. The clusters of flowers in the axils are longer than the petiole of the leaf. Unisexual, apetalous flowers are not together on the same plant and in the same cluster.

### Foreign matter (2.8.2)

Maximum 5 per cent.

### Loss on drying (2.2.32)

Minimum 65.0 per cent, determined on 5.0 g of finely cut herbal drug by drying in an oven at 105 °C for 2 h, if performed to demonstrate the freshness of the herbal drug.

### MOTHER TINCTURE

The mother tincture complies with the requirements of the general monograph *Mother tinctures for homoeopathic preparations* (2029).

### PRODUCTION

The mother tincture of *Urtica dioica* is prepared by maceration using ethanol of a suitable concentration.

### CHARACTERS

#### Appearance

Greenish-brown or orange-brown liquid.

#### IDENTIFICATION

Thin-layer chromatography (2.2.27).

*Test solution* The mother tincture to be examined.

*Reference solution* Dissolve 10 mg of phenylalanine R and 10 mg of serine R in a mixture of equal volumes of methanol R and water R and dilute to 10 mL with the same mixture of solvents.

*Plate* TLC silica gel plate R.

*Mobile phase* glacial acetic acid R, water R, acetone R, butanol R (10:20:35:35 V/V/V/V).

*Application* 20 µL, as bands.

*Development* Over a path of 10 cm.

*Drying* In air.

*Detection* Spray with a 1 g/L solution of ninhydrin R in ethanol (96 per cent) R, heat at 105-110 °C for 5-10 min and examine in daylight within 10 min.

*Results* See below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution.

Top of the plate	
Phenylalanine: a violet to reddish-brown zone	4 red to violet zones
Serine: a reddish-violet zone	A violet zone A violet zone
Reference solution	Test solution

### TESTS

#### Relative density (2.2.5)

0.930 to 0.950.

#### Ethanol (2.9.10)

40 per cent V/V to 56 per cent V/V.

#### Methanol (2.9.11)

Maximum 0.10 per cent V/V.

#### Dry residue (2.8.16)

Minimum 1.1 per cent.

Ph Eur

## Urtica Urens Herb for Homoeopathic Preparations

### DEFINITION

Urtica Urens Herb for Homoeopathic Preparations is the fresh leaves and flowers of *Urtica urens* L.

### CHARACTERISTICS

The plant produces an itchy, burning sensation.

### IDENTIFICATION

Plant Annual.

**Leaves** Decussate with diffusely haired petiole, which in the lower leaves is mostly as long as the lamina; ovate to elliptic, 1 to 5 cm long and 1 to 4 cm wide lamina with incised serrated leaf margin, blunt to cuneate at the base, acuminate towards the apex. The leaves are dark-green on the upper surface, slightly shiny and paler green on the lower surface; prominent stinging hairs occur scattered all over the upper surface, on the lower surface they occur mostly over the veins. The two stipules on each side are lanceolate and the margins are entire.

**Flowers** The complicated inflorescences consist mainly of female flowers and only a few male flowers; they arise from the leaf axils and are about 1.5 to 2 cm long and usually shorter than the leaf petioles. The perigonium of the male flowers is split into four pale green lobes of equal size; each one of the four stamens situated in front of one of the perigonium lobes and has a long filament which at first is incurved and then widens out before the anther releases the pollen. The perigonium of the female flowers consists of two outer, short, bract-like segments and two longer, inner ones, all with ciliated margins and scattered hairs over the surfaces; the superior ovary is ovoid with a short style and a conspicuous, brushlike stigma. The ripe fruits are monospermic and enclosed by the two inner segments of the perigonium.

### TESTS

#### *Urtica dioica*

The plant is dioecious as follows:

- the male and female flowers occur on separate plants;
- the inflorescences are longer than the leaf petioles;
- the leaves, especially those on the lower part of the stem, are longer than their petioles.

### MOTHER TINCTURE

The mother tincture complies with the requirements stated under *Mother Tinctures for Homoeopathic Preparations* and with the following requirements.

### PRODUCTION

The mother tincture of *Urtica urens* L., is prepared from the herbal drug using *Method 2b* described in the monograph for *Methods of Preparation of Homoeopathic Stocks and Potentisation*. Use 62% w/w (70% v/v) of ethanol.

### CHARACTERISTICS

The mother tincture is a green to brownish-green liquid.

### IDENTIFICATION

- To 1 mL of *potassium hydroxide solution* add 1 mL of the mother tincture and heat to boiling. *Red litmus paper* held over the mouth of the test tube turns blue.
- Add 1 mL of *hydrochloric acid* and a few crystals of *resorcinol* to 1 mL of the mother tincture. Heat to boiling. A red colour is produced.

C. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

- (1) The mother tincture.
- (2) Dissolve 10 mg of *leucine* and 10 mg of *threonine* in 10 mL of 50% v/v ethanol.

### CHROMATOGRAPHIC CONDITIONS

- Use as the coating *silica gel G*.
- Use the mobile phase described below.
- Apply 20 µL of each solution as bands.
- Develop the plate to 15 cm.
- After removal of the plate, dry in a current of warm air or in an oven at 100° to 105°. Spray the chromatogram with a 0.5% w/v solution of *ninhydrin* in *butan-1-ol*. Heat for 10 minutes at 100° to 105° and examine in daylight.

### MOBILE PHASE

10 volumes of *glacial acetic acid*, 20 volumes of *water*, 35 volumes of *acetone* and 35 volumes of *butan-1-ol*.

### SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with the solution (2) shows two clearly separated coloured zones due to threonine (reddish pink) in the lower region and leucine (pink) in the middle region.

### CONFIRMATION

The chromatogram obtained with solution (1) shows a pink spot (which may be separated into two spots) corresponding to leucine. A reddish pink spot occurs in the lower region corresponding to threonine. Between the spots corresponding to threonine and leucine there is an orange pink spot and a pink spot present, in order of increasing R<sub>f</sub> value. Several spots are present below the spot corresponding to threonine.

Top of the plate	
A pink band (may be two bands)	Leucine: a pink band
A pink band An orange-pink band	
A reddish-pink band	Threonine: a reddish-pink band
Several bands may be observed	
Solution (1)	Solution (2)

### TESTS

#### Ethanol

25% to 35% w/w (30% to 42% v/v), Appendix VIII F.

#### Dry residue

Not less than 1.0% w/w, Appendix XI P.

#### Relative density

0.956 to 0.968, Appendix V G.

## **Blood-related Products**

**BLOOD-RELATED PRODUCTS**

## Anticoagulant and Preservative Solutions for Blood

(Anticoagulant and Preservative Solutions for Human Blood, Ph. Eur. monograph 0209)

Ph Eur

### DEFINITION

Anticoagulant and preservative solutions for human blood are sterile and pyrogen-free solutions prepared with water for injections, filtered, distributed in the final containers and sterilised. The content of sodium citrate ( $C_6H_5Na_3O_7 \cdot 2H_2O$ ), glucose monohydrate ( $C_6H_{12}O_6 \cdot H_2O$ ) or glucose ( $C_6H_{12}O_6$ ) and sodium dihydrogen phosphate dihydrate ( $NaH_2PO_4 \cdot 2H_2O$ ) is not less than 95.0 per cent and not more than 105.0 per cent of that stated in the formulae below. The content of citric acid monohydrate ( $C_6H_8O_7 \cdot H_2O$ ) or citric acid ( $C_6H_8O_7$ ) is not less than 90.0 per cent and not more than 110.0 per cent of that stated in the formulae below. Subject to agreement by the competent authority, other substances, such as red-cell preservatives, may be included in the formula provided that their name and concentration are stated on the label.

Anticoagulant and preservative solutions for human blood are presented in airtight, tamper-evident containers of glass (3.2.1) or plastic (3.3.4).

### ANTICOAGULANT ACID-CITRATE-GLUCOSE SOLUTIONS (ACD)

	A	B
Sodium citrate (0412)	22.0 g	13.2 g
Citric acid monohydrate (0456) or Citric acid (0455)	8.0 g	4.8 g
Glucose monohydrate (0178)* or Glucose (0177)*	7.3 g	4.4 g
Water for injections (0169) to	24.5 g	14.7 g
Volume to be used per 100 mL of blood	22.3 g	13.4 g
	1000.0 mL	1000.0 mL
	15.0 mL	25.0 mL

\*The competent authority may require that the substances comply with the test for pyrogens given in the monographs on Glucose monohydrate (0178) and Glucose (0177), respectively.

### CHARACTERS

A colourless or faintly yellow, clear liquid, practically free from particles.

### IDENTIFICATION

A. Examine by thin-layer chromatography (2.2.27), using silica gel G R as the coating substance.

**Test solution** Dilute 2 mL of the solution to be examined (for formula A) or 3 mL (for formula B) to 100 mL with a mixture of 2 volumes of water R and 3 volumes of methanol R.

**Reference solution (a)** Dissolve 10 mg of glucose monohydrate CRS in a mixture of 2 volumes of water R and 3 volumes of methanol R and dilute to 20 mL with the same mixture of solvents.

**Reference solution (b)** Dissolve 10 mg of glucose R, 10 mg of fructose R, 10 mg of lactose monohydrate R and 10 mg of sucrose R in a mixture of 2 volumes of water R and 3 volumes of methanol R and dilute to 20 mL with the same mixture of solvents.

Apply separately to the plate 2 µL of each solution and thoroughly dry the points of application. Develop over a path of 15 cm using a mixture of 10 volumes of water R, 15 volumes of methanol R, 25 volumes of anhydrous acetic

acid R and 50 volumes of ethylene chloride R. The volumes of solvents have to be measured accurately since a slight excess of water produces cloudiness. Dry the plate in a current of warm air. Repeat the development immediately, after renewing the mobile phase. Dry the plate in a current of warm air and spray evenly with a solution of 0.5 g of thymol R in a mixture of 5 mL of sulfuric acid R and 95 mL of ethanol (96 per cent) R. Heat at 130 °C for 10 min. The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows 4 clearly separated spots.

B. To 2 mL add 5 mL of cupri-citric solution R. Heat to boiling. An orange precipitate is formed and the solution becomes yellow.

C. To 2 mL (for formula A) add 3 mL of water R or to 4 mL (for formula B) add 1 mL of water R. The solution gives the reaction of citrates (2.3.1).

D. 0.5 mL gives reaction (b) of sodium (2.3.1).

### TESTS

#### pH (2.2.3)

The pH of the solution to be examined is 4.7 to 5.3.

#### Hydroxymethylfurfural

To 2.0 mL add 5.0 mL of a 100 g/L solution of *p*-toluidine R in 2-propanol R containing 10 per cent V/V of glacial acetic acid R and 1.0 mL of a 5 g/L solution of barbituric acid R. The absorbance (2.2.25), determined at 550 nm after allowing the mixture to stand for 2 min to 3 min, is not greater than that of a standard prepared at the same time in the same manner using 2.0 mL of a solution containing 5 ppm of hydroxymethylfurfural R for formula A or 3 ppm of hydroxymethylfurfural R for formula B.

#### Sterility (2.6.1)

They comply with the test for sterility.

#### Pyrogens (2.6.8)

They comply with the test for pyrogens. Dilute with a pyrogen-free, 9 g/L solution of sodium chloride R to obtain a solution containing approximately 5 g/L of sodium citrate. Inject 10 mL of the diluted solution per kilogram of the rabbit's mass.

### ASSAY

#### Citric acid

To 10.0 mL (for formula A) or to 20.0 mL (for formula B) add 0.1 mL of phenolphthalein solution R1. Titrate with 0.2 M sodium hydroxide until a pink colour is obtained.

1 mL of 0.2 M sodium hydroxide is equivalent to 14.01 mg of  $C_6H_8O_7 \cdot H_2O$  or to 12.81 mg of  $C_6H_8O_7$ .

#### Sodium citrate

Prepare a chromatography column 0.10 m long and 10 mm in internal diameter and filled with strongly acidic ion-exchange resin R (300 µm to 840 µm). Maintain a 1 cm layer of liquid above the resin at all times. Wash the column with 50 mL of de-ionised water R at a flow rate of 12-14 mL/min.

Dilute 10.0 mL of the solution to be examined (for formula A) or 15.0 mL (for formula B) to about 40 mL with de-ionised water R in a beaker and transfer to the column reservoir, washing the beaker 3 times with a few millilitres of de-ionised water R. Allow the solution to run through the column at a flow rate of 12-14 mL/min and collect the eluate. Wash the column with 2 quantities, each of 30 mL, and with one quantity of 50 mL, of de-ionised water R.

The column can be used for 3 successive determinations before regeneration with 3 times its volume of *dilute hydrochloric acid R*. Titrate the combined eluate and washings (about 150 mL) with 0.2 M sodium hydroxide, using 0.1 mL of *phenolphthalein solution R1* as indicator.

Calculate the content of sodium citrate in grams per litre from the following expressions:

$$\text{For formula A:} \quad 1.961n - 1.40C$$

$$\text{or} \quad 1.961n - 1.53C'$$

$$\text{For formula B:} \quad 1.307n - 1.40C$$

$$\text{or} \quad 1.307n - 1.53C'$$

- $n$  = number of millilitres of 0.2 M sodium hydroxide used in the titration;  
 $C$  = content of citric acid monohydrate in grams per litre determined as prescribed above;  
 $C'$  = content of citric acid in grams per litre determined as prescribed above.

#### Reducing sugars

Dilute 5.0 mL (for formula A) or 10.0 mL (for formula B) to 100.0 mL with *water R*. Introduce 25.0 mL of the solution into a 250 mL conical flask with ground-glass neck and add 25.0 mL of *cupri-citric solution R1*. Add a few pieces of porous material, attach a reflux condenser, heat so that boiling begins within 2 min and boil for exactly 10 min. Cool and add 3 g of *potassium iodide R* dissolved in 3 mL of *water R*. Add 25 mL of a 25 per cent *m/m* solution of *sulfuric acid R* with caution and in small quantities. Titrate with 0.1 M *sodium thiosulfate* using 0.5 mL of *starch solution R*, added towards the end of the titration, as indicator ( $n_1$  mL). Carry out a blank titration using 25.0 mL of *water R* ( $n_2$  mL).

Calculate the content of reducing sugars as glucose or as glucose monohydrate, as appropriate, from Table 0209.-1.

Table 0209.-1

Volume of 0.1 M sodium thiosulfate ( $n_2 - n_1$ mL)	Glucose (mg)	Glucose monohydrate (mg)
8	19.8	21.6
9	22.4	24.5
10	25.0	27.2
11	27.6	30.2
12	30.3	33.1
13	33.0	36.1
14	35.7	39.0
15	38.3	42.1
16	41.3	45.2

#### STORAGE

Store in an airtight, tamper-evident container, protected from light.

#### LABELLING

The label states:

- the composition and volume of the solution;
- the maximum amount of blood to be collected in the container.

## ANTICOAGULANT CITRATE- PHOSPHATE-GLUCOSE SOLUTION (CPD)

<i>Sodium citrate</i> (0412)	26.3 g
<i>Citric acid monohydrate</i> (0456)	3.27 g
or <i>Citric acid</i> (0455)	2.99 g
<i>Glucose monohydrate</i> (0178)*	25.5 g
or <i>Glucose</i> (0177)*	23.2 g
<i>Sodium dihydrogen phosphate dihydrate</i> (0194)	2.51 g
<i>Water for injections</i> (0169) to	1000.0 mL
Volume to be used per 100 mL of blood	14.0 mL

\*The competent authority may require that the substances comply with the test for pyrogens given in the monographs on *Glucose monohydrate* (0178) and *Glucose* (0177), respectively.

#### CHARACTERS

A colourless or faintly yellow, clear liquid, practically free from particles.

#### IDENTIFICATION

A. Examine by thin-layer chromatography (2.2.27), using *silica gel G R* as the coating substance.

**Test solution** Dilute 2 mL of the solution to be examined to 100 mL with a mixture of 2 volumes of *water R* and 3 volumes of *methanol R*.

**Reference solution (a)** Dissolve 10 mg of *glucose monohydrate CRS* in a mixture of 2 volumes of *water R* and 3 volumes of *methanol R* and dilute to 20 mL with the same mixture of solvents.

**Reference solution (b)** Dissolve 10 mg of *glucose R*, 10 mg of *fructose R*, 10 mg of *lactose monohydrate R* and 10 mg of *sucrose R* in a mixture of 2 volumes of *water R* and 3 volumes of *methanol R* and dilute to 20 mL with the same mixture of solvents.

Apply separately to the plate 2  $\mu$ L of each solution and thoroughly dry the starting points. Develop over a path of 15 cm using a mixture of 10 volumes of *water R*, 15 volumes of *methanol R*, 25 volumes of *anhydrous acetic acid R* and 50 volumes of *ethylene chloride R*. The volumes of solvents have to be measured accurately since a slight excess of water produces cloudiness. Dry the plate in a current of warm air. Repeat the development immediately, after renewing the mobile phase. Dry the plate in a current of warm air and spray evenly with a solution of 0.5 g of *thymol R* in a mixture of 5 mL of *sulfuric acid R* and 95 mL of *ethanol* (96 per cent) *R*. Heat at 130 °C for 10 min. The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows 4 clearly separated spots.

B. To 2 mL add 5 mL of *cupri-citric solution R*. Heat to boiling. An orange precipitate is formed and the solution becomes yellow.

C. To 2 mL add 3 mL of *water R*. The solution gives the reaction of citrates (2.3.1).

D. 1 mL gives reaction (b) of phosphates (2.3.1).

E. 0.5 mL gives reaction (b) of sodium (2.3.1).

#### TESTS

##### pH (2.2.3)

The pH of the solution is 5.3 to 5.9.

##### Hydroxymethylfurfural

To 2.0 mL add 5.0 mL of a 100 g/L solution of *p-toluidine R* in *2-propanol R* containing 10 per cent *V/V* of *glacial acetic acid R* and 1.0 mL of a 5 g/L solution of *barbituric acid R*. The absorbance (2.2.25), determined at 550 nm after

allowing the mixture to stand for 2 min to 3 min, is not greater than that of a standard prepared at the same time in the same manner using 2.0 mL of a solution containing 5 ppm of *hydroxymethylfurfural R*.

#### Sterility (2.6.1)

They comply with the test for sterility.

#### Pyrogens (2.6.8)

They comply with the test for pyrogens. Dilute with a pyrogen-free, 9 g/L solution of *sodium chloride R* to obtain a solution containing approximately 5 g/L of sodium citrate. Inject 10 mL of the diluted solution per kilogram of the rabbit's mass.

#### ASSAY

##### Sodium dihydrogen phosphate

Dilute 10.0 mL to 100.0 mL with *water R*. To 10.0 mL of this solution add 10.0 mL of *nitro-molybdovanadic reagent R*. Mix and allow to stand at 20 °C to 25 °C for 30 min. At the same time and in the same manner, prepare a reference solution using 10.0 mL of a standard solution containing 0.219 g of *potassium dihydrogen phosphate R* per litre. Measure the absorbance (2.2.25) of the 2 solutions at 450 nm using as the compensation liquid a solution prepared in the same manner using 10 mL of *water R*. Calculate the content of sodium dihydrogen phosphate dihydrate (*P*) in grams per litre from the expression:

$$\frac{11.46 \times C \times A_1}{A_2}$$

- C* = concentration of *potassium dihydrogen phosphate R* in the standard solution in grams per litre;  
*A*<sub>1</sub> = absorbance of the test solution;  
*A*<sub>2</sub> = absorbance of the reference solution.

##### Citric acid

To 20.0 mL add 0.1 mL of *phenolphthalein solution R1* and titrate with 0.2 M *sodium hydroxide*.

Calculate the content of citric acid monohydrate (*C*), or citric acid (*C'*), in grams per litre from the equations:

$$C = 0.7005n - 0.4490P$$

$$C' = 0.6404n - 0.4105P$$

- n* = number of millilitres of 0.2 M *sodium hydroxide* used in the titration;  
*P* = content of sodium dihydrogen phosphate dihydrate in grams per litre determined as prescribed above.

##### Sodium citrate

Prepare a chromatography column 0.10 m long and 10 mm in internal diameter and filled with *strongly acidic ion-exchange resin R* (300 µm to 840 µm). Maintain a 1 cm layer of liquid above the resin at all times. Wash the column with 50 mL of de-ionised *water R* at a flow rate of 12-14 mL/min.

Dilute 10.0 mL of the solution to be examined to about 40 mL with de-ionised *water R* in a beaker and transfer to the column reservoir, washing the beaker 3 times with a few millilitres of de-ionised *water R*. Allow the solution to run through the column at a flow rate of 12-14 mL/min and collect the eluate. Wash the column with 2 quantities, each of 30 mL, and with one quantity of 50 mL, of de-ionised *water R*. The column can be used for 3 successive determinations before regeneration with 3 times its volume of *dilute hydrochloric acid R*. Titrate the combined eluate and washings (about 150 mL) with 0.2 M *sodium hydroxide*, using 0.1 mL of *phenolphthalein solution R1* as indicator.

Calculate the content of sodium citrate in grams per litre from the following expressions:

$$1.961n - 1.257P - 1.40C$$

$$1.961n - 1.257P - 1.53C'$$

- n* = number of millilitres of 0.2 M *sodium hydroxide* used in the titration;  
*P* = content of sodium dihydrogen phosphate dihydrate in grams per litre determined as prescribed above;  
*C* = content of citric acid monohydrate in grams per litre determined as prescribed above;  
*C'* = content of citric acid in grams per litre determined as prescribed above.

##### Reducing sugars

Dilute 5.0 mL to 100.0 mL with *water R*. Introduce 25.0 mL of the solution into a 250 mL conical flask with ground-glass neck and add 25.0 mL of *cupri-citric solution R1*. Add a few pieces of porous material, attach a reflux condenser, heat so that boiling begins within 2 min and boil for exactly 10 min. Cool and add 3 g of *potassium iodide R* dissolved in 3 mL of *water R*. Add 25 mL of a 25 per cent *m/m* solution of *sulfuric acid R* with caution and in small quantities. Titrate with 0.1 M *sodium thiosulfate* using 0.5 mL of *starch solution R*, added towards the end of the titration, as indicator (*n*<sub>1</sub> mL). Carry out a blank titration using 25.0 mL of *water R* (*n*<sub>2</sub> mL).

Calculate the content of reducing sugars as glucose or as glucose monohydrate, as appropriate, from Table 0209.-1.

##### STORAGE

Store in an airtight, tamper-evident container, protected from light.

##### LABELLING

The label states:

- the composition and volume of the solution;
- the maximum amount of blood to be collected in the container.

Ph Eur

## Plasma for Fractionation

(*Human Plasma for Fractionation*, Ph. Eur. monograph 0853)

Ph Eur

### DEFINITION

Liquid part of human blood remaining after separation of the cellular elements from blood collected in a receptacle containing an anticoagulant, or separated by continuous filtration or centrifugation of anticoagulated blood in an apheresis procedure; it is intended for the manufacture of plasma-derived products.

### PRODUCTION

#### DONORS

Only a carefully selected, healthy donor who, as far as can be ascertained after medical examination, laboratory blood tests and a study of the donor's medical history, is free from detectable agents of infection transmissible by plasma-derived products may be used. Recommendations in this field are made by the Council of Europe [*Recommendation No. R (95) 15 on the preparation, use and quality assurance of blood components*, or subsequent revision]; a directive of the

European Union also deals with the matter: *Commission Directive 2004/33/EC of 22 March 2004 implementing Directive 2002/98/EC of the European Parliament and of the Council as regards certain technical requirements for blood and blood components.*

#### Immunisation of donors

Immunisation of donors to obtain immunoglobulins with specific activities may be carried out when sufficient supplies of material of suitable quality cannot be obtained from naturally immunised donors. Recommendations for such immunisations are formulated by the World Health Organization (*Requirements for the collection, processing and quality control of blood, blood components and plasma derivatives*, WHO Technical Report Series, No. 840, 1994 or subsequent revision).

#### Records

Records of donors and donations made are kept in such a way that, while maintaining the required degree of confidentiality concerning the donor's identity, the origin of each donation in a plasma pool and the results of the corresponding acceptance procedures and laboratory tests can be traced.

#### Laboratory tests

Laboratory tests are carried out for each donation to detect the following viral markers:

1. antibodies against human immunodeficiency virus 1 (anti-HIV-1);
2. antibodies against human immunodeficiency virus 2 (anti-HIV-2);
3. hepatitis B surface antigen (HBsAg);
4. antibodies against hepatitis C virus (anti-HCV).

The test methods used are of suitable sensitivity and specificity and comply with the regulations in force. If a repeat-reactive result is found in any of these tests, the donation is not accepted.

#### INDIVIDUAL PLASMA UNITS

The plasma is prepared by a method that removes cells and cell debris as completely as possible. Whether prepared from whole blood or by plasmapheresis, the plasma is separated from the cells by a method designed to prevent the introduction of micro-organisms. No antibacterial or antifungal agent is added to the plasma. The containers comply with the requirements for glass containers (3.2.1) or for plastic containers for blood and blood components (3.3.4). The containers are closed so as to prevent any possibility of contamination.

If 2 or more units are pooled prior to freezing, the operations are carried out using sterile connecting devices or under aseptic conditions and using containers that have not previously been used.

When obtained by plasmapheresis or from whole blood (after separation from cellular elements), plasma intended for the recovery of proteins that are labile in plasma is frozen within 24 h of collection by cooling rapidly in conditions validated to ensure that a temperature of  $-25^{\circ}\text{C}$  or below is attained at the core of each plasma unit within 12 h of placing in the freezing apparatus.

When obtained by plasmapheresis, plasma intended solely for the recovery of proteins that are not labile in plasma is frozen by cooling rapidly in a chamber at  $-20^{\circ}\text{C}$  or below within 24 h of collection.

When obtained from whole blood, plasma intended solely for the recovery of proteins that are not labile in plasma is

separated from cellular elements and frozen in a chamber at  $-20^{\circ}\text{C}$  or below within 72 h of collection.

*It is not intended that the determination of total protein and human coagulation factor VIII shown below be carried out on each unit of plasma. They are rather given as guidelines for good manufacturing practice, the test for human coagulation factor VIII being relevant for plasma intended for use in the preparation of concentrates of labile proteins.*

*The total protein content of a unit of plasma depends on the serum protein content of the donor and the degree of dilution inherent in the donation procedure. When plasma is obtained from a suitable donor and using the intended proportion of anticoagulant solution, a total protein content complying with the limit of 50 g/L is obtained. If a volume of blood or plasma smaller than intended is collected into the anticoagulant solution, the resulting plasma is not necessarily unsuitable for pooling for fractionation. The aim of good manufacturing practice must be to achieve the prescribed limit for all normal donations.*

*Preservation of human coagulation factor VIII in the donation depends on the collection procedure and the subsequent handling of the blood and plasma. With good practice, 0.7 IU/mL can usually be achieved, but units of plasma with a lower activity may still be suitable for use in the production of coagulation factor concentrates. The aim of all steps taken during production of plasma is to obtain plasma of the intended quality and to conserve labile proteins as much as possible.*

#### Total protein

Carry out the test using a pool of not fewer than 10 units. Dilute an appropriate volume of the preparation with a 9 g/L solution of sodium chloride R to obtain a solution containing about 15 mg of protein in 2 mL. To 2.0 mL of this solution in a round-bottomed centrifuge tube, add 2 mL of a 75 g/L solution of sodium molybdate R and 2 mL of a mixture of 1 volume of nitrogen-free sulfuric acid R and 30 volumes of water R. Shake, centrifuge for 5 min, decant the supernatant and allow the inverted tube to drain on filter paper. Determine the nitrogen in the residue by the method of sulfuric acid digestion (2.5.9) and calculate the protein content by multiplying the quantity of nitrogen by 6.25. The total protein content is not less than 50 g/L.

#### Human coagulation factor VIII (2.7.4)

Carry out the test using a pool of not fewer than 10 units. Thaw the samples to be examined, if necessary, at  $37^{\circ}\text{C}$ . Carry out the assay using a reference plasma calibrated against the International Standard for human coagulation factor VIII in plasma. The activity is not less than 0.7 IU/mL.

#### STORAGE AND TRANSPORT

Frozen plasma is stored and transported in conditions designed to maintain the temperature at or below  $-20^{\circ}\text{C}$ ; for accidental reasons, the storage temperature may rise above  $-20^{\circ}\text{C}$  on one or more occasions during storage and transport but the plasma is nevertheless considered suitable for fractionation if all the following conditions are fulfilled:

- the total period of time during which the temperature exceeds  $-20^{\circ}\text{C}$  does not exceed 72 h;
- the temperature does not exceed  $-15^{\circ}\text{C}$  on more than 1 occasion;
- the temperature at no time exceeds  $-5^{\circ}\text{C}$ .

#### POOLED PLASMA

During the manufacture of plasma products, the first homogeneous pool of plasma (for example, after removal of cryoprecipitate) is tested for HBsAg and for HIV antibodies using test methods of suitable sensitivity and specificity; the pool must give negative results in these tests.

The plasma pool is also tested for hepatitis C virus RNA using a validated nucleic acid amplification technique (2.6.21). A positive control with 100 IU/mL of hepatitis C virus RNA and, to test for inhibitors, an internal control prepared by addition of a suitable marker to a sample of the plasma pool are included in the test. The test is invalid if the positive control is non-reactive or if the result obtained with the internal control indicates the presence of inhibitors. The plasma pool complies with the test if it is found non-reactive for hepatitis C virus RNA.

*Hepatitis C virus RNA for NAT testing BRP* is suitable for use as a positive control.

#### CHARACTERS

Before freezing: clear or slightly turbid liquid without visible signs of haemolysis; it may vary in colour from light yellow to green.

#### LABELLING

The label enables each individual unit to be traced to a specific donor.

Ph Eur

## Plasma (Pooled and Treated for Virus Inactivation)

(Human Plasma (Pooled and Treated for Virus Inactivation), Ph. Eur. monograph 1646)

Ph Eur

#### DEFINITION

Sterile, frozen or freeze-dried, non-pyrogenic preparation obtained from human plasma derived from donors belonging to the same ABO blood group. The preparation is thawed or reconstituted before use to give a solution for infusion.

The human plasma used complies with the monograph *Human plasma for fractionation (0853)*.

#### PRODUCTION

The units of plasma to be used are cooled to  $-30\text{ }^{\circ}\text{C}$  or lower within 6 h of separation of cells and always within 24 h of collection.

The pool is prepared by mixing units of plasma belonging to the same ABO blood group.

#### PLASMA POOL TESTS

The pool of plasma is tested for hepatitis B surface antigen (HBsAg) and for HIV antibodies using test methods of suitable sensitivity and specificity; the pool must give negative results in these tests.

#### Hepatitis A virus RNA

The plasma pool is tested using a validated nucleic acid amplification technique (2.6.21). A positive control with  $1.0 \times 10^2$  IU of hepatitis A virus RNA per millilitre and, to test for inhibitors, an internal control prepared by addition of a suitable marker to a sample of the plasma pool are included in the test. The test is invalid if the positive control is non-reactive or if the result obtained with the internal control indicates the presence of inhibitors. The pool complies with the test if it is found non-reactive for hepatitis A virus RNA.

*Hepatitis A virus RNA for NAT testing BRP* is suitable for use as a positive control.

#### Hepatitis C virus RNA

The plasma pool is tested using a validated nucleic acid amplification technique (2.6.21). A positive control with

$1.0 \times 10^2$  IU of hepatitis C virus RNA per millilitre and, to test for inhibitors, an internal control prepared by addition of a suitable marker to a sample of the plasma pool are included in the test. The test is invalid if the positive control is non-reactive or if the result obtained with the internal control indicates the presence of inhibitors. The pool complies with the test if it is found non-reactive for hepatitis C virus RNA.

*Hepatitis C virus RNA for NAT testing BRP* is suitable for use as a positive control.

#### Hepatitis E virus RNA

The plasma pool is tested using a validated nucleic acid amplification technique (2.6.21). A positive control with  $3.2 \times 10^2$  IU of hepatitis E virus RNA per millilitre and, to test for inhibitors, an internal control prepared by addition of a suitable marker to a sample of the plasma pool are included in the test. The test is invalid if the positive control is non-reactive or if the result obtained with the internal control indicates the presence of inhibitors. The pool complies with the test if it is found non-reactive for hepatitis E virus RNA.

*Hepatitis E virus RNA for NAT testing BRP* is suitable for use as a positive control.

#### B19 virus DNA

The plasma pool contains not more than 10.0 IU/ $\mu\text{L}$ .

To limit the potential burden of B19 virus in plasma pools, the plasma pool is also tested for B19 virus using a validated nucleic acid amplification technique (2.6.21). A positive control with 10.0 IU of B19 virus DNA per microlitre and, to test for inhibitors, an internal control prepared by addition of a suitable marker to a sample of the plasma pool are included in the test. The test is invalid if the positive control is non-reactive or if the result obtained with the internal control indicates the presence of inhibitors.

*B19 virus DNA for NAT testing BRP* is suitable for use as a positive control.

#### METHOD OF PREPARATION

The method of preparation is designed to minimise activation of any coagulation factor (to minimise potential thrombogenicity) and includes a step or steps that have been shown to inactivate known agents of infection; if substances are used for the inactivation of viruses during production, the subsequent purification procedure must be validated to demonstrate that the concentration of these substances is reduced to a suitable level and that any residues are such as not to compromise the safety of the preparation for patients.

#### Inactivation process

The solvent-detergent process, which is one of the methods used to inactivate enveloped viruses, uses treatment with a combination of tributyl phosphate and octoxinol 10; these reagents are subsequently removed by oil extraction or by solid phase extraction so that the amount in the final product is less than 2  $\mu\text{g/mL}$  for tributyl phosphate and less than 5  $\mu\text{g/mL}$  for octoxinol 10.

No antimicrobial preservative is added.

The solution is passed through a bacteria-retentive filter, distributed aseptically into the final containers and immediately frozen; it may subsequently be freeze-dried.

Plastic containers comply with the requirements for sterile plastic containers for human blood and blood components (3.3.4).

Glass containers comply with the requirements for glass containers for pharmaceutical use (3.2.1).

**CHARACTERS****Appearance**

- *frozen preparation*: clear or slightly opalescent liquid, free from solid and gelatinous particles after thawing;
- *freeze-dried preparation*: almost white or slightly yellow powder or friable solid mass.

Thaw or reconstitute the preparation to be examined as stated on the label immediately before carrying out the identification, tests and assay.

**IDENTIFICATION**

A. Examine by electrophoresis (2.2.31) comparing with normal human plasma. The electropherograms show the same bands.

B. It complies with the test for anti-A and anti-B haemagglutinins (see Tests).

**TESTS****pH (2.2.3)**

6.5 to 7.6.

**Osmolality (2.2.35)**

Minimum 240 mosmol/kg.

**Total protein**

Minimum 45 g/L.

Dilute if necessary with a 9 g/L solution of *sodium chloride R* to obtain a protein concentration of about 7.5 mg/mL. Place 2.0 mL of this solution in a round-bottomed centrifuge tube and add 2 mL of a 75 g/L solution of *sodium molybdate R* and 2 mL of a mixture of 1 volume of *nitrogen-free sulfuric acid R* and 30 volumes of *water R*. Shake, centrifuge for 5 min, decant the supernatant and allow the inverted tube to drain on filter paper. Determine the nitrogen in the residue by the method of sulfuric acid digestion (2.5.9) and calculate the quantity of protein by multiplying the result by 6.25.

**Activated coagulation factors (2.6.22)**

It complies with the test for activated coagulation factors. Carry out the test with 0.1 mL of the preparation to be examined instead of 10-fold and 100-fold dilutions. The coagulation time for the preparation to be examined is not less than 150 s.

**Anti-A and anti-B haemagglutinins (2.6.20, Method A)**

The presence of haemagglutinins (anti-A or anti-B) corresponds to the blood group stated on the label.

**Hepatitis A virus antibodies**

Minimum 0.3 IU/mL, determined by a suitable immunochemical method (2.7.1).

*Human hepatitis A immunoglobulin BRP* is suitable for use as a reference preparation.

**Irregular erythrocyte antibodies**

The preparation to be examined does not show the presence of irregular erythrocyte antibodies when examined without dilution by an indirect antiglobulin test.

**Citrate**

Liquid chromatography (2.2.29).

*Test solution* Dilute the preparation to be examined with an equal volume of a 9 g/L solution of *sodium chloride R*. Filter through a membrane filter (nominal pore size 0.45 µm).

*Reference solution* Dissolve 0.300 g of *sodium citrate R* in *water R* and dilute to 100.0 mL with the same solvent.

**Column:**

— *size*:  $l = 0.3$  m,  $\varnothing = 7.8$  mm;

— *stationary phase*: cation-exchange resin R (9 µm).

*Mobile phase* 0.51 g/L solution of *sulfuric acid R*.

*Flow rate* 0.5 mL/min.

*Detection* Spectrophotometer at 215 nm.

*Equilibration* 15 min.

*Injection* 10 µL.

*Retention time* Citrate = about 10 min.

**Limit:**

— *citrate*: maximum 25 mmol/L.

**Calcium**

Maximum 5.0 mmol/L.

Atomic absorption spectrometry (2.2.23, Method I).

*Source* Calcium hollow-cathode lamp using a transmission band preferably of 0.5 nm.

*Wavelength* 622 nm.

*Atomisation device* Air-acetylene or acetylene-propane flame.

**Potassium**

Maximum 5.0 mmol/L.

Atomic emission spectrometry (2.2.22, Method I).

*Wavelength* 766.5 nm.

**Sodium**

Maximum 200 mmol/L.

Atomic emission spectrometry (2.2.22, Method I).

*Wavelength* 589 nm.

**Water**

Determined by a suitable method, such as the semi-micro determination of water (2.5.12), loss on drying (2.2.32) or near-infrared spectroscopy (2.2.40), the water content is within the limits approved by the competent authority (freeze-dried product).

**Sterility (2.6.1)**

It complies with the test.

**Pyrogens (2.6.8) or Bacterial endotoxins (2.6.14)**

It complies with the test for pyrogens or, preferably and where justified and authorised, with a validated *in vitro* test such as the bacterial endotoxin test.

For the pyrogen test, inject 3 mL per kilogram of the rabbit's mass.

Where the bacterial endotoxin test is used, the preparation to be examined contains less than 0.1 IU of endotoxin per millilitre.

**ASSAY****Assay of human coagulation factor VIII (2.7.4)**

Use a reference plasma calibrated against the International Standard for blood coagulation factor VIII in plasma.

The estimated potency is not less than 0.5 IU/mL.

The confidence limits ( $P = 0.95$ ) are not less than 80 per cent and not more than 120 per cent of the estimated potency.

**Assay of human coagulation factor V**

Carry out the assay of human coagulation factor V described below using a reference plasma calibrated against the International Standard for blood coagulation factor V in plasma.

Using *imidazole buffer solution pH 7.3 R*, prepare at least 3 twofold dilutions of the preparation to be examined, preferably in duplicate, from 1 in 10 to 1 in 40. Test each dilution as follows: mix 1 volume of *plasma substrate deficient in factor V R*, 1 volume of the dilution to be examined, 1 volume of *thromboplastin R* and 1 volume of a 3.5 g/L solution of *calcium chloride R*; measure the coagulation times, i.e. the interval between the moment at which the calcium chloride solution is added and the 1<sup>st</sup> indication of the

formation of fibrin, which may be observed visually or by means of a suitable apparatus.

In the same manner, determine the coagulation time of 4 twofold dilutions (1 in 10 to 1 in 80) of human normal plasma in *imidazole buffer solution pH 7.3 R*.

Check the validity of the assay and calculate the potency of the test preparation by the usual statistical methods (for example, 5.3).

The estimated potency is not less than 0.5 IU/mL. The confidence limits ( $P = 0.95$ ) are not less than 80 per cent and not more than 120 per cent of the estimated potency.

#### Assay of human coagulation factor XI (2.7.22)

Use a reference plasma calibrated against the International Standard for blood coagulation factor XI in plasma.

The estimated potency is not less than 0.5 IU/mL. The confidence limits ( $P = 0.95$ ) are not less than 80 per cent and not more than 125 per cent of the estimated potency.

*Coagulation factors V, VIII, XI and XIII plasma BRP* is suitable for use as a reference preparation in the above assays.

#### Assay of human protein C (2.7.30)

Use a reference plasma calibrated against the International Standard for human protein C in plasma.

The estimated potency is not less than 0.7 IU/mL. The confidence limits ( $P = 0.95$ ) are not less than 80 per cent and not more than 120 per cent of the estimated potency.

#### Assay of human protein S (2.7.31)

Use a reference plasma calibrated against the International Standard for human protein S in plasma.

The estimated potency is within the limits approved for the particular product. The confidence limits ( $P = 0.95$ ) are not less than 80 per cent and not more than 120 per cent of the estimated potency.

#### Assay of human plasmin inhibitor (2.7.25)

( $\alpha_2$ -antiplasmin)

Use a reference plasma calibrated against human normal plasma.

1 unit of human plasmin inhibitor is equal to the activity of 1 mL of human normal plasma. Human normal plasma is prepared by pooling plasma units from not fewer than 30 donors and storing at  $-30\text{ }^\circ\text{C}$  or lower.

The estimated potency is not less than 0.2 units/mL. The confidence limits ( $P = 0.95$ ) are not less than 80 per cent and not more than 120 per cent of the estimated potency.

#### Activated partial thromboplastin time (APTT)

Use an apparatus suitable for measurement of coagulation times or perform the assay with incubation tubes maintained in a water-bath at  $37\text{ }^\circ\text{C}$ . Place in each tube 0.1 mL of the preparation to be examined and 0.1 mL of a suitable APTT reagent (containing phospholipid and contact activator), both previously heated to  $37\text{ }^\circ\text{C}$ , and incubate the mixture for a recommended time at  $37\text{ }^\circ\text{C}$ . To each tube add 0.1 mL of a 3.7 g/L solution of *calcium chloride R* previously heated to  $37\text{ }^\circ\text{C}$ . Using a timer, measure the coagulation time, i.e. the interval between the moment of the addition of the calcium chloride and the 1<sup>st</sup> indication of the formation of fibrin, which may be observed visually or by means of a suitable apparatus. The volumes given above may be adapted to the APTT reagent and apparatus used. The coagulation

time complies with the approved specification for the product.

#### LABELLING

The label states:

- the ABO blood group;
- the method used for virus inactivation.

Ph Eur

## Albumin Solution

Albumin

Human Albumin

(*Human Albumin Solution, Ph. Eur. monograph 0255*)

Ph Eur

#### DEFINITION

Sterile liquid preparation of a plasma protein fraction containing human albumin. It is obtained from plasma that complies with the monograph *Human plasma for fractionation (0853)*. The preparation may contain excipients such as sodium caprylate (sodium octanoate) or *N*-acetyltryptophan or a combination of the two.

#### PRODUCTION

Separation of the albumin is carried out under controlled conditions, particularly of pH, ionic strength and temperature so that in the final product not less than 95 per cent of the total protein is albumin. Human albumin solution is prepared as a concentrated solution containing 150-250 g/L of total protein or as an isotonic solution containing 35-50 g/L of total protein. No antimicrobial preservative or antibiotic is added. The solution is passed through a bacteria-retentive filter and distributed aseptically into sterile containers which are then closed so as to prevent contamination. The solution in its final container is heated to  $60 \pm 1.0\text{ }^\circ\text{C}$  and maintained at this temperature for not less than 10 h. The containers are then incubated at  $30\text{--}32\text{ }^\circ\text{C}$  for not less than 14 days or at  $20\text{--}25\text{ }^\circ\text{C}$  for not less than 4 weeks and examined visually for evidence of microbial contamination.

#### CHARACTERS

##### Appearance

Clear, slightly viscous liquid, almost colourless, yellow, amber or green.

#### IDENTIFICATION

Examine by a suitable immunoelectrophoresis technique. Using antiserum to normal human serum, compare normal human serum and the preparation to be examined, both diluted to contain 10 g/L of protein. The main component of the preparation to be examined corresponds to the main component of normal human serum. The preparation may show the presence of small quantities of other plasma proteins.

#### TESTS

##### pH (2.2.3)

6.7 to 7.3.

Dilute the preparation to be examined with a 9 g/L solution of *sodium chloride R* to obtain a solution containing 10 g/L of protein.

##### Total protein

If necessary, dilute an accurately measured volume of the preparation to be examined with a 9 g/L solution of *sodium chloride R* to obtain a solution containing about 15 mg of protein in 2 mL. To 2.0 mL of this solution in a round-

bottomed centrifuge tube add 2 mL of a 75 g/L solution of sodium molybdate R and 2 mL of a mixture of 1 volume of nitrogen-free sulfuric acid R and 30 volumes of water R. Shake, centrifuge for 5 min, decant the supernatant and allow the inverted tube to drain on filter paper. Determine the nitrogen in the residue by the method of sulfuric acid digestion (2.5.9) and calculate the quantity of protein by multiplying by 6.25. The protein content is not less than 95 per cent and not more than 105 per cent of the stated content.

#### Protein composition

Zone electrophoresis (2.2.31).

Use strips of suitable cellulose acetate gel or agarose gel as the supporting medium and barbital buffer solution pH 8.6 R1 as the electrolyte solution.

If cellulose acetate is the supporting material, the method described below can be used. If agarose gels are used, and because they are normally part of an automated system, the manufacturer's instructions are followed instead.

**Test solution** Dilute the preparation to be examined with a 9 g/L solution of sodium chloride R to a protein concentration of 20 g/L.

**Reference solution** Dilute human albumin for electrophoresis BRP with a 9 g/L solution of sodium chloride R to a protein concentration of 20 g/L.

To a strip apply 2.5 µL of the test solution as a 10 mm band or apply 0.25 µL per millimetre if a narrower strip is used.

To another strip, apply in the same manner the same volume of the reference solution. Apply a suitable electric field such that the most rapid band migrates at least 30 mm. Treat the strips with amido black 10B solution R for 5 min. Decolorise with a mixture of 10 volumes of glacial acetic acid R and 90 volumes of methanol R until the background is just free of colour. Develop the transparency of the strips with a mixture of 19 volumes of glacial acetic acid R and 81 volumes of methanol R. Measure the absorbance of the bands at 600 nm in an instrument having a linear response over the range of measurement. Calculate the result as the mean of 3 measurements of each strip.

**System suitability** In the electropherogram obtained with the reference solution on cellulose acetate or on agarose gels, the proportion of protein in the principal band is within the limits stated in the leaflet accompanying the reference preparation.

**Results** In the electropherogram obtained with the test solution on cellulose acetate or on agarose gels, not more than 5 per cent of the protein has a mobility different from that of the principal band.

#### Molecular-size distribution

Size exclusion chromatography (2.2.30).

**Test solution** Dilute the preparation to be examined with a 9 g/L solution of sodium chloride R to a concentration suitable for the chromatographic system used. A concentration in the range of 4-12 g/L and injection of 50-600 µg of protein are usually suitable.

#### Column:

- size:  $l = 0.6$  m,  $\varnothing = 7.5$  mm, or  $l = 0.3$  m,  $\varnothing = 7.8$  mm;
- stationary phase: hydrophilic silica gel for chromatography R, of a grade suitable for fractionation of globular proteins with relative molecular masses in the range 10 000 to 500 000.

**Mobile phase** Dissolve 4.873 g of disodium hydrogen phosphate dihydrate R, 1.741 g of sodium dihydrogen phosphate monohydrate R, 11.688 g of sodium chloride R and 50 mg of sodium azide R in 1 L of water R.

**Flow rate** 0.5 mL/min.

**Detection** Spectrophotometer at 280 nm.

The peak due to polymers and aggregates is located in the part of the chromatogram representing the void volume. Disregard the peak due to the stabiliser. The area of the peak due to polymers and aggregates is not greater than 10 per cent of the total area of the chromatogram. This represents not more than 5 per cent when expressed in percentage of protein considering the difference in response factor between the albumin monomer and the polymers and aggregates.

#### Haem

Dilute the preparation to be examined using a 9 g/L solution of sodium chloride R to obtain a solution containing 10 g/L of protein. The absorbance (2.2.25) of the solution measured at 403 nm using water R as the compensation liquid is not greater than 0.15.

#### Prekallikrein activator (2.6.15)

Maximum 35 IU/mL.

#### Aluminium

Maximum 200 µg/L.

Atomic absorption spectrometry (2.2.23, Method I or II).

Use a furnace as atomic generator.

Use plastic containers for preparation of the solutions and use plastic equipment where possible. Wash glassware (or equipment) in nitric acid (200 g/L HNO<sub>3</sub>) before use.

**Test solution** Use the preparation to be examined, diluted if necessary.

**Reference solutions** Prepare at least 3 reference solutions in a range spanning the expected aluminium concentration of the test solution, for example by diluting aluminium standard solution (10 ppm Al) R with a 1 g/L solution of octoxinol 10 R.

**Monitor solution** Add aluminium standard solution (10 ppm Al) R or a suitable certified reference material to the test solution in a sufficient amount to increase the aluminium concentration by 20 µg/L.

**Blank solution** 1 g/L solution of octoxinol 10 R.

**Wavelength** 309.3 nm or other suitable wavelength.

**Slit width** 0.5 nm.

**Tube** Pyrolytically coated, with integrated platform.

**Background corrector** Off.

**Atomisation device** Furnace; fire between readings.

The operating conditions in Table 0255.-1 are cited as an example of conditions found suitable for a given apparatus; they may be modified to obtain optimum conditions.

Table 0255.-1. – Operating conditions found suitable, cited as an example

Step	Final temperature (°C)	Ramp time (s)	Hold time (s)	Gas
1	120	10	80	argon
2	200	5	20	argon
3	650	5	10	argon
4	1300	5	10	argon
5	1300	1	10	no gas
6	2500	0.7	4	no gas
7	2600	0.5	3	argon
8	20	12.9	3	no gas

**Injection** Each of the following solutions 3 times: blank solution, reference solutions, test solution and monitor solution.

**System suitability:**

— the recovery of aluminium added in preparation of the monitor solution is within the range 80–120 per cent.

Prepare a calibration curve from the mean of the readings obtained with the reference solutions and determine the aluminium content of the preparation to be examined using the calibration curve.

**Potassium**

Maximum 0.05 mmol of K per gram of protein.

Atomic emission spectrometry (2.2.22, Method I).

Wavelength 766.5 nm.

**Sodium**

Maximum 160 mmol/L, and 95 per cent to 105 per cent of the content of Na stated on the label.

Atomic emission spectrometry (2.2.22, Method I).

Wavelength 589 nm.

**Sterility (2.6.1)**

It complies with the test.

**Pyrogens (2.6.8) or Bacterial endotoxins (2.6.14)**

It complies with the test for pyrogens or, preferably and where justified and authorised, with a validated *in vitro* test such as the bacterial endotoxin test.

For the pyrogen test, for a solution with a protein content of 35–50 g/L, inject 10 mL per kilogram of the rabbit's mass; for a solution with a protein content of 150–250 g/L, inject 5 mL per kilogram of the rabbit's mass.

Where the bacterial endotoxin test is used, the preparation to be examined contains less than 0.5 IU of endotoxin per millilitre for solutions with a protein content not greater than 50 g/L, less than 1.3 IU of endotoxin per millilitre for solutions with a protein content greater than 50 g/L but not greater than 200 g/L, and less than 1.7 IU of endotoxin per millilitre for solutions with a protein content greater than 200 g/L but not greater than 250 g/L.

**STORAGE**

Protected from light.

**LABELLING**

The label states:

- the name of the preparation;
- the volume of the preparation;
- the content of protein expressed in grams per litre;
- the content of sodium expressed in millimoles per litre;
- that the product is not to be used if it is cloudy or if a deposit has formed;
- the name and quantity of any added substance.

Ph Eur

**Antithrombin III Concentrate**

(Human Antithrombin III Concentrate, Ph. Eur. monograph 0878)

**Action and use**

Anticoagulant factor.

Ph Eur

**DEFINITION**

Sterile, freeze-dried preparation of a plasma glycoprotein fraction that inactivates thrombin in the presence of an excess of heparin. It is obtained from human plasma that complies with the monograph on *Human plasma for fractionation (0853)*. The preparation may contain excipients such as stabilisers.

When reconstituted in the volume of solvent stated on the label, the potency is not less than 25 IU of antithrombin III per millilitre.

**PRODUCTION**

The method of preparation is designed to maintain functional integrity of antithrombin III. It includes a step or steps that have been shown to remove or to inactivate known agents of infection; if substances are used for inactivation of viruses during production, the subsequent purification procedure must be validated to demonstrate that the concentration of these substances is reduced to a suitable level and any residues are such as not to compromise the safety of the preparation for patients.

The specific activity is not less than 3 IU of antithrombin III per milligram of total protein, excluding albumin.

The antithrombin III is purified and concentrated. No antimicrobial preservative or antibiotic is added.

The antithrombin III concentrate is passed through a bacteria-retentive filter, distributed aseptically into its final, sterile containers and immediately frozen. It is then freeze-dried and the containers are closed under vacuum or in an atmosphere of inert gas.

It shall be demonstrated that the manufacturing process yields a product with a consistent fraction of antithrombin III able to bind to heparin. It is evaluated by a suitable analytical procedure which is determined during process development, such as:

**Heparin-binding fraction** Examine by agarose gel electrophoresis (2.2.31). Prepare a 10 g/L solution of agarose for electrophoresis R containing 15 IU of heparin R per millilitre in barbital buffer solution pH 8.4 R. Pour 5 mL of this solution onto a glass plate 5 cm square. Cool at 4 °C for 30 min. Cut 2 wells 2 mm in diameter 1 cm and 4 cm from the side of the plate and 1 cm from the cathode. Introduce into one well 5 µL of the preparation to be examined, diluted to an activity of about 1 IU of antithrombin III per millilitre. Introduce into the other well 5 µL of a solution of a marker dye such as bromophenol blue R. Allow the electrophoresis to proceed at 4 °C, using a constant electric field of 7 V/cm, until the dye reaches the anode.

Cut across the agarose gel 1.5 cm from that side of the plate on which the preparation to be examined was applied and remove the larger portion of the gel leaving a band 1.5 cm wide containing the material to be examined. Replace the removed portion with an even layer consisting of 3.5 mL of a 10 g/L solution of agarose for electrophoresis R in barbital buffer solution pH 8.4 R, containing a rabbit anti-human antithrombin III antiserum at a suitable concentration, previously determined, to give adequate peak heights of at least 1.5 cm. Place the plate with the original gel at the cathode so that a 2<sup>nd</sup> electrophoretic migration can occur at right angles to the 1<sup>st</sup>. Allow this 2<sup>nd</sup> electrophoresis to proceed using a constant electric field of 2 V/cm for 16 h. Cover the plates with filter paper and several layers of thick lint soaked in a 9 g/L solution of sodium chloride R and compress for 2 h, renewing the saline several times. Rinse with water R, dry the plates and stain with acid blue 92 solution R.

Calculate the fraction of antithrombin III bound to heparin, which is the peak closest to the anode, with respect to the total amount of antithrombin III, by measuring the area defined by the 2 precipitation peaks.

The fraction of antithrombin III able to bind to heparin is not less than 60 per cent.

**CHARACTERS****Appearance**

White or almost white, hygroscopic, friable solid or powder.

Reconstitute the preparation to be examined as stated on the label immediately before carrying out the identification, tests (except those for solubility, total protein and water) and assay.

**IDENTIFICATION**

It complies with the limits of the assay.

**TESTS****Solubility**

To a container of the preparation to be examined add the volume of liquid stated on the label at the recommended temperature. The preparation dissolves completely under gentle swirling within 10 min in the volume of the solvent stated on the label, forming a clear or slightly turbid, colourless or almost colourless solution.

**pH (2.2.3)**

6.0 to 7.5.

**Osmolality (2.2.35)**

Minimum 240 mosmol/kg.

**Total protein**

If necessary, dilute an accurately measured volume of the reconstituted preparation to obtain a solution containing about 15 mg of protein in 2 mL. To 2.0 mL of the solution in a round-bottomed centrifuge tube add 2 mL of a 75 g/L solution of sodium molybdate R and 2 mL of a mixture of 1 volume of nitrogen-free sulfuric acid R and 30 volumes of water R. Shake, centrifuge for 5 min, decant the supernatant and allow the inverted tube to drain on filter paper. Determine the nitrogen in the residue by the method of sulfuric acid digestion (2.5.9) and calculate the amount of protein by multiplying the result by 6.25.

**Heparin**

Maximum 0.1 IU of heparin per International Unit of antithrombin III.

The anticoagulant activity of heparin is determined *in vitro* by comparing its ability in given conditions to delay the clotting of recalcified citrated sheep plasma with the same ability of a reference preparation of heparin calibrated in International Units.

The International Unit is the activity contained in a stated amount of the International Standard, which consists of a quantity of freeze-dried heparin sodium from pork intestinal mucosa. The equivalence in International Units of the International Standard is stated by the World Health Organization.

Heparin sodium BRP is calibrated in International Units by comparison with the International Standard by means of the assay given below.

Carry out the assay using one of the following methods for determining the onset of clotting and using tubes and other equipment appropriate to the chosen method:

- direct visual inspection, preferably using indirect illumination and viewing against a matt black background;
- spectrophotometric recording of the change in optical density at a wavelength of approximately 600 nm;
- visual detection of the change in fluidity on manual tilting of the tubes;
- mechanical recording of the change in fluidity on stirring, care being taken to cause the minimum disturbance of the solution during the earliest phase of clotting.

It is necessary to validate the method for assay of heparin for each preparation to be examined to allow for interference by antithrombin III.

**ASSAY PROCEDURE**

The volumes are given as examples and may be adapted to the apparatus used provided that the ratios between the different volumes are respected.

Dilute heparin sodium BRP with a 9 g/L solution of sodium chloride R to contain a precisely known number of International Units per millilitre and prepare a similar solution of the preparation to be examined which is expected to have the same activity. Using a 9 g/L solution of sodium chloride R, prepare from each solution a series of dilutions in geometric progression such that the clotting time obtained with the lowest concentration is not less than 1.5 times the blank recalcification time, and that obtained with the highest concentration is such as to give a satisfactory log dose-response curve, as determined in a preliminary test.

Place 12 tubes in a bath of iced water, labelling them in duplicate: T<sub>1</sub>, T<sub>2</sub> and T<sub>3</sub> for the dilutions of the preparation to be examined and S<sub>1</sub>, S<sub>2</sub> and S<sub>3</sub> for the dilutions of the reference preparation. To each tube add 1.0 mL of thawed plasma substrate R1 and 1.0 mL of the appropriate dilution of the preparation to be examined or the reference preparation. After each addition, mix but do not allow bubbles to form. Treating the tubes in the order S<sub>1</sub>, S<sub>2</sub>, S<sub>3</sub>, T<sub>1</sub>, T<sub>2</sub>, T<sub>3</sub>, transfer each tube to a water-bath at 37 °C, allow to equilibrate at 37 °C for about 15 min and add to each tube 1 mL of a suitable APTT (Activated Partial Thromboplastin Time) reagent containing phospholipid and a contact activator, at a dilution giving a suitable blank recalcification time not exceeding 60 s. After exactly 2 min add 1 mL of a 3.7 g/L solution of calcium chloride R previously heated to 37 °C and record as the clotting time the interval in seconds between this last addition and the onset of clotting determined by the chosen technique. Determine the blank recalcification time at the beginning and at the end of the procedure in a similar manner, using 1 mL of a 9 g/L solution of sodium chloride R in place of one of the heparin dilutions; the 2 blank values obtained should not differ significantly. Transform the clotting times to logarithms, using the mean value for the duplicate tubes. Repeat the procedure using fresh dilutions and carrying out the incubation in the order T<sub>1</sub>, T<sub>2</sub>, T<sub>3</sub>, S<sub>1</sub>, S<sub>2</sub>, S<sub>3</sub>. Calculate the results by the usual statistical methods (5.3).

Carry out not fewer than 3 independent assays. For each such assay prepare fresh solutions of the reference preparation and the preparation to be examined and use another, freshly thawed portion of plasma substrate.

Calculate the potency of the preparation to be examined, combining the results of these assays, by the usual statistical methods (5.3). When the variance due to differences between assays is significant at  $P = 0.01$ , a combined estimate of potency may be obtained by calculating the non-weighted mean of potency estimates.

**Water**

Determined by a suitable method, such as semi-micro determination of water (2.5.12), loss on drying (2.2.32) or near-infrared spectroscopy (2.2.40), the water content is within the limits approved by the competent authority.

**Sterility (2.6.1)**

It complies with the test.

**Pyrogens (2.6.8) or Bacterial endotoxins (2.6.14)**

It complies with the test for pyrogens or, preferably and where justified and authorised, with a validated *in vitro* test such as the bacterial endotoxin test.

For the pyrogen test, inject per kilogram of the rabbit's mass a volume equivalent to 50 IU of antithrombin III.

Where the bacterial endotoxin test is used, the preparation to be examined contains less than 0.1 IU of endotoxin per International Unit of antithrombin III.

#### ASSAY

##### Human antithrombin III (2.7.17)

The estimated potency is not less than 80 per cent and not more than 120 per cent of the stated potency.

The confidence limits ( $P = 0.95$ ) are not less than 90 per cent and not more than 110 per cent of the estimated potency.

#### STORAGE

Protected from light, in an airtight container.

#### LABELLING

The label states:

- the number of International Units of antithrombin III in the container;
- the name and volume of the liquid to be used for reconstitution;
- where applicable, the amount of albumin added as a stabiliser.

Ph Eur

## Dried Factor VII Fraction

(Human Coagulation Factor VII, Ph. Eur. monograph 1224)

#### Action and use

Coagulation factor VII substitute.

Ph Eur

#### DEFINITION

Sterile, liquid or freeze-dried preparation of a plasma protein fraction containing the single-chain glycoprotein human coagulation factor VII and may also contain small amounts of the activated form, the 2-chain derivative human coagulation factor VIIa. It may also contain human coagulation factors II, IX and X, protein C and protein S. It is obtained from human plasma that complies with the monograph on *Human plasma for fractionation* (0853).

The preparation may contain excipients such as stabilisers, heparin and antithrombin.

The potency of the preparation, reconstituted as stated on the label, is not less than 15 IU of human coagulation factor VII per millilitre.

#### PRODUCTION

##### GENERAL PROVISIONS

The method of preparation is designed to maintain functional integrity of human coagulation factor VII and to minimise activation of any coagulation factor (to minimise potential thrombogenicity). It includes a step or steps that have been shown to remove or to inactivate known agents of infection; if substances are used for inactivation of viruses during production, the subsequent purification procedure must be validated to demonstrate that the concentration of these substances is reduced to a suitable level and that any residues are such as not to compromise the safety of the preparation for patients.

The specific activity is not less than 2 IU of human coagulation factor VII per milligram of total protein, before the addition of any protein stabiliser.

The human coagulation factor VII fraction is dissolved in a suitable liquid. No antimicrobial preservative or antibiotic is added. The solution is passed through a bacteria-retentive filter, distributed aseptically into the final containers and immediately frozen. It is subsequently freeze-dried and the containers are closed under vacuum or under an inert gas.

#### CONSISTENCY OF THE METHOD OF PRODUCTION

It shall be demonstrated that the manufacturing process yields a product with consistent activities of human coagulation factors II, IX and X, expressed in International Units relative to the activity of human coagulation factor VII. This is evaluated by suitable analytical procedure(s) that is (are) determined during process development.

It shall be demonstrated that the manufacturing process yields a product with a consistent activity of human coagulation factor VIIa. This is evaluated by suitable analytical procedure(s) that is (are) determined during process development.

#### Activity of human coagulation factor VIIa

It may be determined, for example, using a recombinant soluble tissue factor that does not activate human coagulation factor VII but possesses a cofactor function specific for human coagulation factor VIIa; after incubation of a mixture of the recombinant soluble tissue factor with phospholipids reagent and the dilution of the test sample in human coagulation factor VII-deficient plasma, calcium chloride is added and the clotting time determined; the clotting time is inversely related to the human coagulation factor VIIa activity of the test sample.

#### CHARACTERS

##### Appearance

White or almost white, pale yellow, green or blue, hygroscopic powder or friable solid.

*Reconstitute the preparation to be examined as stated on the label immediately before carrying out the identification, tests (except those for solubility and water) and assay.*

#### IDENTIFICATION

It complies with the limits of the assay.

#### TESTS

##### Solubility

To a container of the preparation to be examined add the volume of liquid stated on the label at the recommended temperature. The preparation dissolves completely with gentle swirling within 10 min, giving a clear or slightly opalescent solution that may be coloured.

##### pH (2.2.3)

6.5 to 7.5.

##### Osmolality (2.2.35)

Minimum 240 mosmol/kg.

##### Total protein

If necessary, dilute an accurately measured volume of the reconstituted preparation with a 9 g/L solution of sodium chloride R to obtain a solution containing about 15 mg of protein in 2 mL. To 2.0 mL of the solution in a round-bottomed centrifuge tube, add 2 mL of a 75 g/L solution of sodium molybdate R and 2 mL of a mixture of 1 volume of nitrogen-free sulfuric acid R and 30 volumes of water R. Shake, centrifuge for 5 min, decant the supernatant and allow the inverted tube to drain on filter paper. Determine the nitrogen in the residue by the method of sulfuric acid digestion (2.5.9) and calculate the amount of protein by multiplying the result by 6.25.

**Activated coagulation factors (2.6.22)**

For each of the dilutions, the coagulation time is not less than 150 s.

**Heparin (2.7.12)**

If heparin has been added, the preparation to be examined contains not more than the amount of heparin stated on the label and in any case not more than 0.5 IU of heparin per International Unit of human coagulation factor VII.

**Thrombin**

If the preparation to be examined contains heparin, determine the amount present as described in the test for heparin and neutralise the heparin by addition of *protamine sulfate R* (10 µg of protamine sulfate neutralises 1 IU of heparin). In each of 2 test-tubes, mix equal volumes of the reconstituted preparation and of a 3 g/L solution of *fibrinogen R*. Keep one of the tubes at 37 °C for 6 h and the other at room temperature for 24 h. In a 3<sup>rd</sup> tube, mix equal volumes of the fibrinogen solution and of a solution of *human thrombin R* (1 IU/mL) and place the tube in a water-bath at 37 °C. No coagulation occurs in the tubes containing the preparation to be examined. Coagulation occurs within 30 s in the tube containing thrombin.

**Human coagulation factor II (2.7.18)**

The estimated content is not more than 125 per cent of the stated content. The confidence limits ( $P = 0.95$ ) are not less than 90 per cent and not more than 111 per cent of the estimated potency.

**Human coagulation factor IX (2.7.11)**

The estimated content is not more than 125 per cent of the stated content. The confidence limits ( $P = 0.95$ ) are not less than 80 per cent and not more than 125 per cent of the estimated potency.

**Human coagulation factor X (2.7.19)**

The estimated content is not more than 125 per cent of the stated content. The confidence limits ( $P = 0.95$ ) are not less than 90 per cent and not more than 111 per cent of the estimated potency.

**Water**

Determined by a suitable method, such as the semi-micro determination of water (2.5.12), loss on drying (2.2.32) or near-infrared spectrometry (2.2.40), the water content is within the limits approved by the competent authority.

**Sterility (2.6.1)**

It complies with the test.

**Pyrogens (2.6.8) or Bacterial endotoxins (2.6.14)**

It complies with the test for pyrogens or, preferably and where justified and authorised, with a validated *in vitro* test such as the test for bacterial endotoxins.

For the pyrogen test, inject per kilogram of the rabbit's mass a volume equivalent to not less than 30 IU of human coagulation factor VII.

Where the test for bacterial endotoxins is used, the preparation to be examined contains less than 0.1 IU of endotoxin per International Unit of human coagulation factor VII.

**ASSAY****Human coagulation factor VII (2.7.10)**

The estimated potency is not less than 80 per cent and not more than 125 per cent of the stated potency.

The confidence limits ( $P = 0.95$ ) are not less than

80 per cent and not more than 125 per cent of the estimated potency.

**STORAGE**

In an airtight container, protected from light.

**LABELLING**

The label states:

- the number of International Units of human coagulation factor VII per container;
- the maximum content of human coagulation factor II, human coagulation factor IX and human coagulation factor X per container, in International Units;
- the amount of protein per container;
- the name and quantity of any added substances, including, where applicable, heparin;
- the name and volume of the liquid to be used for reconstitution;
- that the transmission of infectious agents cannot be totally excluded when medicinal products prepared from human blood or plasma are administered.

Ph Eur

**DEFINITION**

Solution containing closely related glycoproteins, which have the same amino acid sequence (406 amino acids) and disulfide bridges as the naturally occurring analogue (plasma-derived activated coagulation factor VII). Human coagulation factor VIIa (rDNA) (eptacog alfa, activated) is a 2-chain molecule, obtained by proteolytic cleavage of the peptide bond between Arg 152 and Ile 153 of single-chain coagulation factor VII, consisting of a 20 kDa light chain (N-

terminal) and a 30 kDa heavy chain (C-terminal) connected by a disulfide bond.

Human coagulation factor VIIa (rDNA) is distinguishable from the naturally occurring analogue in terms of its post-translational modifications, including glycosylation pattern.

#### Content

1.11 mg to 1.78 mg of protein per millilitre.

#### Potency

44 000 IU to 64 000 IU per milligram of protein.

#### PRODUCTION

Human coagulation factor VIIa (rDNA) is produced in mammalian cells by a method based on recombinant DNA technology (rDNA).

Prior to release, the following tests are carried out on each batch of human coagulation factor VIIa (rDNA) concentrated solution, unless exemption has been granted by the competent authority.

#### Host-cell-derived proteins

The limit is approved by the competent authority.

#### Host-cell- and vector-derived DNA

The limit is approved by the competent authority.

#### Glycan analysis

Use a suitable method developed according to general chapter 2.2.59. *Glycan analysis of glycoproteins*.

Glycan analysis includes the following steps:

- after desalting, release of the glycans (see 2.2.59 section 2-3);
- labelling of the glycans with a suitable fluorescent label (Table 2.2.59.-2);
- analysis of the labelled glycans by liquid chromatography (2.2.29) with fluorometric detection.

The following procedures may be used.

**Test solution** Dilute the preparation to be examined in water R to obtain a concentration of about 1.5 mg/mL.

**Reference solution** Dissolve human coagulation factor VIIa (rDNA) CRS in water R to obtain a concentration of 1.5 mg/mL.

#### DESALTING

Desalt the test solution and the reference solution as described under Identification B. The buffer used for desalting and elution is a 1.21 g/L solution of *tris(hydroxymethyl)aminomethane* R, adjusted to pH 7.5 with *hydrochloric acid* R. After desalting, the concentration of the solutions is about 1.0 mg/mL.

#### SELECTIVE RELEASE OF GLYCANS

Transfer 500 µL of the desalted test solution and 500 µL of the desalted reference solution to separate centrifuge tubes, and add 10 µL of a 200 U/mL solution of *peptide N-glycosidase F* R. Cap the tubes and incubate for 16-24 h at 37 °C. Remove the protein fraction by adding 1.5 mL of *ethanol (96 per cent)* R at -20 °C to the tubes. Mix and allow to stand at -20 °C for 20-30 min. Centrifuge the tubes at 10 000 r/min for 10 min. Collect the supernatant and evaporate to dryness, using for example a rotary evaporator.

#### LABELLING OF GLYCANS

Label the liberated glycans with 2-aminobenzamide using a suitable procedure. The procedure employs a combination of reagents optimised and validated for the efficient labelling of glycans, and for the subsequent extraction and recovery of the labelled glycans from the reaction.

#### LIQUID CHROMATOGRAPHY (2.2.29)

##### Precolumn:

- size:  $l = 0.05\text{ m}$ ,  $\varnothing = 4.0\text{ mm}$ ;
- stationary phase: strongly basic anion-exchange resin for chromatography R.

##### Column:

- size:  $l = 0.25\text{ m}$ ,  $\varnothing = 4.0\text{ mm}$ ;
- stationary phase: strongly basic anion-exchange resin for chromatography R;
- temperature: 30 °C.

##### Mobile phase:

- mobile phase A: 6 g/L solution of *sodium hydroxide* R;
- mobile phase B: solution containing 6 g/L of *sodium hydroxide* R and 40.8 g/L of *sodium acetate* R;

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 52	100 → 35	0 → 65
52.0 - 52.1	35 → 0	65 → 100
52.1 - 65	0	100
65 - 65.1	0 → 100	100 → 0
65.1 - 90	100	0

**Flow rate** 0.5 mL/min.

**Detection** Fluorimeter at 330 nm for excitation and 420 nm for emission.

**Injection** 100 µL, using an automatic injector maintained at 2-8 °C.

##### System suitability Reference solution:

- the chromatogram obtained is qualitatively similar to the chromatogram shown in Figure 2534.-1; peaks 1 to 12 are clearly visible;
- *peak width at half-height*: maximum 30 s for peak 8.

Calculate the percentage content of charged glycans in the reference solution using the following expression:

$$\frac{A}{A+B} \times 100$$

- A = sum of the areas of the peaks due to charged glycans (peaks 6 to 12);
- B = sum of the areas of the peaks due to uncharged glycans (peaks 1 to 5).

Calculate the percentage content of charged glycans in the test solution accordingly.

##### Limit:

- *percentage of charged glycans*: as authorised by the competent authority.

#### CHARACTERS

##### Appearance

Colourless liquid.

#### IDENTIFICATION

A. It forms a clot when examined in the conditions described under Assay (Potency).

B. Peptide mapping (2.2.55).

#### SELECTIVE CLEAVAGE OF THE PEPTIDE BONDS

**Solution A** Dissolve 0.74 g of *calcium chloride* R and 6.06 g of *tris(hydroxymethyl)aminomethane* R in 1000 mL of *water* R and adjust to pH 7.5 with *hydrochloric acid* R.

**Test solution** Dilute the preparation to be examined with solution A to obtain a concentration of about 1.5 mg/mL. Desalt a volume of this solution by a suitable method (for example using a suitable centrifugal filter unit or gel-filtration column with solution A as elution buffer). After desalting,

Peak	Charged	Structure	Peak	Charged	Structure
1.	No	Core fucosylated biantennary – non sialylated (2 <i>N</i> -acetylgalactosamine terminals)	7.	Yes	Core fucosylated biantennary – monosialylated (and 1 galactose terminal)
2.	No	Core fucosylated biantennary – non sialylated ( <i>N</i> -acetylgalactosamine and galactose terminals)	8.	Yes	Core fucosylated biantennary – bisialylated
3.	No	Structure not determined	9.	Yes	High-mannose structure with 1 phosphate group
4.	No	Core fucosylated biantennary – non sialylated (galactose and <i>N</i> -acetylglucosamine terminals)	10.	Yes	Core fucosylated triantennary – trisialylated
5.	No	Core fucosylated biantennary – non sialylated (2 galactose terminals)	11.	Yes	Core fucosylated triantennary – trisialylated
6.	Yes	Core fucosylated biantennary – monosialylated (and 1 <i>N</i> -acetylgalactosamine terminal)	12.	Yes	Structure not determined

Figure 2534.-1. – Chromatogram for the test for glycan analysis of human coagulation factor VIIa (rDNA): reference solution

the concentration should be about 1.0 mg/mL. Transfer the desalted solution to a polypropylene tube. Prepare a 1 mg/mL solution of *trypsin for peptide mapping R* and add 10 µL to 1 mL of the desalted solution. Cap the tube and mix gently by inversion. Incubate at 37 °C for 24 h. At time 5.5 h, add 10 µL of the trypsin solution. Remove the sample from the incubator, place it at room temperature, add 9 µL of *glacial acetic acid R* and mix by inversion. Maintain the solution at -15 °C or below until chromatographic separation; if analysed immediately using an automatic injector, maintain at 2-8 °C.

**Reference solution** Dissolve *human coagulation factor VIIa (rDNA) CRS* in solution A to obtain a concentration of 1.5 mg/mL. Desalt and digest at the same time and in the same manner as for the test solution.

**CHROMATOGRAPHIC SEPARATION**

Liquid chromatography (2.2.29).

**Column:**

- size: *l* = 0.25 m,  $\varnothing$  = 4.0 mm;
- stationary phase: *octadecylsilyl silica gel for chromatography R* (5 µm) with a pore size of 30 nm;
- temperature: 30 °C.

**Mobile phase:**

- **mobile phase A:** add 0.65 mL of *trifluoroacetic acid R* to 1000 mL of *water for chromatography R* and degas;

- **mobile phase B:** mix 0.5 mL of *trifluoroacetic acid R*, 100 mL of *water for chromatography R* and 900 mL of *acetonitrile R1* and degas;

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 100	100 → 50	0 → 50
100 - 105	50 → 0	50 → 100
105 - 110	0	100
110 - 110.1	0 → 100	100 → 0
110.1 - 125	100	0

**Flow rate** 1.0 mL/min.

**Detection** Spectrophotometer at 215 nm.

**Injection** 25 µL.

**System suitability** The chromatogram obtained with the reference solution is qualitatively similar to the chromatogram supplied with *human coagulation factor VIIa (rDNA) CRS*.

**Results** The profile of the chromatogram obtained with the test solution corresponds to that of the chromatogram obtained with the reference solution:

- all major peaks identified in the chromatogram obtained with the reference solution are present in the chromatogram obtained with the test solution;
- no new major peaks are observed in the chromatogram obtained with the test solution in

comparison with the chromatogram obtained with the reference solution.

C. Examine the chromatograms obtained in the test for glycan analysis.

**Results** The profile of the chromatogram obtained with the test solution corresponds to that of the chromatogram obtained with the reference solution.

#### TESTS

**Degraded heavy chain and oxidised forms of human coagulation factor VIIa (rDNA)**

Liquid chromatography (2.2.29): use the normalisation procedure.

**Test solution** Dilute the preparation to be examined in water R to obtain a concentration of about 1.5 mg/mL.

**Reference solution** Dissolve human coagulation factor VIIa (rDNA) CRS in water R to obtain a concentration of 1.5 mg/mL.

**Column:**

- size:  $l = 0.25$  m,  $\varnothing = 4.0$  mm;
- stationary phase: end-capped butylsilyl silica gel for chromatography R (5  $\mu$ m) with a pore size of 30 nm;
- temperature: 60–70 °C.

**Mobile phase:**

- mobile phase A: mix 1 mL of trifluoroacetic acid R and 999 mL of water for chromatography R and degas;
- mobile phase B: mix 1 mL of trifluoroacetic acid R, 200 mL of water for chromatography R and 800 mL of acetonitrile R1 and degas;

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 30	54 → 41	46 → 59
30 - 33	41 → 0	59 → 100
33 - 38	0	100
38 - 40	0 → 54	100 → 46

**Flow rate** 1.0 mL/min.

**Detection** Spectrophotometer at 214 nm.

**Injection** About 20  $\mu$ L, using an automatic injector maintained at 2–8 °C.

**Retention time** Human coagulation factor VIIa (rDNA) = about 26 min.

**System suitability:**

- the chromatogram obtained with the reference solution is qualitatively similar to the chromatogram shown in Figure 2534.-2; peaks 1 to 10 are clearly visible;
- peak-to-valley ratio: minimum 1.5, where  $H_p$  = height above the baseline of peak 6 and  $H_v$  = height above the baseline of the lowest point of the curve separating this peak from peak 7.

**Results:**

- the profile of the chromatogram obtained with the test solution corresponds to that of the chromatogram obtained with the reference solution.

Calculate the individual percentage area (relative to the total peak area) of the peaks due to the degraded heavy chain human coagulation factor VIIa (rDNA) (peaks 1, 2 and 6) and oxidised forms of human coagulation factor VIIa (rDNA) (peaks 3, 4 and 5).

**Limits:**

- *sum of degraded heavy chain forms*: maximum 11 per cent;
- *sum of oxidised forms*: maximum 2.2 per cent.

**Gla-domainless human coagulation factor VIIa (rDNA) (gamma-carboxylation)**

Liquid chromatography (2.2.29): use the normalisation procedure.

**Test solution** Dilute the preparation to be examined in *water R* to obtain a concentration of about 1.5 mg/mL.

**Reference solution** Dissolve *human coagulation factor VIIa (rDNA) CRS* in *water R* to obtain a concentration of 1.5 mg/mL.

**Precolumn:**

- *stationary phase*: styrene-divinylbenzene copolymer *R* with iminodiacetic groups, for removal of calcium.

**Column:**

- *size*:  $l = 0.25$  m,  $\varnothing = 4.0$  mm;
- *stationary phase*: strongly basic anion-exchange resin for chromatography *RI*;
- *temperature*: 25 °C.

**Mobile phase:**

- *mobile phase A*: solution containing 1.2 g/L of *tris(hydroxymethyl)aminomethane R* and 2.8 g/L of *bis-tris propane R*, adjusted to pH 9.4 with *glacial acetic acid R* and degassed;
- *mobile phase B*: solution containing 1.2 g/L of *tris(hydroxymethyl)aminomethane R*, 2.8 g/L of *bis-tris propane R* and 107.9 g/L of *ammonium acetate R*, adjusted to pH 9.4 with *concentrated ammonia R* and degassed;

Time (min)	Mobile phase A (per cent <i>V/V</i> )	Mobile phase B (per cent <i>V/V</i> )
0 - 2.5	100	0
2.5 - 27.5	100 → 0	0 → 100
27.5 - 30.5	0 → 100	100 → 0

**Flow rate** 1.0 mL/min.

**Detection** Spectrophotometer at 280 nm.

**Injection** About 100 µL, using an automatic injector maintained at 2-8 °C.

**Relative retention** With reference to human coagulation factor VIIa (rDNA) (retention time = about 14 min): Gla-domainless human coagulation factor VIIa (rDNA) = about 0.7.

**System suitability** Reference solution:

- *resolution*: baseline separation between the peak due to Gla-domainless human coagulation factor VIIa (rDNA) and the peak cluster due to human coagulation factor VIIa (rDNA).

**Limit:**

- *Gla-domainless human coagulation factor VIIa (rDNA)*: maximum 6.1 per cent.

Integrate the peak cluster to baseline.

**Dimers and related substances of higher molecular mass**

Size-exclusion chromatography (2.2.30): use the normalisation procedure.

**Test solution** Dilute the preparation to be examined in *water R* to obtain a concentration of about 1.5 mg/mL.

**Reference solution** Dissolve *human coagulation factor VIIa (rDNA) CRS* in *water R* to obtain a concentration of 1.5 mg/mL.

**Column:**

- *size*:  $l = 0.3$  m,  $\varnothing = 7.5$  mm;
- *stationary phase*: hydrophilic silica gel for chromatography *R* (10 µm) of a grade suitable for fractionation of globular proteins in the relative molecular mass range of 10 000 to 500 000;
- *temperature*: 21-25 °C.

**Mobile phase** Dissolve 26.4 g of *ammonium sulfate R* in approximately 900 mL of *water for chromatography R*. Adjust first to pH 2.5 with *phosphoric acid R* and then to pH 7.0 with *triethylamine R*. Add 50 mL of *2-propanol R* and dilute to 1000 mL with *water for chromatography R*.

**Flow rate** 0.5 mL/min.

**Detection** Spectrophotometer at 215 nm.

**Injection** 20 µL, using an automatic injector maintained at 2-8 °C.

**System suitability** Reference solution:

- the chromatogram obtained is qualitatively similar to the chromatogram supplied with *human coagulation factor VIIa (rDNA) CRS*;
- *symmetry factor*: maximum 1.3 for the peak due to the monomer;
- *peak-to-valley ratio*: minimum 1.1, where  $H_p$  = height above the baseline of the peak due to dimers and  $H_v$  = height above the baseline of the lowest point of the curve separating this peak from the peak due to the monomer.

**Limit:**

- *sum of the areas of the peaks with a retention time less than that of the monomer*: maximum 2.7 per cent.

**Non-activated single-chain factor VII (rDNA)**

Polyacrylamide gel electrophoresis (2.2.31): use the normalisation procedure.

**Gel dimensions** 1 mm thick.

**Resolving gel** 12 per cent acrylamide.

**Sample buffer (reducing conditions)** *concentrated SDS-PAGE sample buffer for reducing conditions R* containing *dithiothreitol R* as the reducing agent.

**Test solution** Dilute the preparation to be examined in *water R* to obtain a concentration of about 800 µg/mL. Mix equal volumes of this solution and the sample buffer (reducing conditions).

**Reference solution (a)** Dissolve *human coagulation factor VIIa (rDNA) CRS* in *water R* to obtain a concentration of about 800 µg/mL. Mix equal volumes of this solution and the sample buffer (reducing conditions).

**Reference solution (b)** Solution of molecular mass markers suitable for calibrating SDS-polyacrylamide gels in the range of 10-70 kDa.

**Sample treatment** Boil for 5 min or heat at  $73 \pm 3$  °C for 10 min.

**Application** 10 µL.

**Detection** By Coomassie staining.

**Quantification** Integrating densitometer.

**System suitability:**

- the principal bands in the electropherogram obtained with the test solution correspond in position to the principal bands in the electropherogram obtained with reference solution (a) (30 kDa, heavy chain and 20-25 kDa, light chain);
- reference solution (b): the validation criteria are met (2.2.31);

- a band corresponding to non-activated single-chain factor VII (rDNA) (molecular mass of 51 kDa) is visible in the electropherogram obtained with reference solution (a).

**Limit:**

- *non-activated single-chain factor VII (rDNA)*: maximum 3 per cent.

**Bacterial endotoxins (2.6.14)**

Less than 10 IU/mL.

**ASSAY****Protein**

Size-exclusion chromatography (2.2.30) as described in the test for dimers and related substances of higher molecular mass with the following modifications.

**Injection** 10 µL, 20 µL and 30 µL of the reference solution.

Plot peak areas against injected protein content and perform a linear regression to create a standard curve.

Calculate the content of human coagulation factor VIIa (rDNA) using the monomer peak area in the chromatogram obtained with the test solution and taking into account the assigned content of *human coagulation factor VIIa (rDNA) CRS*.

**System suitability:**

- **repeatability**: maximum relative standard deviation of 2.0 per cent after 5 injections of 20 µL of the reference solution;
- the correlation coefficient calculated for the standard curve ( $r^2$ ) is not less than 0.990.

**Potency**

The principle of the assay is to measure the ability of a factor VIIa preparation to reduce the prolonged coagulation time of factor VII-deficient plasma.

The biological activity is assessed by comparing the dose-response curve of the preparation to be examined to that of a reference preparation calibrated in International Units.

The International Unit is the activity contained in a stated amount of the International Reference Preparation.

The equivalence in International Units of the International Reference Preparation is stated by the World Health Organization.

**Method.**

Use a suitable coagulation analyser or carry out the assay with incubation tubes and reagents maintained in a water-bath at 37 °C.

**Solution A** Prepare a solution containing 15.12 g/L of 1,4-piperazinediethanesulfonic acid R, 5.73 g/L of sodium chloride R, 0.74 g/L of sodium edetate R and 10 g/L of bovine albumin R; adjust to pH 7.2 with sodium hydroxide R.

Prepare 3 different solutions of the preparation to be examined and of the reference preparation, by diluting with solution A, to obtain concentrations within the linearity range (0.002–0.15 IU/mL). Prepare in duplicate and use the solutions immediately.

To 40 µL of each solution, add 40 µL of *factor VII-deficient plasma R*, incubate for an appropriate time at 37 °C, and add 40 µL of *human tissue factor solution R*.

Measure the coagulation time, i.e. the interval between the addition of the human tissue factor solution and the first indication of the formation of fibrin.

The volumes given above and sequence of reagents may be adapted to the human tissue factor solution and apparatus used.

Calculate the activity in International Units per millilitre using an appropriate statistical method, for example the parallel-line assay (5.3).

The confidence limits ( $P = 0.95$ ) are not less than 80 per cent and not more than 125 per cent of the estimated potency.

**LABELLING**

The label states:

- the content of human coagulation factor VIIa (rDNA), in milligrams per millilitre;
- the specific activity, in International Units per milligram of protein.

Ph Eur

**Dried Factor VIII (rDNA)**

(*Human Coagulation Factor VIII (rDNA)*), Ph. Eur. monograph 1643)

**Action and use**

Coagulation factor VIII substitute.

Ph Eur

**DEFINITION**

Human coagulation factor VIII (rDNA) is a freeze-dried preparation of glycoproteins having the same activity as coagulation factor VIII in human plasma. It acts as a cofactor of the activation of factor X in the presence of factor IXa, phospholipids and calcium ions.

Human coagulation factor VIII circulates in plasma mainly as a two-chain glycosylated protein with 1 heavy (relative molecular mass of about 200 000) and 1 light (relative molecular mass 80 000) chain held together by divalent metal ions. Human coagulation factor VIII (rDNA) is prepared as full-length factor VIII (octocog alfa), or as a shortened two-chain structure (relative molecular mass 90 000 and 80 000), in which the B-domain has been deleted from the heavy chain (morococog alfa).

Full-length human rDNA coagulation factor VIII contains 25 potential *N*-glycosylation sites, 19 in the B domain of the heavy chain, 3 in the remaining part of the heavy chain (relative molecular mass 90 000) and 3 in the light chain (relative molecular mass 80 000). The different products are characterised by their molecular size and post-translational modification and/or other modifications.

**PRODUCTION**

Human coagulation factor VIII (rDNA) is produced by recombinant DNA technology in mammalian cell culture. It is produced under conditions designed to minimise microbial contamination.

Purified bulk factor VIII (rDNA) may contain added human albumin and/or other stabilising agents, as well as other auxiliary substances to provide, for example, correct pH and osmolality.

The specific activity is not less than 2000 IU of factor VIII:C per milligram of total protein before the addition of any protein stabiliser, and varies depending on purity and the type of modification of molecular structure of factor VIII.

The quality of the bulk preparation is controlled using one or more manufacturer's reference preparations as reference.

**MANUFACTURER'S REFERENCE PREPARATIONS**

During development, reference preparations are established for subsequent verification of batch consistency during production, and for control of bulk and final preparation. They are derived from representative batches of purified bulk factor VIII (rDNA) that are extensively characterised by tests including those described below and whose procoagulant and other relevant functional properties have been ascertained and compared, wherever possible, with the International Standard for factor VIII concentrate. The reference preparations are suitably characterised for their intended purpose and are stored in suitably sized aliquots under conditions ensuring their stability.

**PURIFIED BULK FACTOR VIII (RDNA)**

The purified bulk complies with a suitable combination of the following tests for characterisation of integrity of the factor VIII (rDNA). Where any substance added during preparation of the purified bulk interferes with a test, the test is carried out before addition of that substance. Where applicable, the characterisation tests may alternatively be carried out on the finished product.

**Specific biological activity or ratio of factor VIII activity to factor VIII antigen**

Carry out the assay of human coagulation factor VIII (2.7.4). The protein content, or where a protein stabiliser is present, the factor VIII antigen content, is determined by a suitable method and the specific biological activity or the ratio of factor VIII activity to factor VIII antigen is calculated.

**Protein composition**

The protein composition is determined by a selection of appropriate characterisation techniques which may include peptide mapping, Western blots, HPLC, gel electrophoresis, capillary electrophoresis, mass spectrometry or other techniques to monitor integrity and purity. The protein composition is comparable to that of the manufacturer's reference preparation.

**Molecular size distribution**

Using size-exclusion chromatography (2.2.30), the molecular size distribution is comparable to that of the manufacturer's reference preparation.

**Peptide mapping (2.2.55)**

There is no significant difference between the test protein and the manufacturer's reference preparation.

**Carbohydrates/sialic acid**

To monitor batch-to-batch consistency, the monosaccharide content and the degree of sialylation or the oligosaccharide profile are monitored and correspond to those of the manufacturer's reference preparation.

**FINAL LOT**

It complies with the requirements under Identification, Tests and Assay.

**Excipients**

80 per cent to 120 per cent of the stated content, determined by a suitable method, where applicable.

**CHARACTERS****Appearance**

White or slightly yellow powder or friable mass.

**IDENTIFICATION**

- A. It complies with the limits of the assay.
- B. The distribution of characteristic peptide bands corresponds with that of the manufacturer's reference preparation (SDS-PAGE or Western blot).

**TESTS**

Reconstitute the preparation as stated on the label immediately before carrying out the tests (except those for solubility and water) and assay.

**Solubility**

It dissolves within 5 min at 20-25 °C, giving a clear or slightly opalescent solution.

**pH (2.2.3)**

6.5 to 7.5.

**Osmolality (2.2.35)**

Minimum 240 mosmol/kg.

**Water**

Determined by a suitable method, such as the semi-micro determination of water (2.5.12), loss on drying (2.2.32) or near-infrared spectroscopy (2.2.40), the water content is within the limits approved by the competent authority.

**Sterility (2.6.1)**

It complies with the test for sterility.

**Bacterial endotoxins (2.6.14)**

Less than 3 IU in the volume that contains 100 IU of factor VIII activity.

**ASSAY**

Carry out the assay of human coagulation factor VIII (2.7.4).

The estimated potency is not less than 80 per cent and not more than 125 per cent of the stated potency.

The confidence limits ( $P = 0.95$ ) are not less than 80 per cent and not more than 120 per cent of the estimated potency.

**STORAGE**

Protected from light.

**LABELLING**

The label states:

- the factor VIII content in International Units,
- the name and amount of any excipient,
- the composition and volume of the liquid to be used for reconstitution.

Ph Eur

**Dried Factor VIII Fraction**

(Human Coagulation Factor VIII, Ph. Eur. monograph 0275)

**Action and use**

Coagulation factor VIII substitute.

Ph Eur

**DEFINITION**

Sterile, freeze-dried preparation of a plasma protein fraction containing the glycoprotein human coagulation factor VIII together with varying amounts of human von Willebrand factor, depending on the method of preparation. It is prepared from human plasma that complies with the monograph on *Human plasma for fractionation (0853)*.

The preparation may contain excipients such as stabilisers.

The potency of the preparation, reconstituted as stated on the label, is not less than 20 IU of factor VIII:C per millilitre.

**PRODUCTION****GENERAL PROVISIONS**

The method of preparation is designed to maintain functional integrity of human coagulation factor VIII and to

minimise potential neoantigenicity. It includes a step or steps that have been shown to remove or to inactivate known agents of infection; if substances are used for the inactivation of viruses, the subsequent purification procedure must be validated to demonstrate that the concentration of these substances is reduced to a suitable level and that any residues are such as not to compromise the safety of the preparation for patients.

The specific activity is not less than 1 IU of factor VIII:C per milligram of total protein before the addition of any protein stabiliser.

The human coagulation factor VIII fraction is dissolved in a suitable liquid. No antimicrobial preservative or antibiotic is added. The solution is passed through a bacteria-retentive filter, distributed aseptically into the final containers and immediately frozen. It is subsequently freeze-dried and the containers are closed under vacuum or under an inert gas.

#### CONSISTENCY OF THE METHOD OF PRODUCTION

*Products stated to have human von Willebrand factor activity (products intended for treatment of von Willebrand's disease).* It shall be demonstrated by suitable analytical procedures determined during process development that the manufacturing process yields a product with a consistent composition with respect to human von Willebrand factor. This composition may be characterised in a number of ways. For example, the distribution of the different human von Willebrand factor multimers may be determined by sodium dodecyl sulfate (SDS) agarose gel electrophoresis (about 1 per cent agarose) with or without Western blot analysis, using a normal human plasma pool as reference. Visualisation of the multimeric pattern may be performed using, for example, an immunoenzymatic technique and quantitative evaluation may be carried out by densitometric analysis.

*Products that show flakes or particles after reconstitution for use* If a few small flakes or particles remain when the preparation is reconstituted, it shall be demonstrated during validation studies that the potency is not significantly affected after passage of the preparation through the filter provided.

#### CHARACTERS

##### Appearance

White or pale yellow, hygroscopic powder or friable solid.

*Reconstitute the preparation to be examined as stated on the label immediately before carrying out the identification, tests (except those for solubility and water) and assay.*

#### IDENTIFICATION

It complies with the limits of the assay.

#### TESTS

##### Solubility

To a container of the preparation to be examined, add the volume of the liquid stated on the label at the recommended temperature. The preparation dissolves completely with gentle swirling within 10 min, giving a clear or slightly opalescent, colourless or slightly yellow solution.

Where the label states that the product may show a few small flakes or particles after reconstitution, reconstitute the preparation as described on the label and pass it through the filter provided: the filtered solution is clear or slightly opalescent.

##### pH (2.2.3)

6.5 to 7.5.

##### Osmolality (2.2.35)

Minimum 240 mosmol/kg.

##### Total protein

If necessary, dilute an accurately measured volume of the reconstituted preparation with a 9 g/L solution of sodium chloride R to obtain a protein concentration of about 7.5 mg/mL. Place 2.0 mL of this solution in a round-bottomed centrifuge tube and add 2 mL of a 75 g/L solution of sodium molybdate R and 2 mL of a mixture of 1 volume of nitrogen-free sulfuric acid R and 30 volumes of water R. Shake, centrifuge for 5 min, decant the supernatant and allow the inverted tube to drain on filter paper. Determine the nitrogen in the residue by the method of sulfuric acid digestion (2.5.9) and calculate the amount of protein by multiplying the result by 6.25. *For some products, especially those without a protein stabiliser such as albumin, this method may not be applicable and another validated method for protein determination must therefore be performed.*

##### Anti-A and anti-B haemagglutinins (2.6.20, Method A)

The 1 to 64 dilution does not show agglutination. Dilute the reconstituted preparation with a 9 g/L solution of sodium chloride R to contain 3 IU of factor VIII:C per millilitre.

##### Water

Determined by a suitable method, such as semi-micro determination of water (2.5.12), loss on drying (2.2.32) or near-infrared spectroscopy (2.2.40), the water content is within the limits approved by the competent authority.

##### Sterility (2.6.1)

It complies with the test.

##### Pyrogens (2.6.8) or Bacterial endotoxins (2.6.14)

It complies with the test for pyrogens or, preferably and where justified and authorised, with a validated *in vitro* test such as the test for bacterial endotoxins.

For the pyrogen test, inject per kilogram of the rabbit's mass a volume equivalent to not less than 50 IU of factor VIII:C.

Where the test for bacterial endotoxins is used, the preparation to be examined contains less than 0.03 IU of endotoxin per International Unit of factor VIII:C.

#### ASSAY

##### Human coagulation factor VIII (2.7.4)

The estimated potency is not less than 80 per cent and not more than 120 per cent of the stated potency.

The confidence limits ( $P = 0.95$ ) are not less than 80 per cent and not more than 120 per cent of the estimated potency.

##### Human von Willebrand factor (2.7.21)

If preparations are intended for the treatment of von Willebrand's disease, the estimated potency is not less than 60 per cent and not more than 140 per cent of the stated potency.

*Pending the availability of an International Standard for human von Willebrand factor concentrate calibrated for use in the collagen-binding assay, only the ristocetin cofactor assay may be used.*

#### STORAGE

In an airtight container, protected from light.

#### LABELLING

*The label states:*

- the number of International Units of factor VIII:C and, where applicable, of human von Willebrand factor in the container;
- the amount of protein in the container;
- the name and quantity of any added substance;

- the name and volume of the liquid to be used for reconstitution;
- where applicable, that the preparation may show the presence of a few small flakes or particles after reconstitution;
- that the transmission of infectious agents cannot be totally excluded when medicinal products prepared from human blood or plasma are administered.

Ph Eur

### DEFINITION

Solution containing closely related glycoproteins, which have the same amino acid sequence (415 amino acids) as the naturally occurring Ala 148 allelic form analogue (plasma-derived coagulation factor IX). It is a single-chain glycoprotein with structural and functional characteristics similar to those of the endogenous factor IX. It may contain buffer salts and/or non-proteinaceous stabilisers.

### Content

Minimum 150 IU per millilitre.

### Potency

200 to 360 IU per milligram of protein.

### PRODUCTION

Human coagulation factor IX (rDNA) is produced in mammalian cells by a method based on recombinant DNA technology (rDNA). The method of preparation is designed to maintain the functional integrity of factor IX, and to minimise the activation of human coagulation factor IX (rDNA) (to minimise potential thrombogenicity).

No antibiotic or antimicrobial preservative is added.

Prior to release, the following tests are carried out on each batch of human coagulation factor IX (rDNA) concentrated solution, unless exemption has been granted by the competent authority.

#### Host-cell-derived proteins

The limit is approved by the competent authority.

#### Host-cell- and vector-derived DNA

The limit is approved by the competent authority

#### Glycan analysis

Use a suitable method developed according to general chapter 2.2.59. *Glycan analysis of glycoproteins*, Section 2-3.

— Release the glycans using one of the agents described in Table 2.2.59.-1, for example peptide *N*-glycosidase F (PNGase F).

— Label the released glycans with one of the fluorescent labelling agents described in Table 2.2.59.-2, for example 2-aminobenzamide.

— Analyse the labelled glycans by liquid chromatography (2.2.29) using a high-pH-resistant column with fluorescence detection.

The following procedure is given as an example.

**Test solution** Dilute the preparation to be examined with the formulation buffer (see Tests) to obtain a concentration of about 2 mg/mL. Use 50 µL of this solution to proceed to glycan release and labelling. Resuspend or dilute the labelled glycans in 200 µL of water R.

**Reference solution (a)** Dissolve the contents of a vial of human coagulation factor IX (rDNA) CRS in the formulation buffer (see Tests) to obtain a concentration of about 2 mg/mL. Use 50 µL of this solution to proceed to glycan release and labelling. Resuspend or dilute the labelled glycans in 200 µL of water R.

**Reference solution (b)** Use a suitable human coagulation factor IX (rDNA) in-house reference preparation shown to be representative of batches tested clinically and batches used to demonstrate consistency of production. Dilute with the formulation buffer to obtain a concentration of about 2 mg/mL. Use 50 µL of this solution to proceed to glycan release and labelling. Resuspend or dilute the labelled glycans in 200 µL of water R.

**Blank solution** Use 50 µL of the formulation buffer to proceed to glycan release and labelling.

Analyse the labelled glycans by liquid chromatography (2.2.29).

#### Precolumn:

- size: *l* = 0.01 m, Ø = 4.6 mm;
- stationary phase: polyamine grafted poly(vinyl alcohol) copolymer R.

#### Column:

- size: *l* = 0.25 m, Ø = 4.6 mm;
- stationary phase: polyamine grafted poly(vinyl alcohol) copolymer R (5 µm).
- temperature: 50 °C.

#### Mobile phase:

- mobile phase A: water for chromatography R, glacial acetic acid R, acetonitrile R (1:2:97 V/V/V);

BLOOD-RELATED PRODUCTS

Figure 2522.-1. – Chromatogram for the test for glycan analysis of human coagulation factor IX (rDNA)

— mobile phase B: concentrated ammonia R, glacial acetic acid R, water for chromatography R (1:3:96 V/V/V);

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 2	70	30
2 - 67	70 → 0	30 → 100
67 - 70	0	100
70 - 70.1	0 → 70	100 → 30
70.1 - 95	70	30

Flow rate 0.5 mL/min.

Detection Fluorimeter at 330 nm for excitation and 420 nm for emission.

Injection 20 µL, using an automatic injector maintained at 2-8 °C.

If carry-over of material is observed, running a blank gradient after each injection may be appropriate.

**Identification of peak groups** Use the chromatogram in Figure 2522.-1 to identify the 5 groups of oligosaccharides corresponding to P0 neutral, P1 mono-, P2 di-, P3 tri- and P4 tetrasialylated oligosaccharides. Record the retention times of the most prominent peaks in groups P0 to P4. Calculate the relative retentions of the most prominent peaks in groups P0 to P3 with reference to the most prominent peak in group P4.

Calculate the tetrasialylated peak area ratio for the test solution using the following expression:

$$\frac{A_{P4}}{\sum_{i=0}^3 A_{Pi}}$$

$A_{P4}$  = peak area of group P4;  
 $A_{Pi}$  = peak area of groups P0 to P3.

**System suitability:**

- the chromatogram obtained with reference solution (a) is qualitatively similar to the chromatogram supplied with human coagulation factor IX (rDNA) CRS; 5 groups of oligosaccharide peaks corresponding to P0 neutral, P1 mono-, P2 di-, P3 tri- and P4 tetrasialylated oligosaccharides are present; group P4 includes the highest peak, and P3 the second-highest peak;
- no significant peaks are observed in regions P0 to P4 in the chromatogram obtained with the blank solution.

**Results:**

- the profile of the chromatogram obtained with the test solution corresponds to that of the chromatogram obtained with reference solution (b);
- the relative retentions of the most prominent peaks in groups P0 to P3 in the chromatogram obtained with the test solution correspond to those in the chromatogram obtained with reference solution (b);
- the tetrasialylated peak area ratio for the test solution is within the limits authorised by the competent authority.

## CHARACTERS

### Appearance

Clear, colourless liquid.

### IDENTIFICATION

A. It forms a clot when examined in the conditions described under Assay (Potency).

B. Peptide mapping (2.2.55).

### SELECTIVE CLEAVAGE OF THE PEPTIDE BONDS

**Solution A** Dissolve 143.3 g of guanidine hydrochloride R, 9.086 g of tris(hydroxymethyl)aminomethane R and 0.931 g of sodium edetate R in 250 mL of water R and adjust to pH 8.0 ± 0.1 with hydrochloric acid R.

**Test solution** Dilute the preparation to be examined with the formulation buffer (see Tests) to obtain a concentration of about 1.5 mg/mL.

**Reference solution** Dissolve the contents of a vial of *human coagulation factor IX (rDNA) CRS* in the formulation buffer (see Tests) to obtain a concentration of about 1.5 mg/mL.

**Reduction and alkylation** To 67 µL of the test solution add 28 µL of *water R*, 100 µL of solution A, then 5 µL of a 30.85 g/L solution of *dithiothreitol R*, mix well and centrifuge briefly. Overlay with nitrogen. Incubate in a water-bath at 40 °C for 1 h. Add 6.6 µL of a freshly prepared 115.04 g/L solution of *iodoacetic acid R*, mix well and centrifuge briefly. Overlay with nitrogen. Incubate at room temperature for 1 h protected from light. Add 5.3 µL of a 30.85 g/L solution of *dithiothreitol R* and mix well. Add 188.1 µL of *water R*.

**Digestion** To the reduced solution prepared previously, add 10 µL of a freshly prepared 3.4 U/mL solution of *lysyl endopeptidase R*, mix well and centrifuge briefly. Overlay with nitrogen. Incubate at 30 °C for 4 h. Mix 90 µL of the digested solution and 180 µL of a 33.22 g/L solution of *sodium edetate R*.

Carry out the reduction/alkylation and digestion steps for the reference solution in the same manner as for the test solution.

**CHROMATOGRAPHIC SEPARATION**

Liquid chromatography (2.2.29).

**Column:**

- size:  $l = 0.25$  m,  $\varnothing = 2.1$  mm;
- stationary phase: end-capped octadecylsilyl silica gel for chromatography R (5 µm) with a pore size of 30 nm;
- temperature: 25 °C.

**Mobile phase:**

- mobile phase A: add 0.5 mL of *trifluoroacetic acid R* to 1000 mL of *water for chromatography R* and degas;
- mobile phase B: mix 0.5 mL of *trifluoroacetic acid R*, 50 mL of *water for chromatography R* and 950 mL of *acetonitrile R1* and degas;

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 5	97	3
5 - 35	97 → 85	3 → 15
35 - 60	85 → 81	15 → 19
60 - 81	81 → 74	19 → 26
81 - 101	74 → 71	26 → 29
101 - 135	71 → 60	29 → 40
135 - 140	60 → 0	40 → 100
140 - 150	0	100
150 - 150.01	0 → 97	100 → 3
150.01 - 190	97	3
190 - 191	97 → 50	3 → 50
191 - 251	50	50

**Flow rate** 0.25 mL/min.

**Detection** Spectrophotometer at 214 nm.

**Injection** 240 µL, using an automatic injector maintained at 2-8 °C.

**System suitability:**

- the chromatogram obtained with the reference solution is qualitatively similar to the chromatogram supplied with *human coagulation factor IX (rDNA) CRS*;
- all peaks identified in the chromatogram supplied with *human coagulation factor IX (rDNA) CRS* are visible in

the chromatogram obtained with the reference solution.

**Results:**

- the profile of the chromatogram obtained with the test solution corresponds to that of the chromatogram obtained with the reference solution;
- no new major peaks are observed in the chromatogram obtained with the test solution in comparison to the chromatogram obtained with the reference solution.

**C. Polyacrylamide gel electrophoresis (2.2.31).**

Examine the electropherograms obtained in the test for impurities with molecular masses differing from that of *human coagulation factor IX (rDNA)*.

Calculate the relative mobility (in per cent) of the main band in the electropherogram obtained with the test solution with reference to the mobility of the main band in the electropherogram obtained with reference solution (a), using the following expression:

$$\frac{M_1 - M_2}{M_2} \times 100$$

- $M_1$  = molecular mass of the main band in the electropherogram obtained with the test solution;
- $M_2$  = molecular mass of the main band in the electropherogram obtained with reference solution (a).

**Results:**

- the electropherogram obtained with the test solution is similar to the electropherogram obtained with reference solution (a);
- the mobility of the main band in the electropherogram obtained with the test solution is within 10 per cent of that of the main band in the electropherogram obtained with reference solution (a).

**TESTS**

**Formulation buffer**

Dissolve 19.53 g of *glycine R*, 1.55 g of *histidine R* and 10.00 g of *sucrose R* in 1000 mL of *water R*. Add 50 µL of *polysorbate 80 R* and adjust to pH 6.8 with *hydrochloric acid R*.

**Gamma-carboxyglutamic acid (Gla)**

Liquid chromatography (2.2.29): use the normalisation procedure.

**Test solution** Dilute the preparation to be examined with the formulation buffer to obtain a concentration of about 1 mg/mL.

**Reference solution** Dissolve the contents of a vial of *human coagulation factor IX (rDNA) CRS* in the formulation buffer to obtain a concentration of about 1 mg/mL.

**Blank solution** The formulation buffer.

**Column:**

- size:  $l = 0.05$  m,  $\varnothing = 5$  mm;
- stationary phase: strongly basic anion-exchange resin for chromatography R (10 µm).

**Mobile phase:**

- mobile phase A: solution containing 2.42 g/L of *tris(hydroxymethyl)aminomethane R*, adjusted to pH 9.0 with *hydrochloric acid R*;
- mobile phase B: solution containing 2.42 g/L of *tris(hydroxymethyl)aminomethane R* and 58.45 g/L of *sodium chloride R*, adjusted to pH 9.0 with *hydrochloric acid R*;

BLOOD-RELATED PRODUCTS

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 40	70 → 60	30 → 40
40 - 49	60 → 0	40 → 100
49 - 50	0 → 70	100 → 30
50 - 71	70	30

Flow rate 0.75 mL/min.

Detection Spectrophotometer at 214 nm.

Injection 50 µL; perform at least 3 injections using an automatic injector maintained at 2-8 °C.

**Relative retention** With reference to human coagulation factor IX (rDNA) containing 12 Gla residues per molecule (12 Gla, retention time = about 25 min): 9Gla = 0.60; 10Gla = 0.75; 11Gla = 0.85. **NOTE:** molecular species containing 9 or fewer Gla residues per molecule of human coagulation factor IX (rDNA) may not be present in the preparation.

**System suitability** Reference solution:

- **repeatability:** maximum relative standard deviation of 3 per cent for the total area of the peak due to human coagulation factor IX (rDNA), determined on 3 injections performed immediately before the run;
- the 10Gla peak is visible and is similar to the corresponding peak in the chromatogram supplied with *human coagulation factor IX (rDNA) CRS*;
- **peak-to-valley ratio:** minimum 1.2, where  $H_p$  = height above the baseline of the peak due to 11Gla, and  $H_v$  = height above the baseline of the lowest point of the curve separating this peak from the peak due to 12Gla.

**Results:**

- **repeatability:** maximum relative standard deviation of 3 per cent for the total area of the peak due to human coagulation factor IX (rDNA), determined on 3 injections of the test solution;
- the profile of the chromatogram obtained with the test solution corresponds to that of the chromatogram obtained with the reference solution.

Calculate the total Gla content using the following expression:

$$\sum_{i=9}^{12} \frac{A_{Fi}}{\text{total peak area}} \times i \text{ Gla.mol}^{-1}$$

- $A_{Fi}$ : area of the concerned peak (9Gla, 10Gla, 11Gla or 12Gla); any shoulder appearing on the descending part of the 12Gla peak is included in the area of the 12Gla peak;
- **total peak area:** sum of the areas of peaks 9Gla to 12Gla;
- $i \text{ Gla.mol}^{-1}$ : 9, 10, 11 or 12, corresponding to the theoretical number of Gla residues per mole of human coagulation factor IX (rDNA) for the concerned peak.

**Limit:**

- 11.0 to 12.0 moles of Gla per mole of human coagulation factor IX (rDNA).

#### Related proteins and impurities

Liquid chromatography (2.2.29).

**Test solution** Dilute the preparation to be examined with the formulation buffer to obtain a concentration of about 0.5 mg/mL.

**Reference solution** Dissolve the contents of a vial of *human coagulation factor IX (rDNA) CRS* in the formulation buffer to obtain a concentration of about 0.5 mg/mL.

**Column:**

- size:  $l = 0.10 \text{ m}$ ,  $\varnothing = 4.6 \text{ mm}$ ;

— **stationary phase:** styrene-divinylbenzene copolymer R (10 µm) with a pore size of 400 nm;

— **temperature:** 37 °C.

**Mobile phase:**

- **mobile phase A:** add 1 mL of *trifluoroacetic acid R* to 1000 mL of *water for chromatography R*;
- **mobile phase B:** mix 1 mL of *trifluoroacetic acid R*, 200 mL of *water for chromatography R* and 800 mL of *acetonitrile R1*.

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 0.5	75	25
0.5 - 30	75 → 20	25 → 80
30 - 31	20 → 0	80 → 100
31 - 33	0	100

Flow rate 2.0 mL/min.

Detection Spectrophotometer at 214 nm.

Injection 100 µL; perform at least 3 injections using an automatic injector.

**Relative retention** With reference to the 2<sup>nd</sup> peak of the double peak due to human coagulation factor IX (rDNA) (retention time = about 12-14 min): related protein A = about 0.75; related protein B = about 0.78; related protein C = about 0.80; related protein D = about 0.85; related protein E = about 0.93.

**System suitability** Reference solution:

- the chromatogram obtained is qualitatively similar to the chromatogram supplied with *human coagulation factor IX (rDNA) CRS*;
- **repeatability:** maximum relative standard deviation of 3 per cent for the total area of the peak due to human coagulation factor IX (rDNA) after 3 injections performed immediately before the run;
- **peak-to-valley ratio:** minimum 1.2, where  $H_p$  = height above the baseline of the peak due to related protein E and  $H_v$  = height above the baseline of the lowest point of the curve separating this peak from the peak due to human coagulation factor IX (rDNA).

Report individual relative peak areas considering the peak area of the entire chromatogram. Individual relative per cent peak areas are calculated as the average of the 3 injections of the test solution.

**Results:**

- the profile of the chromatogram obtained with the test solution corresponds to that of the chromatogram obtained with the reference solution, except for minor peaks due to impurities, that may be absent in the chromatogram obtained with the test solution.

**Limits:**

- **related protein C:** maximum 0.6 per cent;
- **total impurities** (all peaks not eluted at the positions expected for *human coagulation factor IX (rDNA)* and its related proteins): maximum 1.0 per cent.

**Impurities with molecular masses differing from that of human coagulation factor IX (rDNA)**

Polyacrylamide gel electrophoresis (2.2.31) using a gradient gel with the following modifications.

**Gel dimensions** 1.0 mm thick.

**Resolving gel** 3-15 per cent acrylamide gradient gel.

**Acrylamide solution** 30 per cent acrylamide/bisacrylamide (36.5:1) solution R.

To prepare a 15 per cent acrylamide solution, add *sucrose R* to obtain a concentration of 142 g/L.

The following elements are provided as examples for loading the gel forming apparatus to prepare the stacking gel.

**Stacking gel** The stacking gel solution is prepared by mixing:

- 100 volumes of 30 per cent acrylamide/bisacrylamide (36.5:1) solution *R*;
- 125 volumes of 1 M tris-hydrochloride buffer solution pH 6.8 *R*;
- 740.5 volumes of water *R*;
- 1.5 volumes of tetramethylethylenediamine *R*;
- 33 volumes of a 150 mg/mL solution of ammonium persulfate *R*.

Load the compartments of the gradient-forming apparatus with the acrylamide solutions and proceed as per the instructions of the equipment supplier to obtain the polymerised gradient gel.

After polymerisation is completed, rinse the gradient gel with water *R*. Remove any excess liquid. Pour the stacking gel solution into the equipment, insert a clean comb and allow for polymerisation.

Alternatively, commercially available gradient gels may be used.

**Test solution** Dilute the preparation to be examined with the formulation buffer to obtain a concentration of about 1 mg/mL.

**Reference solution (a)** Dissolve the contents of a vial of human coagulation factor IX (rDNA) CRS in the formulation buffer to obtain a concentration of about 1 mg/mL.

**Reference solution (b)** 0.01-mg/mL solution of bovine albumin *R* in the formulation buffer.

**Reference solution (c)** A solution of molecular mass markers suitable for calibrating SDS-polyacrylamide gels in the range of 5-200 kDa.

**Sample buffer** Concentrated SDS-PAGE sample buffer for reducing conditions *R* containing dithiothreitol as the reducing agent.

**Sample treatment** Incubate in a water-bath for 5 min.

**Application** 35 µL.

Use SDS-PAGE running buffer *R* for running the gel.

For each gel, run 1 lane with reference solution (b), 2 lanes with reference solution (c), 2 lanes with the incubated reducing buffer (as blank) and at least 1 lane with reduced reference solution (a); use the remaining lanes for reduced test solutions.

**Detection** By Coomassie staining.

**Identification of bands** Human coagulation factor IX (rDNA) has an approximate molecular mass of 55 kDa, and related protein bands with molecular masses of approximately 54 kDa, 44 kDa, 29-32 kDa, 27 kDa and 14 kDa are present.

**System suitability:**

- a clear background is obtained after destaining;
- the band in the electropherogram obtained with reference solution (b) is clearly visible;
- all expected bands in the electropherogram obtained with reference solution (c) are visible;
- the bands in the electropherogram obtained with reference solution (c) are clearly separated;
- no band is visible in the blank lanes.

**Results:**

- the electropherogram obtained with the test solution is similar to the electropherogram obtained with reference solution (a);
- no new band in the electropherogram obtained with the test solution has an intensity greater than that of the band in the electropherogram obtained with reference solution (b).

**Impurities with molecular masses greater than that of human coagulation factor IX (rDNA)**

Size-exclusion chromatography (2.2.30): use the normalisation procedure.

**Test solution** Dilute the preparation to be examined with the formulation buffer to obtain a concentration of about 400 µg/mL.

**Reference solution** Dissolve the contents of a vial of human coagulation factor IX (rDNA) CRS in the formulation buffer to obtain a concentration of about 400 µg/mL.

**Resolution solution** Dissolve the contents of a vial of human coagulation factor IX (rDNA) CRS in the formulation buffer to obtain a concentration of about 400 µg/mL. Desalt and concentrate the preparation to be examined using a suitably validated procedure. Reconstitute the recovered material in 0.1 M phosphate buffer solution pH 8.0 *R* to obtain a concentration of 400 µg/mL. To 500 µL of this solution add 1.4 µL of a 250 mg/L solution of glutaraldehyde *R*. Mix and incubate at 37 °C for 120 min.

**Blank solution** The formulation buffer.

**Precolumn:**

- size:  $l = 0.04$  m,  $\varnothing = 6$  mm;
- stationary phase: hydrophilic silica gel for chromatography *R* (5 µm) of a grade suitable for the fractionation of globular proteins in the relative molecular mass range of 10 000 to 500 000.

**Column:**

- size:  $l = 0.30$  m,  $\varnothing = 7.8$  mm;
- stationary phase: hydrophilic silica gel for chromatography *R* (5 µm) of a grade suitable for the fractionation of globular proteins in the relative molecular mass range of 10 000 to 500 000.

**Mobile phase** Dissolve 7.10 g of anhydrous disodium hydrogen phosphate *R* and 8.77 g of sodium chloride *R* in 1000 mL of water for chromatography *R*. Adjust to pH 7.00 ± 0.05 with phosphoric acid *R*.

**Flow rate** 1.0 mL/min.

**Detection** Spectrophotometer at 214 nm.

**Injection** 50 µL; perform 3 injections using an automatic injector maintained at 2-8 °C.

**Retention time** Human coagulation factor IX (rDNA) = about 9 min.

**System suitability:**

- the chromatogram obtained with the reference solution is qualitatively similar to the chromatogram supplied with human coagulation factor IX (rDNA) CRS;
- peak-to-valley ratio: minimum 2.0, where  $H_p$  = height above the baseline of the peak due to the high molecular mass species and  $H_v$  = height above the baseline of the lowest point of the curve separating this peak from the peak due to human coagulation factor IX (rDNA) in the chromatogram obtained with the resolution solution.

Calculate the relative area (in per cent) of the sum of the peaks with retention times less than that of human coagulation factor IX (rDNA), with reference to the area of

the peak due to human coagulation factor IX (rDNA). Any shoulder appearing on the descending part of the peak due to human coagulation factor IX (rDNA) is included in its area.

**Result:**

— the profile of the chromatogram obtained with the test solution corresponds to that of the chromatogram obtained with the reference solution.

**Limit:**

— sum of the peaks eluted before the principal peak: maximum 1.3 per cent.

**Microbial contamination (2.6.12)**

Maximum 10 CFU/mL.

**Bacterial endotoxins (2.6.14)**

Less than 1 IU per 100 IU of factor IX activity.

**ASSAY**

The specific biological activity of the substance is determined before the addition of any protein stabiliser.

**Protein**

Size-exclusion chromatography (2.2.30) as described in the test for impurities with molecular masses greater than that of human coagulation factor IX (rDNA) with the following modifications.

Prepare triplicate dilutions of the test solution.

**Reference solutions** Dissolve the contents of a vial of *human coagulation factor IX (rDNA) CRS* in the formulation buffer to obtain a concentration of 1 mg/mL. Further dilute this solution to prepare a standard curve with concentrations in the range of 100-800 µg/mL (5 concentrations, typically 100 µg/mL, 200 µg/mL, 400 µg/mL, 600 µg/mL, 800 µg/mL).

Plot peak areas versus injected protein content and perform linear regression to create a standard curve.

**System suitability** (in addition to those described in the test for impurities with molecular masses greater than that of human coagulation factor IX (rDNA)):

— the correlation coefficient ( $r^2$ ) calculated for the standard curve is not less than 0.995.

Calculate the protein concentration of each replicate of the preparation to be examined using the standard curve and the assigned content in *human coagulation factor IX (rDNA) CRS*.

**Potency**

Assay of human coagulation factor IX (2.7.11).

The estimated potency is not less than 80 per cent and not more than 125 per cent of the stated potency.

The confidence limits ( $P = 0.95$ ) are not less than 80 per cent and not more than 120 per cent of the estimated potency.

*Human coagulation factor IX concentrate BRP* is suitable for use as a reference preparation.

**STORAGE**

In an airtight container, under approved conditions.

**LABELLING**

The label states the factor IX content in International Units per millilitre and in International Units per milligram of protein.

Ph Eur

**Dried Factor IX Fraction**

(*Human Coagulation Factor IX*, Ph. Eur. monograph 1223)

**Action and use**

Coagulation factor IX substitute.

Ph Eur

**DEFINITION**

Sterile freeze-dried preparation of a plasma protein fraction containing coagulation factor IX. It is obtained from human plasma that complies with the monograph on *Human plasma for fractionation (0853)*, by a method that effectively separates human coagulation factor IX from other prothrombin complex factors (human coagulation factors II, VII and X). The preparation may contain excipients such as stabilisers, heparin and antithrombin.

The potency of the preparation, reconstituted as stated on the label, is not less than 20 IU of human coagulation factor IX per millilitre.

**PRODUCTION****GENERAL PROVISIONS**

The method of preparation is designed to maintain functional integrity of human coagulation factor IX and to minimise activation of any coagulation factor (to minimise potential thrombogenicity). It includes a step or steps that have been shown to remove or to inactivate known agents of infection; if substances are used for inactivation of viruses during production, the subsequent purification procedure must be validated to demonstrate that the concentration of these substances is reduced to a suitable level and that any residues are such as not to compromise the safety of the preparation for patients.

The specific activity is not less than 50 IU of human coagulation factor IX per milligram of total protein, before the addition of any protein stabiliser.

The human coagulation factor IX fraction is dissolved in a suitable liquid. No antimicrobial preservative or antibiotic is added. The solution is passed through a bacteria-retentive filter, distributed aseptically into the final containers and immediately frozen. It is subsequently freeze-dried and the containers are closed under vacuum or under an inert gas.

**CONSISTENCY OF THE METHOD OF PRODUCTION**

It shall be demonstrated that the manufacturing process yields a product having a consistent composition. This is evaluated by suitable analytical procedures that are determined during process development and that normally include:

- assay of human coagulation factor IX;
- determination of activated coagulation factors;
- determination of activities of human coagulation factors II, VII and X, which shall be shown to be not more than 5 per cent of the activity of human coagulation factor IX.

**CHARACTERS****Appearance**

White or pale yellow, hygroscopic powder or friable solid.

Reconstitute the preparation to be examined as stated on the label immediately before carrying out the identification, tests (except those for solubility and water) and assay.

**IDENTIFICATION**

It complies with the limits of the assay.

**TESTS****Solubility**

To a container of the preparation to be examined add the volume of the liquid stated on the label at the recommended temperature. The preparation dissolves completely with gentle swirling within 10 min, giving a clear or slightly opalescent, colourless solution.

**pH (2.2.3)**

6.5 to 7.5.

**Osmolality (2.2.35)**

Minimum 240 mosmol/kg.

**Total protein**

If necessary, dilute an accurately measured volume of the reconstituted preparation with a 9 g/L solution of *sodium chloride R* to obtain a solution containing about 15 mg of protein in 2 mL. To 2.0 mL of the solution in a round-bottomed centrifuge tube, add 2 mL of a 75 g/L solution of *sodium molybdate R* and 2 mL of a mixture of 1 volume of *nitrogen-free sulfuric acid R* and 30 volumes of *water R*. Shake, centrifuge for 5 min, decant the supernatant and allow the inverted tube to drain on filter paper. Determine the nitrogen in the residue by the method of sulfuric acid digestion (2.5.9) and calculate the amount of protein by multiplying the result by 6.25. For some products, especially those without a protein stabiliser such as albumin, this method may not be applicable. Another validated method for protein determination must therefore be performed.

**Activated coagulation factors (2.6.22)**

If necessary, dilute the reconstituted preparation to contain 20 IU of human coagulation factor IX per millilitre. For each of the dilutions, the coagulation time is not less than 150 s.

**Heparin (2.7.12)**

If heparin has been added, the preparation to be examined contains not more than the amount of heparin stated on the label and in all cases not more than 0.5 IU of heparin per International Unit of human coagulation factor IX.

**Water**

Determined by a suitable method, such as semi-micro determination of water (2.5.12), loss on drying (2.2.32) or near-infrared spectroscopy (2.2.40), the water content is within the limits approved by the competent authority.

**Sterility (2.6.1)**

It complies with the test.

**Pyrogens (2.6.8) or Bacterial endotoxins (2.6.14)**

It complies with the test for pyrogens or, preferably and where justified and authorised, with a validated *in vitro* test such as the test for bacterial endotoxins.

For the pyrogen test, inject per kilogram of the rabbit's mass a volume equivalent to not less than 50 IU of human coagulation factor IX.

Where the test for bacterial endotoxins is used, the preparation to be examined contains less than 0.03 IU of endotoxin per International Unit of human coagulation factor IX.

**ASSAY****Human coagulation factor IX (2.7.11)**

The estimated potency is not less than 80 per cent and not more than 125 per cent of the stated potency.

The confidence limits ( $P = 0.95$ ) are not less than 80 per cent and not more than 125 per cent of the estimated potency.

**STORAGE**

In an airtight container, protected from light.

**LABELLING**

The label states:

- the number of International Units of human coagulation factor IX per container;
- the amount of protein per container;
- the name and quantity of any added substances including, where applicable, heparin;
- the name and volume of the liquid to be used for reconstitution;
- that the transmission of infectious agents cannot be totally excluded when medicinal products prepared from human blood or plasma are administered.

Ph Eur

**Dried Factor XI Fraction**

(Human Coagulation Factor XI, Ph. Eur. monograph 1644)

**Action and use**

Coagulation factor XI substitute.

Ph Eur

**DEFINITION**

Sterile plasma protein fraction containing coagulation factor XI. It is prepared from *Human plasma for fractionation (0853)*. The preparation may contain excipients such as heparin, C1-esterase inhibitor and antithrombin III.

The potency of the preparation, reconstituted as stated on the label, is not less than 50 units per millilitre.

**PRODUCTION**

The method of preparation is designed to maintain functional integrity of human coagulation factor XI and to minimise activation of any coagulation factor (to minimise potential thrombogenicity). It includes a step or steps that have been shown to remove or to inactivate known agents of infection; if substances are used for inactivation of viruses during production, the subsequent purification procedure must be validated to demonstrate that the concentration of these substances is reduced to a suitable level and any residues are such as not to compromise the safety of the preparation for patients.

After preparation, the factor XI fraction is dissolved in a suitable liquid. No antimicrobial preservative or antibiotic is added. The solution is distributed into the final containers and immediately frozen. It is subsequently freeze-dried and the containers are closed under vacuum or under inert gas.

**CHARACTERS****Appearance**

White or almost white powder or friable solid.

Reconstitute the preparation to be examined as stated on the label immediately before carrying out the identification, tests (except those for solubility and water) and assay.

**IDENTIFICATION**

It complies with the limits of the assay.

**TESTS****Solubility**

To a container of the preparation to be examined, add the volume of liquid stated on the label at room temperature. The preparation dissolves completely with gentle swirling within 10 min.

**pH (2.2.3)**

6.8 to 7.4.

**Osmolality (2.2.35)**

Minimum 240 mosmol/kg.

**Total protein**

If necessary, dilute an accurately measured volume of the preparation to be examined with a 9 g/L solution of *sodium chloride R* to obtain a protein concentration of about 7.5 mg/mL. Place 2.0 mL of this solution in a round-bottomed centrifuge tube and add 2 mL of a 75 g/L solution of *sodium molybdate R* and 2 mL of a mixture of 1 volume of *nitrogen-free sulfuric acid R* and 30 volumes of *water R*. Shake, centrifuge for 5 min, decant the supernatant and allow the inverted tube to drain on filter paper. Determine the nitrogen in the residue by the method of sulfuric acid digestion (2.5.9) and calculate the amount of protein by multiplying the result by 6.25.

**Activated coagulation factors (2.6.22)**

For each of the dilutions, the coagulation time is not less than 150 s.

**Heparin (2.7.12)**

If heparin has been added, the preparation to be examined contains not more than the amount of heparin stated on the label and in all cases not more than 0.5 IU of heparin per unit of factor XI.

**Antithrombin III (2.7.17)**

If antithrombin III has been added, the preparation to be examined contains not more than the amount of antithrombin III stated on the label.

**C1-esterase inhibitor (2.7.34)**

If C1-esterase inhibitor has been added, the preparation to be examined contains not more than the amount of C1-esterase inhibitor stated on the label.

**Anti-A and anti-B haemagglutinins (2.6.20, Method A)**

The 1 to 64 dilution does not show agglutination.

**Water**

Determined by a suitable method, such as the semi-micro determination of water (2.5.12), loss on drying (2.2.32) or near-infrared spectroscopy (2.2.40), the water content is within the limits approved by the competent authority.

**Sterility (2.6.1)**

It complies with the test.

**Pyrogens (2.6.8) or Bacterial endotoxins (2.6.14)**

It complies with the test for pyrogens or, preferably and where justified and authorised, with a validated *in vitro* test such as the bacterial endotoxin test.

For the pyrogen test, inject per kilogram of the rabbit's mass a volume equivalent to 100 IU of factor XI.

Where the bacterial endotoxin test is used, the preparation to be examined contains less than 0.1 IU of endotoxin per International Unit of factor XI.

**ASSAY**

Carry out the assay of human coagulation factor XI (2.7.22).

The estimated potency is not less than 80 per cent and not more than 120 per cent of the stated potency.

The confidence limits ( $P = 0.95$ ) are not less than 80 per cent and not more than 125 per cent of the estimated potency.

**STORAGE**

Protected from light, at a temperature of 2 °C to 8 °C.

**LABELLING**

The label states:

- the number of units per container;
- the maximum amount of protein per container;
- where applicable, the amount of heparin per container;
- where applicable, the amount of antithrombin III per container;
- where applicable, the amount of C1-esterase inhibitor per container;
- the name and volume of the liquid to be used for reconstitution.

Ph Eur

**Dried Prothrombin Complex**

(Human Prothrombin Complex, Ph. Eur. monograph 0554)

**Action and use**

Coagulation factor IX substitute. Preparations with appropriate activity may be used to correct deficiencies of coagulation factors II or X.

Ph Eur

**DEFINITION**

Sterile plasma protein fraction containing human coagulation factor IX together with variable amounts of human coagulation factors II, VII and X; the presence and proportion of these additional factors depends on the method of fractionation. It is obtained from human plasma that complies with the monograph on *Human plasma for fractionation (0853)*. The preparation may contain excipients such as stabilisers, heparin and antithrombin.

The potency of the preparation, reconstituted as stated on the label, is not less than 20 IU of human coagulation factor IX per millilitre.

If the content of any of the factors is stated as a single value, the estimated potency is not less than 80 per cent and not more than 125 per cent of the stated potency; if the content of any of the factors is stated as a range, the estimated potency is not less than the lower limit and not greater than the upper limit of the stated range.

**PRODUCTION**

The method of preparation is designed to maintain functional integrity of the relevant coagulation factors it contains and to minimise activation of any coagulation factor (to minimise potential thrombogenicity). It includes a step or steps that have been shown to remove or to inactivate known agents of infection; if substances are used for inactivation of viruses during production, the subsequent purification procedure must be validated to demonstrate that the concentration of these substances is reduced to a suitable level and that any residues are such as not to compromise the safety of the preparation for patients.

The specific activity is not less than 0.6 IU of human coagulation factor IX per milligram of total protein, before the addition of any protein stabiliser.

The prothrombin complex fraction is dissolved in a suitable liquid. No antimicrobial preservative or antibiotic is added. The solution is passed through a bacteria-retentive filter, distributed aseptically into the final containers and immediately frozen. It is subsequently freeze-dried and the containers are closed under vacuum or under an inert gas.

**CHARACTERS****Appearance**

White or slightly coloured, very hygroscopic powder or friable solid.

Reconstitute the preparation to be examined as stated on the label immediately before carrying out the identification, tests (except those for solubility and water) and assay.

**IDENTIFICATION**

It complies with the limits of the assays for human coagulation factors IX and II and, where applicable, those for human coagulation factors VII and X.

**TESTS****Solubility**

To a container of the preparation to be examined add the volume of the liquid stated on the label at the recommended temperature. The preparation dissolves completely with gentle swirling within 10 min, giving a clear solution that may be coloured.

**pH (2.2.3)**

6.5 to 7.5.

**Osmolality (2.2.35)**

Minimum 240 mosmol/kg.

**Total protein**

If necessary, dilute an accurately measured volume of the reconstituted preparation with a 9 g/L solution of *sodium chloride R* to obtain a solution containing about 15 mg of protein in 2 mL. To 2.0 mL of the solution in a round-bottomed centrifuge tube add 2 mL of a 75 g/L solution of *sodium molybdate R* and 2 mL of a mixture of 1 volume of *nitrogen-free sulfuric acid R* and 30 volumes of *water R*. Shake, centrifuge for 5 min, decant the supernatant and allow the inverted tube to drain on filter paper. Determine the nitrogen in the residue by the method of sulfuric acid digestion (2.5.9) and calculate the amount of protein by multiplying the result by 6.25.

**Activated coagulation factors (2.6.22)**

If necessary, dilute the reconstituted preparation to contain 20 IU of human coagulation factor IX per millilitre. For each of the dilutions, the coagulation time is not less than 150 s.

**Heparin (2.7.12)**

If heparin has been added during preparation, the preparation to be examined contains not more than the amount of heparin stated on the label and in all cases not more than 0.5 IU of heparin per International Unit of human coagulation factor IX.

**Thrombin**

If the preparation to be examined contains heparin, determine the amount present as described in the test for heparin and neutralise it by addition of *protamine sulfate R* (10 µg of protamine sulfate neutralises 1 IU of heparin). In each of 2 test-tubes, mix equal volumes of the reconstituted preparation and of a 3 g/L solution of *fibrinogen R*. Keep one of the tubes at 37 °C for 6 h and the other at room temperature for 24 h. In a 3<sup>rd</sup> tube, mix equal volumes of the fibrinogen solution and of a solution of *human thrombin R* (1 IU/mL) and place the tube in a water-bath at 37 °C. No coagulation occurs in the tubes containing the preparation to be examined. Coagulation occurs within 30 s in the tube containing thrombin.

**Water**

Determined by a suitable method, such as semi-micro determination of water (2.5.12), loss on drying (2.2.32) or

near-infrared spectrometry (2.2.40), the water content is within the limits approved by the competent authority.

**Sterility (2.6.1)**

It complies with the test.

**Pyrogens (2.6.8) or Bacterial endotoxins (2.6.14)**

It complies with the test for pyrogens or, preferably and where justified and authorised, with a validated *in vitro* test such as the bacterial endotoxin test.

For the pyrogen test, inject per kilogram of the rabbit's mass a volume equivalent to not less than 30 IU of human coagulation factor IX.

Where the bacterial endotoxin test is used, the preparation to be examined contains less than 0.05 IU of endotoxin per International Unit of human coagulation factor IX.

**ASSAY****Human coagulation factor IX (2.7.11)**

The estimated potency is not less than 80 per cent and not more than 125 per cent of the stated potency.

The confidence interval ( $P = 0.95$ ) is not greater than 80 per cent to 125 per cent of the estimated potency.

**Human coagulation factor II (2.7.18)**

The estimated potency is not less than 80 per cent and not more than 125 per cent of the stated potency.

The confidence interval ( $P = 0.95$ ) is not greater than 90 per cent to 111 per cent of the estimated potency.

The estimated human coagulation factor II potency is not less than 70 per cent and not more than 165 per cent of the estimated human coagulation factor IX potency.

**Human coagulation factor VII (2.7.10)**

If the label states that the preparation contains human coagulation factor VII, the estimated potency is not less than 80 per cent and not more than 125 per cent of the stated potency. The confidence interval ( $P = 0.95$ ) is not greater than 80 per cent to 125 per cent of the estimated potency.

**Human coagulation factor X (2.7.19)**

If the label states that the preparation contains human coagulation factor X, the estimated potency is not less than 80 per cent and not more than 125 per cent of the stated potency. The confidence interval ( $P = 0.95$ ) is not greater than 90 per cent to 111 per cent of the estimated potency.

**STORAGE**

In an airtight container, protected from light.

**LABELLING**

The label states:

- the number of International Units of human coagulation factor IX, and the number or range of International Units of human coagulation factor II per container;
- where applicable, the number or range of International Units of human coagulation factor VII and human coagulation factor X per container;
- the amount of protein per container;
- the name and quantity of any added substances, including, where applicable, heparin and antithrombin;
- the name and quantity of the liquid to be used for reconstitution;
- that the transmission of infectious agents cannot be totally excluded when medicinal products prepared from human blood or plasma are administered.

Ph Eur

## Dried Fibrinogen

(Human Fibrinogen, Ph. Eur. monograph 0024)

Ph Eur

### DEFINITION

Sterile, freeze-dried preparation of a plasma protein fraction containing the soluble constituent of human plasma that is transformed to fibrin on the addition of thrombin. It is obtained from human plasma that complies with the monograph on *Human plasma for fractionation (0853)*. The preparation may contain excipients such as salts, buffers and stabilisers.

When reconstituted as stated on the label, the solution contains not less than 10 g/L of fibrinogen.

### PRODUCTION

The method of preparation is designed to maintain functional integrity of human fibrinogen. It includes a step or steps that have been shown to remove or to inactivate known agents of infection; if substances are used for inactivation of viruses during production, the subsequent purification procedure must be validated to demonstrate that the concentration of these substances is reduced to a suitable level and any residues are such as not to compromise the safety of the preparation for patients.

The specific activity (fibrinogen content with respect to total protein content) is not less than 80 per cent before addition of any protein stabiliser. The fibrinogen content is determined by a suitable method such as that described under Assay, and the total protein content is determined by a suitable method such as that described under Total protein in *Human albumin solution (0255)*. Albumin may also be obtained with fibrinogen during fractionation, in which case a specific determination of albumin is carried out by a suitable immunochemical method (2.7.1) and the quantity of albumin determined is subtracted from the total protein content for the calculation of the specific activity.

The protein fraction is dissolved in a suitable liquid. No antimicrobial preservative or antibiotic is added. The solution is passed through a bacteria-retentive filter, distributed aseptically into the final containers and immediately frozen. It is subsequently freeze-dried and the containers are closed under vacuum or under an inert gas.

### CHARACTERS

#### Appearance

White or pale yellow, hygroscopic powder or friable solid.

Reconstitute the preparation to be examined as stated on the label immediately before carrying out the identification, tests (except those for solubility and water) and assay.

### IDENTIFICATION

It complies with the limits of the assay.

### TESTS

#### Solubility

To a container of the preparation to be examined add the volume of liquid stated on the label at the recommended temperature. The preparation dissolves within 30 min at 20–25 °C, forming an almost colourless, slightly opalescent solution.

#### pH (2.2.3)

6.5 to 7.5.

#### Osmolality (2.2.35)

Minimum 240 mosmol/kg.

### Stability of solution

No gel formation appears at 20–25 °C within 60 min following reconstitution.

### Water

Determined by a suitable method, such as semi-micro determination of water (2.5.12), loss on drying (2.2.32) or near-infrared spectroscopy (2.2.40), the water content is within the limits approved by the competent authority.

### Sterility (2.6.1)

It complies with the test.

### Pyrogens (2.6.8) or Bacterial endotoxins (2.6.14)

It complies with the test for pyrogens or, preferably and where justified and authorised, with a validated *in vitro* test such as the test for bacterial endotoxins.

For the pyrogen test, inject per kilogram of the rabbit's mass a volume equivalent to not less than 30 mg of fibrinogen.

Where the test for bacterial endotoxins is used, the preparation to be examined contains less than 0.03 IU of endotoxin per milligram of fibrinogen.

### ASSAY

Mix 0.2 mL of the reconstituted preparation with 2 mL of a suitable buffer solution (pH 6.6–6.8) containing sufficient thrombin (approximately 3 IU/mL) and calcium (0.05 mol/L). Maintain at 37 °C for 20 min, separate the precipitate by centrifugation (5000 g, 20 min) and wash thoroughly with a 9 g/L solution of *sodium chloride R*. Determine the nitrogen content by sulfuric acid digestion (2.5.9) and calculate the fibrinogen (clottable protein) content by multiplying the result by 6.0. The content is not less than 70 per cent and not more than 130 per cent of the stated content of fibrinogen.

### STORAGE

In an airtight container, protected from light.

### LABELLING

The label states:

- the content of fibrinogen in the container;
- the name and volume of the liquid to be used for reconstitution;
- where applicable, the name and amount of protein stabiliser added in the preparation.

Ph Eur

## Fibrin Sealant Kit

(Ph. Eur. monograph 0903)

Ph Eur

### DEFINITION

Sterile, freeze-dried, frozen or liquid preparation of plasma protein fractions containing essentially 2 components, namely fibrinogen concentrate (component 1), a protein fraction containing human fibrinogen, and a preparation containing human thrombin (component 2). A fibrin clot is rapidly formed when the 2 thawed or reconstituted components are mixed. Other ingredients (for example, human coagulation factor XIII, a fibrinolysis inhibitor or calcium ions) and stabilisers (for example, *Human albumin solution (0255)*) may be added.

Human constituents are obtained from plasma that complies with the monograph *Human plasma for fractionation (0853)*.

When thawed or reconstituted as stated on the label, component 1 contains not less than 40 g/L of clottable protein; the thrombin activity of component 2 varies over a wide range (approximately 4-1000 IU/mL).

#### PRODUCTION

The method of preparation is designed to maintain functional integrity of the components. It includes a step or steps that have been shown to remove or to inactivate known agents of infection; if substances are used for inactivation of viruses during production, the subsequent purification procedure must be validated to demonstrate that the concentration of these substances is reduced to a suitable level and any residues are such as not to compromise the safety of the preparation for patients.

The production method is shown to yield consistent levels of human coagulation factor XIII.

The constituents or mixtures of constituents are dissolved in a suitable liquid. No antimicrobial preservative or antibiotic is added. Constituents or mixtures of constituents are passed through a bacteria-retentive filter and distributed aseptically into sterile containers. Containers of freeze-dried constituents are closed under vacuum or filled with a suitable inert gas, such as oxygen-free nitrogen, before being closed.

If the label states that human coagulation factor XIII is an active substance in component 1, the assay of human coagulation factor XIII is carried out.

#### CHARACTERS

##### Appearance

- *freeze-dried constituents*: white or pale yellow, hygroscopic powder or friable solid;
- *frozen constituents*: colourless or pale yellow, opaque solid;
- *liquid constituents*: colourless or pale yellow liquid.

For the freeze-dried or frozen constituents, reconstitute or thaw as stated on the label immediately before carrying out the identification and the tests, except those for solubility and water.

### COMPONENT 1 (FIBRINOGEN CONCENTRATE)

#### IDENTIFICATION

- A. It complies with the limits of the assay of fibrinogen.
- B. It complies with the limits of the assay of human coagulation factor XIII (where its content is stated on the label).

#### TESTS

##### Solubility

Freeze-dried concentrates dissolve within 20 min in the volume of liquid and at the temperature stated on the label, forming an almost colourless, clear or slightly turbid solution.

##### pH (2.2.3)

6.5 to 8.0.

##### Stability of solution

No gel formation appears at room temperature during 120 min following thawing or reconstitution.

##### Water

Determined by a suitable method, such as semi-micro determination of water (2.5.12), loss on drying (2.2.32) or near-infrared spectroscopy (2.2.40), the water content is within the limits approved by the competent authority.

##### Sterility (2.6.1)

It complies with the test.

#### ASSAY

##### Fibrinogen (clottable protein)

Mix 0.2 mL of the reconstituted concentrate with 2 mL of a suitable buffer solution (pH 6.6-7.4) containing sufficient human thrombin R (approximately 3 IU/mL) and calcium (0.05 mol/L). Maintain at 37 °C for 20 min, separate the precipitate by centrifugation at 5000 g for 20 min, wash thoroughly with a 9 g/L solution of sodium chloride R and determine the protein as nitrogen by sulfuric acid digestion (2.5.9). Calculate the clottable protein content by multiplying the result by 6.0. The estimated content in milligrams of clottable protein is not less than 70 per cent and not more than 130 per cent of the stated content. If for a particular preparation this method cannot be applied, use another validated method for determination of fibrinogen.

##### Human coagulation factor XIII

Use a reference plasma calibrated against the International Standard for blood coagulation factor XIII in plasma. If the label states that human coagulation factor XIII is present as an active substance, the estimated potency is not less than 80 per cent and not more than 120 per cent of the stated potency if the factor XIII potency is stated as a single value, or is within the stated range if the factor XIII potency is stated as a range.

Make at least 3 suitable dilutions of thawed or reconstituted concentrate and of the reference preparation using human coagulation factor XIII-deficient plasma or another suitable diluent. Coagulation factors V, VIII, XI and XIII plasma BRP is suitable for use as a reference preparation. Add to each dilution suitable amounts of the following reagents:

- activator reagent, containing bovine or human thrombin, a suitable buffer, calcium chloride and a suitable inhibitor such as Gly-Pro-Arg-Pro-Ala-NH<sub>2</sub> which inhibits clotting of the sample but does not prevent human coagulation factor XIII activation by thrombin;
- detection reagent, containing a suitable factor XIIIa-specific peptide substrate, such as Leu-Gly-Pro-Gly-Glu-Ser-Lys-Val-Ile-Gly-NH<sub>2</sub> and glycine ethyl ester as 2<sup>nd</sup> substrate in a suitable buffer solution;
- NADH reagent, containing glutamate dehydrogenase, α-ketoglutarate and NADH in a suitable buffer solution.

After mixing, the absorbance changes ( $\Delta A/\text{min}$ ) are measured at a wavelength of 340 nm, after the linear phase of the reaction is reached.

Calculate the potency of the test preparation by the usual statistical methods (5.3, for example). The confidence limits ( $P = 0.95$ ) are not less than 80 per cent and not more than 125 per cent of the estimated potency.

### COMPONENT 2 (THROMBIN PREPARATION)

#### IDENTIFICATION

It complies with the limits of the assay of thrombin.

#### TESTS

##### Solubility

Freeze-dried preparations dissolve within 5 min in the volume of liquid stated on the label, forming a colourless, clear or slightly turbid solution.

##### pH (2.2.3)

5.0 to 8.0.

##### Water

Determined by a suitable method, such as semi-micro determination of water (2.5.12), loss on drying (2.2.32) or

near-infrared spectroscopy (2.2.40), the water content is within the limits approved by the competent authority.

#### Sterility (2.6.1)

It complies with the test.

#### ASSAY

##### Thrombin

If necessary, dilute the reconstituted preparation to be examined to approximately 2–20 IU of thrombin per millilitre using as diluent a suitable buffer solution (pH 7.3–7.5), such as *imidazole buffer solution pH 7.3 R* containing 10 g/L of *human albumin R* or *bovine albumin R*. To a suitable volume of the dilution, add a suitable volume of fibrinogen solution (1 g/L of clottable protein) warmed to 37 °C and start measurement of the clotting time immediately. Repeat the procedure with each of at least 3 dilutions, in the range stated above, of a reference preparation of thrombin, calibrated in International Units.

Calculate the activity of the test preparation by the usual statistical methods (5.3, for example). The estimated activity is not less than 80 per cent and not more than 125 per cent of the stated activity. For a component with a low thrombin concentration and a nominal value of approximately 4 IU/mL, the estimated activity is not less than 50 per cent and not more than 150 per cent of the stated activity. The confidence limits ( $P = 0.95$ ) are not less than 80 per cent and not more than 125 per cent of the estimated activity.

*The following sections apply to 2-component fibrin sealant.*

#### STORAGE

Protected from light and, for freeze-dried components, in an airtight container.

#### LABELLING

*The label states:*

- the amount of fibrinogen (milligrams of clottable protein) and thrombin (International Units) per container, and the content of human coagulation factor XIII (International Units per millilitre), if the latter is present as an active substance;
- where applicable, the name and volume of the liquid to be used to reconstitute the components.

Ph Eur

## Human Haematopoietic Stem Cells

(Ph. Eur. monograph 2323)

Ph Eur

*This monograph provides a standard for the preparation and control of human haematopoietic stem cells for use in therapy. It does not exclude the use of alternative preparation and control methods that are acceptable to the competent authority.*

#### DEFINITION

Human haematopoietic stem cells are primitive multipotent cells capable of self-renewal as well as differentiation and maturation into all haematopoietic lineages. They are found in small numbers in bone marrow, in the mononuclear cell fraction of circulating blood and in umbilical cord blood. The preparation also contains haematopoietic progenitor cells, which are capable of differentiation but not self-renewal. The numbers of haematopoietic stem cells and haematopoietic progenitor cells are correlated.

This monograph applies to haematopoietic stem cells that have not undergone expansion or genetic modification, and that are intended to provide a successful engraftment leading to a permanent restoration of all lineages of blood cell production to a sufficient level and function in a recipient whose haematopoiesis has been compromised by, for example, disease or high doses of chemotherapy and/or radiation therapy, or has to be replaced in certain congenital diseases. The infused haematopoietic stem cells can originate from the recipient (autologous) or from another individual (allogeneic).

Haematopoietic stem cells are recognised by their ability to reconstitute human haematopoiesis *in vivo*. They also have the capacity to differentiate into colony-forming cells, which are able to give rise to colonies in the presence of various growth factors. The membrane marker CD34 is commonly used for the successful isolation/purification of haematopoietic stem cells from crude preparations and as an indicator of haematopoietic stem cell content in routine quality control.

#### PRODUCTION

##### DONORS

Where allogeneic cells are used, they are derived from carefully selected donors in accordance with donor selection criteria. Directive 2004/23/EC of the European Union deals with the criteria for donor selection.

##### COLLECTION

*Peripheral blood stem cells* These are collected by cytopheresis after mobilisation from the bone marrow by administration of growth factors and/or treatment of autologous donors with cytotoxic substances. The cells may be processed to select a population of interest and may be cryopreserved.

*Bone marrow* Bone marrow is harvested by aspirating the cells from the cavities of hollow bones, then removing bone fragments by filtration and, if necessary, separating the buffy coat cells after centrifugation or with commercial kits based on the cytopheresis principle. The cells may be processed to select a population of interest and may be cryopreserved.

*Umbilical cord blood* Placental blood haematopoietic cells are collected from placentae via the vein of the umbilical cord. The cells are then cryopreserved.

##### CRYOPRESERVATION

Cryopreservation allows storage for long periods. The cells are suspended in a validated medium containing a suitable cryoprotectant (for example, dimethyl sulfoxide) and macromolecules (for example, autologous plasma/albumin) and are frozen in cryobags in a manner designed to maintain viability of the cells by controlled cooling according to a validated method. They are stored at a temperature of –140 °C or lower. Where cryobags are stored under other conditions of temperature and duration, the functionality of the preparation must be validated. Cryobags from donors that test positive for any infectious disease marker must be stored in such a way as to avoid cross-contamination.

##### SUBSTANCES USED IN PRODUCTION

The quality of substances used in production may be critical with respect to the quality, safety and efficacy of the final product, particularly for substances of biological origin. This is of particular importance for:

- proteins, including enzymes and antibodies;
- cryopreservation reagents;
- purification reagents.

**Quality assurance**

All substances must be produced within a recognised quality management system using suitable production facilities.

**Quality specifications**

A suitable quality specification must be presented for each substance, including notably:

- identity;
- potency (where applicable);
- purity;
- determination of bacterial endotoxins (2.6.14) (where applicable);
- microbiological quality (total viable count, tests for specified micro-organisms);
- sterility (2.6.1) (where applicable).

**Viral safety**

The requirements of chapter 5.1.7 apply.

**Transmissible spongiform encephalopathies (5.2.8)**

A risk assessment of the product with respect to transmissible spongiform encephalopathies is carried out, and suitable measures are taken to minimise any such risk.

**Water**

Water used in the preparation of cellular products complies with the relevant monograph (*Water for injections (0169)*, *Purified water (0008)*). Water incorporated into the final product complies with the section on Water for injections in bulk in the monograph *Water for injections (0169)*, and in addition is sterile.

**TESTS**

Target specifications are established for the different tests, but these are not used as rigid acceptance criteria.

Tests carried out include the following (further tests, such as purging, cell depletion, allogeneic application, may be necessary depending on any treatment applied to the cells and on the intended recipient):

**Nucleated cell count (2.7.29)****Viability (2.7.29)**

Viability is assessed for products that are not infused within 24 h of collection.

**CD34+ cell count**

For peripheral blood stem cells, CD34+ cell count is determined using a validated automated apparatus to analyse cells labelled with anti-CD34 antibodies. The apparatus and method employed must be able to determine the number of CD34+ cells with a sensitivity, accuracy and reproducibility comparable with those of immunophenotyping (2.7.23), where cells are labelled using anti-CD34 and anti-CD45 antibodies conjugated to a fluorochrome and analysed by flow cytometry (2.7.24).

**Colony-forming cell (CFC) assay (2.7.28)**

Proliferative capacity is established by a suitable assay.

The test is not necessarily carried out on each unit.

The correlation between the dose of CD34 and the number of CFCs in a given situation (pathology, packaging, mobilisation) is determined. The CFC assay is carried out periodically; whenever a change that could affect the quality of CD34+ cells is made to the protocol for packaging or mobilisation, it is carried out on a suitable number of units.

**Microbiological control**

Examine as prescribed in general chapter 2.6.27.

*Microbiological examination of cell-based preparations.* Where justified, the product may be released before completion of the test.

## Normal Immunoglobulin for Intramuscular Administration

**Normal Immunoglobulin****Normal Immunoglobulin Injection**

(*Human Normal Immunoglobulin for Intramuscular Administration, Ph. Eur. monograph 0338*)

Ph Eur

**DEFINITION**

Sterile liquid or freeze-dried preparation containing immunoglobulins, mainly immunoglobulin G (IgG). Other proteins may be present. Human normal immunoglobulin for intramuscular administration contains the IgG antibodies of normal subjects and is intended for intramuscular administration. The preparation may contain excipients such as stabilisers. Multidose preparations contain an antimicrobial preservative.

This monograph does not apply to products intentionally prepared to contain fragments of IgG or chemically modified IgG.

Human normal immunoglobulin for intramuscular administration is obtained from plasma that complies with the monograph *Human plasma for fractionation (0853)*.

**PRODUCTION**

The method of preparation includes a step or steps that have been shown to remove or to inactivate known agents of infection; if substances are used for inactivation of viruses, it shall have been shown that any residues present in the final product have no adverse effects on the patients treated with the immunoglobulin.

The product shall have been shown, by suitable tests in animals and evaluation during clinical trials, to be well tolerated when administered intramuscularly.

Any antimicrobial preservative or stabilising agent used shall have been shown to have no deleterious effect on the final product in the amount present.

Human normal immunoglobulin for intramuscular administration is prepared from pooled material from not fewer than 1000 donors by a method that has been shown to yield a product that:

- does not transmit infection;
- at a protein concentration of 50 g/L, contains at least 2 antibodies (1 viral and 1 bacterial) for which an International Standard or reference preparation is available, the concentration of such antibodies being at least 3 times that in the initial pooled material;
- has a defined distribution of IgG subclasses.

Human normal immunoglobulin for intramuscular administration is prepared as a stabilised solution, for example in a 9 g/L solution of sodium chloride, a 22.5 g/L solution of glycine or, if the preparation is to be freeze-dried, a 60 g/L solution of glycine. No antibiotic is added to the plasma used. Single-dose preparations do not contain an antimicrobial preservative. The solution is passed through a bacteria-retentive filter. The preparation may subsequently be freeze-dried and the containers closed under vacuum or under an inert gas.

The stability of the preparation is demonstrated by suitable tests carried out during development studies.

**CHARACTERS****Appearance**

- *liquid preparation*: clear or slightly opalescent, colourless or pale-yellow or light-brown liquid; during storage it may

Ph Eur

show formation of slight turbidity or a small amount of visible particulate matter;

- *freeze-dried preparation*: white or slightly yellow powder or solid friable mass, hygroscopic.

*For the freeze-dried preparation, reconstitute as stated on the label immediately before carrying out the identification and the tests, except those for solubility and water.*

#### IDENTIFICATION

Examine by a suitable immunoelectrophoresis technique.

Using antiserum to normal human serum, compare normal human serum and the preparation to be examined, both diluted to obtain a protein concentration of 10 g/L.

The main component of the preparation to be examined corresponds to the IgG component of normal human serum. The preparation to be examined may show the presence of small quantities of other plasma proteins; if human albumin has been added as a stabiliser, it may be seen as a component.

#### TESTS

##### Solubility

For the freeze-dried preparation, to a container of the preparation to be examined add the volume of the liquid stated on the label at the recommended temperature.

The preparation dissolves completely within 20 min at 20-25 °C.

##### pH (2.2.3)

5.0 to 7.2.

Dilute the preparation to be examined with a 9 g/L solution of sodium chloride R to obtain a protein concentration of 10 g/L.

##### Total protein

The preparation has a protein concentration of not less than 100 g/L and not more than 180 g/L and contains not less than 90 per cent and not more than 110 per cent of the quantity of protein stated on the label.

Dilute the preparation to be examined with a 9 g/L solution of sodium chloride R to obtain a protein concentration of about 7.5 mg/mL. Place 2.0 mL of this solution in a round-bottomed centrifuge tube and add 2 mL of a 75 g/L solution of sodium molybdate R and 2 mL of a mixture of 1 volume of nitrogen-free sulfuric acid R and 30 volumes of water R. Shake, centrifuge for 5 min, decant the supernatant and allow the inverted tube to drain on filter paper. Determine the nitrogen in the centrifugation residue by the method of sulfuric acid digestion (2.5.9) and calculate the content of protein by multiplying the result by 6.25.

##### Protein composition

###### Zone electrophoresis (2.2.31).

Use strips of suitable cellulose acetate gel or suitable agarose gel as the supporting medium and barbital buffer solution pH 8.6 R1 as the electrolyte solution.

If cellulose acetate is the supporting material, the method described below can be used. If agarose gels are used, and because they are normally part of an automated system, the manufacturer's instructions are followed instead.

*Test solution* Dilute the preparation to be examined with a 9 g/L solution of sodium chloride R to obtain a protein concentration of 30 g/L.

*Reference solution* Reconstitute human immunoglobulin for electrophoresis BRP and dilute with a 9 g/L solution of sodium chloride R to obtain a protein concentration of 30 g/L.

To a strip apply 4.0 µL of the test solution as a 10 mm band or apply 0.4 µL per millimetre if a narrower strip is used.

To another strip apply in the same manner the same volume of the reference solution. Apply a suitable electric field such that the albumin band of normal human serum applied on a control strip migrates at least 30 mm. Stain the strip with amido black 10B solution R for 5 min. Decolourise with a mixture of 10 volumes of glacial acetic acid R and 90 volumes of methanol R so that the background is just free of colour. Develop the transparency of the strips with a mixture of 19 volumes of glacial acetic acid R and 81 volumes of methanol R. Measure the absorbance of the bands at 600 nm in an instrument having a linear response over the range of measurement. Calculate the result as the mean of 3 measurements of each strip.

*System suitability* In the electropherogram obtained with the reference solution, the proportion of protein in the principal band is within the limits stated in the leaflet accompanying the reference preparation.

*Results* In the electropherogram obtained with the test solution, not more than 10 per cent of protein has a mobility different from that of the principal band. This limit is not applicable if albumin has been added to the preparation as a stabiliser; for such preparations, a test for protein composition is carried out during manufacture before addition of the stabiliser.

##### Molecular-size distribution

Size-exclusion chromatography (2.2.30).

*Test solution* Dilute the preparation to be examined with a 9 g/L solution of sodium chloride R to a concentration suitable for the chromatographic system used. A concentration in the range of 4-12 g/L and injection of 50-600 µg of protein are usually suitable.

*Reference solution* Dilute human immunoglobulin (molecular size) BRP with a 9 g/L solution of sodium chloride R to the same protein concentration as the test solution.

##### Column:

- *size*:  $l = 0.6$  m,  $\varnothing = 7.5$  mm [or  $l = 0.3$  m,  $\varnothing = 7.8$  mm];
- *stationary phase*: hydrophilic silica gel for chromatography R, of a grade suitable for fractionation of globular proteins with relative molecular masses in the range 10 000 to 500 000.

*Mobile phase* Dissolve 4.873 g of disodium hydrogen phosphate dihydrate R, 1.741 g of sodium dihydrogen phosphate monohydrate R, 11.688 g of sodium chloride R and 50 mg of sodium azide R in 1 L of water R.

*Flow rate* 0.5 mL/min.

*Detection* Spectrophotometer at 280 nm.

*Identification of peaks* In the chromatogram obtained with the reference solution, the principal peak corresponds to the IgG monomer and there is a peak corresponding to the dimer with a relative retention to the principal peak of about 0.85. Identify the peaks in the chromatogram obtained with the test solution by comparison with the chromatogram obtained with the reference solution; any peak with a retention time less than that of the dimer corresponds to polymers and aggregates.

*Results* In the chromatogram obtained with the test solution:

- *retention time*: for the monomer and for the dimer, the retention time relative to the corresponding peak in the chromatogram obtained with the reference solution is  $1 \pm 0.02$ ;
- *peak area*: the sum of the peak areas of the monomer and the dimer represent not less than 85 per cent of the total area of the chromatogram and the sum of the peak areas

of polymers and aggregates represents not more than 10 per cent of the total area of the chromatogram. This requirement is not applicable if albumin has been added as a stabiliser; for such preparations, a test for molecular-size distribution is carried out during manufacture before addition of the stabiliser.

#### Antibody to hepatitis B surface antigen

Minimum 0.5 IU per gram of immunoglobulin, determined by a suitable immunochemical method (2.7.1).

#### Antibody to hepatitis A virus

If intended for use in the prophylaxis of hepatitis A, it complies with the following additional requirement.

Determine the antibody content by comparison with a reference preparation calibrated in International Units, using an immunoassay of suitable sensitivity and specificity (2.7.1).

The International Unit is the activity contained in a stated amount of the International Standard for anti-hepatitis A immunoglobulin. The equivalence in International Units of the International Standard is stated by the World Health Organization.

*Human hepatitis A immunoglobulin BRP* is calibrated in International Units by comparison with the International Standard.

The stated potency is not less than 100 IU/mL. The estimated potency is not less than the stated potency. The confidence limits ( $P = 0.95$ ) are not less than 80 per cent and not more than 125 per cent of the estimated potency.

#### Immunoglobulin A

As determined by a suitable immunochemical method (2.7.1), the content of immunoglobulin A is not greater than the maximum content stated on the label.

#### Water

Determined by a suitable method, such as the semi-micro determination of water (2.5.12), loss on drying (2.2.32) or near-infrared spectroscopy (2.2.40), the water content is within the limits approved by the competent authority.

#### Sterility (2.6.1)

It complies with the test.

#### Pyrogens (2.6.8) or Bacterial endotoxins (2.6.14)

It complies with the test for pyrogens or, preferably and where justified and authorised, with a validated *in vitro* test such as the bacterial endotoxin test.

For the pyrogen test, inject 1 mL per kilogram of the rabbit's mass.

Where the bacterial endotoxin test is used, the preparation to be examined contains less than 5 IU of endotoxin per millilitre.

#### STORAGE

In an airtight, colourless glass container, protected from light, at the temperature stated on the label.

#### LABELLING

The label states:

- for liquid preparations, the volume of the preparation in the container and the protein content expressed in grams per litre;
- for freeze-dried preparations:
  - the quantity of protein in the container;
  - the name or composition and the volume of the reconstituting liquid to be added;
- the route of administration;
- the distribution of subclasses of IgG present in the preparation;

- where applicable, that the preparation is suitable for use in the prophylaxis of hepatitis A infection;
- where applicable, the anti-hepatitis A virus activity in International Units per millilitre;
- where applicable, the amount of albumin added as a stabiliser;
- where applicable, the name and amount of antimicrobial preservative in the preparation;
- the maximum content of immunoglobulin A.

Ph Eur

## Normal Immunoglobulin for Intravenous Use

(*Human Normal Immunoglobulin for Intravenous Administration*, Ph. Eur. monograph 0918)

Ph Eur

#### DEFINITION

Human normal immunoglobulin for intravenous administration is a sterile liquid or freeze-dried preparation containing immunoglobulins, mainly immunoglobulin G (IgG). Other proteins may be present. Human normal immunoglobulin for intravenous administration contains the IgG antibodies of normal subjects. This monograph does not apply to products intentionally prepared to contain fragments or chemically modified IgG.

Human normal immunoglobulin for intravenous administration is obtained from plasma that complies with the monograph *Human plasma for fractionation* (0853). The preparation may contain excipients such as stabilisers.

#### PRODUCTION

The method of preparation includes a step or steps that have been shown to remove or to inactivate known agents of infection; if substances are used for inactivation of viruses, it shall have been shown that any residues present in the final product have no adverse effects on the patients treated with the immunoglobulin. The method of preparation also includes a step or steps that have been shown to remove thrombosis-generating agents. Emphasis is given to the identification of activated coagulation factors and their zymogens and process steps that may cause their activation. Consideration is also to be given to other procoagulant agents that could be introduced by the manufacturing process.

The product shall have been shown, by suitable tests in animals and evaluation during clinical trials, to be well tolerated when administered intravenously.

Human normal immunoglobulin for intravenous administration is prepared from pooled material from not fewer than 1000 donors by a method that has been shown to yield a product that:

- does not transmit infection;
- at an immunoglobulin concentration of 50 g/L, contains antibodies for at least 2 of which (1 viral and 1 bacterial) an International Standard or Reference Preparation is available, the concentration of such antibodies being at least 3 times that in the initial pooled material;
- has a defined distribution of immunoglobulin G subclasses;
- complies with the test for Fc function of immunoglobulin (2.7.9);

— does not exhibit thrombogenic (procoagulant) activity. Human normal immunoglobulin for intravenous administration is prepared as a stabilised solution or as a freeze-dried preparation. In both cases the preparation is passed through a bacteria-retentive filter. The preparation may subsequently be freeze-dried and the containers closed under vacuum or under an inert gas. No antibiotic is added to the plasma used. No antimicrobial preservative is added either during fractionation or at the stage of the final bulk solution.

The stability of the preparation is demonstrated by suitable tests carried out during development studies.

## CHARACTERS

### Appearance

- *liquid preparation*: clear or slightly opalescent, colourless or pale yellow liquid;
- *freeze-dried preparation*: hygroscopic, white or slightly yellow powder or solid friable mass.

*For the freeze-dried preparation, reconstitute as stated on the label immediately before carrying out the identification and the tests, except those for solubility and water.*

## IDENTIFICATION

Examine by a suitable immunoelectrophoresis technique. Using antiserum to normal human serum, compare normal human serum and the preparation to be examined, both diluted to contain 10 g/L of protein. The main component of the preparation to be examined corresponds to the IgG component of normal human serum. The preparation to be examined may show the presence of small quantities of other plasma proteins; if human albumin has been added as a stabiliser, it may be seen as a major component.

## TESTS

### Solubility

For the freeze-dried preparation, add to the container the volume of the liquid stated on the label at the recommended temperature. The preparation dissolves completely within 30 min at 20-25 °C.

### pH (2.2.3)

4.0 to 7.4.

Dilute the preparation to be examined with a 9 g/L solution of *sodium chloride R* to obtain a solution containing 10 g/L of protein.

### Osmolality (2.2.35)

Minimum 240 mosmol/kg.

### Total protein

The preparation contains not less than 30 g/L and between 90 per cent and 110 per cent of the quantity of protein stated on the label.

Dilute the preparation to be examined with a 9 g/L solution of *sodium chloride R* to obtain a solution containing about 15 mg of protein in 2 mL. To 2.0 mL of this solution in a round-bottomed centrifuge tube add 2 mL of a 75 g/L solution of *sodium molybdate R* and 2 mL of a mixture of 1 volume of *nitrogen-free sulfuric acid R* and 30 volumes of *water R*. Shake, centrifuge for 5 min, decant the supernatant and allow the inverted tube to drain on filter paper. Determine the nitrogen in the centrifugation residue by the method of sulfuric acid digestion (2.5.9) and calculate the content of protein by multiplying the result by 6.25.

### Protein composition

Zone electrophoresis (2.2.31).

Use strips of suitable cellulose acetate gel or suitable agarose gel as the supporting medium and *barbital buffer solution pH 8.6 RI* as the electrolyte solution.

If cellulose acetate is the supporting material, the method described below can be used. If agarose gels are used, and because they are normally part of an automated system, the manufacturer's instructions are followed instead.

*Test solution* Dilute the preparation to be examined with a 9 g/L solution of *sodium chloride R* to an immunoglobulin concentration of 30 g/L.

*Reference solution* Reconstitute *human immunoglobulin for electrophoresis BRP* and dilute with a 9 g/L solution of *sodium chloride R* to a protein concentration of 30 g/L.

To a strip apply 4.0 µL of the test solution as a 10 mm band or apply 0.4 µL per millimetre if a narrower strip is used. To another strip apply in the same manner the same volume of the reference solution. Apply a suitable electric field such that the albumin band of normal human serum applied on a control strip migrates at least 30 mm. Stain the strips with *amido black 10B solution R* for 5 min. Decolourise with a mixture of 10 volumes of *glacial acetic acid R* and 90 volumes of *methanol R* so that the background is just free of colour. Develop the transparency of the strips with a mixture of 19 volumes of *glacial acetic acid R* and 81 volumes of *methanol R*. Measure the absorbance of the bands at 600 nm in an instrument having a linear response over the range of measurement. Calculate the result as the mean of 3 measurements of each strip.

*System suitability* In the electropherogram obtained with the reference solution, the proportion of protein in the principal band is within the limits stated in the leaflet accompanying the reference preparation.

*Results* In the electropherogram obtained with the test solution, not more than 5 per cent of protein has a mobility different from that of the principal band. This limit is not applicable if albumin has been added to the preparation as a stabiliser; for such preparations, a test for protein composition is carried out during manufacture before addition of the stabiliser.

### Molecular size distribution

Size exclusion chromatography (2.2.30).

*Test solution* Dilute the preparation to be examined with a 9 g/L solution of *sodium chloride R* to a concentration suitable for the chromatographic system used. A concentration in the range of 4-12 g/L and injection of 50-600 µg of protein are usually suitable.

*Reference solution* Dilute *human immunoglobulin (molecular size) BRP* with a 9 g/L solution of *sodium chloride R* to the same protein concentration as the test solution.

### Column:

- *size*:  $l = 0.6$  m,  $\varnothing = 7.5$  mm, or  $l = 0.3$  m,  $\varnothing = 7.8$  mm;
- *stationary phase*: *hydrophilic silica gel for chromatography R* of a grade suitable for fractionation of globular proteins with relative molecular masses in the range 10 000 to 500 000.

*Mobile phase* Dissolve 4.873 g of *disodium hydrogen phosphate dihydrate R*, 1.741 g of *sodium dihydrogen phosphate monohydrate R*, 11.688 g of *sodium chloride R* and 50 mg of *sodium azide R* in 1 L of *water R*.

*Flow rate* 0.5 mL/min.

*Detection* Spectrophotometer at 280 nm.

*Identification of peaks* In the chromatogram obtained with the reference solution, the principal peak corresponds to the

IgG monomer and there is a peak corresponding to the dimer with a relative retention to the principal peak of about 0.85; identify the peaks in the chromatogram obtained with the test solution by comparison with the chromatogram obtained with the reference solution; any peak with a retention time shorter than that of the dimer corresponds to polymers and aggregates.

**Results** In the chromatogram obtained with the test solution:

- **retention time:** for the monomer and for the dimer, the retention time relative to the corresponding peak in the chromatogram obtained with the reference solution is  $1 \pm 0.02$ ;
- **peak area:** the sum of the peak areas of the monomer and the dimer represent not less than 90 per cent of the total area of the chromatogram and the sum of the peak areas of polymers and aggregates represents not more than 3 per cent of the total area of the chromatogram. This requirement does not apply to products where albumin has been added as a stabiliser; for products stabilised with albumin, a test for distribution of molecular size is carried out during manufacture before addition of the stabiliser.

#### Anticomplementary activity (2.6.17)

The consumption of complement is not greater than 50 per cent (1  $CH_{50}$  per milligram of immunoglobulin).

#### Prekallikrein activator (2.6.15)

Maximum 35 IU/mL, calculated with reference to a dilution of the preparation to be examined containing 30 g/L of immunoglobulin.

#### Anti-A and anti-B haemagglutinins (2.6.20, Method B)

It complies with the test for anti-A and anti-B haemagglutinins (direct method).

#### Anti-D antibodies (2.6.26)

It complies with the test for anti-D antibodies in human immunoglobulin.

#### Antibody to hepatitis B surface antigen

Minimum 0.5 IU per gram of immunoglobulin, determined by a suitable immunochemical method (2.7.1).

#### Immunoglobulin A.

As determined by a suitable immunochemical method (2.7.1), the content of immunoglobulin A is not greater than the maximum content stated on the label.

#### Water

Determined by a suitable method, such as the semi-micro determination of water (2.5.12), loss on drying (2.2.32) or near-infrared spectroscopy (2.2.40), the water content is within the limits approved by the competent authority.

#### Sterility (2.6.1)

It complies with the test.

#### Pyrogens (2.6.8) or Bacterial endotoxins (2.6.14)

It complies with the test for pyrogens or, preferably and where justified and authorised, with a validated *in vitro* test such as the bacterial endotoxin test.

For the pyrogen test, inject per kilogram of the rabbit's mass a volume equivalent to 0.5 g of immunoglobulin, but not more than 10 mL per kilogram of the rabbit's mass.

Where the bacterial endotoxin test is used, the preparation to be examined contains less than 0.5 IU of endotoxin per millilitre for solutions with a protein content not greater than 50 g/L, and less than 1.0 IU of endotoxin per millilitre for solutions with a protein content greater than 50 g/L but not greater than 100 g/L.

#### STORAGE

Liquid preparation: in a colourless glass container, protected from light, at the temperature stated on the label.

Freeze-dried preparation: in an airtight colourless glass container, protected from light, at a temperature not exceeding 25 °C.

#### LABELLING

The label states:

- for liquid preparations, the volume of the preparation in the container and the protein content expressed in grams per litre;
- for freeze-dried preparations:
  - the quantity of protein in the container;
  - the name or composition and the volume of the reconstituting liquid to be added;
- the amount of immunoglobulin in the container;
- the route of administration;
- the distribution of subclasses of immunoglobulin G present in the preparation;
- where applicable, the amount of albumin added as a stabiliser;
- the maximum content of immunoglobulin A.

Ph Eur

## Normal Immunoglobulin for Subcutaneous Administration

(Human Normal Immunoglobulin for Subcutaneous Administration, Ph. Eur. monograph 2788)

Ph Eur

#### DEFINITION

Sterile liquid or freeze-dried preparation containing immunoglobulins, mainly immunoglobulin G (IgG). Other proteins may be present. Human normal immunoglobulin for subcutaneous administration contains the IgG antibodies of normal subjects and is intended for subcutaneous administration. The preparation may contain excipients such as stabilisers.

This monograph does not apply to products intentionally prepared to contain fragments of IgG or chemically modified IgG.

Human normal immunoglobulin for subcutaneous administration is obtained from plasma that complies with the monograph *Human plasma for fractionation* (0853).

#### PRODUCTION

The method of preparation includes a step or steps that have been shown to remove or to inactivate known agents of infection; if substances are used for inactivation of viruses, it shall have been shown that any residues present in the final product have no adverse effects on the patients treated with the immunoglobulin.

The method of preparation also includes a step or steps that have been shown to remove thrombosis-generating agents. Emphasis is given to the identification of activated coagulation factors and their zymogens and process steps that may cause their activation. Consideration is also to be given to other procoagulant agents that could be introduced by the manufacturing process.

The product shall have been shown, by suitable tests in animals and evaluation during clinical trials, to be well tolerated when administered subcutaneously. Any stabilising

agent used shall have been shown to have no deleterious effect on the final product in the amount present.

Human normal immunoglobulin for subcutaneous administration is prepared from pooled material from not fewer than 1000 donors by a method that has been shown to yield a product that:

- does not transmit infection;
- at a protein concentration of 50 g/L, contains at least 2 antibodies (1 viral and 1 bacterial) for which an International Standard or reference preparation is available, the concentration of such antibodies being at least 3 times that in the initial pooled material;
- has a defined distribution of IgG subclasses;
- complies with the test for Fc function of immunoglobulin (2.7.9);
- does not exhibit thrombogenic (procoagulant) activity.

Human normal immunoglobulin for subcutaneous administration is prepared as a stabilised solution, for example in a 9 g/L solution of sodium chloride, a 22.5 g/L solution of glycine or, if the preparation is to be freeze-dried, a 60 g/L solution of glycine. No antibiotic is added to the plasma used. Preparations do not contain an antimicrobial preservative. The solution is passed through a bacteria-retentive filter. The preparation may subsequently be freeze-dried and the containers closed under vacuum or under an inert gas.

The stability of the preparation is demonstrated by suitable tests carried out during development studies.

## CHARACTERS

### Appearance

- *liquid preparation*: clear or slightly opalescent, colourless or pale-yellow or light-brown liquid; during storage it may show formation of slight turbidity or a small amount of visible particulate matter;
- *freeze-dried preparation*: white or slightly yellow powder or solid friable mass, hygroscopic.

*For the freeze-dried preparation, reconstitute as stated on the label immediately before carrying out the identification and the tests, except those for solubility and water.*

## IDENTIFICATION

Examine by a suitable immunoelectrophoresis technique. Using antiserum to normal human serum, compare normal human serum and the preparation to be examined, both diluted to obtain a protein concentration of 10 g/L. The main component of the preparation to be examined corresponds to the IgG component of normal human serum. The preparation to be examined may show the presence of small quantities of other plasma proteins; if human albumin has been added as a stabiliser, it may be seen as a component.

## TESTS

### Solubility

For the freeze-dried preparation, to a container of the preparation to be examined add the volume of the liquid stated on the label at the recommended temperature. The preparation dissolves completely within 20 min at 20-25 °C.

**pH (2.2.3)**  
4.6 to 7.2.

Dilute the preparation to be examined with a 9 g/L solution of sodium chloride R to obtain a protein concentration of 10 g/L.

### Total protein

The preparation has a protein concentration of not less than 100 g/L and not more than 220 g/L and contains not less than 90 per cent and not more than 110 per cent of the quantity of protein stated on the label.

Dilute the preparation to be examined with a 9 g/L solution of sodium chloride R to obtain a protein concentration of about 7.5 mg/mL. Place 2.0 mL of this solution in a round-bottomed centrifuge tube and add 2 mL of a 75 g/L solution of sodium molybdate R and 2 mL of a mixture of 1 volume of nitrogen-free sulfuric acid R and 30 volumes of water R. Shake, centrifuge for 5 min, decant the supernatant and allow the inverted tube to drain on filter paper. Determine the nitrogen in the centrifugation residue by the method of sulfuric acid digestion (2.5.9) and calculate the content of protein by multiplying the result by 6.25.

### Protein composition

Zone electrophoresis (2.2.31).

Use strips of suitable cellulose acetate gel or suitable agarose gel as the supporting medium and barbital buffer solution pH 8.6 R1 as the electrolyte solution.

If cellulose acetate is the supporting material, the method described below can be used. If agarose gels are used, and because they are normally part of an automated system, the manufacturer's instructions are followed instead.

**Test solution** Dilute the preparation to be examined with a 9 g/L solution of sodium chloride R to obtain a protein concentration of 30 g/L.

**Reference solution** Reconstitute human immunoglobulin for electrophoresis BRP and dilute with a 9 g/L solution of sodium chloride R to obtain a protein concentration of 30 g/L.

To a strip apply 4.0 µL of the test solution as a 10 mm band or apply 0.4 µL per millimetre if a narrower strip is used. To another strip apply in the same manner the same volume of the reference solution. Apply a suitable electric field such that the albumin band of normal human serum applied on a control strip migrates at least 30 mm. Stain the strip with amido black 10B solution R for 5 min. Decolourise with a mixture of 10 volumes of glacial acetic acid R and 90 volumes of methanol R so that the background is just free of colour. Develop the transparency of the strips with a mixture of 19 volumes of glacial acetic acid R and 81 volumes of methanol R. Measure the absorbance of the bands at 600 nm in an instrument having a linear response over the range of measurement. Calculate the result as the mean of 3 measurements of each strip.

**System suitability** In the electropherogram obtained with the reference solution, the proportion of protein in the principal band is within the limits stated in the leaflet accompanying the reference preparation.

**Results** In the electropherogram obtained with the test solution, not more than 10 per cent of protein has a mobility different from that of the principal band. This limit is not applicable if albumin has been added to the preparation as a stabiliser; for such preparations, a test for protein composition is carried out during manufacture before addition of the stabiliser.

### Molecular-size distribution

Size-exclusion chromatography (2.2.30).

**Test solution** Dilute the preparation to be examined with a 9 g/L solution of sodium chloride R to a concentration suitable for the chromatographic system used. A concentration in the range of 4-12 g/L and injection of 50-600 µg of protein are usually suitable.

**Reference solution** Dilute human immunoglobulin (molecular size) BRP with a 9 g/L solution of sodium chloride R to the same protein concentration as the test solution.

**Column:**

- size:  $l = 0.6$  m,  $\varnothing = 7.5$  mm [or  $l = 0.3$  m,  $\varnothing = 7.8$  mm];
- stationary phase: hydrophilic silica gel for chromatography R, of a grade suitable for fractionation of globular proteins with relative molecular masses in the range 10 000 to 500 000.

**Mobile phase** Dissolve 4.873 g of disodium hydrogen phosphate dihydrate R, 1.741 g of sodium dihydrogen phosphate monohydrate R, 11.688 g of sodium chloride R and 50 mg of sodium azide R in 1 L of water R.

**Flow rate** 0.5 mL/min.

**Detection** Spectrophotometer at 280 nm.

**Identification of peaks** In the chromatogram obtained with the reference solution, the principal peak corresponds to the IgG monomer and there is a peak corresponding to the dimer with a relative retention to the principal peak of about 0.85. Identify the peaks in the chromatogram obtained with the test solution by comparison with the chromatogram obtained with the reference solution; any peak with a retention time less than that of the dimer corresponds to polymers and aggregates.

**Results** In the chromatogram obtained with the test solution:

- **retention time:** for the monomer and for the dimer, the retention time relative to the corresponding peak in the chromatogram obtained with the reference solution is  $1 \pm 0.02$ ;
- **peak area:** the sum of the peak areas of the monomer and the dimer represent not less than 85 per cent of the total area of the chromatogram and the sum of the peak areas of polymers and aggregates represents not more than 10 per cent of the total area of the chromatogram. This requirement is not applicable if albumin has been added as a stabiliser; for such preparations, a test for molecular-size distribution is carried out during manufacture before addition of the stabiliser.

**Anti-A and anti-B haemagglutinins (2.6.20, Method B).**  
It complies with the test.

**Anti-D antibodies (2.6.26)**  
It complies with the test.

**Antibody to hepatitis B surface antigen**  
Minimum 0.5 IU per gram of immunoglobulin, determined by a suitable immunochemical method (2.7.1).

**Immunoglobulin A**

As determined by a suitable immunochemical method (2.7.1), the content of immunoglobulin A is not greater than the maximum content stated on the label.

**Water**

Determined by a suitable method, such as the semi-micro determination of water (2.5.12), loss on drying (2.2.32) or near-infrared spectroscopy (2.2.40), the water content is within the limits approved by the competent authority.

**Sterility (2.6.1)**

It complies with the test.

**Pyrogens (2.6.8) or Bacterial endotoxins (2.6.14)**  
It complies with the test for pyrogens or, preferably and where justified and authorised, with a validated *in vitro* test such as the bacterial endotoxin test.

For the pyrogen test, inject 1 mL per kilogram of the rabbit's mass.

Where the bacterial endotoxin test is used, the preparation to be examined contains less than 5 IU of endotoxin per millilitre.

**STORAGE**

In an airtight, colourless glass container, protected from light, at the temperature stated on the label.

**LABELLING**

*The label states:*

- for liquid preparations, the volume of the preparation in the container and the protein content expressed in grams per litre;
- for freeze-dried preparations:
  - the quantity of protein in the container;
  - the name or composition and the volume of the reconstituting liquid to be added;
- the route of administration;
- the distribution of subclasses of IgG present in the preparation;
- where applicable, the amount of albumin added as a stabiliser;
- the maximum content of immunoglobulin A.

Ph Eur

## Anti-D (Rh0) Immunoglobulin

(Human Anti-D Immunoglobulin, Ph. Eur. monograph 0557)

Ph Eur

**DEFINITION**

Sterile liquid or freeze-dried preparation containing immunoglobulins, mainly immunoglobulin G. The preparation is intended for intramuscular administration. It contains specific antibodies against erythrocyte D-antigen and may also contain small quantities of other blood-group antibodies. *Human normal immunoglobulin for intramuscular administration (0338)* and/or *Human albumin solution (0255)* may be added.

It complies with the monograph *Human normal immunoglobulin for intramuscular administration (0338)*, except for the minimum number of donors and the minimum total protein content.

The assay of human anti-D immunoglobulin (2.7.13) is carried out, as prescribed below under Potency.

For products prepared by a method that eliminates immunoglobulins with specificities other than anti-D, where authorised, the test for antibodies to hepatitis B surface antigen is not required.

**PRODUCTION**

Human anti-D immunoglobulin is preferably obtained from the plasma of donors with a sufficient titre of previously acquired anti-D antibodies. Where necessary, in order to ensure an adequate supply of human anti-D immunoglobulin, it is obtained from plasma derived from donors immunised with D-positive erythrocytes that are compatible in relevant blood group systems in order to avoid formation of undesirable antibodies.

**ERYTHROCYTE DONORS**

Erythrocyte donors comply with the requirements for donors prescribed in the monograph *Human plasma for fractionation (0853)*.

**IMMUNISATION**

Immunisation of the plasma donor is carried out under proper medical supervision. Recommendations concerning donor immunisation, including testing of erythrocyte donors, have been formulated by the World Health Organization (*Requirements for the collection, processing and quality control of blood, blood components and plasma derivatives*, WHO Technical Report Series, No. 840, 1994 or subsequent revision).

**POOLED PLASMA**

To limit the potential B19 virus burden in plasma pools used for the manufacture of anti-D immunoglobulin, the plasma pool is tested for B19 virus using validated nucleic acid amplification techniques (2.6.21).

**B19 virus DNA**

Maximum 10.0 IU/ $\mu$ L.

A positive control with 10.0 IU of B19 virus DNA per microlitre and, to test for inhibitors, an internal control prepared by addition of a suitable marker to a sample of the plasma pool are included in the test. The test is invalid if the positive control is non-reactive or if the result obtained with the internal control indicates the presence of inhibitors.

*B19 virus DNA for NAT testing BRP* is suitable for use as a positive control.

If *Human normal immunoglobulin for intramuscular administration (0338)* and/or *Human albumin solution (0255)* are added to the preparation, the plasma pool or pools from which they are derived comply with the above requirement for B19 virus DNA.

**POTENCY**

**Human anti-D immunoglobulin (2.7.13, Method A)**

The estimated potency is not less than 90 per cent of the stated potency. The confidence limits ( $P = 0.95$ ) are not less than 80 per cent and not more than 120 per cent of the estimated potency.

Method B or C (2.7.13) may be used for potency determination if a satisfactory correlation with the results obtained by Method A has been established for the particular product.

**STORAGE**

See *Human normal immunoglobulin for intramuscular administration (0338)*.

**LABELLING**

See *Human normal immunoglobulin for intramuscular administration (0338)*.

The label states the number of International Units per container.

Ph Eur

## Anti-D Immunoglobulin for Intravenous Use

(*Human Anti-D Immunoglobulin for Intravenous Administration, Ph. Eur. monograph 1527*)

Ph Eur

**DEFINITION**

Sterile liquid or freeze-dried preparation containing immunoglobulins, mainly immunoglobulin G. It contains specific antibodies against erythrocyte D-antigen and may also contain small quantities of other blood-group antibodies.

*Human normal immunoglobulin for intravenous administration (0918)* and/or *Human albumin solution (0255)* may be added.

It complies with the monograph *Human normal immunoglobulin for intravenous administration (0918)*, except for the minimum number of donors, the minimum total protein content, the limit for osmolality and the limit for prekallikrein activator.

The test for anti-D antibodies (2.6.26) prescribed in the monograph *Human normal immunoglobulin for intravenous administration (0918)* is not carried out, since it is replaced by the assay of human anti-D immunoglobulin (2.7.13) as prescribed below under Potency.

For products prepared by a method that eliminates immunoglobulins with specificities other than anti-D, where authorised, the test for antibodies to hepatitis B surface antigen is not required; a suitable test for Fc function is carried out instead of that described in general chapter 2.7.9, which is not applicable to such a product.

**PRODUCTION**

Human anti-D immunoglobulin is preferably obtained from the plasma of donors with a sufficient titre of previously acquired anti-D antibodies. Where necessary, in order to ensure an adequate supply of human anti-D immunoglobulin, it is obtained from plasma derived from donors immunised with D-positive erythrocytes that are compatible in relevant blood group systems in order to avoid formation of undesirable antibodies.

**ERYTHROCYTE DONORS**

Erythrocyte donors comply with the requirements for donors prescribed in the monograph *Human plasma for fractionation (0853)*.

**IMMUNISATION**

Immunisation of the plasma donor is carried out under proper medical supervision. Recommendations concerning donor immunisation, including testing of erythrocyte donors, have been formulated by the World Health Organization (*Requirements for the collection, processing and quality control of blood, blood components and plasma derivatives*, WHO Technical Report Series, No. 840, 1994 or subsequent revision).

**POOLED PLASMA**

To limit the potential B19 virus burden in plasma pools used for the manufacture of anti-D immunoglobulin, the plasma pool is tested for B19 virus using validated nucleic acid amplification techniques (2.6.21).

**B19 virus DNA**

Maximum 10.0 IU/ $\mu$ L.

A positive control with 10.0 IU of B19 virus DNA per microlitre and, to test for inhibitors, an internal control prepared by addition of a suitable marker to a sample of the plasma pool are included in the test. The test is invalid if the positive control is non-reactive or if the result obtained with the internal control indicates the presence of inhibitors.

*B19 virus DNA for NAT testing BRP* is suitable for use as a positive control.

If *Human normal immunoglobulin for intravenous administration (0918)* and/or *Human albumin solution (0255)* are added to the preparation, the plasma pool or pools from which they are derived comply with the above requirement for B19 virus DNA.

**ASSAY****Human anti-D immunoglobulin (2.7.13, Method A)**

The estimated potency is not less than 90 per cent of the stated potency. The confidence limits ( $P = 0.95$ ) are not less than 80 per cent and not more than 120 per cent of the estimated potency.

Method B or C (2.7.13) may be used for potency determination if a satisfactory correlation with the results obtained by Method A has been established for the particular product.

**STORAGE**

See *Human normal immunoglobulin for intravenous administration (0918)*.

**LABELLING**

See *Human normal immunoglobulin for intravenous administration (0918)*.

The label states the number of International Units per container.

Ph Eur

**Hepatitis A Immunoglobulin**

(*Human Hepatitis A Immunoglobulin, Ph. Eur. monograph 0769*)

Ph Eur

**DEFINITION**

Sterile liquid or freeze-dried preparation containing immunoglobulins, mainly immunoglobulin G.

The preparation is intended for intramuscular administration. It is obtained from plasma from selected donors having antibodies against hepatitis A virus. *Human normal immunoglobulin for intramuscular administration (0338)* may be added.

It complies with the monograph on *Human normal immunoglobulin for intramuscular administration (0338)*, except for the minimum number of donors and the minimum total protein content.

**POTENCY**

The potency is determined by comparing the antibody titre of the immunoglobulin to be examined with that of a reference preparation calibrated in International Units, using an immunoassay of suitable sensitivity and specificity (2.7.1).

The International Unit is the activity contained in a stated amount of the International Standard for anti-hepatitis A immunoglobulin. The equivalence in International Units of the International Standard is stated by the World Health Organization.

*Human hepatitis A immunoglobulin BRP* is calibrated in International Units by comparison with the International Standard.

The stated potency is not less than 600 IU/mL. The estimated potency is not less than the stated potency. The confidence limits ( $P = 0.95$ ) are not less than 80 per cent and not more than 125 per cent of the estimated potency.

**STORAGE**

See *Human normal immunoglobulin for intramuscular administration (0338)*.

**LABELLING**

See *Human normal immunoglobulin for intramuscular administration (0338)*.

The label states the number of International Units per container.

Ph Eur

**Hepatitis B Immunoglobulin**

(*Human Hepatitis B Immunoglobulin, Ph. Eur. monograph 0722*)

Ph Eur

**DEFINITION**

Sterile liquid or freeze-dried preparation containing immunoglobulins, mainly immunoglobulin G.

The preparation is intended for intramuscular or subcutaneous administration. It is obtained from plasma from selected and/or immunised donors having antibodies against hepatitis B surface antigen. *Human normal immunoglobulin for intramuscular administration (0338)* or *Human normal immunoglobulin for subcutaneous administration (2788)* may be added.

Depending on the route of administration, it complies with the monograph on *Human normal immunoglobulin for intramuscular administration (0338)* or *Human normal immunoglobulin for subcutaneous administration (2788)*, except for the minimum number of donors and the minimum total protein content.

**POTENCY**

The potency is determined by comparing the antibody titre of the immunoglobulin to be examined with that of a reference preparation calibrated in International Units, using an immunoassay of suitable sensitivity and specificity (2.7.1).

The International Unit is the activity contained in a stated amount of the International Standard for anti-hepatitis B immunoglobulin. The equivalence in International Units of the International Standard is stated by the World Health Organization.

*Human hepatitis B immunoglobulin BRP* is calibrated in International Units by comparison with the International Standard.

The stated potency is not less than 100 IU/mL. The estimated potency is not less than the stated potency. The confidence limits ( $P = 0.95$ ) are not less than 80 per cent and not more than 125 per cent of the estimated potency.

**STORAGE**

See *Human normal immunoglobulin for intramuscular administration (0338)* or *Human normal immunoglobulin for subcutaneous administration (2788)*.

**LABELLING**

See *Human normal immunoglobulin for intramuscular administration (0338)* or *Human normal immunoglobulin for subcutaneous administration (2788)*.

The label states the number of International Units per container.

Ph Eur

## Hepatitis B Immunoglobulin for Intravenous Use

(Human Hepatitis B Immunoglobulin for Intravenous Administration, Ph. Eur. monograph 1016)

Ph Eur

### DEFINITION

Sterile liquid or freeze-dried preparation containing immunoglobulins, mainly immunoglobulin G. It is obtained from plasma from selected and/or immunised donors having antibodies against hepatitis B surface antigen. *Human normal immunoglobulin for intravenous administration (0918)* may be added.

It complies with the monograph *Human normal immunoglobulin for intravenous administration (0918)*, except for the minimum number of donors, the minimum total protein content and the limit for osmolality.

### POTENCY

The potency is determined by comparing the antibody titre of the immunoglobulin to be examined with that of a reference preparation calibrated in International Units, using an immunoassay (2.7.1) of suitable sensitivity and specificity. The International Unit is the activity contained in a stated amount of the International Standard for anti-hepatitis B immunoglobulin. The equivalence in International Units of the International Standard is stated by the World Health Organization.

*Human hepatitis B immunoglobulin BRP* is calibrated in International Units by comparison with the International Standard.

The stated potency is not less than 50 IU/mL. The estimated potency is not less than the stated potency. The confidence limits ( $P = 0.95$ ) are not less than 80 per cent and not more than 125 per cent of the estimated potency.

### STORAGE

See *Human normal immunoglobulin for intravenous administration (0918)*.

### LABELLING

See *Human normal immunoglobulin for intravenous administration (0918)*.

The label states the minimum number of International Units of hepatitis B immunoglobulin per container.

Ph Eur

for the minimum number of donors and the minimum total protein content.

### POTENCY

The potency of the liquid preparation and of the freeze-dried preparation after reconstitution as stated on the label is not less than 50 IU per millilitre of neutralising antibody against measles virus.

The potency is determined by comparing the antibody titre of the immunoglobulin to be examined with that of a reference preparation calibrated in International Units, using a challenge dose of measles virus in a suitable cell culture system. An alternative method may be used providing that the competent authority is satisfied that it correlates with the determination of neutralising activity for the measles virus by comparison with the reference preparation.

The International Unit is the specific neutralising activity for measles virus contained in a stated amount of the International Standard for human anti-measles serum. The equivalence in International Units of the International Reference Preparation is stated by the World Health Organization.

### Method

Prepare serial 2-fold dilutions of the immunoglobulin to be examined and of the reference preparation. Mix each dilution with an equal volume of a suspension of measles virus containing about 100 CCID<sub>50</sub> in 0.1 mL and incubate protected from light at 37 °C for 2 h. Using not fewer than 6 cell cultures per mixture, inoculate 0.2 mL of each mixture into each of the cell cultures allocated to that mixture and incubate for not less than 10 days. Examine the cultures for viral activity and compare the dilution containing the smallest quantity of the immunoglobulin which neutralises the virus with that of the corresponding dilution of the reference preparation.

Calculate the potency of the immunoglobulin to be examined in International Units per millilitre of neutralising antibody against measles virus.

### STORAGE

## Measles Immunoglobulin

(Human Measles Immunoglobulin, Ph. Eur. monograph 0397)

Ph Eur

### DEFINITION

Sterile liquid or freeze-dried preparation containing immunoglobulins, mainly immunoglobulin G. The preparation is intended for intramuscular administration. It is obtained from plasma containing specific antibodies against measles virus. *Human normal immunoglobulin for intramuscular administration (0338)* may be added.

It complies with the monograph on *Human normal immunoglobulin for intramuscular administration (0338)*, except

## Human $\alpha$ -1-proteinase Inhibitor

(Ph. Eur. monograph 2387)

Ph Eur

### DEFINITION

Sterile liquid or freeze-dried preparation of a plasma protein fraction containing mainly human  $\alpha$ -1-proteinase inhibitor (also known as human  $\alpha$ -1-antitrypsin or  $\alpha$ -1-antiproteinase). Human  $\alpha$ -1-proteinase inhibitor is a glycoprotein existing in isoforms with different isoelectric points and is the most abundant multifunctional serine proteinase inhibitor in human plasma.

It is obtained from human plasma that complies with the monograph *Human plasma for fractionation (0853)*, using a suitable fractionation process and further purification steps. Other plasma proteins may be present. The preparation may contain excipients such as stabilisers.

#### PRODUCTION

##### GENERAL PROVISIONS

The method of preparation is designed to maintain functional integrity of  $\alpha$ -1-proteinase inhibitor. It includes a step or steps that have been shown to remove or to inactivate known agents of infection. The subsequent purification procedure must be validated to demonstrate that the concentration of any substances used for inactivation of viruses during production is reduced to a suitable level and that any residues are such as not to compromise the safety of the preparation for patients.

The specific activity is not less than 0.35 mg of active human  $\alpha$ -1-proteinase inhibitor per milligram of total protein.

The ratio of human  $\alpha$ -1 proteinase inhibitor activity to human  $\alpha$ -1-proteinase inhibitor antigen is not less than 0.7.

No antimicrobial preservative or antibiotic is added.

The solution is passed through a bacteria-retentive filter and distributed aseptically into the final containers. It may be subsequently freeze-dried.

##### CONSISTENCY OF THE METHOD OF PRODUCTION

It shall be demonstrated that the manufacturing process yields a product with a consistent composition. It is evaluated by suitable analytical procedures that are determined during process development, and which include:

- assay of human  $\alpha$ -1-proteinase inhibitor activity;
- determination of specific human  $\alpha$ -1-proteinase inhibitor activity, expressed as the ratio of active human  $\alpha$ -1-proteinase inhibitor to total protein;
- characterisation of isoform composition and protein structure by suitable methods such as isoelectric focusing (2.2.54), spectrometric methods (for example, mass spectrometry) or capillary electrophoresis (2.2.47);
- determination of the ratio of human  $\alpha$ -1-proteinase inhibitor activity to human  $\alpha$ -1-proteinase inhibitor antigen;
- characterisation of accompanying plasma proteins that might be present, by a set of suitable methods such as SDS-PAGE, cellulose acetate electrophoresis or capillary zone electrophoresis (2.2.31) and quantitative determination of relevant accompanying plasma proteins;
- determination of molecular-size distribution, used to quantify the polymeric forms of human  $\alpha$ -1-proteinase inhibitor; consideration is given to the potential presence of accompanying proteins that might affect the results.

#### CHARACTERS

##### Appearance

- *liquid preparations*: clear or slightly opalescent, colourless or pale yellow or pale green or pale brown;
- *freeze-dried preparations*: powders or solid friable masses, hygroscopic, white or pale yellow or pale brown.

If the preparation to be examined is freeze-dried, reconstitute it as stated on the label immediately before carrying out the identification, tests (except those for solubility and water) and assay.

##### IDENTIFICATION

It complies with the limits of the assay.

#### TESTS

##### pH (2.2.3)

6.5 to 7.8.

##### Solubility

For freeze-dried preparations, add to a container of the preparation to be examined the volume of the liquid stated on the label at room temperature. The preparation dissolves completely, giving a clear, colourless or pale green or pale yellow or pale brown solution.

##### Osmolality (2.2.35)

Minimum 210 mosmol/kg.

##### Total protein

Dilute the preparation to be examined with a 9 g/L solution of sodium chloride R to obtain a protein concentration of about 7.5 mg/mL. To 2.0 mL of this solution in a round-bottomed centrifuge tube, add 2 mL of a 75 g/L solution of sodium molybdate R and 2 mL of a mixture of 1 volume of nitrogen-free sulfuric acid R and 30 volumes of water R. Shake, centrifuge for 5 min, decant the supernatant and allow the inverted tube to drain on filter paper. Determine the nitrogen in the residue by the method of sulfuric acid digestion (2.5.9) and calculate the protein content by multiplying by 6.25.

##### Water

Determined by a suitable method, such as the semi-micro determination of water (2.5.12), loss on drying (2.2.32) or near-infrared spectroscopy (2.2.40), the water content is within the limits approved by the competent authority.

##### Sterility (2.6.1)

It complies with the test.

##### Pyrogens (2.6.8) or Bacterial endotoxins (2.6.14)

It complies with the test for pyrogens or, preferably and where justified and authorised, with a validated *in vitro* test such as the bacterial endotoxin test.

For the pyrogen test, inject per kilogram of the rabbit's mass a volume equivalent to not less than 60 mg of human  $\alpha$ -1-proteinase inhibitor. Where the bacterial endotoxin test is used, the preparation to be examined contains less than 0.08 IU of endotoxin per milligram of human  $\alpha$ -1-proteinase inhibitor.

#### ASSAY

##### Assay of human $\alpha$ -1-proteinase inhibitor (2.7.32)

The estimated potency is not less than 80 per cent and not more than 120 per cent of the stated potency. The confidence limits ( $P = 0.95$ ) are not less than 80 per cent and not more than 120 per cent of the estimated potency.

#### STORAGE

In an airtight and sterile container, at a temperature not exceeding 25 °C, unless otherwise justified and authorised.

#### LABELLING

The label states:

- the potency of active (functional) human  $\alpha$ -1-proteinase inhibitor per container;
- the name and quantity of any added substances;
- the quantity of protein in the container;
- the route of administration;
- where applicable, the name and volume of the liquid to be used for reconstitution;
- that the transmission of infectious agents cannot be totally excluded when medicinal products prepared from human blood or plasma are administered.

Ph Eur

## Human C1-Esterase Inhibitor

(Ph. Eur. monograph 2818)

### Action and use

Prophylaxis and treatment of hereditary angioedema.

Ph Eur

### DEFINITION

Plasma protein fraction containing mainly human C1-esterase inhibitor (also known as C1-inhibitor or C1-INH). Human C1-esterase inhibitor is a soluble, single-chain glycoprotein containing 478 amino-acid residues. Human C1-esterase inhibitor belongs to the group of serine protease inhibitors. It is obtained from human plasma that complies with the monograph *Human plasma for fractionation (0853)*, using a suitable fractionation process and further purification steps. Other plasma proteins may be present.

### PRODUCTION

The method of preparation includes a step or steps that have been shown to remove or to inactivate known agents of infection; if substances are used for inactivation of viruses during production, the subsequent purification procedure must be validated to demonstrate that the concentration of these substances is reduced to a suitable level and any residues are such as not to compromise the safety of the preparation for patients.

Human C1-esterase inhibitor is purified. The method of preparation is designed to maintain the functional integrity of human C1-esterase inhibitor. Buffers and other auxiliary substances such as a stabiliser may be included. The solution is passed through a bacteria-retentive filter, distributed aseptically into the final containers and immediately frozen. It is subsequently freeze-dried and the containers are closed under vacuum or under an inert gas. No antimicrobial preservative is added at any stage of production.

### CONSISTENCY OF THE METHOD OF PRODUCTION

It shall be demonstrated that the manufacturing process yields a product having a consistent composition. This is evaluated by suitable analytical procedures that are determined during process development and that normally include:

- assay of human C1-esterase inhibitor (2.7.34);
- determination of specific human C1-esterase inhibitor activity, expressed as the ratio of active human C1-esterase inhibitor content to total protein content;
- determination of molecular-size distribution by size-exclusion chromatography (2.2.30);
- molecular identification of human C1-esterase inhibitor, characterisation of accompanying plasma proteins that might be present, by a set of suitable methods such as SDS-PAGE, cellulose acetate electrophoresis or capillary zone electrophoresis (2.2.31, 2.2.47) and quantitative determination of relevant accompanying plasma proteins.

### CHARACTERS

#### Appearance

White, pale yellow, pale blue or greenish, hygroscopic powder or friable solid.

Reconstitute the preparation to be examined as stated on the label immediately before carrying out the identification, tests (except those for solubility and water) and assay.

### IDENTIFICATION

It complies with the limits of the assay.

### TESTS

#### Solubility

To the contents of a container of the preparation to be examined add the volume of the solvent stated on the label at the recommended temperature. The preparation dissolves completely with gentle swirling within the limits approved by the competent authority, giving a clear, colourless, pale yellow, pale blue or greenish solution.

#### pH (2.2.3)

6.5 to 7.5.

#### Osmolality (2.2.35)

Minimum 200 mosmol/kg.

#### Total protein

If necessary, dilute an accurately measured volume of the reconstituted preparation to be examined with a 9 g/L solution of *sodium chloride R* to obtain a protein concentration of about 7.5 mg/mL. Place 2.0 mL of this solution in a round-bottomed centrifuge tube and add 2 mL of a 75 g/L solution of *sodium molybdate R* and 2 mL of a mixture of 1 volume of *nitrogen-free sulfuric acid R* and 30 volumes of *water R*. Shake, centrifuge for 5 min, decant the supernatant and allow the inverted tube to drain on filter paper. Determine the nitrogen in the residue by the method of sulfuric acid digestion (2.5.9) and calculate the protein content by multiplying the result by 6.25. The protein content is within the limits approved by the competent authority.

#### Specific activity

Minimum 4 IU/mg.

Calculate the ratio of active human C1-esterase inhibitor content (as determined under Assay) to total protein content.

#### Water

Determined by a suitable method, such as the semi-micro determination of water (2.5.12), loss on drying (2.2.32) or near-infrared spectroscopy (2.2.40), the water content is within the limits approved by the competent authority.

#### Sterility (2.6.1)

It complies with the test.

#### Pyrogens (2.6.8) or Bacterial endotoxins (2.6.14)

It complies with the test for pyrogens or, preferably and where justified and authorised, with a validated *in vitro* test such as the bacterial endotoxin test.

For the pyrogen test, inject per kilogram of the rabbit's mass a volume equivalent to 50 IU of human C1-esterase inhibitor.

Where the bacterial endotoxin test is used, the preparation to be examined contains less than 0.25 IU of endotoxin per International Unit of human C1-esterase inhibitor.

### ASSAY

Carry out the assay of human C1-esterase inhibitor (2.7.34).

The estimated potency is not less than 75 per cent and not more than 125 per cent of the stated potency.

The confidence limits ( $P = 0.95$ ) are not less than

80 per cent and not more than 120 per cent of the estimated potency.

### STORAGE

In an airtight and sterile container, protected from light, at a temperature not exceeding 25 °C, unless otherwise justified and authorised.

### LABELLING

The label states:

- the number of International Units of human C1-esterase inhibitor per container;

- the quantity of protein in the container;
- the name and quantity of any added substance;
- the name and volume of the solvent to be used for reconstitution;
- that the transmission of infectious agents cannot be totally excluded when medicinal products prepared from human blood or plasma are administered.

Ph Eur

## Rabies Immunoglobulin

(Human Rabies Immunoglobulin, Ph. Eur. monograph 0723)

Ph Eur

### DEFINITION

Sterile liquid or freeze-dried preparation containing immunoglobulins, mainly immunoglobulin G. The preparation is intended for intramuscular administration. It is obtained from plasma from donors immunised against rabies. It contains specific antibodies neutralising the rabies virus. *Human normal immunoglobulin for intramuscular administration (0338)* may be added.

It complies with the monograph on *Human normal immunoglobulin for intramuscular administration (0338)*, except for the minimum number of donors and the minimum total protein content.

### POTENCY

The potency is determined by comparing the dose of immunoglobulin required to neutralise the infectivity of a rabies virus suspension with the dose of a reference preparation, calibrated in International Units, required to produce the same degree of neutralisation (2.7.1). The test is performed in sensitive cell cultures and the presence of unneutralised virus is revealed by immunofluorescence.

The International Unit is the specific neutralising activity for rabies virus in a stated amount of the International Standard for anti-rabies immunoglobulin. The equivalence in International Units of the International Standard is stated by the World Health Organization.

*Human rabies immunoglobulin BRP* is calibrated in International Units by comparison with the International Standard.

### Method

Carry out the test in suitable sensitive cells. It is usual to use the BHK-21 cell line, grown in the medium described below, between the 18<sup>th</sup> and 30<sup>th</sup> passage levels counted from the ATCC seed lot. Harvest the cells after 2 to 4 days of growth, treat with trypsin and prepare a suspension containing 500 000 cells per millilitre (cell suspension). 10 min before using this suspension add 10 µg of *diethylaminoethyl-dextran R* per millilitre, if necessary, to increase the sensitivity of the cells.

Use a fixed virus strain grown in sensitive cells, such as the CVS strain of rabies virus adapted to growth in the BHK-21 cell line (seed virus suspension). Estimate the titre of the seed virus suspension as follows.

Prepare a series of dilutions of the viral suspension. In the chambers of cell-culture slides (8 chambers per slide), place 0.1 mL of each dilution and 0.1 mL of medium and add 0.2 mL of the cell suspension. Incubate in an atmosphere of carbon dioxide at 37 °C for 24 h. Carry out fixation,

immunofluorescence staining and evaluation as described below. Determine the end-point titre of the seed virus suspension and prepare the working virus dilution corresponding to 100 CCID<sub>50</sub> per 0.1 mL.

For each assay, check the amount of virus used by performing a control titration: from the dilution corresponding to 100 CCID<sub>50</sub> per 0.1 mL, make 3 tenfold dilutions. Add 0.1 mL of each dilution to 4 chambers containing 0.1 mL of medium and add 0.2 mL of the cell suspension. The test is not valid unless the titre lies between 30 CCID<sub>50</sub> and 300 CCID<sub>50</sub>.

Dilute the reference preparation to a concentration of 2 IU/mL using non-supplemented culture medium (stock reference dilution, stored below -80 °C). Prepare 2 suitable predilutions (1:8 and 1:10) of the stock reference dilution so that the dilution of the reference preparation that reduces the number of fluorescent fields by 50 per cent lies within the 4 dilutions of the cell-culture slide. Add 0.1 mL of the medium to each chamber, except the first in each of 2 rows, to which add respectively 0.2 mL of the 2 predilutions of the stock reference dilution transferring successively 0.1 mL to the other chambers.

Dilute the preparation to be examined 1 in 100 using non-supplemented medium (stock immunoglobulin dilution) – to reduce to a minimum errors due to viscosity of the undiluted preparation – and make 3 suitable predilutions so that the dilution of the preparation to be examined that reduces the number of fluorescent fields by 50 per cent lies within the 4 dilutions of the cell-culture slide. Add 0.1 mL of the medium to all the chambers except the first in each of 3 rows, to which add respectively 0.2 mL of the 3 predilutions of the stock immunoglobulin dilution. Prepare a series of 2-fold dilutions transferring successively 0.1 mL to the other chambers.

To all the chambers containing the dilutions of the reference preparation and the dilutions of the preparation to be examined, add 0.1 mL of the virus suspension corresponding to 100 CCID<sub>50</sub> per 0.1 mL (working virus dilution), shake manually, allow to stand in an atmosphere of carbon dioxide at 37 °C for 90 min, add 0.2 mL of the cell suspension, shake manually and allow to stand in an atmosphere of carbon dioxide at 37 °C for 24 h.

After 24 h, discard the medium and remove the plastic walls. Wash the cell monolayer with *phosphate buffered saline pH 7.4 R* and then with a mixture of 20 volumes of *water R* and 80 volumes of *acetone R* and fix in a mixture of 20 volumes of *water R* and 80 volumes of *acetone R* at -20 °C for 3 min. Spread on the slides *fluorescein-conjugated rabies antiserum R* ready for use. Allow to stand in an atmosphere with a high level of moisture at 37 °C for 30 min. Wash with *phosphate buffered saline pH 7.4 R* and dry. Examine 20 fields in each chamber at a magnification of 250 ×, using a microscope equipped for fluorescence readings. Note the number of fields with at least 1 fluorescent cell. Check the test dose used in the virus titration slide and determine the dilution of the reference preparation and the dilution of the preparation to be examined that reduce the number of fluorescent fields by 50 per cent, calculating the 2 or 3 dilutions together using probit analysis. The test is not valid unless the statistical analysis shows a significant slope of the dose-response curve and no evidence of deviation from linearity or parallelism. The stated potency is not less than 150 IU/mL. The estimated potency is not less than the stated potency and is not greater than twice the stated potency.

The confidence limits ( $P = 0.95$ ) are not less than 80 per cent and not more than 125 per cent of the estimated potency.

#### CULTURE MEDIUM FOR GROWTH OF BHK-21 CELLS

Commercially available media that have a slightly different composition from that shown below may also be used.

Sodium chloride	6.4 g
Potassium chloride	0.40 g
Calcium chloride, anhydrous	0.20 g
Magnesium sulfate, heptahydrate	0.20 g
Sodium dihydrogen phosphate, monohydrate	0.124 g
Glucose monohydrate	4.5 g
Ferric nitrate, nonahydrate	0.10 mg
L-Arginine hydrochloride	42.0 mg
L-Cystine	24.0 mg
L-Histidine	16.0 mg
L-Isoleucine	52.0 mg
L-Leucine	52.0 mg
L-Lysine hydrochloride	74.0 mg
L-Phenylalanine	33.0 mg
L-Threonine	48.0 mg
L-Tryptophan	8.0 mg
L-Tyrosine	36.0 mg
L-Valine	47.0 mg
L-Methionine	15.0 mg
L-Glutamine	0.292 g
D-Inositol	3.60 mg
Choline chloride	2.0 mg
Folic acid	2.0 mg
Nicotinamide	2.0 mg
Calcium pantothenate	2.0 mg
Pyridoxal hydrochloride	2.0 mg
Thiamine hydrochloride	2.0 mg
Riboflavin	0.2 mg
Phenol red	15.0 mg
Sodium hydrogen carbonate	2.75 g
Water	to 1000 mL

The medium is supplemented with:

Foetal calf serum (heated at 56 °C for 30 min)	10 per cent
Tryptose phosphate broth	10 per cent
Benzylpenicillin sodium	60 mg/L
Streptomycin	0.1 g/L

See *Human normal immunoglobulin for intramuscular administration (0338)*.

The label states the number of International Units per container.

Ph Eur

## Rubella Immunoglobulin

(*Human Rubella Immunoglobulin, Ph. Eur. monograph 0617*)

Ph Eur

#### DEFINITION

Sterile liquid or freeze-dried preparation containing immunoglobulins, mainly immunoglobulin G.

The preparation is intended for intramuscular administration. It is obtained from plasma containing specific antibodies against rubella virus. *Human normal immunoglobulin for intramuscular administration (0338)* may be added.

It complies with the monograph on *Human normal immunoglobulin for intramuscular administration (0338)*, except for the minimum number of donors and the minimum total protein content.

#### POTENCY

The potency is determined by comparing the activity of the preparation to be examined in a suitable haemagglutination-inhibition test with that of a reference preparation calibrated in International Units.

The International Unit is the activity contained in a stated amount of the International Standard for anti-rubella immunoglobulin. The equivalence in International Units of the International Reference Preparation is stated by the World Health Organization.

The estimated potency is not less than 4500 IU/mL. The confidence limits ( $P = 0.95$ ) of the estimated potency are not less than 50 per cent and not more than 200 per cent of the stated potency.

#### STORAGE

See *Human normal immunoglobulin for intramuscular administration (0338)*.

#### LABELLING

See *Human normal immunoglobulin for intramuscular administration (0338)*.

The label states the number of International Units per millilitre.

Ph Eur

## Tetanus Immunoglobulin

(*Human Tetanus Immunoglobulin, Ph. Eur. monograph 0398*)

Ph Eur

#### DEFINITION

Sterile liquid or freeze-dried preparation containing immunoglobulins, mainly immunoglobulin G.

The preparation is intended for intramuscular administration. It is obtained from plasma containing specific antibodies against the toxin of *Clostridium tetani*. *Human normal immunoglobulin for intramuscular administration (0338)* may be added.

It complies with the monograph *Human normal immunoglobulin for intramuscular administration (0338)*, except for the minimum number of donors and the minimum total protein content.

#### PRODUCTION

During development, a satisfactory relationship shall be established between the potency determined by immunoassay as described under Potency and that determined by means of the following test for toxin-neutralising capacity in mice.

**Toxin-neutralising capacity in mice** The potency is determined by comparing the quantity necessary to protect mice against the paralytic effects of a fixed quantity of tetanus toxin with the quantity of a reference preparation of human tetanus immunoglobulin, calibrated in International Units, necessary to give the same protection.

The International Unit of antitoxin is the specific neutralising activity for tetanus toxin contained in a stated amount of the International Standard, which consists of freeze-dried human immunoglobulin. The equivalence in International Units of

the International Standard is stated by the World Health Organization.

*Human tetanus immunoglobulin BRP* is calibrated in International Units by comparison with the International Standard.

#### Method

**Selection of animals** Use mice weighing 16-20 g.

**Preparation of the test toxin** Prepare the test toxin by a suitable method from the sterile filtrate of a culture in liquid medium of *C. tetani*. The 2 methods shown below are given as examples and any other suitable method may be used.

(1) To the filtrate of an approximately 9-day culture, add 1-2 volumes of *glycerol R* and store the mixture in the liquid state at a temperature slightly below 0 °C.

(2) Precipitate the toxin by addition to the filtrate of *ammonium sulfate R*, dry the precipitate *in vacuo* over *diphosphorus pentoxide R*, reduce to a powder and store dry, either in sealed ampoules or *in vacuo* over *diphosphorus pentoxide R*.

**Determination of test dose of toxin (Lp/10 dose)** Prepare a solution of the reference preparation in a suitable liquid such that it contains 0.5 IU of antitoxin per millilitre. If the test toxin is stored dry, reconstitute it using a suitable liquid. Prepare mixtures of the solution of the reference preparation and the test toxin such that each contains 2.0 mL of the solution of the reference preparation, one of a graded series of volumes of the test toxin and sufficient of a suitable liquid to bring the volume to 5.0 mL. Allow the mixtures to stand, protected from light, for 60 min. Using 6 mice for each mixture, inject a dose of 0.5 mL subcutaneously into each mouse. Observe the mice for 96 h. Mice that become paralysed may be euthanised. The test dose of toxin is the quantity in 0.5 mL of the mixture made with the smallest amount of toxin capable of causing, despite partial neutralisation by the reference preparation, paralysis in all 6 mice injected with the mixture, within the observation period.

**Determination of potency of the immunoglobulin** Prepare a solution of the reference preparation in a suitable liquid such that it contains 0.5 IU of antitoxin per millilitre. Prepare a solution of the test toxin in a suitable liquid such that it contains 5 test doses per millilitre. Prepare mixtures of the solution of the test toxin and the immunoglobulin to be examined such that each contains 2.0 mL of the solution of the test toxin, one of a graded series of volumes of the immunoglobulin to be examined and sufficient of a suitable liquid to bring the total volume to 5.0 mL. Also prepare mixtures of the solution of the test toxin and the solution of the reference preparation such that each contains 2.0 mL of the solution of the test toxin, one of a graded series of volumes of the solution of the reference preparation centred on that volume (2.0 mL) that contains 1 IU and sufficient of a suitable liquid to bring the total volume to 5.0 mL. Allow the mixtures to stand, protected from light, for 60 min. Using 6 mice for each mixture, inject subcutaneously a dose of 0.5 mL into each mouse. Observe the mice for 96 h. Mice that become paralysed may be euthanised. The mixture that contains the largest volume of immunoglobulin that fails to protect the mice from paralysis contains 1 IU. This quantity is used to calculate the potency of the immunoglobulin in International Units per millilitre.

The test is not valid unless all the mice injected with mixtures containing 2.0 mL or less of the solution of the reference preparation show paralysis and all those injected with mixtures containing more do not.

#### POTENCY

The potency is determined by comparing the antibody titre of the preparation to be examined with that of a reference preparation calibrated in International Units, using suitable immunochemical methods (2.7.1) such as enzyme-linked immunosorbent assay (ELISA) or toxoid inhibition assay (TIA).

The International Unit is the activity contained in a stated amount of the International Standard for anti-tetanus immunoglobulin. The equivalence in International Units of the International Standard is stated by the World Health Organization.

*Human tetanus immunoglobulin BRP* is calibrated in International Units and is suitable for use as a reference preparation.

The stated potency is not less than 100 IU/mL of tetanus antitoxin. The estimated potency is not less than the stated potency. The confidence limits ( $P = 0.95$ ) are not less than 80 per cent and not more than 125 per cent of the estimated potency.

The description of methods A and B below are provided as examples.

#### Method A: direct enzyme immunoassay

The amount of tetanus immunoglobulin bound to tetanus toxoid, which is coated to a microtitre plate, is determined by means of a peroxidase-conjugated polyclonal anti-human IgG antibody.

#### Materials

- *Phosphate-buffered saline pH 7.1 (PBS)*. Dissolve 0.2 g of *potassium chloride R*, 0.2 g of *potassium dihydrogen phosphate R*, 1.15 g of *anhydrous disodium hydrogen phosphate R* and 8.0 g of *sodium chloride R* in *water R* and adjust the pH (2.2.3) if necessary. Dilute to 1000 mL with *water R*.
- *PBS-T*. PBS containing 0.05 per cent *V/V* of *polysorbate 20 R*.
- *Carbonate buffer pH 9.6*. Dissolve 1.4 g of *anhydrous sodium carbonate R* and 3.0 g of *sodium hydrogen carbonate R* in *water R* and adjust the pH (2.2.3) if necessary. Dilute to 1000 mL with *water R*.
- *Tetanus toxoid*. Purified and chemically inactivated tetanus toxin.
- *Microtitre plate*. Use a flat-bottomed microtitre plate with high protein-binding capacity.

#### Method

Distribute 100 µL of a 0.2 IU/mL solution of tetanus toxoid in carbonate buffer pH 9.6 into each of the wells of the microtitre plate. Incubate at 4 °C for approximately 18 h. Wash the plate 5 times with PBS-T. To block unbound binding sites add 200 µL of PBS containing 5 g/L of *bovine albumin R* to each of the wells and incubate for 1 h at 37 °C on a plate shaker set at 120 r/min. Wash 5 times with PBS-T.

Reconstitute the reference preparation and the preparation to be examined according to the instructions. For each preparation, prepare 2 independent predilutions of 0.004 IU/mL in PBS by applying several dilution steps. Using PBS, prepare from each predilution 5 serial dilutions with a dilution factor of 1.5 resulting in a dilution series of 6 dilutions in the range of 0.0005-0.004 IU/mL. Depending on the reagents used, a small modification of the dilution series might be necessary to meet the conditions of the statistical model used.

Apply 100 µL of each of the samples of the dilution series to the plate. Incubate for 2 h at 37 °C on a plate shaker set at 120 r/min and wash the plate 5 times with PBS-T. Apply 100 µL of a peroxidase-conjugated anti-human IgG antibody diluted to a suitable concentration with PBS-T containing 5 g/L of bovine albumin R to each of the wells and incubate for 1 h at 37 °C on a plate shaker set at 120 r/min. Wash the plate 5 times with PBS-T and apply 100 µL of a suitable 3,3',5,5'-tetramethylbenzidine (TMB) substrate to each of the wells and incubate at room temperature for 10 min in the dark. To stop the reaction, add 100 µL of a 196.2 g/L solution of sulfuric acid R to each of the wells. Measure the absorbances at 450 nm and at the reference wavelength of 630 nm. Calculate the potencies of the preparations by the usual statistical methods (5.3).

#### Method B: indirect determination by toxoid-binding inhibition assay

The amount of unbound toxoid in a mixture of toxoid and tetanus immunoglobulin is determined by an enzyme immunoassay and is inversely proportional to the amount of tetanus immunoglobulin present. The method is performed over 2 consecutive days.

#### Materials

- Phosphate-buffered saline pH 7.1 (PBS). See under Method A.
- PBS-T. See under Method A.
- Carbonate buffer pH 9.6. See under Method A.
- Tetanus toxoid. See under Method A.
- Mab. Mouse monoclonal tetanus toxoid antibody. Use according to the instructions. Prepare a suitable dilution of Mab, e.g. 1/5000, in PBS.
- Peroxidase-conjugated antibody. Peroxidase-conjugated anti-mouse IgG (H+L) antibody, affinity-purified F(ab)<sub>2</sub> fragment without cross-reactivity to human serum proteins. Use according to the instructions. Prepare a suitable dilution of the peroxidase-conjugated antibody in PBS-T containing 5 g/L of bovine albumin R.
- Microtitre plate. Use a round-bottomed microtitre plate with medium protein-binding capacity.
- ELISA plate. Use a flat-bottomed microtitre plate with high protein-binding capacity.

#### Method

##### Day 1

To block the protein-binding sites of the microtitre plate, add 200 µL of PBS containing 5 g/L of bovine albumin R to each of the wells of the microtitre plate and incubate for 1 h at 37 °C on a plate shaker set at 120 r/min. Wash the plate 5 times with PBS-T.

Reconstitute the reference preparation and the preparation to be examined according to the instructions. For each preparation, prepare 2 independent predilutions of 0.4 IU/mL in PBS by applying several dilution steps. Prepare from each predilution a dilution series of dilutions containing 0.04 IU/mL, 0.10 IU/mL, 0.12 IU/mL, 0.14 IU/mL, 0.16 IU/mL, 0.18 IU/mL and 0.20 IU/mL. Prepare each dilution directly from the 0.4 IU/mL predilution.

Transfer 100 µL of each dilution of the dilution series to a well of the blocked plate and add 50 µL of a 0.2 Lf/mL solution of tetanus toxoid in carbonate buffer pH 9.6 into each of the wells. Incubate for approximately 18 h at 37 °C on a plate shaker set at 120 r/min.

To coat the ELISA plate, distribute 100 µL of a solution of a human tetanus immunoglobulin diluted to 1 IU/mL in carbonate buffer pH 9.6 into each of the wells of the ELISA

plate. Incubate for approximately 18 h at 37 °C on a plate shaker set at 120 r/min.

##### Day 2

Wash the coated ELISA plate 5 times with PBS-T. To block unbound binding sites add 200 µL of PBS containing 5 g/L of bovine albumin R to each of the wells and incubate for 1 h at 37 °C on a plate shaker set at 120 r/min. Wash the plate 5 times with PBS-T. Transfer 100 µL of each mixture of toxoid and tetanus immunoglobulin from the microtitre plate to the coated ELISA plate and incubate for 2 hours at 37 °C on a plate shaker set at 120 r/min. Wash the plate 5 times with PBS-T. Add 100 µL of diluted Mab to each of the wells, incubate the plate for 1 h at 37 °C on a plate shaker set at 120 r/min and wash the plate 5 times with PBS-T. Add 100 µL of the diluted peroxidase-conjugated antibody to each of the wells, incubate the plate for 1 h at 37 °C on a plate shaker set at 120 r/min and wash the plate 5 times with PBS-T. Apply 100 µL of a suitable 3,3',5,5'-tetramethylbenzidine (TMB) substrate to each of the wells and incubate at room temperature for 10 min in the dark. To stop the reaction, add 100 µL of a 196.2 g/L solution of sulfuric acid R to each of the wells. Measure the absorbances at 450 nm and at the reference wavelength of 630 nm. Calculate the potencies of the preparations by the usual statistical methods (5.3).

#### STORAGE

See Human normal immunoglobulin for intramuscular administration (0338).

#### LABELLING

See Human normal immunoglobulin for intramuscular administration (0338).

The label states the number of International Units per container.

Ph Eur

## Varicella Immunoglobulin

(Human Varicella Immunoglobulin, Ph. Eur. monograph 0724)

Ph Eur

#### DEFINITION

Sterile liquid or freeze-dried preparation containing immunoglobulins, mainly immunoglobulin G.

The preparation is intended for intramuscular administration. It is obtained from plasma from selected donors having antibodies against *Herpesvirus varicellae*. Human normal immunoglobulin for intramuscular administration (0338) may be added.

It complies with the monograph on Human normal immunoglobulin for intramuscular administration (0338) except for the minimum number of donors, the minimum total protein content and, where authorised, the test for antibody to hepatitis B surface antigen.

#### POTENCY

The potency is determined by comparing the antibody titre of the immunoglobulin to be examined with that of a reference preparation calibrated in International Units, using an immunoassay of suitable sensitivity and specificity (2.7.1). The International Unit is the activity contained in a stated amount of the International Standard for anti varicella-zoster.

The equivalence in International Units of the International Standard is stated by the World Health Organization.

The stated potency is not less than 100 IU/mL.

The estimated potency is not less than the stated potency.

The confidence limits ( $P = 0.95$ ) are not less than 80 per cent and not more than 125 per cent of the estimated potency.

#### STORAGE

See *Human normal immunoglobulin for intramuscular administration (0338)*.

#### LABELLING

See *Human normal immunoglobulin for intramuscular administration (0338)*.

The label states the number of International Units per container.

Ph Eur

## von Willebrand Factor

(*Human von Willebrand factor, Ph. Eur. monograph 2298*)

Ph Eur

#### DEFINITION

Sterile, freeze-dried preparation of a plasma protein fraction containing the glycoprotein human von Willebrand factor with varying amounts of human coagulation factor VIII, depending on the method of preparation. It is prepared from human plasma that complies with the monograph on *Human plasma for fractionation (0853)*. The preparation may contain excipients such as stabilisers.

This monograph applies to preparations formulated according to the human von Willebrand factor activity.

The potency of the preparation, reconstituted as stated on the label, is not less than 20 IU of human von Willebrand factor per millilitre.

#### PRODUCTION

##### GENERAL PROVISIONS

The method of preparation is designed to maintain functional integrity of human von Willebrand factor. It includes steps that have been shown to remove or to inactivate known agents of infection; if substances are used for the inactivation of viruses, the subsequent purification procedure must be validated to demonstrate that the concentration of these substances is reduced to a suitable level and that any residues are such as not to compromise the safety of the preparation for patients.

The specific activity is not less than 1 IU of human von Willebrand factor per milligram of total protein, before the addition of any protein stabiliser.

The human von Willebrand factor fraction is dissolved in a suitable liquid. No antimicrobial preservative or antibiotic is added. The solution is passed through a bacteria-retentive filter, distributed aseptically into the final containers and immediately frozen. It is subsequently freeze-dried and the containers are closed under vacuum or under an inert gas.

##### CONSISTENCY OF THE METHOD OF PRODUCTION

It shall be demonstrated that the manufacturing process yields a product having a consistent composition with respect to human von Willebrand factor, human coagulation factor VIII and the proportions of human von Willebrand factor and human coagulation factor VIII. This is evaluated by suitable analytical procedures that are determined during process development, and that include the following checks:

##### Human von Willebrand factor multimers

The distribution of the different human von Willebrand factor multimers is determined by a suitable method such as sodium dodecyl sulfate (SDS) agarose gel electrophoresis with or without Western blot analysis, using a suitable normal human plasma as standard. Visualisation of the multimeric pattern may be performed using, for example, an immunoenzymatic technique and quantitative evaluation may be carried out by densitometric analysis.

##### Human von Willebrand factor activity (2.7.21)

The human von Willebrand factor activity is estimated by determining the ristocetin cofactor activity and by one or more other suitable assays such as determination of collagen-binding activity using a suitable reference preparation.

## Varicella Immunoglobulin for Intravenous Use

(*Human Varicella Immunoglobulin for Intravenous Administration, Ph. Eur. monograph 1528*)

Ph Eur

#### DEFINITION

Sterile liquid or freeze-dried preparation containing immunoglobulins, mainly immunoglobulin G. It is obtained from plasma from selected donors having antibodies against human herpesvirus 3 (varicella-zoster virus 1). *Human normal immunoglobulin for intravenous administration (0918)* may be added.

It complies with the monograph on *Human normal immunoglobulin for intravenous administration (0918)*, except for the minimum number of donors, the minimum total protein content and the limit for osmolality.

#### POTENCY

The potency is determined by comparing the antibody titre of the immunoglobulin to be examined with that of a reference preparation calibrated in International Units, using an immunoassay of suitable sensitivity and specificity (2.7.1).

The International Unit is the activity contained in a stated amount of the International Standard for anti varicella-zoster immunoglobulin. The equivalence in International Units of the International Standard is stated by the World Health Organization.

The stated potency is not less than 25 IU/mL. The estimated potency is not less than the stated potency. The confidence limits ( $P = 0.95$ ) are not less than 80 per cent and not more than 125 per cent of the estimated potency.

#### STORAGE

See *Human normal immunoglobulin for intravenous administration (0918)*.

#### LABELLING

See *Human normal immunoglobulin for intravenous administration (0918)*.

The label states the number of International Units per container.

Ph Eur

**Human von Willebrand factor activity/antigen ratio**

Consistency of the manufacturing process with respect to the ratio of human von Willebrand factor activity to human von Willebrand factor antigen content is demonstrated.

**PRODUCTS THAT SHOW PARTICLES AFTER RECONSTITUTION**

If a few particles remain when the preparation is reconstituted, it shall be demonstrated during validation studies that the potency is not significantly affected after passage of the preparation through the filter to be provided with the preparation.

**CHARACTERS****Appearance**

Hygroscopic, white or pale yellow, powder or friable solid.

*Reconstitute the preparation to be examined as stated on the label immediately before carrying out the identification, tests (except those for solubility and water) and assay.*

**IDENTIFICATION**

It complies with the limits of the assay.

**TESTS****Solubility**

To a container of the preparation to be examined, add the volume of the liquid stated on the label at the recommended temperature. The preparation dissolves completely with gentle swirling within 10 min, forming a clear or slightly opalescent, colourless or slightly yellow solution.

In addition, where the label states that the product may show a few particles after reconstitution, reconstitute the preparation as described on the label and pass it through the filter provided: the filtered solution is clear or slightly opalescent.

**pH (2.2.3)**

6.5 to 7.5.

**Osmolality (2.2.35)**

Minimum 240 mosmol/kg.

**Total protein**

If necessary, dilute an accurately measured volume of the reconstituted preparation with a 9 g/L solution of sodium chloride R to obtain a protein concentration of about 7.5 mg/mL. Place 2.0 mL of this solution in a round-bottomed centrifuge tube and add 2 mL of a 75 g/L solution of sodium molybdate R and 2 mL of a mixture of 1 volume of nitrogen-free sulfuric acid R and 30 volumes of water R. Shake, centrifuge for 5 min, decant the supernatant and allow the inverted tube to drain on filter paper. Determine the nitrogen in the residue by the method of sulfuric acid digestion (2.5.9) and calculate the amount of protein by multiplying the result by 6.25. *For some products, especially those without a protein stabiliser, this method may not be applicable. Another validated method for protein determination must therefore be performed.*

**Anti-A and anti-B haemagglutinins (2.6.20, Method A)**

The 1 to 64 dilution does not show agglutination. Dilute the reconstituted preparation with a 9 g/L solution of sodium chloride R to contain 6 IU of human von Willebrand factor activity per millilitre.

**Water**

Determined by a suitable method, such as semi-micro determination of water (2.5.12), loss on drying (2.2.32) or near-infrared spectroscopy (2.2.40), the water content is within the limits approved by the competent authority.

**Sterility (2.6.1)**

It complies with the test.

**Pyrogens (2.6.8) or Bacterial endotoxins (2.6.14)**

It complies with the test for pyrogens or, preferably and where justified and authorised, with a validated *in vitro* test such as the test for bacterial endotoxins.

For the pyrogen test, inject per kilogram of the rabbit's mass a volume equivalent to not less than 100 IU of human von Willebrand factor.

Where the test for bacterial endotoxins is used, the preparation to be examined contains less than 0.05 IU of endotoxin per International Unit of human von Willebrand factor.

**ASSAY****Human von Willebrand factor (2.7.21)**

The estimated potency is not less than 80 per cent and not more than 120 per cent of the stated potency.

The confidence limits ( $P = 0.95$ ) are not less than 80 per cent and not more than 120 per cent of the estimated potency.

*Pending the availability of an International Standard for human von Willebrand factor concentrate calibrated for use in the collagen-binding assay, only the ristocetin cofactor assay may be used.*

**Human coagulation factor VIII (2.7.4)**

The assay is carried out where the human coagulation factor VIII content is greater than 10 IU of human coagulation factor VIII per 100 IU of human von Willebrand factor activity. The estimated potency is not less than 60 per cent and not more than 140 per cent of the stated potency. The confidence limits ( $P = 0.95$ ) are not less than 80 per cent and not more than 120 per cent of the estimated potency.

**STORAGE**

In an airtight container, protected from light.

**LABELLING**

*The label states:*

- the number of International Units of human von Willebrand factor in the container;
- the number of International Units of human coagulation factor VIII in the container, or that the content of human coagulation factor VIII is less than or equal to 10 IU of human coagulation factor VIII per 100 IU of human von Willebrand factor activity;
- the amount of protein in the container;
- the name and quantity of any added substance;
- the name and volume of the liquid to be used for reconstitution;
- where applicable, that the preparation may show the presence of a few particles after reconstitution;
- that the transmission of infectious agents cannot be totally excluded when medicinal products prepared from human blood or plasma are administered.

IMMUNOLOGICAL PRODUCTS

## Monoclonal Antibodies for Human Use

(Ph. Eur. monograph 2031)

*Monoclonal Antibodies for Human Use comply with the requirements of the European Pharmacopoeia. These requirements are reproduced below.*

*The requirements of the monograph for Immunosera do not necessarily apply to the monograph for Monoclonal Antibodies for Human Use.*

Ph Eur

### DEFINITION

Monoclonal antibodies for human use are preparations of an immunoglobulin or a fragment of an immunoglobulin, for example, F(ab')<sub>2</sub>, with defined specificity, produced by a single clone of cells. They may be conjugated to other substances, including for radiolabelling.

They can be obtained from immortalised B lymphocytes that are cloned and expanded as continuous cell lines or from rDNA-engineered cell lines.

Examined under suitable conditions of visibility, they are practically free from particles.

Currently available rDNA-engineered antibodies include the following antibodies.

**Chimeric monoclonal antibodies** The variable heavy- and light-chain domains of a human antibody are replaced by those of a non-human species that possess the desired antigen specificity.

**Humanised monoclonal antibodies** The 3 short hypervariable sequences (the complementarity-determining regions) of non-human variable domains for each chain are engineered into the variable domain framework of a human antibody; other sequence changes may be made to improve antigen binding.

**Recombinant human monoclonal antibodies** The variable heavy- and light-chain domains of a human antibody are combined with the constant region of a human antibody.

Monoclonal antibodies obtained from cell lines modified by recombinant DNA technology also comply with the requirements of the monograph *Products of recombinant DNA technology (0784)*.

This monograph applies to monoclonal antibodies, including conjugates, for therapeutic and prophylactic use and for use as *in vivo* diagnostics. It does not apply to monoclonal antibodies used as reagents in the manufacture of medicinal products. Nor does it apply to monoclonal antibodies produced in ascites, for which requirements are decided by the competent authority.

### PRODUCTION

#### GENERAL PROVISIONS

Production is based on a seed-lot system using a master cell bank and, if applicable, a working cell bank derived from the cloned cells. The production method is validated during development studies in order to prevent transmission of infectious agents by the final product. All biological materials and cells used in the production are characterised and are in compliance with chapter 5.2.8. *Minimising the risk of transmitting animal spongiform encephalopathy agents via human and veterinary medicinal products*. Where monoclonal antibodies for human use are manufactured using materials of human or animal origin, the requirements of chapter 5.1.7. *Viral safety* also apply. Where an immunogen is used, it is

characterised and the method of immunisation is documented.

#### Process validation

During development studies, the production method is validated for the following aspects:

- consistency of the production process including cell-culture/fermentation, purification and, where applicable, fragmentation method;
- removal or inactivation of infectious agents;
- adequate removal of product- and process-related impurities (for example, host-cell protein and DNA, protein A, antibiotics, cell-culture components);
- specificity and biological activity of the monoclonal antibody;
- absence of non-endotoxin pyrogens, where applicable;
- reusability of purification components (for example, column material), limits or acceptance criteria being set as a function of the validation;
- methods used for conjugation, where applicable.

#### Product characterisation

The product is characterised to obtain adequate information including: structural integrity, isotype, amino-acid sequence, secondary structure, carbohydrate moiety, disulfide bridges, conformation, specificity, affinity, biological activity and heterogeneity (characterisation of isoforms).

A battery of suitable analytical techniques is used including chemical, physical, immunochemical and biological tests (for example, peptide mapping, *N*- and *C*-terminal amino-acid sequencing, mass spectrometry, chromatographic, electrophoretic and spectroscopic techniques). Additional tests are performed to obtain information on cross-reactivity with human tissues.

For those products that are modified by fragmentation or conjugation, the influence of the methods used on the antibody is characterised.

#### Process intermediates

Where process intermediates are stored, an expiry date or a storage period justified by stability data is established for each.

#### Biological assay

The biological assay is chosen in terms of its correlation with the intended mode of action of the monoclonal antibody.

#### Reference preparation

A batch shown to be stable and shown to be suitable in clinical trials, or a batch representative thereof, is used as a reference preparation for the identification, tests and assay. The reference preparation is appropriately characterised as defined under Product characterisation, except that it is not necessary to examine cross-reactivity for each batch of reference preparation.

#### Definition of a batch

Definition of a batch is required throughout the process.

#### SOURCE CELLS

Source cells include fusion partners, lymphocytes, myeloma cells, feeder cells and host cells for the expression of the recombinant monoclonal antibody.

The origin and characteristics of the parental cell are documented, including information on the health of the donors, and on the fusion partner used (for example, myeloma cell line, human lymphoblastoid B-cell line).

Wherever possible, source cells undergo suitable screening for extraneous agents and endogenous agents. The choice of viruses for the tests is dependent on the species and tissue of origin.

### CELL LINE PRODUCING THE MONOCLONAL ANTIBODY

The suitability of the cell line producing the monoclonal antibody is demonstrated by:

- documentation on the history of the cell line including description of the cell fusion, immortalisation or transfection and cloning procedure;
- characterisation of the cell line (for example, phenotype, isoenzyme analysis, immunochemical markers and cytogenetic markers);
- characterisation of relevant features of the antibody;
- consistency of critical quality attributes for the antibody up to or beyond the population doubling level or generation number used for routine production;
- for recombinant DNA products, consistency of the coding sequence of the expression construct in cells cultivated to the limit of *in vitro* cell age for production use or beyond, by either nucleic acid testing or product analysis.

### CELL BANKS

The master cell bank is a homogeneous suspension of the cell line producing the monoclonal antibody, distributed in equal volumes in a single operation into individual containers for storage.

A working cell bank is a homogeneous suspension of the cell material derived from the master cell bank at a finite passage level, distributed in equal volumes in a single operation into individual containers for storage.

Post-production cells are cells cultured up to or beyond the population doubling level or generation number used for routine production.

The following tests are performed on the master cell bank: viability, identity, absence of bacterial, fungal and mycoplasmal contamination, characterisation of the monoclonal antibody produced. Adventitious viral contamination is tested with a suitable range of *in vivo* and *in vitro* tests. Retrovirus and other endogenous viral contamination is tested using a suitable range of *in vitro* tests.

The following tests are performed on the working cell bank: viability, identity, absence of bacterial, fungal and mycoplasmal contamination. Adventitious viral contamination is tested with a suitable range of *in vivo* and *in vitro* tests. For the first working cell bank, these tests are performed on post-production cells, generated from that working cell bank; for working cell banks subsequent to the first working cell bank, a single *in vitro* and *in vivo* test can be done either directly on the working cell bank or on post-production cells.

For the master cell bank and working cell bank, tests for specific viruses are carried out when potentially contaminated biological material has been used during preparation of the cell banks, taking into account the species of origin of this material. This may not be necessary when this material is inactivated using validated procedures.

The following tests are performed on the post-production cells: absence of bacterial, fungal and mycoplasmal contamination. Adventitious viral contamination is tested with a suitable range of *in vivo* and *in vitro* tests. Retrovirus and other endogenous viral contamination is tested using a suitable range of *in vitro* tests.

### CULTURE AND HARVEST

#### Production at finite passage level (single harvest)

Cells are cultivated up to a defined maximum number of passages or population doublings, or up to a fixed harvest

time (in accordance with the stability of the cell line). Product is harvested in a single operation.

#### Continuous-culture production (multiple harvest)

Cells are continuously cultivated for a defined period (in accordance with the stability of the system and production consistency). Monitoring is necessary throughout the life of the culture; the required frequency and type of monitoring will depend on the nature of the production system.

Each harvest is tested for antibody content, bioburden, endotoxin and mycoplasmas. General or specific tests for adventitious viruses are carried out at a suitable stage depending on the nature of the manufacturing process and the materials used. For processes using production at finite passage level (single harvest), at least 3 harvests are tested for adventitious viruses using a suitable range of *in vitro* methods.

The acceptance criteria for harvests for further processing are clearly defined and linked to the schedule of monitoring applied. If any adventitious viruses are detected, the process is carefully investigated to determine the cause of the contamination and the harvest is not further processed. Harvests in which an endogenous virus has been detected are not used for purification unless an appropriate action plan has been defined to prevent transmission of infectious agents.

### PURIFICATION

Harvests or intermediate pools may be pooled before further processing. The purification process includes steps that remove and/or inactivate non-enveloped and enveloped viruses. A validated purification process, for which removal and/or inactivation of infectious agents and removal of product- and process-related impurities has been demonstrated, is used. Defined steps of the process lead to a purified monoclonal antibody (active substance) of consistent quality and biological activity.

### ACTIVE SUBSTANCE

The test programme for the active substance depends on the validation of the process, on demonstration of consistency and on the expected level of product- and process-related impurities. The active substance is tested for appearance, identity, bioburden and bacterial endotoxins, product-related substances, product- and process-related impurities including tests for host-cell-derived proteins and host-cell- and vector-derived DNA, as well as structural integrity, protein content and biological activity by suitable analytical methods, comparing with the reference preparation where necessary. When the active substance is a conjugated or transformed antibody, appropriate tests must be performed before and after the antibody conjugation/modification.

If storage of intermediates is intended, adequate stability of these preparations and its impact on quality or shelf-life of the finished product are evaluated.

### FINAL BULK

One or more batches of active substance may be combined to produce the final bulk. Suitable stabilisers and other excipients may be added during preparation of the final bulk.

The final bulk must be stored under validated conditions with respect to bioburden and stability.

### FINAL LOT

The final bulk is sterile-filtered and distributed under aseptic conditions into sterile containers, which may subsequently be freeze-dried.

As part of the in-process control each container (vial, syringe or ampoule) is inspected after filling to eliminate containers that contain visible particles. During development of the

product it must be demonstrated that either the process will not generate visible proteinaceous particles in the final lot or such particles are reduced to a low level as justified and authorised.

#### CHARACTERS

Liquid preparations are clear or slightly opalescent, colourless or slightly coloured liquids. Freeze-dried products are white or slightly coloured powders or solid friable masses. After reconstitution they show the same characteristics as liquid preparations.

#### IDENTIFICATION

The identity is established by suitable validated methods comparing the product with the reference preparation, where appropriate. The assay also contributes to identification.

#### TESTS

##### Appearance

Liquid or reconstituted freeze-dried preparations comply with the limits approved for the particular product with regard to degree of opalescence (2.2.1) and degree of coloration (2.2.2). They are without visible particles, unless otherwise justified and authorised.

##### Solubility

Freeze-dried preparations dissolve completely in the prescribed volume of reconstituting liquid, within a defined time, as approved for the particular product.

##### pH (2.2.3)

It complies with the limits approved for the particular product.

##### Osmolality (2.2.35)

Minimum 240 mosmol/kg, unless otherwise justified and authorised.

##### Extractable volume (2.9.17)

It complies with the test for extractable volume.

##### Total protein (2.5.33)

It complies with the limits approved for the particular product.

##### Molecular-size distribution

Molecular-size distribution is determined by a suitable method, for example size-exclusion chromatography (2.2.30). It complies with the limits approved for the particular product.

##### Molecular identity and structural integrity

Depending on the nature of the monoclonal antibody, its microheterogeneity and isoforms, a number of different tests can be used to demonstrate molecular identity and structural integrity. These tests may include peptide mapping, isoelectric focusing, ion-exchange chromatography, hydrophobic interaction chromatography, oligosaccharide mapping, monosaccharide content and mass spectrometry.

##### Purity

Tests for process- and product-related impurities are carried out by suitable validated methods. Provided that tests for process-related impurities have been carried out on the active substance or on the final bulk with satisfactory results, they may be omitted on the final lot.

##### Stabiliser

Where applicable, it complies with the limits approved for the particular product.

##### Water (2.5.12)

Freeze-dried products comply with the limits approved for the particular product.

##### Sterility (2.6.1)

It complies with the test for sterility.

##### Bacterial endotoxins (2.6.14)

It complies with the limits approved for the particular product.

##### Tests applied to modified antibodies

Suitable tests are carried out depending on the type of modification.

#### ASSAY

Carry out a suitable biological assay compared to the reference preparation. Design of the assay and calculation of the results are made according to the usual principles (for example, 5.3).

#### STORAGE

As stated on the label.

**Expiry date** The expiry date is calculated from the date of sterile filtration, the date of filling (for liquid preparations) or the date of freeze-drying (where applicable).

#### LABELLING

The label states:

- the number of units per millilitre, where applicable;
- the quantity of protein per container;
- the quantity of monoclonal antibody in the container;
- for liquid preparations, the volume of the preparation in the container;
- for freeze-dried preparations:
  - the name and the volume of the reconstitution liquid to be added;
  - the period of time within which the monoclonal antibody is to be used after reconstitution;
- the dilution to be made before use of the product, where applicable.

Ph Eur

## Immunosera

### Antisera

(Immunosera for Human Use, Animal, Ph. Eur. monograph 0084)

Immunosera comply with the requirements of the European Pharmacopoeia monograph for Immunosera for Human Use, Animal. These requirements are reproduced below.

Ph Eur

#### DEFINITION

Animal immunosera for human use are liquid or freeze-dried preparations containing purified immunoglobulins or immunoglobulin fragments obtained from serum or plasma of immunised animals of different species.

The immunoglobulins or immunoglobulin fragments have the power of specifically neutralising or binding to the antigen used for immunisation. The antigens include microbial or other toxins, human antigens, suspensions of bacterial and viral antigens and venoms of snakes, scorpions and spiders. The preparation is intended for intravenous or intramuscular administration, after dilution where applicable.

#### PRODUCTION

##### GENERAL PROVISIONS

The production method shall have been shown to yield consistently immunosera of acceptable safety, potency in man and stability.

Any reagent of biological origin used in the production of immunosera shall be free of contamination with bacteria, fungi and viruses. The general requirements of chapter 5.1.7. *Viral safety* apply to the manufacture of animal immunosera for human use, in conjunction with the more specific requirements relating to viral safety in this monograph. The method of preparation includes a step or steps that have been shown to remove or inactivate known agents of infection.

Methods used for production are validated, effective, reproducible and do not impair the biological activity of the product.

**Reference preparation** A batch shown to be suitable in clinical trials, or a batch representative thereof, is used as the reference preparation for the tests for high molecular mass proteins and purity.

### ANIMALS

The animals used are of a species approved by the competent authority, are healthy and are exclusively reserved for production of immunoserum. They are tested and shown to be free from a defined list of infectious agents.

The introduction of animals into a closed herd follows specified procedures, including definition of quarantine measures. Where appropriate, additional specific agents are considered depending on the geographical localisation of the establishment used for the breeding and production of the animals. The feed originates from a controlled source and no animal proteins are added. The suppliers of animals are certified by the competent authority.

If the animals are treated with antibiotics, a suitable withdrawal period is allowed before collection of blood or plasma. The animals are not treated with penicillin antibiotics. If a live vaccine is administered, a suitable waiting period is imposed between vaccination and collection of serum or plasma for immunoserum production.

### IMMUNISATION

The antigens used are identified and characterised, where appropriate; where relevant, they are shown to be free from extraneous infectious agents. They are identified by their names and a batch number; information on the source and preparation are recorded.

The selected animals are isolated for at least 1 week before being immunised according to a defined schedule, with booster injections at suitable intervals. Adjuvants may be used.

Animals are kept under general health surveillance and specific antibody production is controlled at each cycle of immunisation.

Animals are thoroughly examined before collection of blood or plasma. If an animal shows any pathological lesion not related to the immunisation process, it is not used, nor are any other of the animals in the group concerned, unless it is evident that their use will not impair the safety of the product.

### COLLECTION OF BLOOD OR PLASMA

Collection of blood is made by venepuncture or plasmapheresis. The puncture area is shaved, cleaned and disinfected. The animals may be anaesthetised under conditions that do not influence the quality of the product. Unless otherwise prescribed, an antimicrobial preservative may be added. The blood or plasma is collected in such a manner as to maintain sterility of the product. The blood or plasma collection is conducted at a site separate from the area where the animals are kept or bred and the area where

the immunoserum is purified. If the serum or plasma is stored before further processing, precautions are taken to avoid microbial contamination.

Several single plasma or serum samples may be pooled before purification. The single or pooled samples are tested before purification for the following tests.

### Tests for contaminating viruses

If an antimicrobial preservative is added, it must be neutralised before carrying out the tests, or the tests are carried out on a sample taken before addition of the antimicrobial preservative. Each pool is tested for contaminating viruses by suitable *in vitro* tests.

Each pool is tested for viruses by inoculation into cell cultures capable of detecting a wide range of viruses relevant for the particular product.

### Potency

Carry out a biological assay as indicated in the monograph and express the result in International Units per millilitre, where applicable. A validated *in vitro* method may also be used.

### Protein content

Dilute the product to be examined with a 9 g/L solution of sodium chloride R to obtain a solution containing about 15 mg of protein in 2 mL. To 2 mL of this solution in a round-bottomed centrifuge tube add 2 mL of a 75 g/L solution of sodium molybdate R and 2 mL of a mixture of 1 volume of nitrogen-free sulfuric acid R and 30 volumes of water R. Shake, centrifuge for 5 min, decant the supernatant and allow the inverted tube to drain on filter paper. Determine the nitrogen in the residue by the method of sulfuric acid digestion (2.5.9) and calculate the content of protein by multiplying by 6.25. The protein content is within approved limits.

### PURIFICATION AND VIRAL INACTIVATION

The immunoglobulins are concentrated and purified by fractional precipitation, chromatography, immunoabsorption or by other chemical or physical methods. They may be processed further by enzyme treatment. The methods are selected and validated to avoid contamination at all steps of processing and to avoid formation of protein aggregates that affect the immunobiological characteristics of the product. For products intended to consist of immunoglobulin fragments, the methods are validated to guarantee total fragmentation. The methods of purification used are such that they do not generate additional components that compromise the quality and the safety of the product.

Unless otherwise justified and authorised, validated procedures are applied for removal and/or inactivation of viruses. The procedures are selected to avoid the formation of polymers or aggregates and, unless the product is intended to consist of Fab' fragments, to minimise the splitting of  $F(ab')_2$  into Fab' fragments.

After purification and treatment for removal and/or inactivation of viruses, a stabiliser may be added to the intermediate product, which may be stored for a period defined in light of stability data.

Only an intermediate product that complies with the following requirements may be used in the preparation of the final bulk.

### Purity

Examine by non-reducing polyacrylamide gel electrophoresis (2.2.31), by comparison with the reference preparation. The bands are compared in intensity and no additional bands are found.

**FINAL BULK**

The final bulk is prepared from a single intermediate product or from a pool of intermediate products obtained from animals of the same species. Intermediate products with different specificities may be pooled.

An antimicrobial preservative and a stabiliser may be added. If an antimicrobial preservative has been added to the blood or plasma, the same substance is used as the antimicrobial preservative in the final bulk.

Only a final bulk that complies with the following requirements may be used in the preparation of the final lot.

**Antimicrobial preservative**

Where applicable, determine the amount of antimicrobial preservative by a suitable physico-chemical method. It contains not less than 85 per cent and not more than 115 per cent of the amount stated on the label.

**Sterility (2.6.1)**

It complies with the test for sterility.

**FINAL LOT**

The final bulk of immunoserum is distributed aseptically into sterile, tamper-evident containers. The containers are closed so as to prevent contamination.

Only a final lot that complies with the requirements prescribed below under Identification, Tests and Assay may be released for use. Provided that the tests for osmolality, protein content, molecular-size distribution, antimicrobial preservative, stabiliser, purity, foreign proteins and albumin and the assay have been carried out with satisfactory results on the final bulk, they may be omitted on the final lot.

*Reconstitute the preparation to be examined as stated on the label immediately before carrying out the identification, tests (except those for solubility and water) and assay.*

**IDENTIFICATION**

The identity is established by immunological tests and, where necessary, by determination of biological activity. The assay may also serve for identification.

**CHARACTERS**

Immunosera are clear to opalescent and colourless to very faintly yellow liquids. They are free from turbidity. Freeze-dried products are white or slightly yellow powders or solid friable masses. After reconstitution they show the same characteristics as liquid preparations.

**TESTS****Solubility**

To a container of the preparation to be examined, add the volume of the liquid for reconstitution stated on the label. The preparation dissolves completely within the time stated on the label.

**Extractable volume (2.9.17)**

It complies with the requirement for extractable volume.

**pH (2.2.3)**

The pH is within the limits approved for the particular product.

**Osmolality (2.2.35)**

Minimum 240 mosmol/kg after dilution, where applicable.

**Protein content**

90 per cent to 110 per cent of the amount stated on the label, and, unless otherwise justified and authorised, not more than 100 g/L.

Dilute the preparation to be examined with a 9 g/L solution of sodium chloride R to obtain a solution containing about 15 mg of protein in 2 mL. To 2 mL of this solution in a

round-bottomed centrifuge tube add 2 mL of a 75 g/L solution of sodium molybdate R and 2 mL of a mixture of 1 volume of nitrogen-free sulfuric acid R and 30 volumes of water R. Shake, centrifuge for 5 min, decant the supernatant and allow the inverted tube to drain on filter paper.

Determine the nitrogen in the residue by the method of sulfuric acid digestion (2.5.9) and calculate the content of protein by multiplying by 6.25.

**Molecular-size distribution**

Examine by liquid chromatography (2.2.29 or 2.2.30).

It complies with the specification approved for the particular product.

**Antimicrobial preservative**

Where applicable, determine the amount of antimicrobial preservative by a suitable physico-chemical method.

The amount is not less than the minimum amount shown to be effective and is not greater than 115 per cent of that stated on the label.

**Phenol (2.5.15)**

Maximum 2.5 g/L for preparations containing phenol.

**Stabiliser**

Determine the amount of stabiliser by a suitable physico-chemical method. The preparation contains not less than 80 per cent and not more than 120 per cent of the quantity stated on the label.

**Purity**

Examine by non-reducing polyacrylamide gel electrophoresis (2.2.31), by comparison with the reference preparation. No additional bands are found for the preparation to be examined.

**Foreign proteins**

When examined by precipitation tests with specific antisera, only protein from the declared animal species is shown to be present, unless otherwise prescribed, for example where material of human origin is used during production.

**Albumin**

Unless otherwise prescribed in the monograph, when examined electrophoretically, the content of albumin is not greater than the limit approved for the particular product and, in any case, is not greater than 3 per cent.

**Water (2.5.12)**

Maximum 3 per cent.

**Sterility (2.6.1)**

It complies with the test for sterility.

**Pyrogens (2.6.8)**

Unless otherwise justified and authorised, it complies with the test for pyrogens. Unless otherwise prescribed, inject 1 mL per kilogram of the rabbit's body mass.

**ASSAY**

Carry out a biological assay as indicated in the monograph and express the result in International Units per millilitre, where appropriate. A validated *in vitro* method may also be used.

**Animal tests**

In accordance with the provisions of the European Convention for the Protection of Vertebrate Animals Used for Experimental and Other Scientific Purposes, tests must be carried out in such a way as to use the minimum number of animals and to cause the least pain, suffering, distress or lasting harm. The criteria for judging tests in monographs must be applied in light of this. For example, if it is indicated that an animal is considered to be positive, infected, etc. when typical clinical signs or death occur, then as soon as

sufficient indication of a positive result is obtained the animal in question shall be either euthanised or given suitable treatment to prevent unnecessary suffering. In accordance with the General Notices, alternative test methods may be used to demonstrate compliance with the monograph and the use of such tests is particularly encouraged when this leads to replacement or reduction of animal use or reduction of suffering. Guidance on how to substitute *in vivo* methods by *in vitro* methods where a direct head-to-head comparison is not possible may be found in general chapter 5.2.14.

#### STORAGE

Protected from light, at the temperature stated on the label. Do not allow liquid preparations to freeze.

**Expiry date** The expiry date is calculated from the beginning of the assay.

#### LABELLING

The label states:

- the number of International Units per millilitre, where applicable;
- the amount of protein per container;
- for freeze-dried preparations:
  - the name and volume of the reconstituting liquid to be added;
  - that the immunosera is to be used immediately after reconstitution;
  - the time required for complete dissolution;
- the route of administration;
- the storage conditions;
- the expiry date, except for containers of less than 1 mL which are individually packed; the expiry date may be omitted from the label on the container, provided it is shown on the package and the label on the package states that the container must be kept in the package until required for use;
- the animal species of origin;
- the name and amount of any antimicrobial preservative, any stabiliser and any other excipient.

Ph Eur

## Anti-T Lymphocyte Immunoglobulin for Human Use, Animal

(Ph. Eur. monograph 1928)

Ph Eur

#### DEFINITION

Sterile liquid or freeze-dried preparation containing immunoglobulins, obtained from serum or plasma of animals, mainly rabbits or horses, immunised with human lymphocytic antigens.

The immunoglobulin has the property of diminishing the number and function of immunocompetent cells, in particular T-lymphocytes. The preparation contains principally immunoglobulin G. It may contain antibodies against other lymphocyte subpopulations and against other cells. The preparation is intended for intravenous administration, after dilution with a suitable diluent where applicable. The preparation may contain excipients such as stabilisers.

Applicable provisions of the monograph on *Immunosera for human use, animal (0084)* are stated below.

#### PRODUCTION

##### GENERAL PROVISIONS

The production method has been shown to yield consistently immunoglobulins of acceptable safety, potency in man and stability.

Any reagent of biological origin used in production shall be free of contamination with bacteria, fungi and viruses. The method of preparation includes a step or steps that have been shown to remove or inactivate known agents of infection.

During development studies, it shall be demonstrated that the production method yields a product that:

- does not transmit infectious agents,
- is characterised by a defined pattern of immunological activity, notably: antigen binding, complement-dependent and independent cytotoxicity, cytokine release, induction of T-cell activation, cell death,
- does not contain antibodies that cross-react with human tissues to a degree that would impair clinical safety,
- has a defined maximum content of anti-thrombocyte antibody activity,
- has a defined maximum content of haemoglobin.

The product has been shown, by suitable tests in animals and evaluation during clinical trials, to be well tolerated.

**Reference preparation** A batch shown to be suitable for checking the validity of the assay and whose efficacy has been demonstrated in clinical trials, or a batch representative thereof.

##### ANIMALS

The animals used are of a species approved by the competent authority, are healthy and exclusively reserved for production of anti-T lymphocyte immunoglobulin. They are tested and shown to be free from a defined list of infectious agents. The introduction of animals into a closed herd follows specified procedures, including definition of quarantine measures. Where appropriate, tests for additional specific agents are considered depending on the geographical localisation of the establishment used for the breeding and production of the animals. The feed originates from a controlled source and no animal proteins are added. The suppliers of animals are certified by the competent authority.

If the animals are treated with antibiotics, a suitable withdrawal period is allowed before collection of blood or plasma. The animals are not treated with penicillin antibiotics. If a live vaccine is administered, a suitable waiting period is imposed between vaccination and collection of serum or plasma for immunoglobulin production.

The species, origin and identification number of the animals are specified.

##### IMMUNISATION

The antigens used are identified and characterised, where appropriate. They are identified by their names and a batch number; information on the source and preparation are recorded.

The selected animals are isolated for at least 1 week before being immunised according to a defined schedule with booster injections at suitable intervals. Adjuvants may be used.

Animals are kept under general health surveillance and specific antibody production is controlled at each cycle of immunisation.

Animals are thoroughly examined before collection of blood or plasma. If an animal shows any pathological lesion not

related to the immunisation process, it is not used, nor are any other of the animals in the group concerned, unless it is evident that their use will not impair the safety of the product.

Human antigens such as continuously growing T-lymphocyte cell lines or thymocytes are used to immunise the animals. Cells may be subjected to a sorting procedure.

The immunising antigens are shown to be free from infectious agents by validated methods for relevant blood-borne pathogens, notably hepatitis B virus (HBV), hepatitis C virus (HCV) and human immunodeficiency virus (HIV) and other relevant adventitious agents originating from the preparation of the antigen. The cells used comply with defined requirements for purity of the cell population and freedom from adventitious agents.

#### **COLLECTION OF BLOOD OR PLASMA**

Collection of blood is made by venepuncture or plasmapheresis. The puncture area is shaved, cleaned and disinfected. The animals may be anaesthetised under conditions that do not influence the quality of the product.

No antimicrobial preservative is added to the plasma and serum samples. The blood or plasma is collected in such a manner as to maintain sterility of the product. The blood or plasma collection is conducted at a site separate from the area where the animals are kept or bred and the area where the immunoglobulin is purified. If the serum or plasma is stored before further processing, precautions are taken to avoid microbial contamination.

Several single plasma or serum samples may be pooled before purification. The single or pooled samples are tested before purification for the following tests.

#### **Tests for contaminating viruses**

Each pool is tested for contaminating viruses by suitable *in vitro* tests including inoculation to cell cultures capable of detecting a wide range of viruses relevant for the particular product. Where applicable, *in vitro* tests for contaminating viruses are carried out on the adsorbed pool, after the last production stage that may introduce viral contaminants.

#### **PURIFICATION AND VIRAL INACTIVATION**

The immunoglobulins are concentrated and purified by fractional precipitation, chromatography, immuno-adsorption or by other suitable chemical or physical methods. The methods are selected and validated to avoid contamination at all steps of processing and to avoid formation of protein aggregates that effect immunobiological characteristics of the product.

Unless otherwise justified and authorised, validated procedures are applied for removal and/or inactivation of viruses.

After purification and treatment for removal and/or inactivation of viruses, a stabiliser may be added to the intermediate product, which may be stored for a period defined in the light of stability data.

Only an intermediate product that complies with the following requirements may be used in the preparation of the final bulk.

If the method of preparation includes a step for adsorption of cross-reacting anti-human antibodies using material from human tissues and/or red blood cells, the human materials are submitted to a validated procedure for inactivation of infectious agents, unless otherwise justified and authorised. If erythrocytes are used for adsorption, the donors for such materials comply with the requirements for donors of blood and plasma of the monograph on *Human plasma for*

*fractionation (0853)*. If other human material is used, it is shown by validated methods to be free from relevant blood-borne pathogens, notably HBV, HCV and HIV. If substances are used for inactivation or removal of viruses, it shall have been shown that any residues present in the final product have no adverse effects on the patients treated with the anti-T lymphocyte immunoglobulin.

#### **FINAL BULK**

The final bulk is prepared from a single intermediate product or from a pool of intermediate products obtained from animals of the same species. No antimicrobial preservative is added either during the manufacturing procedure or for preparation of the final bulk solution. During manufacturing, the solution is passed through a bacteria-retentive filter.

#### **FINAL LOT**

The final bulk of anti-T-lymphocyte immunoglobulin is distributed aseptically into sterile, tamper-evident containers. The containers are closed as to prevent contamination.

Only a final lot that complies with the requirements prescribed below under Identification, Tests and Assay may be released for use.

#### **CHARACTERS**

##### **Appearance**

- *liquid preparation*: clear or slightly opalescent, colourless or pale yellow liquid;
- *freeze-dried preparation*: white or slightly yellow powder or solid friable mass, which after reconstitution gives a liquid preparation corresponding to the description above.

#### **IDENTIFICATION**

A. Using a suitable range of species-specific antisera, carry out precipitation tests on the preparation to be examined. It is recommended that the test be carried out using antisera specific to the plasma proteins of each species of domestic animal commonly used in the preparation of materials of biological origin in the country concerned and antisera specific to human plasma proteins. The preparation is shown to contain proteins originating from the animal used for the anti-T lymphocyte immunoglobulin production.

B. Examine by a suitable immunoelectrophoresis technique. Using antiserum to normal serum of the animal used for production, compare this serum and the preparation to be examined, both diluted to a concentration that will allow a clear gammaglobulin precipitation arc to be obtained on the gel. The main component of the preparation to be examined corresponds to the IgG component of normal serum of the animal used for production.

C. The preparation complies with the assay.

#### **TESTS**

##### **Solubility**

For the freeze-dried preparation, to a container add the volume of the liquid stated on the label. The preparation dissolves completely within the time stated on the label.

##### **Extractable volume (2.9.17)**

It complies with the requirement for extractable volume.

##### **pH (2.2.3)**

The pH is within the limits approved for the particular product.

##### **Osmolality (2.2.35)**

Minimum 240 mosmol/kg after dilution, where applicable.

##### **Total protein (2.5.33)**

90 per cent to 110 per cent of the amount stated on the label.

**Stabiliser**

Determine the amount of stabiliser by a suitable physico-chemical method. The preparation contains not less than 80 per cent and not more than 120 per cent of the quantity stated on the label.

**Distribution of molecular size**

Size-exclusion chromatography (2.2.30).

**Test solution** Dilute the preparation to be examined with a 9 g/L solution of sodium chloride R to a concentration suitable for the chromatographic system used. A concentration in the range 2-20 g/L is usually suitable.

**Reference solution** Dilute human immunoglobulin (molecular size) BRP with a 9 g/L solution of sodium chloride R to the same protein concentration as the test solution.

**Column:**

- size:  $l = 0.6$  m,  $\varnothing = 7.5$  mm,
- stationary phase: silica gel for size-exclusion chromatography R, a grade suitable for fractionation of globular proteins in the molecular mass range of 20 000 to 200 000.

**Mobile phase** Dissolve 4.873 g of disodium hydrogen phosphate dihydrate R, 1.741 g of sodium dihydrogen phosphate monohydrate R and 11.688 g of sodium chloride R in 1 L of water R.

**Flow rate** 0.5 mL/min.

**Detection** Spectrophotometer at 280 nm.

**Injection** 50-600 µg of protein.

**Retention time** Identify the peaks in the chromatogram obtained with the test solution by comparison with the chromatogram obtained with the reference solution; any peak with a retention time shorter than that of dimer corresponds to polymers and aggregates.

**System suitability:**

- reference solution: the principal peak corresponds to IgG monomer and there is a peak corresponding to dimer with a retention time relative to monomer of  $0.85 \pm 0.05$ ,
- test solution: the relative retentions of monomer and dimer are  $1 \pm 0.05$  with reference to the corresponding peaks in the chromatogram obtained with the reference solution.

**Limits:**

- total monomer and dimer: at least 95 per cent of the total area of the peaks;
- total polymers and aggregates: maximum 5 per cent of the total area of the peaks.

**Purity**

Polyacrylamide gel electrophoresis (2.2.31), under non-reducing and reducing conditions.

**Resolving gel** Non-reducing conditions: 8 per cent acrylamide; reducing conditions: 12 per cent acrylamide.

**Test solution** Dilute the preparation to be examined to a protein concentration of 0.5-2 mg/mL.

**Reference solution** Dilute the reference preparation to the same protein concentration as the test solution.

**Application** 10 µL.

**Detection** Coomassie staining.

**Results** Compared with the electropherogram of the reference solution, no additional bands are found in the electropherogram of the test solution.

**Anti-A and anti-B haemagglutinins (2.6.20, Method A)**

The 1 to 64 dilution does not show agglutination.

Where applicable, dilute the preparation to be examined as prescribed for use before preparing the dilutions for the test.

**Haemolysins**

Prepare a 1 to 64 dilution of the preparation to be examined, diluted if necessary as stated on the label. Take 6 aliquots of the 1 to 64 dilution. To 1 volume of 3 of the aliquots, add 1 volume of a 10 per cent V/V suspension of group A1, group B and group O erythrocytes in a 9 g/L solution of sodium chloride R, respectively. To 1 volume of the remaining 3 aliquots, add 1 volume of a 10 per cent V/V suspension of group A1, group B and group O erythrocytes in a 9 g/L solution of sodium chloride R, respectively, and to each aliquot 1 volume of fresh group AB serum (as a source of complement). Mix and incubate at 37 °C for 1 h. Examine the supernatant liquids for haemolysis. No signs of haemolysis are present.

**Thrombocyte antibodies**

Examined by a suitable method, the level of thrombocyte antibodies is shown to be below that approved for the specific product.

**Water (2.5.12)**

Maximum 3 per cent.

**Sterility (2.6.1)**

It complies with the test.

**Pyrogens (2.6.8)**

Unless otherwise justified and authorised, it complies with the test for pyrogens. Unless otherwise prescribed, inject 1 mL per kilogram of the rabbit's body mass.

**ASSAY**

The biological activity is determined by measuring the complement-dependent cytotoxicity on target cells. Flow cytometry is performed with read-out of dead cells stained using propidium iodide. The activity is expressed as the concentration of anti-T lymphocyte immunoglobulin in milligrams per millilitre which mediates 50 per cent cytotoxicity.

**Lymphocyte separation medium** Commercial separation media with low viscosity and a density of 1.077 g/mL.

**Complement** Commercial complement is suitable.

**Buffered salt solution pH 7.2** Dissolve 8.0 g of sodium chloride R, 0.2 g of potassium chloride R, 3.18 g of disodium hydrogen phosphate dodecahydrate R and 0.2 g of potassium dihydrogen phosphate R in water R and dilute to 1000.0 mL with the same solvent.

**Buffer solution for flow cytometry** Add 40 mL of 0.1 per cent V/V sodium azide R and 10 mL of foetal calf serum to 440 mL of buffered salt solution pH 7.2. The foetal calf serum is inactivated at 56 °C for 30 min prior to use. Store at 4 °C.

**Propidium iodide solution** Dissolve propidium iodide R in buffered salt solution pH 7.2, to a concentration of 1 mg/mL. Store this stock solution at 2-8 °C and use within 1 month. For the assay, dilute this solution with buffer solution for flow cytometry, to obtain a concentration of 5 µg/mL. Store at 2-8 °C and use within 3 h.

**Microtitre plates** Plates used to prepare immunoglobulin dilutions are U- or V-bottomed polystyrene or poly(vinyl chloride) plates without surface treatment.

**Micronic tubes** Suitable for flow cytometry measurement.

**Cell suspension** Collect blood in anticoagulant from at least one healthy donor. Immediately isolate the peripheral blood mononuclear cells (PBMC) by gradient centrifugation in lymphocyte separation medium so that the PBMC form a visible clean interface between the plasma and the separation medium. Collect the layer containing the cells and dispense

into centrifuge tubes containing buffered salt solution pH 7.2. Centrifuge at 400 *g* at 2-8 °C for 10 min. Discard the supernatant. Suspend the cell pellet in buffer solution for flow cytometry. Repeat the centrifugation and resuspension procedure of the cells twice. After the third centrifugation, resuspend the cell pellet in 1 mL of buffer solution for flow cytometry. Determine the number and vitality of the cells using a haemocytometer. Cell viability of at least 90 per cent is required. Adjust the cell number to  $7 \times 10^6$ /mL by adding buffer solution for flow cytometry. Store the cell suspension at 4 °C and use within 12 h.

If necessary, the first PBMC pellet may be resuspended in buffered salt solution pH 7.2 containing 20 per cent foetal calf serum and stored overnight at 2 °C. Centrifuge at 400 *g* at 2-8 °C for 10 min. Discard the supernatant. Suspend the cell pellet in buffer solution for flow cytometry. Determine the number and vitality of the cells using a haemocytometer. Cell viability of at least 90 per cent is required. Adjust the cell number to  $7 \times 10^6$ /mL by adding buffer solution for flow cytometry.

It is also possible for cells to be immediately frozen and stored in nitrogen using the following method.

**Buffer solution for freezing** To 20 mL of cell culture medium, add 25 mL of foetal calf serum and 5 mL of dimethyl sulfoxide (DMSO). Store this solution at 2-8 °C and use within 3 h.

$20 \times 10^6$  cells per ampoule are frozen. These ampoules are stored in liquid nitrogen.

**Buffer solution for thawing** To 450 mL of cell culture medium, add 50 mL of foetal calf serum. Store this solution at 2-8 °C and use within 3 h.

Each ampoule is thawed in a water-bath at 37 °C with shaking. Cell suspension is repeated in a buffer solution for thawing. Centrifuge at 200 *g* at 2-8 °C for 10 min. Discard the supernatant. Suspend the cell pellet in buffer solution for flow cytometry. Repeat the procedure for centrifugation and resuspension of cells once. After the second centrifugation, resuspend the cells pellet in 1 mL of buffer solution for flow cytometry. Determine the number and vitality of the cells using a haemocytometer. Cell viability of at least 90 per cent is required. Adjust the cell number to  $7 \times 10^6$ /mL by adding buffer solution for flow cytometry. Store the cell suspension at 4 °C and use within 3 h.

**Test solutions** For freeze-dried preparations, reconstitute as stated on the label. Prepare 3 independent series of not fewer than 7 dilutions using buffer solution for flow cytometry as diluent.

**Reference solutions** For freeze-dried preparations, reconstitute according to the instructions for use. Prepare 3 independent dilution series of not fewer than 7 dilutions using buffer solution for flow cytometry as diluent.

Distribute 75 µL of each of the dilutions of the test solution or reference solution to each of a series of wells of a microtitre plate. Add 25 µL of the cell suspension of PBMC into each well. Add 25 µL of rabbit complement to each of the wells. Incubate at 37 °C for 30 min.

Centrifuge the plates at 200 *g* at 4 °C for 8 min, discard the supernatant and keep the plate on ice. Preparation for flow cytometry measurement is done step-wise by using a certain number of wells in order to allow labelling with propidium iodide R solution and measurement within a defined time period. Resuspend carefully the cell pellet of a certain number of wells with 200 µL of propidium iodide solution.

Transfer the suspension into tubes. Incubate at 25 °C for 10 min then place immediately on ice.

Proceed with fluorescence measurement in a flow cytometer. Define a region including all propidium iodide-positive cells on the basis of Forward-Scattered, light (FSC) and fluorescence (FL2 or FL3 for propidium iodide). Measure the percentage of propidium iodide-positive cells, without gating but excluding debris. Analyse at least 3000 cells for each of the test and reference solutions.

Use the percentages of dead cells to estimate the potency as the concentration in milligrams per millilitre of the preparation to be examined necessary to induce 50 per cent of cytotoxicity by fitting a sigmoidal dose response curve to the data obtained with the test and the reference preparations and by using a 4-parameter logistic model (see, for example, chapter 5.3) and suitable software. The test is not valid unless the percentage of propidium iodide-positive cells at the lower asymptote of the curve is less than 15 per cent and the percentage of propidium iodide-positive cells at the upper asymptote of the curve is at least 80 per cent.

The estimated activity is 70 per cent to 130 per cent of the activity approved for the particular product.

The confidence limits ( $P = 0.95$ ) are not less than 80 per cent and not more than 125 per cent of the estimated potency.

#### STORAGE

Protected from light at the temperature stated on the label.

**Expiry date** The expiry date is calculated from the beginning of the assay.

#### LABELLING

The label states:

- for liquid preparations, the volume of the preparation in the container and the protein content,
- for freeze-dried preparations:
  - the name and the volume of the reconstitution liquid to be added,
  - the quantity of protein in the container,
  - that the immunosera is to be used immediately after reconstitution,
  - the time required for complete dissolution,
- the animal species of origin,
- the name and amount of stabiliser, where applicable,
- the dilution to be made before use of the product.

Ph Eur

## Botulinum Antitoxin

(Ph. Eur. monograph 0085)

The label may state 'Bot/Ser' followed by a letter or letters indicating the type or types present.

When Mixed Botulinum Antitoxin or Botulinum Antitoxin is prescribed or demanded and the types to be present are not stated, Botulinum Antitoxin prepared from types A, B and E shall be dispensed or supplied.

Ph Eur

#### DEFINITION

Liquid or freeze-dried preparation containing purified immunoglobulin fragments obtained from serum or plasma of immunised animals that have the power of specifically neutralising the toxins formed by *Clostridium botulinum* type A, type B or type E, or any mixture of these types.

**PRODUCTION**

Botulinum antitoxin is obtained by fractionation from the serum of horses, or other mammals, that have been immunised against *C. botulinum* type A, type B and type E toxins.

**IDENTIFICATION**

Botulinum antitoxin specifically neutralises the types of *C. botulinum* toxins stated on the label, rendering them harmless to susceptible animals. Alternatively, botulinum antitoxin can be identified by a suitable immunochemical method (2.7.1).

**POTENCY**

Not less than 500 IU of antitoxin per millilitre for each of types A and B and not less than 50 IU of antitoxin per millilitre for type E.

In accordance with the provisions of the European Convention for the Protection of Vertebrate Animals used for Experimental and Other Scientific Purposes, tests must be carried out in such a way as to use the minimum number of animals and to cause the least pain, suffering, distress or lasting harm. The assay described below is associated with severe suffering of animals and manufacturers are strongly encouraged to develop and validate assays that will reduce the number of animals used, or refine or replace the test procedure with the goal of promoting animal welfare.

The potency of botulinum antitoxin is determined by comparing the dose necessary to protect mice against the lethal effects of a fixed dose of botulinum toxin with the quantity of the standard preparation of botulinum antitoxin necessary to give the same protection. For this comparison a reference preparation of each type of botulinum antitoxin, calibrated in International Units, and suitable preparations of botulinum toxins, for use as test toxins, are required. The potency of each test toxin is determined in relation to the specific reference preparation; the potency of the botulinum antitoxin to be examined is determined in relation to the potency of the test toxins by the same method.

International Units of the antitoxin are the specific neutralising activity for botulinum toxin type A, type B and type E contained in stated amounts of the International Standards that consist of dried immune horse sera of types A, B and E. The equivalence in International Units of the International Standard is stated by the World Health Organization.

**Selection of animals** Use mice having body masses such that the difference between the lightest and the heaviest does not exceed 5 g.

**Preparation of test toxins** **CAUTION:** botulinum toxin is extremely toxic; exceptional care must be taken in any procedure in which it is employed. Prepare types A, B and E toxins from sterile filtrates of approximately 7-day cultures in liquid medium of *C. botulinum* types A, B and E. To the filtrates add 2 volumes of glycerol, concentrate if necessary by dialysis against glycerol, and store at or slightly below 0 °C.

**Selection of test toxins** Select toxins of each type for use as test toxins by determining for mice the L<sub>1/10</sub> dose and the LD<sub>50</sub>, the observation period being 96 h. The test toxins contain at least 1000 LD<sub>50</sub> in an L<sub>1/10</sub> dose.

**Determination of test doses of the toxins** (L<sub>1/10</sub> dose). Prepare solutions of the reference preparations in a suitable liquid such that each contains 0.25 IU of antitoxin per millilitre. Using each solution in turn, determine the test dose of the corresponding test toxin.

Prepare mixtures of the solution of the reference preparation and the test toxin such that each contains 2.0 mL of the solution of the reference preparation, one of a graded series of volumes of the test toxin and a sufficient volume of a suitable liquid to bring the total volume to 5.0 mL. Allow the mixtures to stand at room temperature, protected from light, for 60 min. Using 4 mice for each mixture, inject a dose of 1.0 mL intraperitoneally into each mouse. Observe the mice for 96 h.

The test dose of toxin is the quantity in 1.0 mL of the mixture made with the smallest amount of toxin capable of causing, despite partial neutralisation by the reference preparation, the death of all 4 mice injected with the mixture within the observation period.

**Determination of potency of the antitoxin** Prepare solutions of each reference preparation in a suitable liquid such that each contains 0.25 IU of antitoxin per millilitre.

Prepare solutions of each test toxin in a suitable liquid such that each contains 2.5 test doses per millilitre.

Using each toxin solution and the corresponding reference preparation in turn, determine the potency of the antitoxin. Prepare mixtures of the solution of the test toxin and the antitoxin to be examined such that each contains 2.0 mL of the solution of the test toxin, one of a graded series of volumes of the antitoxin to be examined, and a sufficient volume of a suitable liquid to bring the total volume to 5.0 mL. Also prepare mixtures of the solution of the test toxin and the solution of the reference preparation such that each contains 2.0 mL of the solution of the test toxin, one of a graded series of volumes of the solution of the reference preparation centred on that volume (2.0 mL) that contains 0.5 IU, and a sufficient volume of a suitable liquid to bring the total volume to 5.0 mL. Allow the mixtures to stand at room temperature, protected from light, for 60 min. Using 4 mice for each mixture, inject a dose of 1.0 mL intraperitoneally into each mouse. Observe the mice for 96 h.

The mixture that contains the largest volume of antitoxin that fails to protect the mice from death contains 0.5 IU. This quantity is used to calculate the potency of the antitoxin in International Units per millilitre.

The test is not valid unless all the mice injected with mixtures containing 2.0 mL or less of the solution of the reference preparation die and all those injected with mixtures containing more survive.

After validation with respect to the LD<sub>50</sub> method, the product potency may be assessed by other methods, for example mouse bioassays using paralysis or digit abduction as an end point, *ex vivo* assays using mouse phrenic nerve diaphragm, or cell-based or other suitable *in vitro* methods. Potency is calculated with respect to a suitable reference preparation calibrated in International Units.

**LABELLING**

The label states the types of *C. botulinum* toxin neutralised by the preparation.

Ph Eur

## Diphtheria Antitoxin

(Ph. Eur. monograph 0086)

The label may state 'Dip/Ser'.

Ph Eur

### DEFINITION

Diphtheria antitoxin is a preparation containing antitoxic globulins that have the power of specifically neutralising the toxin formed by *Corynebacterium diphtheriae*.

### PRODUCTION

It is obtained by fractionation from the serum of horses, or other mammals, that have been immunised against diphtheria toxin.

### IDENTIFICATION

It specifically neutralises the toxin formed by *C. diphtheriae*, rendering it harmless to susceptible animals.

### ASSAY

Not less than 1000 IU of antitoxin per millilitre for antitoxin obtained from horse serum. Not less than 500 IU of antitoxin per millilitre for antitoxin obtained from the serum of other mammals.

The potency of diphtheria antitoxin is determined by comparing the dose necessary to protect guinea-pigs or rabbits against the erythrogenic effects of a fixed dose of diphtheria toxin with the quantity of the standard preparation of diphtheria antitoxin necessary to give the same protection.

For this comparison a reference preparation of diphtheria antitoxin, calibrated in International Units, and a suitable preparation of diphtheria toxin, for use as a test toxin, are required. The potency of the test toxin is determined in relation to the reference preparation; the potency of the diphtheria antitoxin to be examined is determined in relation to the potency of the test toxin by the same method.

The International Unit of antitoxin is the specific neutralising activity for diphtheria toxin contained in a stated amount of the International Standard, which consists of a quantity of dried immune horse serum. The equivalence in International Units of the International Standard is stated by the World Health Organization.

**Preparation of test toxin** Prepare diphtheria toxin from cultures of *C. diphtheriae* in a liquid medium. Filter the culture to obtain a sterile toxic filtrate and store at 4 °C.

**Selection of test toxin** Select a toxin for use as a test toxin by determining for guinea-pigs or rabbits the 1/100 dose and the minimal reacting dose, the observation period being 48 h. The test toxin has at least 200 minimal reacting doses in the 1/100 dose.

**Minimal reacting dose** This is the smallest quantity of toxin which, when injected intracutaneously into guinea-pigs or rabbits, causes a small, characteristic reaction at the site of injection within 48 h.

The test toxin is allowed to stand for some months before being used for the assay of antitoxin. During this time its toxicity declines and the 1/100 dose may be increased. Determine the minimal reacting dose and the 1/100 dose at frequent intervals. When experiment shows that the 1/100 dose is constant, the test toxin is ready for use and may be used for a long period. Store the test toxin in the dark at 0 °C to 5 °C. Maintain its sterility by the addition of toluene or other antimicrobial preservative that does not cause a rapid decline in specific toxicity.

**Determination of test dose of toxin** (1/100 dose). Prepare a solution of the reference preparation in a suitable liquid such that it contains 0.1 IU of antitoxin per millilitre.

Prepare mixtures of the solution of the reference preparation and of the test toxin such that each contains 1.0 mL of the solution of the reference preparation, one of a graded series of volumes of the test toxin and sufficient of a suitable liquid to bring the total volume to 2.0 mL. Allow the mixtures to stand at room temperature, protected from light, for 15 min to 60 min. Using two animals for each mixture, inject a dose of 0.2 mL intracutaneously into the shaven or depilated flanks of each animal. Observe the animals for 48 h.

The test dose of toxin is the quantity in 0.2 mL of the mixture made with the smallest amount of toxin capable of causing, despite partial neutralisation by the reference preparation, a small but characteristic erythematous lesion at the site of injection.

**Determination of potency of the antitoxin** Prepare a solution of the reference preparation in a suitable liquid such that it contains 0.125 IU of antitoxin per millilitre.

Prepare a solution of the test toxin in a suitable liquid such that it contains 12.5 test doses per millilitre.

Prepare mixtures of the solution of the test toxin and of the antitoxin to be examined such that each contains 0.8 mL of the solution of the test toxin, one of a graded series of volumes of the antitoxin to be examined and sufficient of a suitable liquid to bring the total volume to 2.0 mL. Also prepare mixtures of the solution of the test toxin and the solution of the reference preparation such that each contains 0.8 mL of the solution of the test toxin, one of a graded series of volumes of the solution of the reference preparation centred on that volume (0.8 mL) that contains 0.1 IU and sufficient of a suitable liquid to bring the total volume to 2.0 mL. Allow the mixtures to stand at room temperature, protected from light, for 15 min to 60 min. Using two animals for each mixture, inject a dose of 0.2 mL intracutaneously into the shaven or depilated flanks of each animal. Observe the animals for 48 h.

The mixture that contains the largest volume of antitoxin that fails to protect the guinea-pigs from the erythematous effects of the toxin contains 0.1 IU. This quantity is used to calculate the potency of the antitoxin in International Units per millilitre.

The test is not valid unless all the sites injected with mixtures containing 0.8 mL or less of the solution of the reference preparation show erythematous lesions and at all those injected with mixtures containing more there are no lesions.

Ph Eur

## European Viper Venom Antiserum

(Ph. Eur. monograph 0145)

The only poisonous snake native to the British Isles is the adder or common viper, *Vipera berus*. In a geographical region where other species of snake (including elapids) are found, antisera able to neutralise the venoms of the species of snake indigenous to the region should be used. When the preparation is intended to neutralise the venom or venoms of one or more snakes other than vipers, the title Snake Venom Antiserum is used.

Ph Eur

### DEFINITION

European viper venom antiserum is a preparation containing antitoxic globulins that have the power of neutralising the

venom of one or more species of viper. The globulins are obtained by fractionation of the serum of animals that have been immunised against the venom or venoms.

#### IDENTIFICATION

It neutralises the venom of *Vipera ammodytes*, or *Vipera aspis*, or *Vipera berus*, or *Vipera ursinii* or the mixture of these venoms stated on the label, rendering them harmless to susceptible animals.

#### ASSAY

Each millilitre of the preparation to be examined contains sufficient antitoxic globulins to neutralise not less than 100 mouse LD<sub>50</sub> of *Vipera ammodytes* venom or *Vipera aspis* venom and not less than 50 mouse LD<sub>50</sub> of the venoms of other species of viper.

The potency of European viper venom antiserum is determined by estimating the dose necessary to protect mice against the lethal effects of a fixed dose of venom of the relevant species of viper.

**Selection of test venoms** Use venoms which have the normal physico-chemical, toxicological and immunological characteristics of venoms from the particular species of vipers. They are preferably freeze-dried and stored in the dark at  $5 \pm 3$  °C.

Select a venom for use as a test venom by determining the LD<sub>50</sub> for mice, the observation period being 48 h.

**Determination of the test dose of venom** Prepare graded dilutions of the reconstituted venom in a 9 g/L solution of sodium chloride R or other isotonic diluent in such a manner that the middle dilution contains in 0.25 mL the dose expected to be the LD<sub>50</sub>. Dilute with an equal volume of the same diluent. Using at least four mice, each weighing 18 g to 20 g, for each dilution, inject 0.5 mL intravenously into each mouse. Observe the mice for 48 h and record the number of deaths. Calculate the LD<sub>50</sub> using the usual statistical methods.

**Determination of the potency of the antiserum to be examined** Dilute the reconstituted test venom so that 0.25 mL contains the test dose of 5 LD<sub>50</sub> (test venom solution).

Prepare serial dilutions of the antiserum to be examined in a 9 g/L solution of sodium chloride R or other isotonic diluent, the dilution factor being 1.5 to 2.5. Use a sufficient number and range of dilutions to enable a mortality curve between 20 per cent and 80 per cent mortality to be established and to permit an estimation of the statistical variation.

Prepare mixtures such that 5 mL of each mixture contains 2.5 mL of one of the dilutions of the antiserum to be examined and 2.5 mL of the test venom solution. Allow the mixtures to stand in a water-bath at 37 °C for 30 min. Using not fewer than six mice, each weighing 18 g to 20 g, for each mixture, inject 0.5 mL intravenously into each mouse.

Observe the mice for 48 h and record the number of deaths. Calculate the PD<sub>50</sub>, using the usual statistical methods. At the same time verify the number of LD<sub>50</sub> in the test dose of venom, using the method described above. Calculate the potency of the antiserum using the following expression:

$$\frac{(T_v - 1)}{PD_{50}}$$

$T_v$  = number of LD<sub>50</sub> in the test dose of venom.

In each mouse dose of the venom-antiserum mixture at the end point there is one LD<sub>50</sub> of venom remaining unneutralised by the antiserum and it is this unneutralised venom that is responsible for the deaths of 50 per cent of the

mice inoculated with the mixture. The amount of venom neutralised by the antiserum is thus one LD<sub>50</sub> less than the total amount contained in each mouse dose. Therefore, as the potency of the antiserum is defined in terms of the number of LD<sub>50</sub> of venom that are neutralised, rather than the number of LD<sub>50</sub> in each mouse dose, the expression required in the calculation of potency is  $T_v - 1$  rather than  $T_v$ .

Alternatively, the quantity of test venom in milligrams that is neutralised by 1 mL or some other defined volume of the antiserum to be examined may be calculated.

#### LABELLING

The label states the venom or venoms against which the antiserum is effective.

**CAUTION** because of the allergenic properties of viper venoms, inhalation of venom dust should be avoided by suitable precautions.

Ph Eur

## Gas-gangrene Antitoxin (Novyi)

Gas-gangrene Antitoxin (Oedematiens)

(Ph. Eur. monograph 0087)

The label may state 'Nov/Ser'.

#### Preparation

Mixed Gas-gangrene Antitoxin

Ph Eur

#### DEFINITION

Gas-gangrene antitoxin (novyi) is a preparation containing antitoxic globulins that have the power of neutralising the alpha toxin formed by *Clostridium novyi* (Former nomenclature: *Clostridium oedematiens*). It is obtained by fractionation from the serum of horses, or other mammals, that have been immunised against *Cl. novyi* alpha toxin.

#### IDENTIFICATION

It specifically neutralises the alpha toxin formed by *Cl. novyi*, rendering it harmless to susceptible animals.

#### ASSAY

Not less than 3750 IU of antitoxin per millilitre.

The potency of gas-gangrene antitoxin (novyi) is determined by comparing the dose necessary to protect mice or other suitable animals against the lethal effects of a fixed dose of *Cl. novyi* toxin with the quantity of the standard preparation of gas-gangrene antitoxin (novyi) necessary to give the same protection. For this comparison a reference preparation of gas-gangrene antitoxin (novyi), calibrated in International Units, and a suitable preparation of *Cl. novyi* toxin for use as a test toxin are required. The potency of the test toxin is determined in relation to the reference preparation; the potency of the gas-gangrene antitoxin (novyi) to be examined is determined in relation to the potency of the test toxin by the same method.

The International Unit of antitoxin is the specific neutralising activity for *Cl. novyi* toxin contained in a stated amount of the International Standard, which consists of a quantity of dried immune horse serum. The equivalence in International Units of the International Standard is stated by the World Health Organization.

**Selection of animals** Use mice having body masses such that the difference between the lightest and the heaviest does not exceed 5 g.

**Preparation of test toxin** Prepare the test toxin from a sterile filtrate of an approximately 5-day culture in liquid medium of *Cl. novyi*. Treat the filtrate with *ammonium sulfate R*, collect the precipitate, which contains the toxin, dry *in vacuo* over *diphosphorus pentoxide R*, powder and store dry.

**Selection of test toxin** Select a toxin for use as a test toxin by determining for mice the L+ dose and the LD<sub>50</sub>, the observation period being 72 h. The test toxin has an L+ dose of 0.5 mg or less and contains not less than 25 LD<sub>50</sub> in each L+ dose.

**Determination of test dose of toxin (L+ dose)** Prepare a solution of the reference preparation in a suitable liquid such that it contains 12.5 IU of antitoxin per millilitre.

Prepare a solution of the test toxin in a suitable liquid such that 1 mL contains a precisely known amount such as 10 mg.

Prepare mixtures of the solution of the reference preparation and the solution of the test toxin such that each contains 0.8 mL of the solution of the reference preparation, one of a graded series of volumes of the solution of the test toxin and sufficient of a suitable liquid to bring the total volume to 2.0 mL. Allow the mixtures to stand at room temperature, protected from light, for 60 min. Using six mice for each mixture, inject a dose of 0.2 mL intramuscularly into each mouse. Observe the mice for 72 h.

The test dose of toxin is the quantity in 0.2 mL of the mixture made with the smallest amount of toxin capable of causing, despite partial neutralisation by the reference preparation, the death of all six mice injected with the mixture within the observation period.

**Determination of potency of the antitoxin** Prepare a solution of the reference preparation in a suitable liquid such that it contains 12.5 IU of antitoxin per millilitre.

Prepare a solution of the test toxin in a suitable liquid such that it contains 12.5 test doses per millilitre.

Prepare mixtures of the solution of the test toxin and the antitoxin to be examined such that each contains 0.8 mL of the solution of the test toxin, one of a graded series of volumes of the antitoxin to be examined and sufficient of a suitable liquid to bring the total volume to 2.0 mL. Also prepare mixtures of the solution of the test toxin and the solution of the reference preparation such that each contains 0.8 mL of the solution of the test toxin, one of a graded series of volumes of the solution of the reference preparation centred on that volume (0.8 mL) that contains 10 IU and sufficient of a suitable liquid to bring the total volume to 2.0 mL. Allow the mixtures to stand at room temperature, protected from light, for 60 min. Using six mice for each mixture, inject a dose of 0.2 mL intramuscularly into each mouse. Observe the mice for 72 h.

The mixture that contains the largest volume of antitoxin that fails to protect the mice from death contains 10 IU. This quantity is used to calculate the potency of the antitoxin in International Units per millilitre.

The test is not valid unless all the mice injected with mixtures containing 0.8 mL or less of the solution of the reference preparation die and all those injected with mixtures containing a larger volume survive.

Ph Eur

## Gas-gangrene Antitoxin (Perfringens)

(Ph. Eur. monograph 0088)

The label may state 'Perf/Ser'.

### Preparation

Mixed Gas-gangrene Antitoxin

Ph Eur

### DEFINITION

Gas-gangrene antitoxin (perfringens) is a preparation containing antitoxic globulins that have the power of specifically neutralising the alpha toxin formed by *Clostridium perfringens*. It is obtained by fractionation from the serum of horses, or other mammals, that have been immunised against *Cl. perfringens* alpha toxin.

### IDENTIFICATION

It specifically neutralises the alpha toxin formed by *Cl. perfringens*, rendering it harmless to susceptible animals.

### ASSAY

Not less than 1500 IU of antitoxin per millilitre.

The potency of gas-gangrene antitoxin (perfringens) is determined by comparing the dose necessary to protect mice or other suitable animals against the lethal effects of a fixed dose of *Cl. perfringens* toxin with the quantity of the standard preparation of gas-gangrene antitoxin (perfringens) necessary to give the same protection. For this comparison a reference preparation of gas-gangrene antitoxin (perfringens), calibrated in International Units, and a suitable preparation of *Cl. perfringens* toxin for use as a test toxin are required. The potency of the test toxin is determined in relation to the reference preparation; the potency of the gas-gangrene antitoxin (perfringens) to be examined is determined in relation to the potency of the test toxin by the same method. The International Unit of antitoxin is the specific neutralising activity for *Cl. perfringens* toxin contained in a stated amount of the International Standard, which consists of a quantity of dried immune horse serum. The equivalence in International Units of the International Standard is stated by the World Health Organization.

**Selection of animals** Use mice having body masses such that the difference between the lightest and the heaviest does not exceed 5 g.

**Preparation of test toxin** Prepare the test toxin from a sterile filtrate of an approximately 5-day culture in liquid medium of *Cl. perfringens*. Treat the filtrate with *ammonium sulfate R*, collect the precipitate, which contains the toxin, dry *in vacuo* over *diphosphorus pentoxide R*, powder and store dry.

**Selection of test toxin** Select a toxin for use as a test toxin by determining for mice the L+ dose and the LD<sub>50</sub>, the observation period being 48 h. The test toxin has an L+ dose of 4 mg or less and contains not less than 20 LD<sub>50</sub> in each L+ dose.

**Determination of test dose of toxin (L+ dose)** Prepare a solution of the reference preparation in a suitable liquid such that it contains 5 IU of antitoxin per millilitre.

Prepare a solution of the test toxin in a suitable liquid such that 1 mL contains a precisely known amount such as 10 mg.

Prepare mixtures of the solution of the reference preparation and the solution of the test toxin such that each contains 2.0 mL of the solution of the reference preparation, one of a graded series of volumes of the solution of the test toxin and

sufficient of a suitable liquid to bring the total volume to 5.0 mL. Allow the mixtures to stand at room temperature, protected from light, for 60 min. Using six mice for each mixture, inject a dose of 0.5 mL intravenously into each mouse. Observe the mice for 48 h.

The test dose of toxin is the quantity in 0.5 mL of the mixture made with the smallest amount of toxin capable of causing, despite partial neutralisation by the reference preparation, the death of all six mice injected with the mixture within the observation period.

**Determination of potency of the antitoxin** Prepare a solution of the reference preparation in a suitable liquid such that it contains 5 IU of antitoxin per millilitre.

Prepare a solution of the test toxin in a suitable liquid such that it contains five test doses per millilitre.

Prepare mixtures of the solution of the test toxin and the antitoxin to be examined such that each contains 2.0 mL of the solution of the test toxin, one of a graded series of volumes of the antitoxin to be examined and sufficient of a suitable liquid to bring the total volume to 5.0 mL. Also prepare mixtures of the solution of the test toxin and the solution of the reference preparation such that each contains 2.0 mL of the solution of the test toxin, one of a graded series of volumes of the solution of the reference preparation centred on that volume (2.0 mL) that contains 10 IU and sufficient of a suitable liquid to bring the total volume to 5.0 mL. Allow the mixtures to stand at room temperature, protected from light, for 60 min. Using six mice for each mixture, inject a dose of 0.5 mL intravenously into each mouse. Observe the mice for 48 h.

The mixture that contains the largest volume of antitoxin that fails to protect the mice from death contains 10 IU. This quantity is used to calculate the potency of the antitoxin in International Units per millilitre.

The test is not valid unless all the mice injected with mixtures containing 2.0 mL or less of the solution of the reference preparation die and all those injected with mixtures containing a larger volume survive.

Ph Eur

## Gas-gangrene Antitoxin (Septicum)

(Ph. Eur. monograph 0089)

The label may state 'Sep/Ser'.

### Preparation

Mixed Gas-gangrene Antitoxin

Ph Eur

### DEFINITION

Gas-gangrene antitoxin (septicum) is a preparation containing antitoxic globulins that have the power of specifically neutralising the alpha toxin formed by *Clostridium septicum*. It is obtained by fractionation from the serum of horses, or other mammals, that have been immunised against *Cl. septicum* alpha toxin.

### IDENTIFICATION

It specifically neutralises the alpha toxin formed by *Cl. septicum*, rendering it harmless to susceptible animals.

### ASSAY

Not less than 1500 IU of antitoxin per millilitre.

The potency of gas-gangrene antitoxin (septicum) is determined by comparing the dose necessary to protect mice or other suitable animals against the lethal effects of a fixed dose of *Cl. septicum* toxin with the quantity of the standard preparation of gas-gangrene antitoxin (septicum) necessary to give the same protection. For this comparison a reference preparation of gas-gangrene antitoxin (septicum), calibrated in International Units, and a suitable preparation of *Cl. septicum* toxin for use as a test toxin are required. The potency of the test toxin is determined in relation to the reference preparation; the potency of the gas-gangrene antitoxin (septicum) to be examined is determined in relation to the potency of the test toxin by the same method.

The International Unit of antitoxin is the specific neutralising activity for *Cl. septicum* toxin contained in a stated amount of the International Standard, which consists of a quantity of dried immune horse serum. The equivalence in International Units of the International Standard is stated by the World Health Organization.

**Selection of animals** Use mice having body masses such that the difference between the lightest and the heaviest does not exceed 5 g.

**Preparation of test toxin** Prepare the test toxin from a sterile filtrate of an approximately 5-day culture in liquid medium of *Cl. septicum*. Treat the filtrate with ammonium sulfate R, collect the precipitate, which contains the toxin, dry *in vacuo* over diphosphorus pentoxide R, powder and store dry.

**Selection of test toxin** Select a toxin for use as a test toxin by determining for mice the L+ dose and the LD<sub>50</sub>, the observation period being 72 h. The test toxin has an L+ dose of 0.5 mg or less and contains not less than 25 LD<sub>50</sub> in each L+ dose.

**Determination of test dose of toxin (L+ dose)** Prepare a solution of the reference preparation in a suitable liquid such that it contains 5 IU of antitoxin per millilitre.

Prepare a solution of the test toxin in a suitable liquid such that 1 mL contains a precisely known amount such as 20 mg.

Prepare mixtures of the solution of the reference preparation and the solution of the test toxin such that each contains 2.0 mL of the solution of the reference preparation, one of a graded series of volumes of the solution of the test toxin and sufficient of a suitable liquid to bring the total volume to 5.0 mL. Allow the mixtures to stand at room temperature, protected from light, for 60 min. Using six mice for each mixture, inject a dose of 0.5 mL intravenously into each mouse. Observe the mice for 72 h.

The test dose of toxin is the quantity in 0.5 mL of the mixture made with the smallest amount of toxin capable of causing, despite partial neutralisation by the reference preparation, the death of all six mice injected with the mixture within the observation period.

**Determination of potency of the antitoxin** Prepare a solution of the reference preparation in a suitable liquid such that it contains 5 IU of antitoxin per millilitre.

Prepare a solution of the test toxin in a suitable liquid such that it contains five test doses per millilitre.

Prepare mixtures of the solution of the test toxin and the antitoxin to be examined such that each contains 2.0 mL of the solution of the test toxin, one of a graded series of volumes of the antitoxin to be examined and sufficient of a suitable liquid to bring the total volume to 5.0 mL. Also prepare mixtures of the solution of the test toxin and the solution of the reference preparation such that each contains

2.0 mL of the solution of the test toxin, one of a graded series of volumes of the solution of the reference preparation centred on that volume (2.0 mL) that contains 10 IU and sufficient of a suitable liquid to bring the total volume to 5.0 mL. Allow the mixtures to stand at room temperature, protected from light, for 60 min. Using six mice for each mixture, inject a dose of 0.5 mL intravenously into each mouse. Observe the mice for 72 h.

The mixture that contains the largest volume of antitoxin that fails to protect the mice from death contains 10 IU. This quantity is used to calculate the potency of the antitoxin in International Units per millilitre.

The test is not valid unless all the mice injected with mixtures containing 2.0 mL or less of the solution of the reference preparation die and all those injected with mixtures containing more survive.

Ph Eur

## Mixed Gas-gangrene Antitoxin

(Ph. Eur. monograph 0090)

The label may state 'Gas/Ser'.

Ph Eur

### DEFINITION

Mixed gas-gangrene antitoxin is prepared by mixing gas-gangrene antitoxin (novyi), gas-gangrene antitoxin (perfringens) and gas-gangrene antitoxin (septicum) in appropriate quantities.

### IDENTIFICATION

It specifically neutralises the alpha toxins formed by *Clostridium novyi* (former nomenclature: *Clostridium oedematiens*), *Clostridium perfringens* and *Clostridium septicum*, rendering them harmless to susceptible animals.

### ASSAY

Gas-gangrene antitoxin (novyi), not less than 1000 IU of antitoxin per millilitre; gas-gangrene antitoxin (perfringens), not less than 1000 IU of antitoxin per millilitre; gas-gangrene antitoxin (septicum) not less than 500 IU of antitoxin per millilitre.

Carry out the assay for each component, as prescribed in the monographs on *Gas-gangrene antitoxin (novyi)* (0087), *Gas-gangrene antitoxin (perfringens)* (0088) and *Gas-gangrene antitoxin (septicum)* (0089).

Ph Eur

## Tetanus Antitoxin

(Tetanus Antitoxin for Human Use, Ph. Eur. monograph 0091)

The label may state 'Tet/Ser'.

Ph Eur

### DEFINITION

Tetanus antitoxin for human use is a preparation containing antitoxic globulins that have the power of specifically neutralising the toxin formed by *Clostridium tetani*.

### PRODUCTION

It is obtained by fractionation from the serum of horses, or other mammals, that have been immunised against tetanus toxin.

### IDENTIFICATION

It specifically neutralises the toxin formed by *Cl. tetani*, rendering it harmless to susceptible animals.

### POTENCY

Not less than 1000 IU of antitoxin per millilitre when intended for prophylactic use. Not less than 3000 IU of antitoxin per millilitre when intended for therapeutic use.

The potency of tetanus antitoxin is determined by comparing the dose necessary to protect guinea-pigs or mice against the paralytic effects of a fixed dose of tetanus toxin with the quantity of the standard preparation of tetanus antitoxin necessary to give the same protection. In countries where the paralysis method is not obligatory the lethal method may be used. For this method the number of animals and the procedure are identical with those described for the paralysis method but the end-point is the death of the animal rather than the onset of paralysis and the L+10 dose is used instead of the Lp/10 dose. For this comparison a reference preparation of tetanus antitoxin, calibrated in International Units, and a suitable preparation of tetanus toxin, for use as a test toxin, are required. The potency of the test toxin is determined in relation to the reference preparation; the potency of the tetanus antitoxin to be examined is determined in relation to the potency of the test toxin by the same method.

The International Unit of antitoxin is the specific neutralising activity for tetanus toxin contained in a stated amount of the International Standard which consists of a quantity of dried immune horse serum. The equivalence in International Units of the International Standard is stated by the World Health Organization.

**Selection of animals** If mice are used, the body masses should be such that the difference between the lightest and the heaviest does not exceed 5 g.

**Preparation of test toxin** Prepare the test toxin from a sterile filtrate of an approximately 9-day culture in liquid medium of *Cl. tetani*. To the filtrate add 1 to 2 volumes of glycerol and store slightly below 0 °C. Alternatively, treat the filtrate with *ammonium sulfate R*, collect the precipitate, which contains the toxin, dry *in vacuo* over *diphosphorus pentoxide R*, powder and store dry, either in sealed ampoules or *in vacuo* over *diphosphorus pentoxide R*.

**Determination of test dose of toxin (Lp/10 dose)** Prepare a solution of the reference preparation in a suitable liquid such that it contains 0.5 IU of antitoxin per millilitre.

If the test toxin is stored dry, reconstitute it using a suitable liquid.

Prepare mixtures of the solution of the reference preparation and the test toxin such that each contains 2.0 mL of the solution of the reference preparation, one of a graded series of volumes of the test toxin and sufficient of a suitable liquid to bring the volume to 5.0 mL. Allow the mixtures to stand at room temperature, protected from light, for 60 min. Using six mice for each mixture, inject a dose of 0.5 mL subcutaneously into each mouse. Observe the mice for 96 h. Mice that become paralysed may be euthanised.

The test dose of toxin is the quantity in 0.5 mL of the mixture made with the smallest amount of toxin capable of causing, despite partial neutralisation by the reference preparation, paralysis in all six mice injected with the mixture within the observation period.

**Determination of potency of the antitoxin** Prepare a solution of the reference preparation in a suitable liquid such that it contains 0.5 IU of antitoxin per millilitre.

Prepare a solution of the test toxin in a suitable liquid such that it contains five test doses per millilitre.

Prepare mixtures of the solution of the test toxin and the antitoxin to be examined such that each contains 2.0 mL of the solution of the test toxin, one of a graded series of volumes of the antitoxin to be examined and sufficient of a suitable liquid to bring the total volume to 5.0 mL. Also prepare mixtures of the solution of the test toxin and the solution of the reference preparation such that each contains 2.0 mL of the solution of the test toxin, one of a graded series of volumes of the solution of the reference preparation centred on that volume (2.0 mL) that contains 1 IU and sufficient of a suitable liquid to bring the total volume to 5.0 mL. Allow the mixtures to stand at room temperature, protected from light, for 60 min. Using six mice for each mixture, inject into each mouse subcutaneously a dose of 0.5 mL. Observe the mice for 96 h. Mice that become paralysed may be euthanised.

The mixture that contains the largest volume of antitoxin that fails to protect the mice from paralysis contains 1 IU. This quantity is used to calculate the potency of the antitoxin in International Units per millilitre.

The test is not valid unless all the mice injected with mixtures containing 2.0 mL or less of the solution of the reference preparation show paralysis and all those injected with mixtures containing more do not.

Ph Eur

## Vaccines

(Vaccines for Human Use, Ph. Eur. monograph 0153)

Vaccines comply with the requirements of the European Pharmacopoeia monograph for Vaccines for Human Use. These requirements are reproduced below.

Ph Eur

### DEFINITION

Vaccines for human use are preparations containing antigens capable of inducing a specific and active immunity in man against an infecting agent or the toxin or antigen elaborated by it. Immune responses include the induction of the innate and the adaptive (cellular, humoral) parts of the immune system. Vaccines for human use shall have been shown to have acceptable immunogenic activity and safety in man with the intended vaccination schedule.

Vaccines for human use may contain: whole micro-organisms (bacteria, viruses or parasites), inactivated by chemical or physical means that maintain adequate immunogenic properties; whole live micro-organisms that are naturally avirulent or that have been treated to attenuate their virulence whilst retaining adequate immunogenic properties; antigens extracted from the micro-organisms or secreted by the micro-organisms or produced by genetic engineering or chemical synthesis. The antigens may be used in their native state or may be detoxified or otherwise modified by chemical or physical means and may be aggregated, polymerised or conjugated to a carrier to increase their immunogenicity. Vaccines may contain an adjuvant. Where the antigen is adsorbed on a mineral adjuvant, the vaccine is referred to as 'adsorbed'.

Terminology used in monographs on vaccines for human use is defined in general chapter 5.2.1.

**Bacterial vaccines containing whole cells** Are suspensions of various degrees of opacity in colourless or almost colourless liquids, or may be freeze-dried. They may be adsorbed. The concentration of living or inactivated bacteria is expressed in terms of International Units of opacity or, where appropriate, is determined by direct cell count or, for live bacteria, by viable count.

**Bacterial vaccines containing bacterial components** Are suspensions or freeze-dried products. They may be adsorbed. The antigen content is determined by a suitable validated assay.

**Bacterial toxoids** Are prepared from toxins by diminishing their toxicity to an acceptable level or by completely eliminating it by physical or chemical procedures whilst retaining adequate immunogenic properties. The toxins are obtained from selected strains of micro-organisms. The method of production is such that the toxoid does not revert to toxin. The toxoids are purified. Purification is performed before and/or after detoxification. Toxoid vaccines may be adsorbed.

**Viral vaccines** Are prepared from viruses grown in animals, in fertilised eggs, in suitable cell cultures or in suitable tissues, or by culture of genetically engineered cells. They are liquids that vary in opacity according to the type of preparation or may be freeze-dried. They may be adsorbed. Liquid preparations and freeze-dried preparations after reconstitution may be coloured if a pH indicator such as phenol red has been used in the culture medium.

**Synthetic antigen vaccines** Are generally clear or colourless liquids. The concentration of the components is usually expressed in terms of specific antigen content.

**Combined vaccines** Are multicomponent preparations formulated so that different antigens are administered simultaneously. The different antigenic components are intended to protect against different strains or types of the same organism and/or against different organisms. A combined vaccine may be supplied by the manufacturer either as a single liquid or freeze-dried preparation or as several constituents with directions for admixture before use. Where there is no monograph to cover a particular combination, the vaccine complies with the monograph for each individual component, with any necessary modifications approved by the competent authority.

**Adsorbed vaccines** Are suspensions and may form a sediment at the bottom of the container.

### PRODUCTION

#### General provisions

The production method for a given product must have been shown to yield consistently batches comparable with the batch of proven clinical efficacy, immunogenicity and safety in man. Product specifications including in-process testing should be set. Specific requirements for production including in-process testing are included in individual monographs. Where justified and authorised, certain tests may be omitted where it can be demonstrated, for example by validation studies, that the production process consistently ensures compliance with the test.

Unless otherwise justified and authorised, vaccines are produced using a seed-lot system. The methods of preparation are designed to maintain adequate immunogenic properties, to render the preparation harmless and to prevent contamination with extraneous agents.

Where vaccines for human use are manufactured using materials of human or animal origin, the general

requirements of general chapter 5.1.7. *Viral safety* apply in conjunction with the more specific requirements relating to viral safety in this monograph, in individual vaccine monographs and in general chapters 5.2.2. *Chicken flocks free from specified pathogens for the production and quality control of vaccines*, 5.2.3. *Cell substrates for the production of vaccines for human use* and, with the exception of egg-derived inactivated influenza vaccines, 2.6.16. *Tests for extraneous agents in viral vaccines for human use*.

Unless otherwise justified and authorised, in the production of a final lot of vaccine, the number of passages of a virus, or the number of subcultures of a bacterium, from the master seed lot shall not exceed that used for production of the vaccine shown to be satisfactory in clinical trials with respect to safety and efficacy or immunogenicity.

Vaccines are as far as possible free from ingredients known to cause toxic, allergic or other undesirable reactions in man. Suitable additives, including stabilisers and adjuvants may be incorporated. Penicillin and streptomycin are neither used at any stage of production nor added to the final product; however, master seed lots prepared with media containing penicillin or streptomycin may, where justified and authorised, be used for production.

Consistency of production is an important feature of vaccine production. Monographs on vaccines for human use give limits for various tests carried out during production and on the final lot. These limits may be in the form of maximum values, minimum values, or minimum and maximum tolerances around a given value. While compliance with these limits is required, it is not necessarily sufficient to ensure consistency of production for a given vaccine. For relevant tests, the manufacturer must therefore define for each product a suitable action or release limit or limits to be applied in view of the results found for batches tested clinically and those used to demonstrate consistency of production. These limits may subsequently be refined on a statistical basis in light of production data.

#### Substrates for propagation

Substrates for propagation comply with the relevant requirements of the Pharmacopoeia (5.2.2, 5.2.3) or in the absence of such requirements with those of the competent authority. Processing of cell banks and subsequent cell cultures is done under aseptic conditions in an area where no other cells are being handled. Serum and trypsin used in the preparation of cell suspensions shall be shown to be free from extraneous agents.

#### Seed lots/cell banks

The master seed lot or cell bank is identified by historical records that include information on its origin and subsequent manipulation. Suitable measures are taken to ensure that no extraneous agent or undesirable substance is present in a master or working seed lot or a cell bank.

#### Culture media

Culture media are as far as possible free from ingredients known to cause toxic, allergic or other undesirable reactions in man; if inclusion of such ingredients is necessary, it shall be demonstrated that the amount present in the final lot is reduced to such a level as to render the product safe. Approved animal (but not human) serum may be used in the growth medium for cell cultures but the medium used for maintaining cell growth during virus multiplication shall not contain serum, unless otherwise stated. Cell culture media may contain a pH indicator such as phenol red and approved antibiotics at the lowest effective concentration, although it is

preferable to have a medium free from antibiotics during production.

#### Propagation and harvest

The seed cultures are propagated and harvested under defined conditions. The purity of the harvest is verified by suitable tests as defined in the monograph.

#### Control cells

For vaccines produced in cell cultures, control cells are maintained and tested as prescribed. In order to provide a valid control, these cells must be maintained in conditions that are essentially equivalent to those used for the production cell cultures, including use of the same batches of media and media changes.

#### Control eggs

For live vaccines produced in eggs, control eggs are incubated and tested as prescribed in the monograph.

#### Purification

Where applicable, validated purification procedures may be applied.

#### Inactivation

Inactivated vaccines are produced using a validated inactivation process whose effectiveness and consistency have been demonstrated. Where it is recognised that extraneous agents may be present in a harvest, for example in vaccines produced in eggs from healthy, non-SPF flocks, the inactivation process is also validated with respect to a panel of model extraneous agents representative of the potential extraneous agents. A test for effectiveness of the inactivation process is carried out as soon as possible after the inactivation process.

#### Carrier proteins

Bacterial polysaccharide antigens may be conjugated with carrier proteins to improve their immunogenicity to enable the induction of a protective response in infants. Carrier proteins comply with the relevant requirements of general chapter 5.2.11. *Carrier proteins for the production of conjugated polysaccharide vaccines for human use*.

**Test for sterility of intermediates prior to final bulk**  
Individual monographs on vaccines for human use may prescribe a test for sterility for intermediates.

In agreement with the competent authority, replacement of the sterility test by a bioburden test with a low bioburden limit based on batch data and process validation may be acceptable for intermediates preceding the final bulk, provided that a sterilising filtration is performed later in the production process.

It is a prerequisite that the intermediate is filtered through a bacteria-retentive filter prior to storage, that authorised pre-filtration bioburden limits have been established for this filtration, and that adequate measures are in place to avoid contamination and growth of micro-organisms during storage of the intermediate.

#### Final bulk

The final bulk is prepared by aseptically blending the ingredients of the vaccine. For non-liquid vaccines for administration by a non-parenteral route, the final bulk is prepared by blending the ingredients of the vaccine under suitable conditions.

**Adjuvants** One or more adjuvants may be included in the formulation of a vaccine to potentiate and/or modulate the immune response to the antigen(s). Adjuvants may be included in the formulation of the final vaccine or presented separately. Suitable characterisation and quality control of the

adjuvant(s), alone and in combination with the antigen(s), is essential for consistent production. Quality specifications are established for each adjuvant, alone and in combination with the antigen(s).

**Adsorbents as adjuvants** Vaccines may be adsorbed on aluminium hydroxide, aluminium phosphate, calcium phosphate or other suitable adsorbents. The adsorbents are prepared in special conditions that confer the appropriate physical form and adsorptive properties.

Where an adsorbent is used as an adjuvant and is generated *in situ* during production of the vaccine, quality specifications are established for each of the ingredients and for the generated adsorbent in the vaccine. Quality specifications are intended to control, in particular:

- qualitative and quantitative chemical composition;
- physical form and associated adsorptive properties, where relevant, and particularly where the adjuvant will be present as an adsorbent;
- interaction between adjuvant and antigen;
- purity, including bacterial endotoxin content and microbiological quality;
- any other parameters identified as being critical for functionality.

The stability of each adjuvant, alone and in combination with the antigen(s), particularly for critical parameters, is established during development studies.

**Antimicrobial preservatives** Antimicrobial preservatives are used to prevent spoilage or adverse effects caused by microbial contamination occurring during the use of a vaccine. Antimicrobial preservatives are not included in freeze-dried products. For single-dose liquid preparations, inclusion of antimicrobial preservatives is not normally acceptable. For multidose liquid preparations, the need for effective antimicrobial preservation is evaluated taking into account likely contamination during use and the maximum recommended period of use after breaching of the container. If an antimicrobial preservative is used, it shall be shown that it does not impair the safety or efficacy of the vaccine. Addition of antibiotics as antimicrobial preservatives is not normally acceptable.

During development studies, the effectiveness of the antimicrobial preservative throughout the period of validity shall be demonstrated to the satisfaction of the competent authority.

The efficacy of the antimicrobial preservative is evaluated as described in general chapter 5.1.3. If neither the A criteria nor the B criteria can be met, then in justified cases the following criteria are applied to vaccines for human use: bacteria, no increase at 24 h and 7 days, 3 log<sub>10</sub> reduction at 14 days, no increase at 28 days; fungi, no increase at 14 days and 28 days.

#### Stability of intermediates

During production of vaccines, intermediates are obtained at various stages and are stored, sometimes for long periods. Such intermediates include:

- seed lots and cell banks;
- live or inactivated harvests;
- purified harvests that may consist of toxins or toxoids, polysaccharides, bacterial or viral suspensions;
- purified antigens;
- adsorbed antigens;
- conjugated polysaccharides;
- final bulk vaccine;

- vaccine in the final closed container stored at a temperature lower than that used for final-product stability studies and intended for release without re-assay.

Except where they are used within a short period of time, stability studies are carried out on the intermediates in the intended storage conditions to establish the expected extent of degradation. For final bulk vaccine, stability studies may be carried out on representative samples in conditions equivalent to those intended to be used for storage. For each intermediate (except for seed lots and cell banks), a period of validity applicable for the intended storage conditions is established, where appropriate in light of stability studies.

#### Final lot

The final lot is prepared by aseptically distributing the final bulk into sterile, tamper-evident containers, which, after freeze-drying where applicable, are closed so as to exclude contamination. For non-liquid vaccines for administration by a non-parenteral route, the final lot is prepared by distributing the final bulk under suitable conditions into sterile, tamper-evident containers. Where justified and authorised, certain tests prescribed for the final lot may be carried out on the final bulk, if it has been demonstrated that subsequent manufacturing operations do not affect compliance.

#### Appearance

Unless otherwise justified and authorised, each container (vial, syringe or ampoule) in each final lot is inspected visually or mechanically for acceptable appearance.

**Degree of adsorption** For an adsorbed vaccine, unless otherwise justified and authorised, a release specification for the degree of adsorption is established in light of results found for batches used in clinical trials. From the stability data generated for the vaccine it must be shown that at the end of the period of validity the degree of adsorption is not less than for batches used in clinical trials.

**Thermal stability** When the thermal stability test is prescribed in a monograph for a live attenuated vaccine, the test is carried out on the final lot to monitor the lot-to-lot consistency in heat-sensitivity of viral/bacterial particles in the product. Suitable conditions are indicated in the individual monograph. The test may be omitted as a routine test for a given product once the consistency of the production process has been demonstrated, in agreement with the competent authority, using relevant parameters, such as consistency in yield, ratio of infectious viruses (viable bacteria) before and after freeze-drying, potency at release and real-time stability under the prescribed conditions as well as thermal stability. Where there is a significant change in the manufacturing procedure of the antigen(s) or formulation, the need for re-introduction of the test is considered.

**Stability** During development studies, maintenance of potency of the final lot throughout the period of validity shall be demonstrated; the loss of potency in the recommended storage conditions is assessed. Excessive loss even within the limits of acceptable potency may indicate that the vaccine is unacceptable.

**Expiry date** Unless otherwise stated, the expiry date is calculated from the beginning of the assay or from the beginning of the first assay for a combined vaccine.

For vaccines stored at a temperature lower than that used for stability studies and intended for release without re-assay, the expiry date is calculated from the date of removal from cold storage. If, for a given vaccine, an assay is not carried out, the expiry date for the final lot is calculated from the date of an approved stability-indicating test or, failing this, from the

date of freeze-drying or the date of filling into the final containers. For a combined vaccine where components are presented in separate containers, the expiry date is that of the component which expires first.

The expiry date applies to vaccines stored in the prescribed conditions.

#### Animal tests

In accordance with the provisions of the European Convention for the Protection of Vertebrate Animals Used for Experimental and Other Scientific Purposes, tests must be carried out in such a way as to use the minimum number of animals and to cause the least pain, suffering, distress or lasting harm. The criteria for judging tests in monographs must be applied in light of this. For example, if it is indicated that an animal is considered to be positive, infected, etc. when typical clinical signs or death occur, then as soon as sufficient indication of a positive result is obtained the animal in question shall be either euthanised or given suitable treatment to prevent unnecessary suffering. In accordance with the General Notices, alternative test methods may be used to demonstrate compliance with the monograph and the use of such tests is particularly encouraged when this leads to replacement or reduction of animal use or reduction of suffering. Guidance on how to substitute *in vivo* methods by *in vitro* methods, in cases where a direct head-to-head comparison is not possible, can be found in general chapter 5.2.14.

#### TESTS

Vaccines comply with the tests prescribed in individual monographs including, where applicable, the following:

##### pH (2.2.3)

Liquid vaccines, after reconstitution where applicable, comply with the limits for pH approved for the particular preparation.

##### Adjuvant

If the vaccine contains an adjuvant, the amount is determined and shown to be within acceptable limits with respect to the expected amount (see also the tests for aluminium and calcium below).

##### Aluminium (2.5.13)

Maximum 1.25 mg of aluminium (Al) per single human dose where an aluminium adsorbent has been used in the vaccine, unless otherwise stated.

##### Calcium (2.5.14)

Maximum 1.3 mg of calcium (Ca) per single human dose where a calcium adsorbent has been used in the vaccine, unless otherwise stated.

##### Free formaldehyde (2.4.18)

Maximum 0.2 g/L of free formaldehyde in the final product where formaldehyde has been used in the preparation of the vaccine, unless otherwise stated.

##### Phenol (2.5.15)

Maximum 2.5 g/L in the final product where phenol has been used in the preparation of the vaccine, unless otherwise stated.

##### Water (2.5.12)

Maximum 3.0 per cent *m/m* for freeze-dried vaccines, unless otherwise stated.

##### Extractable volume (2.9.17)

Unless otherwise justified and authorised, it complies with the requirement for extractable volume.

#### Bacterial endotoxins

Unless otherwise justified and authorised, a test for bacterial endotoxins is carried out on the final product. Where no limit is specified in the individual monograph, the content of bacterial endotoxins determined by a suitable method (2.6.14) is less than the limit approved for the particular product.

#### STORAGE

Store protected from light. Unless otherwise stated, the storage temperature is  $5 \pm 3$  °C; liquid adsorbed vaccines must not be allowed to freeze.

#### LABELLING

The label states:

- the name of the preparation;
- a reference identifying the final lot;
- the recommended human dose and route of administration;
- the storage conditions;
- the expiry date;
- the name and amount of any antimicrobial preservative;
- the name of any antibiotic, adjuvant, flavour or stabiliser present in the vaccine;
- where applicable, that the vaccine is adsorbed;
- the name of any constituent that may cause adverse reactions and any contra-indications to the use of the vaccine;
- for freeze-dried vaccines:
  - the name or composition and the volume of the reconstituting liquid to be added;
  - the time within which the vaccine is to be used after reconstitution.

Ph Eur

## Anthrax Vaccine for Human Use (Adsorbed, Prepared from Culture Filtrates)

(Ph. Eur. monograph 2188)

The label may state 'Anthrax'.

Ph Eur

#### DEFINITION

Anthrax vaccine for human use (adsorbed, prepared from culture filtrates) is a preparation of *Bacillus anthracis* antigens precipitated by aluminium potassium sulfate. The antigens are prepared from a sterile culture filtrate produced by a non-encapsulated strain, either avirulent or attenuated, of *B. anthracis*.

The main virulence components of *B. anthracis* are the polyglutamic acid capsule and 2 binary anthrax toxins, namely lethal toxin and oedema toxin, formed from the respective combination of protective antigen (PA) with either lethal factor (LF) or oedema factor (EF).

LF is a zinc-dependent endopeptidase and EF is a potent calmodulin and calcium-dependent adenylate cyclase. Cell-free cultures of *B. anthracis* contain PA and because expression of the 3 toxin-component genes is co-ordinately regulated, LF and EF are also present. In addition, the vaccine is likely to contain many other *B. anthracis* antigens, including membrane proteins, secreted proteins, cytoplasmic proteins, peptidoglycans, nucleic acids and carbohydrates.

**PRODUCTION****GENERAL PROVISIONS**

Cultures are managed in a seed-lot system. The vaccine strain is toxigenic but lacks the plasmid with the necessary genes for synthesis of the capsule, an important virulence factor.

The production method must be shown to yield a consistent and active product with a safety and efficacy profile that is adequate or equivalent to previous lots. The vaccine must show a level of protection against a virulent strain of *B. anthracis*, in a suitable animal infection model, that is equal to or greater than that of a reference vaccine. The vaccine must not show a level of toxicity that exceeds that of a reference vaccine.

The production method and stability of the final lot and relevant intermediates are evaluated using one or more indicator tests. Such tests include potency and specific toxicity, and may be supported by tests confirming the presence of relevant antigens and associated proteins. Release and shelf-life specifications are established based upon the results of stability testing so as to ensure satisfactory product performance during the approved period of validity.

**SEED LOTS**

The attenuated non-encapsulated strain of *B. anthracis* used is identified by historical records that include information on its origin and subsequent manipulation and the tests used to characterise the strain. These include morphological, cultural, biochemical and genetic properties of the strain. Only a master seed lot or, where applicable, working seed lots, that comply with the following requirements may be used.

**Identification**

Each seed lot is identified as containing *B. anthracis*.

**Phenotypic parameters**

Each seed lot must have a known biochemical and enzymatic profile and have a known history of absence of antibiotic resistance.

**Microbial purity**

Each seed lot complies with the requirements for absence of contaminating organisms. Purity of bacterial cultures is verified by methods of suitable sensitivity.

**Virulence test**

The absence of bacterial capsule is demonstrated for each seed lot by McFadyean stain and the specific toxicity (oedema) test.

**REFERENCE PREPARATION**

The potency and toxicity of the vaccine bulk are verified using reference standards derived from representative vaccine batches. These batches are extensively characterised for their intended purpose and are stored in suitably sized aliquots under conditions ensuring their stability.

**PROPAGATION AND HARVEST**

The attenuated strain is grown using suitable liquid media. At the end of cultivation, the purity of the culture is tested. The culture medium is separated from the bacterial mass by filtration. The pH of the filtrate is determined after dilution with a 0.9 g/L solution of sodium chloride R and is shown to be within limits suitable for stability. A suitable test for absence of live *B. anthracis*, including spores, is carried out. Aluminium potassium sulfate or an alternative adjuvant may be added at this stage. An antimicrobial preservative may be added to the suspension to form the purified harvest.

Only a purified harvest that complies with the following requirements may be used in the preparation of the final lot.

**Immunological identity**

Confirm the presence of *B. anthracis* protective antigen by a suitable immunochemical method (2.7.1).

**Antimicrobial preservative**

Determine the amount of antimicrobial preservative by a suitable chemical method. The amount is not less than 85 per cent and not greater than 115 per cent of the intended content.

**FINAL BULK VACCINE**

The purified harvest is diluted aseptically with sterile saline solution to make the final bulk vaccine.

Only a final bulk vaccine that complies with the following requirement may be used in the preparation of the final lot.

**Sterility (2.6.1)**

Carry out the test for sterility, using 10 mL for each medium.

**FINAL LOT**

The final bulk vaccine is distributed aseptically into sterile, tamper-evident glass ampoules and heat-sealed to prevent contamination.

Only a final lot that is satisfactory with respect to each of the requirements given below under Identification, Tests and Assay may be released for use. Provided the potency assay, the specific toxicity (oedema) test and the test for antimicrobial preservative have been carried out with satisfactory results on the purified harvest, they may be omitted on the final lot.

**IDENTIFICATION**

The presence of *B. anthracis* protective antigen is confirmed by a suitable immunochemical method (2.7.1).

**TESTS****Specific toxicity (oedema) test**

Use not fewer than 2 rabbits per test. Prepare serial two-fold dilutions of vaccine with normal saline, corresponding to 4, 2, 1, 0.5 and 0.25 human doses. Inject intradermally 0.1 mL of each dilution of the test and of the reference vaccine into the shaved flanks of 2 rabbits. Each rabbit receives the 10 previously prepared injections (5 dilutions of the test vaccine and 5 dilutions of the reference vaccine). In one of the rabbits, the lower concentrations are injected at the anterior end and the higher concentrations at the posterior end. The reverse is used for the 2<sup>nd</sup> rabbit. The rabbits are monitored for 24 h for signs of oedema at the injection site. The vaccine complies with the test if the oedematous reaction is not greater than that observed with the reference vaccine.

Alternatively, specific *in vitro* assays for lethal factor and adenylate cyclase activity may be used, subject to validation.

**Antimicrobial preservative**

Determine the amount of antimicrobial preservative by a suitable chemical method. The content is not less than the minimum amount shown to be effective and is not greater than 115 per cent of the intended content.

**Aluminium (2.5.13)**

Maximum 1.25 mg per single human dose.

**Sterility (2.6.1)**

It complies with the test for sterility.

**ASSAY**

The potency of the anthrax vaccine is determined by comparing the dose required to protect guinea-pigs against intradermal challenge by a virulent strain of *B. anthracis* with the dose of a suitable reference preparation that gives the

same protection. Use 9 groups of not fewer than 16 female guinea-pigs, each weighing 250-350 g. Prepare 4 dilutions of the vaccine and of the reference preparation containing 1.5, 0.5, 0.17 and 0.05 human doses in 0.5 mL. Allocate each dilution to a separate group. The remaining group receives 0.5 mL of saline and is used to verify the challenge dose. Inject subcutaneously into each guinea-pig 0.5 mL of the dilution allocated to its group on each of 2 occasions, 1 week apart. 7 days after the 2<sup>nd</sup> injection, inject intradermally into each guinea-pig 2000 spores of a virulent strain of *B. anthracis* (Vollum) in 0.1 mL. Observe the animals for 10 days and record the number of deaths per group. The test is not valid unless all the control animals die within 5 days of challenge. Using the proportions of animals that survive in each of the vaccinated groups, calculate the potency of the vaccine relative to the reference preparation using the usual statistical methods (5.3). The vaccine complies with the test if:

- the relative potency estimate exceeds 1.0, or;
- the 95 per cent confidence interval for the relative potency includes 1.0, and the lower 95 per cent confidence limit is not less than 50 per cent of the relative potency estimate.

#### LABELLING

The label states that the vaccine is not to be frozen.

Ph Eur

## Bacillus Calmette-Guérin Vaccine

BCG Vaccine

(BCG Vaccine, Freeze-dried, Ph. Eur. monograph 0163)

The label may state 'BCG'.

Ph Eur

#### DEFINITION

Freeze-dried BCG vaccine is a preparation of live bacteria derived from a culture of the bacillus of Calmette and Guérin (*Mycobacterium bovis* BCG) whose capacity to protect against tuberculosis has been established.

#### PRODUCTION

##### GENERAL PROVISIONS

BCG vaccine shall be produced by a staff consisting of healthy persons who do not work with other infectious agents; in particular they shall not work with virulent strains of *Mycobacterium tuberculosis*, nor shall they be exposed to a known risk of tuberculosis infection. Staff are examined periodically for tuberculosis. BCG vaccine is susceptible to sunlight: the procedures for the preparation of the vaccine shall be designed so that all cultures and vaccines are protected from direct sunlight and from ultraviolet light at all stages of manufacture, testing and storage.

Production of the vaccine is based on a seed-lot system.

The production method shall have been shown to yield consistently BCG vaccines that induce adequate sensitivity to tuberculin in man, that have acceptable protective potency in animals and are safe. The vaccine is prepared from cultures which are derived from the master seed lot by as few subcultures as possible and in any case not more than 8 subcultures. During the course of these subcultures the preparation is not freeze-dried more than once.

If a bioluminescence test or other biochemical method is used instead of viable count, the method is validated against the viable count for each stage of the process at which it is used.

#### BACTERIAL SEED LOTS

The strain used to establish the master seed lot is chosen for and maintained to preserve its characteristics, its capacity to sensitise man to tuberculin and to protect animals against tuberculosis, and its relative absence of pathogenicity for man and laboratory animals. The strain used shall be identified by historical records that include information on its origin and subsequent manipulation.

A suitable batch of vaccine is prepared from the first working seed lot and is reserved for use as the comparison vaccine. When a new working seed lot is established, a suitable test for delayed hypersensitivity in guinea-pigs is carried out on a batch of vaccine prepared from the new working seed lot; the vaccine is shown to be not significantly different in activity from the comparison vaccine. Antimicrobial agent sensitivity testing is also carried out.

Only a working seed lot that complies with the following requirements may be used for propagation.

#### Identification

The bacteria in the working seed lot are identified as *Mycobacterium bovis* BCG using microbiological techniques, which may be supplemented by molecular biology techniques (for example, nucleic acid amplification and restriction-fragment-length polymorphism).

#### Bacterial and fungal contamination

Carry out the test for sterility (2.6.1), using 10 mL for each medium. The working seed lot complies with the test for sterility except for the presence of mycobacteria.

#### Virulent mycobacteria

Examine the working seed lot as prescribed under Tests, using 10 guinea-pigs.

#### PROPAGATION AND HARVEST

The bacteria are grown in a suitable medium for not more than 21 days by surface or submerged culture. The culture medium does not contain substances known to cause toxic or allergic reactions in humans or to cause the bacteria to become virulent for guinea-pigs. The culture is harvested and suspended in a sterile liquid medium that protects the viability of the vaccine as determined by a suitable method of viable count.

#### FINAL BULK VACCINE

The final bulk vaccine is prepared from a single harvest or by pooling a number of single harvests. A stabiliser may be added; if the stabiliser interferes with the determination of bacterial concentration in the final bulk vaccine, the determination is carried out before addition of the stabiliser.

Only final bulk vaccine that complies with the following requirements may be used in the preparation of the final lot.

#### Bacterial and fungal contamination

Carry out the test for sterility (2.6.1), using 10 mL for each medium. The final bulk vaccine complies with the test for sterility except for the presence of mycobacteria.

#### Count of viable units

Determine the number of viable units per millilitre by viable count on solid medium using a method suitable for the vaccine to be examined or by a suitable biochemical method. Carry out the test in parallel on a reference preparation of the same strain.

#### Bacterial concentration

Determine the total bacterial concentration by a suitable method, either directly by determining the mass of the micro-organisms, or indirectly by an opacity method that has been calibrated in relation to the mass of the organisms; if the

bacterial concentration is determined before addition of a stabiliser, the concentration in the final bulk vaccine is established by calculation. The total bacterial concentration is within the limits approved for the particular product.

The ratio of the count of viable units to the total bacterial concentration is not less than that approved for the particular product.

#### FINAL LOT

The final bulk vaccine is distributed into sterile containers and freeze-dried to a moisture content favourable to the stability of the vaccine; the containers are closed either under vacuum or under an inert gas.

Except where the filled and closed containers are stored at a temperature of  $-20^{\circ}\text{C}$  or lower, the expiry date is not later than 4 years from the date of harvest.

Only a final lot that complies with the following requirement for count of viable units and with each of the requirements given below under Identification, Tests and Assay may be released for use. Provided the test for virulent mycobacteria has been carried out with satisfactory results on the final bulk vaccine, it may be omitted on the final lot. Provided the test for excessive dermal reactivity has been carried out with satisfactory results on the working seed lot and on 5 consecutive final lots produced from it, the test may be omitted on the final lot.

#### Count of viable units

Determine the number of viable units per millilitre of the reconstituted vaccine by viable count on solid medium using a method suitable for the vaccine to be examined or by a suitable biochemical method. The ratio of the count of viable units after freeze-drying to that before is not less than that approved for the particular product.

#### Thermal stability

Maintain containers of the final lot of freeze-dried vaccine in the dry state at  $37 \pm 1^{\circ}\text{C}$  for 4 weeks. Determine the number of viable units as described under Assay in parallel for the heated vaccine and for vaccine stored at the temperature recommended for storage. The number of viable units in the heated vaccine is not less than 20 per cent of that in the unheated vaccine.

#### IDENTIFICATION

BCG vaccine is identified by microscopic examination of the bacilli in stained smears demonstrating their acid-fast property and by the characteristic appearance of colonies grown on solid medium. Alternatively, molecular biology techniques (for example nucleic acid amplification) may be used.

#### TESTS

##### Virulent mycobacteria

Inject subcutaneously or intramuscularly into each of 6 guinea-pigs, each weighing 250–400 g and having received no treatment likely to interfere with the test, a quantity of vaccine equivalent to at least 50 human doses. Observe the animals for at least 42 days. At the end of this period, euthanise the guinea-pigs and examine by autopsy for signs of infection with tuberculosis, ignoring any minor reactions at the site of injection. Animals that die during the observation period are also examined for signs of tuberculosis.

The vaccine complies with the test if none of the guinea-pigs shows signs of tuberculosis and if not more than 1 animal dies during the observation period. If 2 animals die during this period and autopsy does not reveal signs of tuberculosis repeat the test on 6 other guinea-pigs. The vaccine complies with the test if not more than 1 animal dies during the

42 days following the injection and autopsy does not reveal any sign of tuberculosis.

#### Bacterial and fungal contamination

The reconstituted vaccine complies with the test for sterility (2.6.1) except for the presence of mycobacteria.

#### Excessive dermal reactivity

Use 6 healthy, white or pale-coloured guinea-pigs, each weighing not less than 250 g and having received no treatment likely to interfere with the test. Inject intradermally into each guinea-pig, according to a randomised plan, 0.1 mL of the reconstituted vaccine and of 2 tenfold serial dilutions of the vaccine and identical doses of the comparison vaccine. Observe the lesions formed at the site of the injection for 4 weeks. The vaccine complies with the test if the reaction it produces is not markedly different from that produced by the comparison vaccine.

#### Water

Not more than the limit approved for the particular product, determined by a suitable method.

#### ASSAY

Determine the number of viable units in the reconstituted vaccine by viable count on solid medium using a method suitable for the vaccine to be examined or by a suitable validated biochemical method. The number is within the range stated on the label. Determine the number of viable units in the comparison vaccine in parallel.

#### LABELLING

The label states:

- the minimum and maximum number of viable units per millilitre in the reconstituted vaccine,
- that the vaccine must be protected from direct sunlight.

Ph Eur

## BCG for Immunotherapy

(Ph. Eur. monograph 1929)

Ph Eur

#### DEFINITION

BCG for immunotherapy is a freeze-dried preparation of live bacteria derived from a culture of the bacillus of Calmette and Guérin (*Mycobacterium bovis* BCG) whose capacity for treatment has been established.

It complies with the monograph *Vaccines for human use* (0153).

#### PRODUCTION

##### GENERAL PROVISIONS

BCG for immunotherapy shall be produced by a staff consisting of healthy persons who do not work with other infectious agents; in particular they shall not work with virulent strains of *Mycobacterium tuberculosis*, nor shall they be exposed to a known risk of tuberculosis infection. Staff are examined periodically for tuberculosis. BCG for immunotherapy is susceptible to sunlight: the procedures for production shall be so designed that all products are protected from direct sunlight and from ultraviolet light at all stages of manufacture, testing and storage.

Production is based on a seed-lot system. The production method shall have been shown to yield consistently BCG products that can be used for treatment of superficial bladder cancer and are safe. The product is prepared from cultures

which are separated from the master seed lot by as few subcultures as possible and in any case not more than 8 subcultures. During the course of these subcultures the preparation is not freeze-dried more than once.

If a bioluminescence test or other biochemical method is used instead of viable count, the method is validated against the viable count for each stage of the process at which it is used.

#### **SEED LOTS**

The strain used to establish the master seed lot is chosen for and maintained to preserve its characteristics, its capacity to treat and prevent superficial bladder cancer, and its relative absence of pathogenicity for man and laboratory animals. The strain used shall be identified by historical records that include information on its origin and subsequent manipulation.

Before establishment of a working seed lot a batch is prepared and reserved for use as the comparison product. When a new working seed lot is established, a suitable test for delayed hypersensitivity in guinea-pigs is carried out on a batch of product prepared from the new working seed lot; the product is shown to be not significantly different in activity from the comparison product. Antimicrobial agent sensitivity testing is also carried out.

Only a working seed lot that complies with the following requirements may be used for propagation.

#### **Identification**

The bacteria in the working seed lot are identified as *Mycobacterium bovis* BCG using microbiological techniques, which may be supplemented by molecular biology techniques (for example, nucleic acid amplification and restriction-fragment-length polymorphism).

#### **Bacterial and fungal contamination**

Carry out the test for sterility (2.6.1), using 10 mL for each medium. The working seed lot complies with the test for sterility, except for the presence of mycobacteria.

#### **Virulent mycobacteria**

Examine the working seed lot as prescribed under Tests, using 10 guinea-pigs.

#### **PROPAGATION AND HARVEST**

The bacteria are grown in a suitable medium for not more than 21 days by surface or submerged culture. The culture medium does not contain substances known to cause toxic or allergic reactions in human beings or to cause the bacteria to become virulent for guinea-pigs. The culture is harvested and suspended in a sterile liquid medium that protects the viability of the culture as determined by a suitable method of viable count.

#### **FINAL BULK**

The final bulk is prepared from a single harvest or by pooling a number of single harvests. A stabiliser may be added; if the stabiliser interferes with the determination of bacterial concentration on the final bulk, the determination is carried out before addition of the stabiliser.

Only final bulk that complies with the following requirements may be used in the preparation of the final lot.

#### **Bacterial and fungal contamination**

Carry out the test for sterility (2.6.1), using 10 mL of final bulk for each medium. The final bulk complies with the test for sterility, except for the presence of mycobacteria.

#### **Count of viable units**

Determine the number of viable units per millilitre by viable count on solid medium using a method suitable for the

product to be examined or by a suitable biochemical method. Carry out the test in parallel on a reference preparation of the same strain.

#### **Bacterial concentration**

Determine the total bacterial concentration by a suitable method, either directly by determining the mass of the micro-organisms, or indirectly by an opacity method that has been calibrated in relation to the mass of the micro-organisms; if the bacterial concentration is determined before addition of a stabiliser, the concentration in the final bulk is established by calculation. The total bacterial concentration is within the limits approved for the particular product.

The ratio of the count of viable units to the total bacterial concentration is not less than that approved for the particular product.

#### **FINAL LOT**

The final bulk is distributed into sterile containers and freeze-dried to a moisture content favourable to the stability of the product; the containers are closed either under vacuum or under an inert gas.

Except where the filled and closed containers are stored at a temperature of  $-20^{\circ}\text{C}$  or lower, the expiry date is not later than 4 years from the date of harvest.

Only a final lot that complies with the following requirement for count of viable units and with each of the requirements given below under Identification, Tests and Assay may be released for use. Provided the test for virulent mycobacteria has been carried out with satisfactory results on the final bulk, it may be omitted on the final lot.

#### **Count of viable units**

Determine the number of viable units per millilitre of the reconstituted product by viable count on solid medium using a method suitable for the product to be examined, or by a suitable biochemical method. The ratio of the count of viable units after freeze-drying to that before is not less than that approved for the particular product.

#### **IDENTIFICATION**

BCG for immunotherapy is identified by microscopic examination of the bacilli in stained smears demonstrating their acid-fast property and by the characteristic appearance of colonies grown on solid medium. Alternatively, molecular biology techniques (for example, nucleic acid amplification) may be used.

#### **TESTS**

##### **Virulent mycobacteria**

Inject subcutaneously or intramuscularly into each of 6 guinea-pigs, each weighing 250-400 g and having received no treatment likely to interfere with the test, a quantity of the product to be examined equivalent to at least 1/25 of 1 human dose. Observe the animals for at least 42 days. At the end of this period, euthanise the guinea-pigs and examine by autopsy for signs of infection with tuberculosis, ignoring any minor reactions at the site of injection. Animals that die during the observation period are also examined for signs of tuberculosis. The product complies with the test if none of the guinea-pigs shows signs of tuberculosis and if not more than 1 animal dies during the observation period. If 2 animals die during this period and autopsy does not reveal signs of tuberculosis, repeat the test on 6 other guinea-pigs. The product complies with the test if not more than 1 animal dies during the 42 days following the injection and autopsy does not reveal any sign of tuberculosis.

**Bacterial and fungal contamination**

The reconstituted product complies with the test for sterility (2.6.1) except for the presence of mycobacteria.

**Water**

Not more than the limit approved for the particular product, determined by a suitable method.

**ASSAY**

Determine the number of viable units in the reconstituted product by viable count on solid medium using a method suitable for the product to be examined or by a suitable validated biochemical method. The number is within the range stated on the label. Determine the number of viable units in the comparison control in parallel.

**LABELLING**

The label states:

- the minimum and the maximum number of viable units per dose in the reconstituted product;
- that the product must be protected from direct sunlight.

Ph Eur

## Cholera Vaccine (Inactivated, Oral)

(Ph. Eur. monograph 2327)

The label may state 'Cholera (oral)'.

Ph Eur

**DEFINITION**

Cholera vaccine (inactivated, oral) is a homogeneous suspension of inactivated suitable strains of *Vibrio cholerae* serogroup O1, representing serotypes and biotypes of epidemic strains. The vaccine may contain the B subunit of cholera toxin (CTB). Just prior to ingestion, one dose of vaccine suspension is mixed with a suitable buffer as stated on the label.

**PRODUCTION****GENERAL PROVISIONS**

The production method must be validated to yield consistently vaccines comparable with the vaccine of proven clinical efficacy and safety in man.

The production process must be validated to show that no clinically significant quantities of active toxin are present in the product.

**CHOICE OF VACCINE STRAIN**

The vaccine consists of a mixture of epidemic *V. cholerae* strains inactivated by a suitable method such as heat or formalin inactivation. All strains express smooth lipopolysaccharide (LPS). The CTB is produced by recombinant DNA technology in a strain that lacks the gene for cholera toxin subunit A (*ctxA*). Selected *V. cholerae* strains are low cholera-toxin producers.

The World Health Organization (WHO) can recommend new vaccine strains or antigens that may be used if necessary, in accordance with the regulations in force in the signatory states of the Convention on the Elaboration of a European Pharmacopoeia.

**SEED LOTS**

The strains of *V. cholerae* used shall be identified by historical records that include information on the origin of the strains and their subsequent manipulation. Characterisation and maintenance of the recombinant strains and plasmids used for production of the recombinant B subunit of cholera

toxin (rCTB) and the origin of the gene for cholera toxin subunit B (*ctxB*) are documented. The stability of the rCTB plasmid in the recombinant strain during storage and beyond the passage level used in production is confirmed.

Characterisation of the rCTB is undertaken using a variety of analytical techniques including determination of molecular size, charge and amino acid composition. Techniques suitable for such purposes include sodium dodecyl sulfate polyacrylamide gel electrophoresis (SDS-PAGE) and different liquid chromatographies. The identity of the product is confirmed by at least partial *N*-terminal and *C*-terminal amino acid sequencing.

Master seed lots are grown on agar plates, which may contain appropriate antibiotics. Colonies are used to produce working seed lots in liquid media that are free from antibiotics. Cultures derived from the working seed lot must have the same characteristics as the cultures of the strain from which the master seed lot was derived.

Only a seed lot that complies with the following requirements may be used in the preparation of the monovalent cell harvest.

**Identification**

Master seed lots are identified by colony morphology, and by biochemical characterisation, using suitable molecular assays or immunoassays. Working seed lots are identified by colony morphology and by molecular assays or immunoassays.

**Purity**

Purity of master seed lots and working seed lots is verified by methods of suitable sensitivity.

**PROPAGATION AND HARVEST**

Each strain is grown separately from the working seed lot.

Cultures are checked at different stages of fermentation (subcultures and main culture) for purity, identity, cell opacity, pH and biochemical characteristics. Unsatisfactory cultures must be discarded.

Production cultures are shown to be consistent in respect of growth rate, pH and yield of cells or cell products.

**MONOVALENT CELL HARVEST**

Only a monovalent harvest that complies with established specifications for the following tests may be used.

**pH (2.2.3)**

Within the range approved for the particular product.

**Identification**

Relevant antigenic characteristics are verified by suitable immunological or biochemical assays.

**Purity**

Samples of culture are examined by microscopy of Gram-stained smears, by inoculation of appropriate culture media or by another suitable procedure.

**Opacity**

The absorbance at 600 nm (2.2.25) is within the range approved for the particular product.

**INACTIVATED MONOVALENT CELL BULK**

To limit the possibility of contamination, inactivation is initiated as soon as possible after preparation. Bacteria are inactivated after washing, either by treatment with formaldehyde or by heating under conditions that ensure inactivation.

Only an inactivated monovalent cell bulk that complies with established specifications for the following tests may be used in the preparation of the final bulk.

**pH (2.2.3)**

Within the range approved for the particular product.

**Identification**

Verified by slide agglutination.

**Inactivation**

Complete inactivation is verified by a suitable culture method.

**Sterility (2.6.1)**

It complies with the test for sterility, carried out using 10 mL for each medium.

**Opacity**

The inactivation process may affect the accuracy of opacity measurements.

**Purity**

Samples of culture are examined by microscopy of Gram-stained smears, by inoculation of appropriate culture media or by another suitable procedure.

**Smooth LPS content**

Verified by a suitable immunoassay (2.7.1).

**Residual cholera toxin**

The absence of residual cholera toxin is verified by a suitable immunoassay (2.7.1) or biochemical assay.

**Free formaldehyde (2.4.18)**

Content to be determined where formaldehyde is used for inactivation.

**PURIFIED RCTB**

Production of the rCTB follows the guidelines for assuring the quality of pharmaceutical and biological products prepared by recombinant-technology and is covered by the monograph *Products of recombinant DNA technology (0784)*. Prior to harvest, the cell culture is checked for purity and opacity. rCTB is harvested by suitable filtration, concentrated by diafiltration, purified by chromatography, filter-sterilised and stored under suitable conditions. The pH of the pooled eluate is adjusted prior to buffer exchange.

Only purified rCTB that complies with established specifications for the following tests may be used in the preparation of the final bulk.

**pH (2.2.3)**

Within the range approved for the particular product.

**Purity**

Verified by SDS-PAGE (2.2.31) and an appropriate liquid chromatography method (2.2.29).

**Sterility (2.6.1)**

It complies with the test for sterility, carried out using 10 mL for each medium.

**rCTB**

The amount of rCTB is determined by a suitable immunoassay (2.7.1).

**FINAL BULK**

The final bulk vaccine is prepared by aseptically mixing a suitable buffer with monovalent cell bulks. Where used, the rCTB bulk is added in appropriate amounts. Preservatives, if used, may be added at this stage.

Only a final bulk that complies with the following requirements may be used in the preparation of the final lot.

**Sterility (2.6.1)**

It complies with the test for sterility, carried out using 10 mL for each medium.

**Antimicrobial preservative**

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical or physico-chemical method. The amount is not less than 85 per cent and not greater than 115 per cent of the intended amount.

**FINAL LOT**

The final bulk is mixed to homogeneity and filled aseptically into suitable containers.

Only a final lot that is within the limits approved for the particular product and is satisfactory with respect to each of the requirements given below under Identification, Tests and Assay may be released for use.

**IDENTIFICATION**

Serotypes are detected by a suitable immunoassay (2.7.1) or molecular assay. rCTB is detected by a suitable immunoassay (2.7.1). The antigen-content assays may also serve as an identity test.

**TESTS****pH (2.2.3)**

Within the range approved for the particular product.

**Sterility (2.6.1)**

It complies with the test for sterility.

**Free formaldehyde (2.4.18)**

Maximum 0.2 g/L, where applicable.

**Antimicrobial preservative**

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical or physico-chemical method. The amount is not less than 85 per cent and not greater than 115 per cent of the intended amount.

**ASSAY****Antigen content**

The amount of smooth LPS, and where applicable, the amount of rCTB, are within the limits approved for the particular product, determined by a suitable immunoassay (2.7.1).

**LABELLING**

*The label states:*

- the method of inactivation;
- the serogroup, serotypes and biotypes of vaccine strains;
- the number of bacteria per human dose;
- the amount of rCTB.

Ph Eur

**Adsorbed Diphtheria Vaccine**

(*Diphtheria Vaccine (Adsorbed)*, Ph. Eur. monograph 0443)

Ph Eur

**DEFINITION**

Diphtheria vaccine (adsorbed) is a preparation of diphtheria formol toxoid with a mineral adsorbent. The formol toxoid is prepared from the toxin produced by the growth of *Corynebacterium diphtheriae*.

**PRODUCTION****GENERAL PROVISIONS****Specific toxicity**

The production method is validated to demonstrate that the product, if tested, would comply with the following test: inject subcutaneously 5 times the single human dose stated

on the label into each of 5 healthy guinea-pigs, each weighing 250-350 g, that have not previously been treated with any material that will interfere with the test. If within 42 days of the injection any of the animals shows signs of or dies from diphtheria toxæmia, the vaccine does not comply with the test. If more than 1 animal dies from non-specific causes, repeat the test once; if more than 1 animal dies in the second test, the vaccine does not comply with the test.

#### **BULK PURIFIED TOXOID**

For the production of diphtheria toxin, from which toxoid is prepared, seed cultures are managed in a defined seed-lot system in which toxinogenicity is conserved and, where necessary, restored by deliberate reselection. A highly toxinogenic strain of *Corynebacterium diphtheriae* with known origin and history is grown in a suitable liquid medium. At the end of cultivation, the purity of each culture is tested and contaminated cultures are discarded. Toxin-containing culture medium is separated aseptically from the bacterial mass as soon as possible. The toxin content (Lf per millilitre) is checked (2.7.27) to monitor consistency of production. Single harvests may be pooled to prepare the bulk purified toxoid. The toxin is purified to remove components likely to cause adverse reactions in humans. The purified toxin is detoxified with formaldehyde by a method that avoids destruction of the immunogenic potency of the toxoid and reversion of the toxoid to toxin, particularly on exposure to heat. Alternatively, purification may be carried out after detoxification.

Only bulk purified toxoid that complies with the following requirements may be used in the preparation of the final bulk vaccine.

#### **Sterility (2.6.1)**

Carry out the test for sterility using 10 mL for each medium.

#### **Absence of toxin and irreversibility of toxoid**

Using the same buffer solution as for the final vaccine, without adsorbent, prepare a solution of bulk purified toxoid at 100 Lf/mL. Divide the solution into 2 equal parts. Maintain 1 part at  $5 \pm 3$  °C and the other at 37 °C for 6 weeks. Carry out a test in Vero cells for active diphtheria toxin using 50 µL/well of both samples. The sample should not contain antimicrobial preservatives and detoxifying agents should be determined to be below the concentration toxic to Vero cells. Non-specific toxicity may be eliminated by dialysis.

Use freshly trypsinised Vero cells at a suitable concentration, for example  $2.5 \times 10^5$  mL<sup>-1</sup> and a reference diphtheria toxin diluted in 100 Lf/mL diphtheria toxoid. A suitable reference diphtheria toxin will contain either not less than 100 LD<sub>50</sub>/mL or 67 to 133 I<sub>h</sub>/100 in 1 Lf and 25 000 to 50 000 minimal reacting doses for guinea-pig skin in 1 Lf (diphtheria toxin BRP is suitable for use as the reference toxin). Dilute the toxin in 100 Lf/mL diphtheria toxoid to a suitable concentration, for example  $2 \times 10^{-4}$  Lf/mL. Prepare serial twofold dilutions of the diluted diphtheria toxin and use undiluted test samples (50 µL/well). Distribute them in the wells of a sterile tissue culture plate containing a medium suitable for Vero cells. To ascertain that any cytotoxic effect noted is specific to diphtheria toxin, prepare in parallel dilutions where the toxin is neutralised by a suitable concentration of diphtheria antitoxin, for example 100 IU/mL. Include control wells without toxoid or toxin and with non-toxic toxoid at 100 Lf/mL on each plate to verify normal cell growth. Add cell suspension to each well, seal the plates and incubate at 37 °C for 5-6 days. Cytotoxic effect is judged to be present where there is complete

metabolic inhibition of the Vero cells, indicated by the pH indicator of the medium. Confirm cytopathic effect by microscopic examination or suitable staining such as MTT dye. The test is invalid if  $5 \times 10^{-5}$  Lf/mL of reference diphtheria toxin in 100 Lf/mL toxoid has no cytotoxic effect on Vero cells or if the cytotoxic effect of this amount of toxin is not neutralised in the wells containing diphtheria antitoxin. The bulk purified toxoid complies with the test if no toxicity neutralisable by antitoxin is found in either sample.

#### **Antigenic purity (2.7.27)**

Not less than 1500 Lf per milligram of protein nitrogen.

#### **FINAL BULK VACCINE**

The final bulk vaccine is prepared by adsorption of a suitable quantity of bulk purified toxoid onto a mineral carrier such as hydrated aluminium phosphate or aluminium hydroxide; the resulting mixture is approximately isotonic with blood. Suitable antimicrobial preservatives may be added. Certain antimicrobial preservatives, particularly those of the phenolic type, adversely affect the antigenic activity and must not be used.

Only a final bulk vaccine that complies with the following requirements may be used in the preparation of the final lot.

#### **Antimicrobial preservative**

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The amount is not less than 85 per cent and not greater than 115 per cent of the intended amount.

#### **Sterility (2.6.1)**

Carry out the test for sterility using 10 mL for each medium.

#### **FINAL LOT**

The final bulk vaccine is distributed aseptically into sterile, tamper-evident containers. The containers are closed so as to prevent contamination.

Only a final lot that is satisfactory with respect to each of the requirements given below under Identification, Tests and Assay may be released for use. Provided the test for antimicrobial preservative and the assay have been carried out with satisfactory results on the final bulk vaccine, they may be omitted on the final lot.

Provided the free formaldehyde content has been determined on the bulk purified antigens or on the final bulk and it has been shown that the content in the final lot will not exceed 0.2 g/L, the test for free formaldehyde may be omitted on the final lot.

#### **IDENTIFICATION**

Diphtheria toxoid is identified by a suitable immunochemical method (2.7.1). The following method, applicable to certain vaccines, is given as an example. Dissolve in the vaccine to be examined sufficient sodium citrate R to give a 100 g/L solution. Maintain at 37 °C for about 16 h and centrifuge until a clear supernatant is obtained. The clear supernatant reacts with a suitable diphtheria antitoxin, giving a precipitate.

#### **TESTS**

##### **Aluminium (2.5.13)**

Maximum 1.25 mg per single human dose, if aluminium hydroxide or hydrated aluminium phosphate is used as the adsorbent.

##### **Free formaldehyde (2.4.18)**

Maximum 0.2 g/L.

##### **Antimicrobial preservative**

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The content is

not less than the minimum amount shown to be effective and is not greater than 115 per cent of the quantity stated on the label.

#### **Sterility (2.6.1)**

The vaccine complies with the test for sterility.

#### **ASSAY**

Carry out one of the prescribed methods for the assay of diphtheria vaccine (adsorbed) (2.7.6).

The lower confidence limit ( $P = 0.95$ ) of the estimated potency is not less than 30 IU per single human dose.

#### **LABELLING**

The label states:

- the minimum number of International Units per single human dose,
- where applicable, that the vaccine is intended for primary vaccination of children and is not necessarily suitable for reinforcing doses or for administration to adults,
- the name and the amount of the adsorbent,
- that the vaccine must be shaken before use,
- that the vaccine is not to be frozen.

Ph Eur

## **Diphtheria Vaccine (Adsorbed, Reduced Antigen Content)**

Adsorbed Diphtheria Vaccine for Adults and Adolescents

(Ph. Eur. monograph 0646)

For a vaccine for use in the United Kingdom, the amount of toxoid used is adjusted so that the final vaccine contains not more than 2.0 flocculation equivalents (2.0 Lf) per dose.

Ph Eur

#### **DEFINITION**

Diphtheria vaccine (adsorbed, reduced antigen content) is a preparation of diphtheria formol toxoid with a mineral adsorbent. The formol toxoid is prepared from the toxin produced by the growth of *Corynebacterium diphtheriae*. The amount of diphtheria toxoid per single human dose is reduced compared to vaccines generally used for primary vaccination.

#### **PRODUCTION**

##### **GENERAL PROVISIONS**

##### **Specific toxicity**

The production method is validated to demonstrate that the product, if tested, would comply with the following test: inject subcutaneously 5 times the single human dose stated on the label into each of 5 healthy guinea-pigs, each weighing 250-350 g, that have not previously been treated with any material that will interfere with the test. If within 42 days of the injection any of the animals shows signs of or dies from diphtheria toxæmia, the vaccine does not comply with the test. If more than one animal dies from non-specific causes, repeat the test once; if more than one animal dies in the second test, the vaccine does not comply with the test.

##### **BULK PURIFIED TOXOID**

The bulk purified toxoid is prepared as described in the monograph *Diphtheria vaccine (adsorbed)* (0443) and complies with the requirements prescribed therein.

#### **FINAL BULK VACCINE**

The final bulk vaccine is prepared by adsorption of a suitable quantity of bulk purified toxoid onto a mineral carrier such as hydrated aluminium phosphate or aluminium hydroxide; the resulting mixture is approximately isotonic with blood. Suitable antimicrobial preservatives may be added. Certain antimicrobial preservatives, particularly those of the phenolic type, adversely affect the antigenic activity and must not be used.

Only a final bulk vaccine that complies with the following requirements may be used in the preparation of the final lot.

##### **Antimicrobial preservative**

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The amount is not less than 85 per cent and not greater than 115 per cent of the intended amount.

##### **Sterility (2.6.1)**

Carry out the test for sterility using 10 mL for each medium.

##### **FINAL LOT**

The final bulk vaccine is distributed aseptically into sterile, tamper-evident containers. The containers are closed so as to prevent contamination.

Only a final lot that is satisfactory with respect to each of the requirements given below under Identification, Tests and Assay may be released for use. Provided the test for antimicrobial preservative and the assay have been carried out with satisfactory results on the final bulk vaccine, they may be omitted on the final lot.

Provided the free formaldehyde content has been determined on the bulk purified toxoid or on the final bulk and it has been shown that the content in the final lot will not exceed 0.2 g/L, the test for free formaldehyde may be omitted on the final lot.

#### **IDENTIFICATION**

Diphtheria toxoid is identified by a suitable immunochemical method (2.7.1). The following method, applicable to certain vaccines, is given as an example. Dissolve in the vaccine to be examined sufficient *sodium citrate R* to give a 100 g/L solution. Maintain at 37 °C for about 16 h and centrifuge until a clear supernatant is obtained. The clear supernatant reacts with a suitable diphtheria antitoxin, giving a precipitate. If a satisfactory result is not obtained with a vaccine adsorbed on aluminium hydroxide, carry out the test as follows. Centrifuge 15 mL of the vaccine to be examined and suspend the residue in 5 mL of a freshly prepared mixture of 1 volume of a 56 g/L solution of *sodium edetate R* and 49 volumes of *disodium hydrogen phosphate solution R*. Maintain at 37 °C for not less than 6 h and centrifuge. The clear supernatant reacts with a suitable diphtheria antitoxin, giving a precipitate.

#### **TESTS**

##### **Aluminium (2.5.13)**

Maximum 1.25 mg per single human dose, if aluminium hydroxide or hydrated aluminium phosphate is used as the adsorbent.

##### **Free formaldehyde (2.4.18)**

Maximum 0.2 g/L.

##### **Antimicrobial preservative**

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The content is not less than the minimum amount shown to be effective and is not greater than 115 per cent of the quantity stated on the label.

**Sterility (2.6.1)**

The vaccine complies with the test for sterility.

**ASSAY**

Carry out one of the prescribed methods for the assay of diphtheria vaccine (adsorbed) (2.7.6).

The lower confidence limit ( $P = 0.95$ ) of the estimated potency is not less than 2 IU per single human dose.

**LABELLING**

The label states:

- the minimum number of International Units per single human dose;
- the name and the amount of the adsorbent;
- that the vaccine must be shaken before use;
- that the vaccine is not to be frozen.

Ph Eur

## Adsorbed Diphtheria and Tetanus Vaccine

(Diphtheria and Tetanus Vaccine (Adsorbed),  
Ph. Eur. monograph 0444)

The label may state 'DT'.

Ph Eur

**DEFINITION**

Diphtheria and tetanus vaccine (adsorbed) is a preparation of diphtheria formol toxoid and tetanus formol toxoid with a mineral adsorbent. The formol toxoids are prepared from the toxins produced by the growth of *Corynebacterium diphtheriae* and *Clostridium tetani*, respectively.

**PRODUCTION****GENERAL PROVISIONS****Specific toxicity of the diphtheria component**

The production method is validated to demonstrate that the product, if tested, would comply with the following test: inject subcutaneously 5 times the single human dose stated on the label into each of 5 healthy guinea-pigs, each weighing 250-350 g, that have not previously been treated with any material that will interfere with the test. If within 42 days of the injection any of the animals shows signs of or dies from diphtheria toxæmia, the vaccine does not comply with the test. If more than 1 animal dies from non-specific causes, repeat the test once; if more than 1 animal dies in the second test, the vaccine does not comply with the test.

**BULK PURIFIED DIPHTHERIA AND TETANUS TOXOIDS**

The bulk purified diphtheria and tetanus toxoids are prepared as described in the monographs *Diphtheria vaccine (adsorbed)* (0443) and *Tetanus vaccine (adsorbed)* (0452) and comply with the requirements prescribed therein.

**FINAL BULK VACCINE**

The final bulk vaccine is prepared by adsorption of suitable quantities of bulk purified diphtheria toxoid and tetanus toxoid onto a mineral carrier such as hydrated aluminium phosphate or aluminium hydroxide; the resulting mixture is approximately isotonic with blood. Suitable antimicrobial preservatives may be added. Certain antimicrobial preservatives, particularly those of the phenolic type, adversely affect the antigenic activity and must not be used. Only a final bulk vaccine that complies with the following requirements may be used in the preparation of the final lot.

**Antimicrobial preservative**

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The amount is not less than 85 per cent and not greater than 115 per cent of the intended amount.

**Sterility (2.6.1)**

Carry out the test for sterility using 10 mL for each medium.

**FINAL LOT**

The final bulk vaccine is distributed aseptically into sterile, tamper-evident containers. The containers are closed so as to prevent contamination.

Only a final lot that is satisfactory with respect to each of the requirements given below under Identification, Tests and Assay may be released for use. Provided the test for antimicrobial preservative and the assay have been carried out with satisfactory results on the final bulk vaccine, they may be omitted on the final lot.

Provided the free formaldehyde content has been determined on the bulk purified antigens or on the final bulk and it has been shown that the content in the final lot will not exceed 0.2 g/L, the test for free formaldehyde may be omitted on the final lot.

**IDENTIFICATION**

A. Diphtheria toxoid is identified by a suitable immunochemical method (2.7.1). The following method, applicable to certain vaccines, is given as an example. Dissolve in the vaccine to be examined sufficient sodium citrate R to give a 100 g/L solution. Maintain at 37 °C for about 16 h and centrifuge until a clear supernatant is obtained. The clear supernatant reacts with a suitable diphtheria antitoxin, giving a precipitate.

B. Tetanus toxoid is identified by a suitable immunochemical method (2.7.1). The following method, applicable to certain vaccines, is given as an example. The clear supernatant obtained as described in identification test A reacts with a suitable tetanus antitoxin, giving a precipitate.

**TESTS****Aluminium (2.5.13)**

Maximum 1.25 mg per single human dose, if aluminium hydroxide or hydrated aluminium phosphate is used as the adsorbent.

**Free formaldehyde (2.4.18)**

Maximum 0.2 g/L.

**Antimicrobial preservative**

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The content is not less than the minimum amount shown to be effective and is not greater than 115 per cent of the quantity stated on the label.

**Sterility (2.6.1)**

The vaccine complies with the test for sterility.

**ASSAY****Diphtheria component**

Carry out one of the prescribed methods for the assay of diphtheria vaccine (adsorbed) (2.7.6).

The lower confidence limit ( $P = 0.95$ ) of the estimated potency is not less than 30 IU per single human dose.

**Tetanus component**

Carry out one of the prescribed methods for the assay of tetanus vaccine (adsorbed) (2.7.8).

The lower confidence limit ( $P = 0.95$ ) of the estimated potency is not less than 40 IU per single human dose.

**LABELLING**

The label states:

- the minimum number of International Units of each component per single human dose,
- the name and the amount of the adsorbent,
- where applicable, that the vaccine is intended for primary vaccination of children and is not necessarily suitable for reinforcing doses or for administration to adults,
- that the vaccine must be shaken before use,
- that the vaccine is not to be frozen.

Ph Eur

## Diphtheria and Tetanus Vaccine (Adsorbed, Reduced Antigen(s) Content)

Adsorbed Diphtheria and Tetanus Vaccine for  
Adults and Adolescents

(Ph. Eur. monograph 0647)

The label may state 'dT'.

For a vaccine for use in the United Kingdom, the amount of diphtheria toxoid used is adjusted so that the final vaccine contains not more than 2.0 flocculation equivalents (2.0 Lf) of diphtheria toxoid per dose.

Ph Eur

**DEFINITION**

Diphtheria and tetanus vaccine (adsorbed, reduced antigen(s) content) is a preparation of diphtheria formol toxoid and tetanus formol toxoid with a mineral adsorbent. The formol toxoids are prepared from the toxins produced by the growth of *Corynebacterium diphtheriae* and *Clostridium tetani*, respectively. The amount of diphtheria toxoid per single human dose is reduced compared to vaccines generally used for primary vaccination; the amount of tetanus toxoid may also be reduced.

**PRODUCTION****GENERAL PROVISIONS****Specific toxicity of the diphtheria component**

The production method is validated to demonstrate that the product, if tested, would comply with the following test: inject subcutaneously 5 times the single human dose stated on the label into each of 5 healthy guinea-pigs, each weighing 250-350 g, that have not previously been treated with any material that will interfere with the test. If within 42 days of the injection any of the animals shows signs of or dies from diphtheria toxæmia, the vaccine does not comply with the test. If more than one animal dies from non-specific causes, repeat the test once; if more than one animal dies in the second test, the vaccine does not comply with the test.

**BULK PURIFIED DIPHTHERIA TOXOID AND TETANUS TOXOIDS**

The bulk purified diphtheria and tetanus toxoids are prepared as described in the monographs *Diphtheria vaccine (adsorbed)* (0443) and *Tetanus vaccine (adsorbed)* (0452) and comply with the requirements prescribed therein.

**FINAL BULK VACCINE**

The vaccine is prepared by adsorption of suitable quantities of bulk purified diphtheria toxoid and tetanus toxoid onto a mineral carrier such as hydrated aluminium phosphate or aluminium hydroxide; the resulting mixture is approximately isotonic with blood. Suitable antimicrobial preservatives may

be added. Certain antimicrobial preservatives, particularly those of the phenolic type, adversely affect the antigenic activity and must not be used.

Only a final bulk vaccine that complies with the following requirements may be used in the preparation of the final lot.

**Antimicrobial preservative**

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The amount is not less than 85 per cent and not greater than 115 per cent of the intended amount.

**Sterility (2.6.1)**

Carry out the test for sterility using 10 mL for each medium.

**FINAL LOT**

The final bulk vaccine is distributed aseptically into sterile, tamper-evident containers. The containers are closed so as to prevent contamination.

Only a final lot that is satisfactory with respect to each of the requirements given below under Identification, Tests and Assay may be released for use. Provided the test for antimicrobial preservative and the assay have been carried out with satisfactory results on the final bulk vaccine, they may be omitted on the final lot.

Provided the free formaldehyde content has been determined on the bulk purified toxoids or on the final bulk and it has been shown that the content in the final lot will not exceed 0.2 g/L, the test for free formaldehyde may be omitted on the final lot.

**IDENTIFICATION**

A. Diphtheria toxoid is identified by a suitable immunochemical method (2.7.1). The following method, applicable to certain vaccines, is given as an example. Dissolve in the vaccine to be examined sufficient *sodium citrate R* to give a 100 g/L solution. Maintain at 37 °C for about 16 h and centrifuge until a clear supernatant is obtained. The clear supernatant reacts with a suitable diphtheria antitoxin, giving a precipitate. If a satisfactory result is not obtained with a vaccine adsorbed on aluminium hydroxide, carry out the test as follows. Centrifuge 15 mL of the vaccine to be examined and suspend the residue in 5 mL of a freshly prepared mixture of 1 volume of a 56 g/L solution of *sodium edetate R* and 49 volumes of *disodium hydrogen phosphate solution R*. Maintain at 37 °C for not less than 6 h and centrifuge. The clear supernatant reacts with a suitable diphtheria antitoxin, giving a precipitate.

B. Tetanus toxoid is identified by a suitable immunochemical method (2.7.1). The following method, applicable to certain vaccines, is given as an example. The clear supernatant obtained during identification test A reacts with a suitable tetanus antitoxin, giving a precipitate.

**TESTS****Aluminium (2.5.13)**

Maximum 1.25 mg per single human dose, if aluminium hydroxide or hydrated aluminium phosphate is used as the adsorbent.

**Free formaldehyde (2.4.18)**

Maximum 0.2 g/L.

**Antimicrobial preservative**

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The content is not less than the minimum amount shown to be effective and is not greater than 115 per cent of the quantity stated on the label.

**Sterility (2.6.1)**

The vaccine complies with the test for sterility.

**ASSAY****Diphtheria component**

Carry out one of the prescribed methods for the assay of diphtheria vaccine (adsorbed) (2.7.6).

The lower confidence limit ( $P = 0.95$ ) of the estimated potency is not less than 2 IU per single human dose.

**Tetanus component**

Carry out one of the prescribed methods for the assay of tetanus vaccine (adsorbed) (2.7.8).

The lower confidence limit ( $P = 0.95$ ) of the estimated potency is not less than 20 IU per single human dose.

**LABELLING**

The label states:

- the minimum number of International Units of each component per single human dose;
- the name and the amount of the adsorbent;
- that the vaccine must be shaken before use;
- that the vaccine is not to be frozen.

Ph Eur

## Diphtheria, Tetanus and Hepatitis B (rDNA) Vaccine (Adsorbed)

(Ph. Eur. monograph 2062)

Label may state 'DT/HepB'.

Ph Eur

**DEFINITION**

Diphtheria, tetanus and hepatitis B (rDNA) vaccine (adsorbed) is a combined vaccine composed of: diphtheria formol toxoid; tetanus formol toxoid; hepatitis B surface antigen (HBsAg); a mineral adsorbent such as aluminium hydroxide or hydrated aluminium phosphate.

The formol toxoids are prepared from the toxins produced by the growth of *Corynebacterium diphtheriae* and *Clostridium tetani*, respectively.

HBsAg is a component protein of hepatitis B virus; the antigen is obtained by recombinant DNA technology.

**PRODUCTION****GENERAL PROVISIONS**

The production method shall have been shown to yield consistently vaccines comparable with the vaccine of proven clinical efficacy and safety in man.

**Specific toxicity of the diphtheria component**

The production method is validated to demonstrate that the product, if tested, would comply with the following test: inject subcutaneously 5 times the single human dose stated on the label into each of 5 healthy guinea-pigs, each weighing 250-350 g, that have not previously been treated with any material that will interfere with the test. If within 42 days of the injection any of the animals shows signs of or dies from diphtheria toxæmia, the vaccine does not comply with the test. If more than 1 animal dies from non-specific causes, repeat the test once; if more than 1 animal dies in the second test, the vaccine does not comply with the test.

The content of bacterial endotoxins (2.6.14) in the bulk purified diphtheria toxoid and tetanus toxoid is determined

to monitor the purification procedure and to limit the amount in the final vaccine. For each component, the content of bacterial endotoxins is less than the limit approved for the particular vaccine and in any case the contents are such that the final vaccine contains less than 100 IU per single human dose.

**Reference vaccine(s)** Provided valid assays can be performed, monocomponent reference vaccines may be used for the assays on the combined vaccine. If this is not possible because of interaction between the components of the combined vaccine or because of the difference in composition between monocomponent reference vaccine and the test vaccine, a batch of combined vaccine shown to be effective in clinical trials or a batch representative thereof is used as a reference vaccine. For the preparation of a representative batch, strict adherence to the production process used for the batch tested in clinical trials is necessary. The reference vaccine may be stabilised by a method that has been shown to have no effect on the assay procedure.

**PRODUCTION OF THE COMPONENTS**

The production of the components complies with the requirements of the monographs *Diphtheria vaccine (adsorbed)* (0443), *Tetanus vaccine (adsorbed)* (0452) and *Hepatitis B vaccine (rDNA)* (1056).

**FINAL BULK VACCINE**

The final bulk vaccine is prepared by adsorption, separately or together, of suitable quantities of bulk purified diphtheria toxoid, tetanus toxoid and HBsAg onto a mineral carrier such as aluminium hydroxide or hydrated aluminium phosphate. Suitable antimicrobial preservatives may be added.

Only a final bulk vaccine that complies with the following requirements may be used in the preparation of the final lot.

**Antimicrobial preservative**

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The amount is not less than 85 per cent and not greater than 115 per cent of the intended content.

**Sterility (2.6.1)**

Carry out the test for sterility using 10 mL for each medium.

**FINAL LOT**

Only a final lot that is satisfactory with respect to the test for osmolality and with respect to each of the requirements given below under Identification, Tests and Assay may be released for use.

Provided the test for antimicrobial preservative and the assays for the diphtheria and tetanus components have been carried out with satisfactory results on the final bulk vaccine, they may be omitted on the final lot.

Provided the content of free formaldehyde has been determined on the bulk purified antigens or on the final bulk and it has been shown that the content in the final lot will not exceed 0.2 g/L, the test for free formaldehyde may be omitted on the final lot.

If an *in vivo* assay is used for the hepatitis B component, provided it has been carried out with satisfactory results on the final bulk vaccine, it may be omitted on the final lot.

**Osmolality (2.2.35)**

The osmolality of the vaccine is within the limits approved for the particular preparation.

**IDENTIFICATION**

A. Diphtheria toxoid is identified by a suitable immunochemical method (2.7.1). The following method,

applicable to certain vaccines, is given as an example. Dissolve in the vaccine to be examined sufficient *sodium citrate R* to give a 100 g/L solution. Maintain at 37 °C for about 16 h and centrifuge until a clear supernatant is obtained. The clear supernatant reacts with a suitable diphtheria antitoxin, giving a precipitate.

B. Tetanus toxoid is identified by a suitable immunochemical method (2.7.1). The following method, applicable to certain vaccines, is given as an example. The clear supernatant obtained during identification test A reacts with a suitable tetanus antitoxin, giving a precipitate.

C. The assay or, where applicable, the electrophoretic profile, serves also to identify the hepatitis B component of the vaccine.

#### TESTS

##### Aluminium (2.5.13)

Maximum 1.25 mg per single human dose, if aluminium hydroxide or hydrated aluminium phosphate is used as the adsorbent.

##### Free formaldehyde (2.4.18)

Maximum 0.2 g/L.

##### Antimicrobial preservative

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The content is not less than the minimum amount shown to be effective and is not greater than 115 per cent of the quantity stated on the label.

##### Sterility (2.6.1)

The vaccine complies with the test for sterility.

##### Pyrogens (2.6.8)

It complies with the test for pyrogens. Inject the equivalent of 1 human dose into each rabbit.

#### ASSAY

##### Diphtheria component

Carry out one of the prescribed methods for the assay of diphtheria vaccine (adsorbed) (2.7.6).

The lower confidence limit ( $P = 0.95$ ) of the estimated potency is not less than 30 IU per single human dose.

##### Tetanus component

Carry out one of the prescribed methods for the assay of tetanus vaccine (adsorbed) (2.7.8).

The lower confidence limit ( $P = 0.95$ ) of the estimated potency is not less than 40 IU per single human dose.

##### Hepatitis B component

It complies with the assay of hepatitis B vaccine (2.7.15).

#### LABELLING

The label states:

- the minimum number of International Units of diphtheria and tetanus toxoid per single human dose,
- the amount of HBsAg per single human dose,
- the type of cells used for production of the HBsAg component,
- the name and the amount of the adsorbent,
- where applicable, that the vaccine is intended for primary vaccination of children and is not necessarily suitable for reinforcing doses or for administration to adults,
- that the vaccine must be shaken before use,
- that the vaccine is not to be frozen.

Ph Eur

## Diphtheria, Tetanus and Pertussis (Whole Cell) Vaccine (Adsorbed)

Diphtheria, Tetanus and Pertussis Vaccine (Adsorbed)

(Ph. Eur. monograph 0445)

The label may state 'DTwP'.

Ph Eur

#### DEFINITION

Diphtheria, tetanus and pertussis (whole cell) vaccine (adsorbed) is a preparation of diphtheria formol toxoid and tetanus formol toxoid with a mineral adsorbent to which a suspension of inactivated *Bordetella pertussis* has been added. The formol toxoids are prepared from the toxins produced by the growth of *Corynebacterium diphtheriae* and *Clostridium tetani*, respectively.

#### PRODUCTION

##### GENERAL PROVISIONS

##### Specific toxicity of the diphtheria component

The production method is validated to demonstrate that the product, if tested, would comply with the following test: inject subcutaneously 5 times the single human dose stated on the label into each of 5 healthy guinea-pigs, each weighing 250-350 g, that have not previously been treated with any material that will interfere with the test. If within 42 days of the injection any of the animals shows signs of or dies from diphtheria toxæmia, the vaccine does not comply with the test. If more than 1 animal dies from non-specific causes, repeat the test once; if more than 1 animal dies in the second test, the vaccine does not comply with the test.

##### BULK PURIFIED DIPHTHERIA AND TETANUS TOXOIDS, BULK INACTIVATED *B. PERTUSSIS* SUSPENSION

The bulk purified diphtheria and tetanus toxoids and the inactivated *B. pertussis* suspension are prepared as described in the monographs *Diphtheria vaccine (adsorbed)* (0443), *Tetanus vaccine (adsorbed)* (0452) and *Pertussis vaccine (whole cell, adsorbed)* (0161), respectively, and comply with the requirements prescribed therein.

##### FINAL BULK VACCINE

The final bulk vaccine is prepared by adsorption of suitable quantities of bulk purified diphtheria toxoid and tetanus toxoid onto a mineral carrier such as hydrated aluminium phosphate or aluminium hydroxide and admixture of an appropriate quantity of a suspension of inactivated *B. pertussis*; the resulting mixture is approximately isotonic with blood. The *B. pertussis* concentration of the final bulk vaccine does not exceed that corresponding to an opacity of 20 IU per single human dose. If 2 or more strains of *B. pertussis* are used, the composition of consecutive lots of the final bulk vaccine shall be consistent with respect to the proportion of each strain as measured in opacity units. Suitable antimicrobial preservatives may be added to the bulk vaccine. Certain antimicrobial preservatives, particularly those of the phenolic type, adversely affect the antigenic activity and must not be used.

Only a final bulk vaccine that complies with the following requirements may be used in the preparation of the final lot.

##### Antimicrobial preservative

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The amount is not less than 85 per cent and not greater than 115 per cent of the intended amount.

**Sterility (2.6.1)**

Carry out the test for sterility using 10 mL for each medium.

**FINAL LOT**

The final bulk vaccine is distributed aseptically into sterile, tamper-evident containers. The containers are closed so as to prevent contamination.

Only a final lot that is satisfactory with respect to each of the requirements given below under Identification, Tests and Assay may be released for use. Provided the tests for specific toxicity of the pertussis component, antimicrobial preservative and the assay have been carried out with satisfactory results on the final bulk vaccine, they may be omitted on the final lot.

Provided the free formaldehyde content has been determined on the bulk purified antigens or on the final bulk and it has been shown that the content in the final lot will not exceed 0.2 g/L, the test for free formaldehyde may be omitted on the final lot.

**IDENTIFICATION**

A. Diphtheria toxoid is identified by a suitable immunochemical method (2.7.1). The following method, applicable to certain vaccines, is given as an example. Dissolve in the vaccine to be examined sufficient sodium citrate R to give a 100 g/L solution. Maintain at 37 °C for about 16 h and centrifuge until a clear supernatant is obtained. The clear supernatant reacts with a suitable diphtheria antitoxin, giving a precipitate.

B. Tetanus toxoid is identified by a suitable immunochemical method (2.7.1). The following method, applicable to certain vaccines, is given as an example. The clear supernatant obtained during identification test A reacts with a suitable tetanus antitoxin, giving a precipitate.

C. The centrifugation residue obtained in identification A may be used. Other suitable methods for separating the bacteria from the adsorbent may also be used. Identify pertussis vaccine by agglutination of the bacteria from the resuspended precipitate by antisera specific to *B. pertussis* or by the assay of the pertussis component described under Assay.

**TESTS****Specific toxicity of the pertussis component**

Use not fewer than 5 mice each weighing 14 - 16 g for the vaccine group and for the saline control. Use mice of the same sex or distribute males and females equally between the groups. Allow the animals access to food and water for at least 2 h before injection and during the test. Inject each mouse of the vaccine group intraperitoneally with 0.5 mL, containing a quantity of the vaccine equivalent to not less than half the single human dose. Inject each mouse of the control group with 0.5 mL of a 9 g/L sterile solution of sodium chloride R, preferably containing the same amount of antimicrobial preservative as that injected with the vaccine. Weigh the groups of mice immediately before the injection and 72 h and 7 days after the injection. The vaccine complies with the test if: (a) at the end of 72 h the total mass of the group of vaccinated mice is not less than that preceding the injection; (b) at the end of 7 days the average increase in mass per vaccinated mouse is not less than 60 per cent of that per control mouse; and (c) not more than 5 per cent of the vaccinated mice die during the test. The test may be repeated and the results of the tests combined.

**Aluminium (2.5.13)**

Maximum 1.25 mg per single human dose, if aluminium hydroxide or hydrated aluminium phosphate is used as the adsorbent.

**Free formaldehyde (2.4.18)**

Maximum 0.2 g/L.

**Antimicrobial preservative**

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The content is not less than the minimum amount shown to be effective and is not greater than 115 per cent of the quantity stated on the label.

**Sterility (2.6.1)**

The vaccine complies with the test for sterility.

**ASSAY****Diphtheria component**

Carry out one of the prescribed methods for the assay of diphtheria vaccine (adsorbed) (2.7.6).

The lower confidence limit ( $P = 0.95$ ) of the estimated potency is not less than 30 IU per single human dose.

**Tetanus component**

Carry out one of the prescribed methods for the assay of tetanus vaccine (adsorbed) (2.7.8).

If the test is carried out in guinea-pigs, the lower confidence limit ( $P = 0.95$ ) of the estimated potency is not less than 40 IU per single human dose; if the test is carried out in mice, the lower confidence limit ( $P = 0.95$ ) of the estimated potency is not less than 60 IU per single human dose.

**Pertussis component**

Carry out the assay of pertussis vaccine (whole cell) (2.7.7).

The estimated potency is not less than 4.0 IU per single human dose and the lower confidence limit ( $P = 0.95$ ) of the estimated potency is not less than 2.0 IU per single human dose.

**LABELLING**

The label states:

- the minimum number of International Units of each component per single human dose;
- the name and the amount of the adsorbent;
- where applicable, that the vaccine is intended for primary vaccination of children and is not necessarily suitable for reinforcing doses or for administration to adults;
- that the vaccine must be shaken before use;
- that the vaccine is not to be frozen.

Ph Eur

## Adsorbed Diphtheria, Tetanus and Pertussis (Acellular Component) Vaccine

(Diphtheria, Tetanus and Pertussis (Acellular, Component) Vaccine (Adsorbed), Ph. Eur. monograph 1931)

Ph Eur

**DEFINITION**

Diphtheria, tetanus and pertussis (acellular, component) vaccine (adsorbed) is a combined vaccine composed of: diphtheria formol toxoid; tetanus formol toxoid; individually purified antigenic components of *Bordetella pertussis*; a mineral

adsorbent such as aluminium hydroxide or hydrated aluminium phosphate.

The formol toxoids are prepared from the toxins produced by the growth of *Corynebacterium diphtheriae* and *Clostridium tetani*, respectively.

The vaccine contains either pertussis toxoid (chemically detoxified pertussis toxin) or a pertussis toxin-like protein free from toxic properties, produced by expression of a genetically modified form of the corresponding gene. The vaccine may also contain filamentous haemagglutinin, pertactin (a 69 kDa outer-membrane protein) and other defined components of *B. pertussis* such as fimbrial-2 and fimbrial-3 antigens. The latter 2 antigens may be co-purified. The antigenic composition and characteristics are based on evidence of protection and freedom from unexpected reactions in the target group for which the vaccine is intended.

## PRODUCTION

### GENERAL PROVISIONS

The production method shall have been shown to yield consistently vaccines comparable with the vaccine of proven clinical efficacy and safety in man.

#### Specific toxicity of the diphtheria component

The production method is validated to demonstrate that the product, if tested, would comply with the following test: inject subcutaneously 5 times the single human dose stated on the label into each of 5 healthy guinea-pigs, each weighing 250-350 g, that have not previously been treated with any material that will interfere with the test. If within 42 days of the injection any of the animals shows signs of or dies from diphtheria toxæmia, the vaccine does not comply with the test. If more than 1 animal dies from non-specific causes, repeat the test once; if more than 1 animal dies in the second test, the vaccine does not comply with the test.

The content of bacterial endotoxins (2.6.14) in the bulk purified diphtheria toxoid, tetanus toxoid and pertussis components is determined to monitor the purification procedure and to limit the amount in the final vaccine. For each component, the content of bacterial endotoxins is less than the limit approved for the particular vaccine and, in any case, the contents are such that the final vaccine contains less than 100 IU per single human dose.

**Reference vaccine(s)** Provided valid assays can be performed, monocomponent reference vaccines may be used for the assays on the combined vaccine. If this is not possible because of interaction between the components of the combined vaccine or because of differences in composition between the monocomponent reference vaccine and the test vaccine, a batch of combined vaccine shown to be effective in clinical trials or a batch representative thereof is used as a reference vaccine. For the preparation of a representative batch, strict adherence to the production process used for the batch tested in clinical trials is necessary. The reference vaccine may be stabilised by a method that has been shown to have no effect on the assay procedure.

### PRODUCTION OF THE COMPONENTS

The production of the components complies with the requirements of the monographs *Diphtheria vaccine (adsorbed)* (0443), *Tetanus vaccine (adsorbed)* (0452) and *Pertussis vaccine (acellular, component, adsorbed)* (1356).

### FINAL BULK VACCINE

The final bulk vaccine is prepared by adsorption of suitable quantities of bulk purified diphtheria toxoid, tetanus toxoid and pertussis components separately or together onto a

mineral carrier such as aluminium hydroxide or hydrated aluminium phosphate. Suitable antimicrobial preservatives may be added.

Only a final bulk vaccine that complies with the following requirements may be used in the preparation of the final lot.

#### Antimicrobial preservative

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The amount is not less than 85 per cent and not greater than 115 per cent of the intended content.

#### Sterility (2.6.1)

Carry out the test for sterility using 10 mL for each medium.

#### FINAL LOT

Only a final lot that is satisfactory with respect to the test for osmolality and with respect to each of the requirements given below under Identification, Tests and Assay may be released for use.

Provided the tests for free formaldehyde and antimicrobial preservative and the assay have been carried out with satisfactory results on the final bulk vaccine, they may be omitted on the final lot.

Provided the free formaldehyde content has been determined on the bulk purified antigens or on the final bulk and it has been shown that the content in the final lot will not exceed 0.2 g/L, the test for free formaldehyde may be omitted on the final lot.

#### Osmolality (2.2.35)

The osmolality of the vaccine is within the limits approved for the particular preparation.

## IDENTIFICATION

A. Diphtheria toxoid is identified by a suitable immunochemical method (2.7.1). The following method, applicable to certain vaccines, is given as an example. Dissolve in the vaccine to be examined sufficient *sodium citrate R* to give a 100 g/L solution. Maintain at 37 °C for about 16 h and centrifuge until a clear supernatant is obtained. The clear supernatant reacts with a suitable diphtheria antitoxin, giving a precipitate.

B. Tetanus toxoid is identified by a suitable immunochemical method (2.7.1). The following method, applicable to certain vaccines, is given as an example. The clear supernatant obtained as described in identification test A reacts with a suitable tetanus antitoxin, giving a precipitate.

C. The pertussis components are identified by a suitable immunochemical method (2.7.1). The following method, applicable to certain vaccines, is given as an example. The clear supernatant obtained as described in identification test A reacts with specific antisera to the pertussis components of the vaccine.

## TESTS

#### Aluminium (2.5.13)

Maximum 1.25 mg per single human dose, if aluminium hydroxide or hydrated aluminium phosphate is used as the adsorbent.

#### Free formaldehyde (2.4.18)

Maximum 0.2 g/L.

#### Antimicrobial preservative

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The content is not less than the minimum amount shown to be effective and is not greater than 115 per cent of the quantity stated on the label.

**Sterility (2.6.1)**

The vaccine complies with the test for sterility.

**ASSAY****Diphtheria component**

Carry out one of the prescribed methods for the assay of diphtheria vaccine (adsorbed) (2.7.6).

The lower confidence limit ( $P = 0.95$ ) of the estimated potency is not less than the minimum potency stated on the label.

Unless otherwise justified and authorised, the minimum potency stated on the label is 30 IU per single human dose.

**Tetanus component**

Carry out one of the prescribed methods for the assay of tetanus vaccine (adsorbed) (2.7.8).

The lower confidence limit ( $P = 0.95$ ) of the estimated potency is not less than 40 IU per single human dose.

**Pertussis component**

Carry out one of the prescribed methods for the assay of pertussis vaccine (acellular) (2.7.16). The vaccine complies with the limit approved for the particular product.

**LABELLING**

The label states:

- the minimum number of International Units of diphtheria and tetanus toxoid per single human dose;
- the names and amounts of the pertussis components per single human dose;
- where applicable, that the vaccine contains a pertussis toxin-like protein produced by genetic modification;
- the name and the amount of the adsorbent;
- where applicable, that the vaccine is intended for primary vaccination of children and is not necessarily suitable for reinforcing doses or for administration to adults;
- that the vaccine must be shaken before use;
- that the vaccine is not to be frozen.

Ph Eur

## Diphtheria, Tetanus and Pertussis (Acellular Component) Vaccine (Adsorbed, Reduced Antigen(s) Content)

(Ph. Eur. monograph 2764)

Ph Eur

**DEFINITION**

Diphtheria, tetanus and pertussis (acellular, component) vaccine (adsorbed, reduced antigen(s) content) is a combined vaccine containing: diphtheria formol toxoid; tetanus formol toxoid; individually purified antigenic components of *Bordetella pertussis*; a mineral adsorbent such as aluminium hydroxide or hydrated aluminium phosphate.

The formol toxoids are prepared from the toxins produced by the growth of *Corynebacterium diphtheriae* and *Clostridium tetani* respectively.

The amount of diphtheria toxoid per single human dose is reduced compared to vaccines generally used for primary vaccination; the amounts of tetanus toxoid and pertussis components may also be reduced.

The vaccine contains either pertussis toxoid (chemically detoxified pertussis toxin) or a pertussis toxin-like protein

free from toxic properties, produced by expression of a genetically modified form of the corresponding gene.

The vaccine may also contain filamentous haemagglutinin, pertactin (a 69 kDa outer-membrane protein) and other defined components of *B. pertussis* such as fimbrial-2 and fimbrial-3 antigens. The latter 2 antigens may be co-purified. The antigenic composition and characteristics are based on evidence of protection and freedom from unexpected reactions in the target group for which the vaccine is intended.

**PRODUCTION****GENERAL PROVISIONS**

The production method shall have been shown to yield consistently vaccines comparable with the vaccine of proven clinical efficacy and safety in man.

**Specific toxicity of the diphtheria component**

The production method is validated to demonstrate that the product, if tested, would comply with the following test: inject subcutaneously 5 times the single human dose stated on the label into each of 5 healthy guinea-pigs, each weighing 250–350 g, that have not previously been treated with any material that will interfere with the test. If within 42 days of the injection any of the animals shows signs of or dies from diphtheria toxæmia, the vaccine does not comply with the test. If more than 1 animal dies from non-specific causes, repeat the test once; if more than 1 animal dies in the second test, the vaccine does not comply with the test.

The content of bacterial endotoxins (2.6.14) in bulk purified pertussis components is determined to monitor the purification procedure and to limit the amount in the final vaccine. For each component, the content of bacterial endotoxins is less than the limit approved for the particular vaccine and, in any case, the contents are such that the final vaccine contains less than 100 IU per single human dose.

**Reference vaccine(s)** Provided valid assays can be performed, monocomponent reference vaccines may be used for the assays on the combined vaccine. If this is not possible because of interaction between the components of the combined vaccine or because of differences in composition between the monocomponent reference vaccine and the test vaccine, a batch of combined vaccine shown to be effective in clinical trials or a batch representative thereof is used as a reference vaccine. For the preparation of a representative batch, strict adherence to the production process used for the batch tested in clinical trials is necessary. The reference vaccine may be stabilised by a method that has been shown to have no effect on the assay procedure.

**PRODUCTION OF THE COMPONENTS**

The production of the components complies with the requirements of the monographs *Diphtheria vaccine (adsorbed)* (0443), *Tetanus vaccine (adsorbed)* (0452) and *Pertussis vaccine (acellular, component, adsorbed)* (1356).

**FINAL BULK VACCINE**

The final bulk vaccine is prepared by adsorption onto a mineral carrier such as aluminium hydroxide or hydrated aluminium phosphate, separately or together, of suitable quantities of bulk purified diphtheria toxoid, tetanus toxoid and acellular pertussis components. Suitable antimicrobial preservatives may be added.

Only a final bulk vaccine that complies with the following requirements may be used in the preparation of the final lot.

**Antimicrobial preservative**

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The amount is

not less than 85 per cent and not greater than 115 per cent of the intended content.

#### **Sterility (2.6.1)**

Carry out the test for sterility using 10 mL for each medium.

#### **FINAL LOT**

The final bulk vaccine is distributed aseptically into sterile, tamper-evident containers. The containers are closed so as to prevent contamination.

Only a final lot that is satisfactory with respect to the test for osmolality and with respect to each of the requirements given below under Identification, Tests and Assay may be released for use.

Provided the test for antimicrobial preservative and the assays for the diphtheria, tetanus and pertussis components have been carried out with satisfactory results on the final bulk vaccine, they may be omitted on the final lot.

Provided the free formaldehyde content has been determined on the bulk purified antigens or on the final bulk and it has been shown that the content in the final lot will not exceed 0.2 g/L, the test for free formaldehyde may be omitted on the final lot.

Where there is a significant change in the manufacturing process of the antigens or their formulation, any impact on the *in vivo* and *in vitro* assays must be evaluated, and the need for revalidation considered.

#### **Osmolality (2.2.35)**

The osmolality of the vaccine is within the limits approved for the particular preparation.

#### **IDENTIFICATION**

A. Diphtheria toxoid is identified by a suitable immunochemical method (2.7.1). The following method, applicable to certain vaccines, is given as an example. Dissolve in the vaccine to be examined sufficient *sodium citrate R* to give a 100 g/L solution. Maintain at 37 °C for about 16 h and centrifuge until a clear supernatant is obtained. The clear supernatant reacts with a suitable diphtheria antitoxin, giving a precipitate. If a satisfactory result is not obtained with a vaccine adsorbed on aluminium hydroxide, carry out the test as follows. Centrifuge 15 mL of the vaccine to be examined and suspend the residue in 5 mL of a freshly prepared mixture of 1 volume of a 56 g/L solution of *sodium edetate R* and 49 volumes of *disodium hydrogen phosphate solution R*. Maintain at 37 °C for not less than 6 h and centrifuge. The clear supernatant reacts with a suitable diphtheria antitoxin, giving a precipitate.

B. Tetanus toxoid is identified by a suitable immunochemical method (2.7.1). The following method, applicable to certain vaccines, is given as an example. The clear supernatant obtained as described in identification test A reacts with a suitable tetanus antitoxin, giving a precipitate.

C. The pertussis components are identified by a suitable immunochemical method (2.7.1). The following method, applicable to certain vaccines, is given as an example. The clear supernatant obtained as described in identification test A reacts with specific antisera to the pertussis components of the vaccine.

#### **TESTS**

##### **Aluminium (2.5.13)**

Maximum 1.25 mg per single human dose, if aluminium hydroxide or hydrated aluminium phosphate is used as the adsorbent.

##### **Free formaldehyde (2.4.18)**

Maximum 0.2 g/L.

#### **Antimicrobial preservative**

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The content is not less than the minimum amount shown to be effective and is not greater than 115 per cent of the quantity stated on the label.

#### **Sterility (2.6.1)**

The vaccine complies with the test for sterility.

#### **ASSAY**

##### **Diphtheria component**

Carry out one of the prescribed methods for the assay of diphtheria vaccine (adsorbed) (2.7.6).

The lower confidence limit ( $P = 0.95$ ) of the estimated potency is not less than 2 IU per single human dose.

##### **Tetanus component**

Carry out one of the prescribed methods for the assay of tetanus vaccine (adsorbed) (2.7.8).

The lower confidence limit ( $P = 0.95$ ) of the estimated potency is not less than 20 IU per single human dose.

##### **Pertussis component**

Carry out one of the prescribed methods for the assay of pertussis vaccine (acellular) (2.7.16). The vaccine complies with the limit approved for the particular product.

#### **LABELLING**

The label states:

- the minimum number of International Units of diphtheria and tetanus toxoid per single human dose;
- the names and amounts of the pertussis components per single human dose;
- where applicable, that the vaccine contains a pertussis toxin-like protein produced by genetic modification;
- the name and the amount of the adsorbent;
- that the vaccine must be shaken before use;
- that the vaccine is not to be frozen.

Ph Eur

## **Adsorbed Diphtheria, Tetanus, Pertussis (Acellular Component) and Haemophilus Type b Conjugate Vaccine**

(Diphtheria, Tetanus, Pertussis (Acellular, Component) and Haemophilus Type b Conjugate Vaccine (Adsorbed), Ph. Eur. monograph 1932)

Ph Eur

#### **DEFINITION**

Diphtheria, tetanus, pertussis (acellular, component) and haemophilus type b conjugate vaccine (adsorbed) is a combined vaccine composed of: diphtheria formol toxoid; tetanus formol toxoid; individually purified antigenic components of *Bordetella pertussis*; polyribosylribitol phosphate (PRP) covalently bound to a carrier protein; a mineral absorbent such as aluminium hydroxide or hydrated aluminium phosphate. The product is presented either as a tetravalent liquid formulation in the same container, or as a trivalent liquid formulation with the haemophilus component in a separate container, the contents of which are mixed with the other components immediately before use.

The formal toxoids are prepared from the toxins produced by the growth of *Corynebacterium diphtheriae* and *Clostridium tetani* respectively.

The vaccine contains either pertussis toxoid (chemically detoxified pertussis toxin) or a pertussis toxin-like protein free from toxic properties produced by expression of a genetically modified form of the corresponding gene. The acellular pertussis component may also contain filamentous haemagglutinin, pertactin (a 69 kDa outer-membrane protein) and other defined components of *B. pertussis* such as fimbrial-2 and fimbrial-3 antigens. The latter 2 antigens may be co-purified. The antigenic composition and characteristics are based on evidence of protection and freedom from unexpected reactions in the target group for which the vaccine is intended.

PRP is a linear copolymer composed of repeated units of 3-β-D-ribofuranosyl-(1→1)-ribitol-5-phosphate [(C<sub>10</sub>H<sub>19</sub>O<sub>11</sub>P)<sub>n</sub>], with a defined molecular size and derived from a suitable strain of *Haemophilus influenzae* type b. The carrier protein, when conjugated to PRP, is capable of inducing a T-cell-dependent B-cell immune response to the polysaccharide.

## PRODUCTION

### GENERAL PROVISIONS

The production method shall have been shown to yield consistently vaccines comparable with the vaccine of proven clinical efficacy and safety in man.

Where the haemophilus component is presented in a separate container, as part of consistency studies the assays of the diphtheria, tetanus and pertussis components are carried out on a suitable number of batches of vaccine reconstituted as for use. For subsequent routine control, the assays of these components may be carried out without mixing with the haemophilus component.

### Specific toxicity of the diphtheria component

The production method is validated to demonstrate that the product, if tested, would comply with the following test: inject subcutaneously 5 times the single human dose stated on the label into each of 5 healthy guinea-pigs, each weighing 250-350 g, that have not previously been treated with any material that will interfere with the test. If within 42 days of the injection any of the animals shows signs of or dies from diphtheria toxæmia, the vaccine does not comply with the test. If more than 1 animal dies from non-specific causes, repeat the test once; if more than 1 animal dies in the second test, the vaccine does not comply with the test.

The content of bacterial endotoxins (2.6.14) in bulk purified diphtheria toxoid, tetanus toxoid, pertussis components and bulk PRP conjugate is determined to monitor the purification procedure and to limit the amount in the final vaccine.

For each component, the content of bacterial endotoxins is less than the limit approved for the particular vaccine; where the haemophilus component is presented in a separate container, the contents of the diphtheria, tetanus and pertussis antigens are in any case such that the final vial for these components contains less than 100 IU per single human dose.

During development studies, it shall be demonstrated that the vaccine consistently induces a T-cell-dependent B-cell immune response to PRP. If the manufacturing process is modified, it shall be demonstrated by appropriate *in vitro* methods that the characteristic properties of the conjugate are not affected.

Where the haemophilus component is presented in a separate container, the production method is validated to demonstrate that the haemophilus component, if tested, would comply with the test for pyrogens (2.6.8), carried out as follows: inject per kilogram of the rabbit's mass a quantity of the vaccine equivalent to: 1 µg of PRP for a vaccine with diphtheria toxoid or CRM 197 diphtheria protein as carrier; 0.1 µg of PRP for a vaccine with tetanus toxoid as carrier; 0.025 µg of PRP for a vaccine with OMP (meningococcal group B outer membrane protein complex) as carrier.

**Reference vaccine(s)** Provided valid assays can be performed, monocomponent reference vaccines may be used for the assays on the combined vaccine. If this is not possible because of interaction between the components of the combined vaccine or because of differences in composition between the monocomponent reference vaccine and the test vaccine, a batch of combined vaccine shown to be effective in clinical trials or a batch representative thereof is used as a reference vaccine. For the preparation of a representative batch, strict adherence to the production process used for the batch tested in clinical trials is necessary. The reference vaccine may be stabilised by a method that has been shown to have no effect on the assay procedure.

### PRODUCTION OF THE COMPONENTS

The production of the components complies with the requirements of the monographs *Diphtheria vaccine (adsorbed)* (0443), *Tetanus vaccine (adsorbed)* (0452), *Pertussis vaccine (acellular, component, adsorbed)* (1356) and *Haemophilus type b conjugate vaccine* (1219).

### FINAL BULK VACCINE

Different methods of preparation may be used: a final bulk vaccine may be prepared by adsorption, separately or together, of suitable quantities of bulk purified diphtheria toxoid, tetanus toxoid, acellular pertussis components and PRP conjugate onto a mineral carrier such as aluminium hydroxide or hydrated aluminium phosphate; or 2 final bulks may be prepared and filled separately, one containing the diphtheria, tetanus and pertussis components, the other the haemophilus component, which may be freeze-dried. Suitable antimicrobial preservatives may be added.

Only a final bulk vaccine that complies with the following requirements may be used in the preparation of the final lot.

#### Antimicrobial preservative

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The amount is not less than 85 per cent and not greater than 115 per cent of the intended content.

#### Sterility (2.6.1)

Carry out the test for sterility using 10 mL for each medium.

#### FINAL LOT

Only a final lot that is satisfactory with respect to the test for osmolality shown below and with respect to each of the requirements given below under Identification, Tests and Assay may be released for use.

Provided the test for antimicrobial preservative and the assay have been carried out with satisfactory results on the final bulk vaccine, they may be omitted on the final lot.

Provided the free formaldehyde content has been determined on the bulk purified antigens or the final bulk and it has been shown that the content in the final lot will not exceed 0.2 g/L, the test for free formaldehyde may be omitted on the final lot.

**Osmolality (2.2.35)**

The osmolality of the vaccine, reconstituted where applicable, is within the limits approved for the particular preparation.

**pH (2.2.3)**

The pH of the vaccine, reconstituted if necessary, is within the range approved for the particular product.

**Free PRP**

Unbound PRP is determined after removal of the conjugate, for example by anion-exchange, size-exclusion or hydrophobic chromatography, ultrafiltration or other validated methods. The amount of free PRP is not greater than that approved for the particular product.

**IDENTIFICATION**

*Where the haemophilus component is presented in a separate container: identification tests A, B and C are carried out using the container containing the diphtheria, tetanus and pertussis components; identification test D is carried out on the container containing the haemophilus component.*

A. Diphtheria toxoid is identified by a suitable immunochemical method (2.7.1). The following method, applicable to certain vaccines, is given as an example. Dissolve in the vaccine to be examined sufficient sodium citrate R to give a 100 g/L solution. Maintain at 37 °C for about 16 h and centrifuge until a clear supernatant is obtained. The clear supernatant reacts with a suitable diphtheria antitoxin, giving a precipitate.

B. Tetanus toxoid is identified by a suitable immunochemical method (2.7.1). The following method, applicable to certain vaccines, is given as an example. The clear supernatant obtained as described in identification test A reacts with a suitable tetanus antitoxin, giving a precipitate.

C. The pertussis components are identified by a suitable immunochemical method (2.7.1). The following method, applicable to certain vaccines, is given as an example. The clear supernatant obtained as described in identification test A reacts with specific antisera to the pertussis components of the vaccine.

D. The haemophilus component is identified by a suitable immunochemical method (2.7.1) for PRP.

**TESTS**

*Where the product is presented with the haemophilus component in a separate container: the tests for aluminium, free formaldehyde, antimicrobial preservative and sterility are carried out on the container with the diphtheria, tetanus and pertussis components; the tests for PRP content, water (where applicable), sterility and bacterial endotoxins are carried out on the container with the haemophilus component.*

*If the haemophilus component is freeze-dried, some tests may be carried out on the freeze-dried product rather than on the bulk conjugate where the freeze-drying process may affect the component to be tested.*

**PRP**

Minimum 80 per cent of the amount of PRP stated on the label. PRP is determined either by assay of ribose (2.5.31) or phosphorus (2.5.18), by an immunochemical method (2.7.1) or by anion-exchange liquid chromatography (2.2.29) with pulsed amperometric detection.

**Aluminium (2.5.13)**

Maximum 1.25 mg per single human dose, if aluminium hydroxide or hydrated aluminium phosphate is used as the adsorbent.

**Free formaldehyde (2.4.18)**

Maximum 0.2 g/L.

**Antimicrobial preservative**

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The content is not less than the minimum amount shown to be effective and is not greater than 115 per cent of the quantity stated on the label.

**Water (2.5.12)**

Maximum 3.0 per cent for the freeze-dried haemophilus component.

**Sterility (2.6.1)**

The vaccine complies with the test for sterility.

**Bacterial endotoxins (2.6.14)**

The content is within the limits approved by the competent authority for the haemophilus component of the particular product. If any components of the vaccine prevent the determination of endotoxin, a test for pyrogens is carried out as described under General provisions.

**ASSAY****Diphtheria component**

Carry out one of the prescribed methods for the assay of diphtheria vaccine (adsorbed) (2.7.6).

The lower confidence limit ( $P = 0.95$ ) of the estimated potency is not less than the minimum potency stated on the label.

Unless otherwise justified and authorised, the minimum potency stated on the label is 30 IU per single human dose.

**Tetanus component**

Carry out one of the prescribed methods for the assay of tetanus vaccine (adsorbed) (2.7.8).

The lower confidence limit ( $P = 0.95$ ) of the estimated potency is not less than 40 IU per single human dose.

**Pertussis component**

Carry out one of the prescribed methods for the assay of pertussis vaccine (acellular) (2.7.16). The vaccine complies with the limit approved for the particular product.

**LABELLING**

*The label states:*

- the minimum number of International Units of diphtheria and tetanus toxoid per single human dose;
- the names and amounts of the pertussis components per single human dose;
- where applicable, that the vaccine contains a pertussis toxin-like protein produced by genetic modification;
- the number of micrograms of PRP per single human dose;
- the type and nominal amount of carrier protein per single human dose;
- the name and the amount of the adsorbent;
- where applicable, that the vaccine is intended for primary vaccination of children and is not necessarily suitable for reinforcing doses or for administration to adults;
- that the vaccine must be shaken before use;
- that the vaccine is not to be frozen.

Ph Eur

## Adsorbed Diphtheria, Tetanus, Pertussis (Acellular Component) and Hepatitis B (rDNA) Vaccine

(Diphtheria, Tetanus, Pertussis (Acellular, Component) and Hepatitis B (rDNA) Vaccine (Adsorbed), Ph. Eur. monograph 1933)

Ph Eur

### DEFINITION

Diphtheria, tetanus, pertussis (acellular, component) and hepatitis B (rDNA) vaccine (adsorbed) is a combined vaccine composed of: diphtheria formol toxoid; tetanus formol toxoid; individually purified antigenic components of *Bordetella pertussis*; hepatitis B surface antigen; a mineral adsorbent such as aluminium hydroxide or hydrated aluminium phosphate.

The formol toxoids are prepared from the toxins produced by the growth of *Corynebacterium diphtheriae* and *Clostridium tetani*, respectively.

The vaccine contains either pertussis toxoid (chemically detoxified pertussis toxin) or a pertussis toxin-like protein free from toxic properties, produced by expression of a genetically modified form of the corresponding gene.

The vaccine may also contain filamentous haemagglutinin, pertactin (a 69 kDa outer-membrane protein) and other defined components of *B. pertussis* such as fimbrial-2 and fimbrial-3 antigens. The latter 2 antigens may be co-purified. The antigenic composition and characteristics are based on evidence of protection and freedom from unexpected reactions in the target group for which the vaccine is intended.

Hepatitis B surface antigen is a component protein of hepatitis B virus; the antigen is obtained by recombinant DNA technology.

### PRODUCTION

#### GENERAL PROVISIONS

The production method shall have been shown to yield consistently vaccines comparable with the vaccine of proven clinical efficacy and safety in man.

#### Specific toxicity of the diphtheria component

The production method is validated to demonstrate that the product, if tested, would comply with the following test: inject subcutaneously 5 times the single human dose stated on the label into each of 5 healthy guinea-pigs, each weighing 250-350 g, that have not previously been treated with any material that will interfere with the test. If within 42 days of the injection any of the animals shows signs of or dies from diphtheria toxæmia, the vaccine does not comply with the test. If more than 1 animal dies from non-specific causes, repeat the test once; if more than 1 animal dies in the second test, the vaccine does not comply with the test.

The content of bacterial endotoxins (2.6.14) in the bulk purified diphtheria toxoid, tetanus toxoid and pertussis components is determined to monitor the purification procedure and to limit the amount in the final vaccine. For each component, the content of bacterial endotoxins is less than the limit approved for the particular vaccine.

**Reference vaccine(s)** Provided valid assays can be performed, monocomponent reference vaccines may be used for the assays on the combined vaccine. If this is not possible because of interaction between the components of the combined vaccine or because of differences in composition between the monocomponent reference vaccine and the test

vaccine, a batch of combined vaccine shown to be effective in clinical trials or a batch representative thereof is used as a reference vaccine. For the preparation of a representative batch, strict adherence to the production process used for the batch tested in clinical trials is necessary. The reference vaccine may be stabilised by a method that has been shown to have no effect on the assay procedure.

### PRODUCTION OF THE COMPONENTS

The production of the components complies with the requirements of the monographs *Diphtheria vaccine (adsorbed)* (0443), *Tetanus vaccine (adsorbed)* (0452), *Pertussis vaccine (acellular, component, adsorbed)* (1356) and *Hepatitis B vaccine (rDNA)* (1056).

### FINAL BULK VACCINE

The final bulk vaccine is prepared by adsorption, separately or together, of suitable quantities of bulk purified diphtheria toxoid, tetanus toxoid, acellular pertussis components and hepatitis B surface antigen onto a mineral carrier such as aluminium hydroxide or hydrated aluminium phosphate. Suitable antimicrobial preservatives may be added.

Only a final bulk vaccine that complies with the following requirements may be used in the preparation of the final lot.

#### Antimicrobial preservative

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The amount is not less than 85 per cent and not greater than 115 per cent of the intended content.

#### Sterility (2.6.1)

Carry out the test for sterility using 10 mL for each medium.

#### FINAL LOT

Only a final lot that is satisfactory with respect to the test for osmolality and with respect to each of the requirements given below under Identification, Tests and Assay may be released for use.

Provided the test for antimicrobial preservative and the assays for the diphtheria, tetanus and pertussis components have been carried out with satisfactory results on the final bulk vaccine, they may be omitted on the final lot.

Provided the content of free formaldehyde has been determined on the bulk purified antigens or on the final bulk and it has been shown that the content in the final lot will not exceed 0.2 g/L, the test for free formaldehyde may be omitted on the final lot.

If an *in vivo* assay is used for the hepatitis B component, provided it has been carried out with satisfactory results on the final bulk vaccine, it may be omitted on the final lot.

#### Osmolality (2.2.35)

The osmolality of the vaccine is within the limits approved for the particular preparation.

### IDENTIFICATION

A. Diphtheria toxoid is identified by a suitable immunochemical method (2.7.1). The following method, applicable to certain vaccines, is given as an example. Dissolve in the vaccine to be examined sufficient sodium citrate R to give a 100 g/L solution. Maintain at 37 °C for about 16 h and centrifuge until a clear supernatant is obtained. The clear supernatant reacts with a suitable diphtheria antitoxin, giving a precipitate.

B. Tetanus toxoid is identified by a suitable immunochemical method (2.7.1). The following method, applicable to certain vaccines, is given as an example. The clear supernatant obtained as described in identification test A reacts with a suitable tetanus antitoxin, giving a precipitate.

C. The pertussis components are identified by a suitable immunochemical method (2.7.1). The following method, applicable to certain vaccines, is given as an example. The clear supernatant obtained as described in identification test A reacts with specific antisera to the pertussis components of the vaccine.

D. The assay or, where applicable, the electrophoretic profile, serves also to identify the hepatitis B component of the vaccine.

#### TESTS

##### Aluminium (2.5.13)

Maximum 1.25 mg per single human dose, if aluminium hydroxide or hydrated aluminium phosphate is used as the adsorbent.

##### Free formaldehyde (2.4.18)

Maximum 0.2 g/L.

##### Antimicrobial preservative

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The content is not less than the minimum amount shown to be effective and is not greater than 115 per cent of the quantity stated on the label.

##### Sterility (2.6.1)

The vaccine complies with the test for sterility.

##### Pyrogens (2.6.8)

The vaccine complies with the test for pyrogens. Inject the equivalent of 1 human dose into each rabbit.

#### ASSAY

##### Diphtheria component.

Carry out one of the prescribed methods for the assay of diphtheria vaccine (adsorbed) (2.7.6).

The lower confidence limit ( $P = 0.95$ ) of the estimated potency is not less than the minimum potency stated on the label.

Unless otherwise justified and authorised, the minimum potency stated on the label is 30 IU per single human dose.

##### Tetanus component

Carry out one of the prescribed methods for the assay of tetanus vaccine (adsorbed) (2.7.8).

The lower confidence limit ( $P = 0.95$ ) of the estimated potency is not less than 40 IU per single human dose.

##### Pertussis component

Carry out one of the prescribed methods for the assay of pertussis vaccine (acellular) (2.7.16). The vaccine complies with the limit approved for the particular product.

##### Hepatitis B component

The vaccine complies with the assay of hepatitis B vaccine (2.7.15).

#### LABELLING

The label states:

- the minimum number of International Units of diphtheria and tetanus toxoid per single human dose;
- the names and amounts of the pertussis components per single human dose;
- where applicable, that the vaccine contains a pertussis toxin-like protein produced by genetic modification;
- the amount of HBsAg per single human dose;
- the type of cells used for production of the hepatitis B component;
- the name and the amount of the adsorbent;

- where applicable, that the vaccine is intended for primary vaccination of children and is not necessarily suitable for reinforcing doses or for administration to adults;
- that the vaccine must be shaken before use;
- that the vaccine is not to be frozen.

Ph Eur

## Adsorbed Diphtheria, Tetanus, Pertussis (Acellular Component) and Inactivated Poliomyelitis Vaccine

(Diphtheria, Tetanus, Pertussis (Acellular, Component) and Poliomyelitis (Inactivated) Vaccine (Adsorbed), Ph. Eur. monograph 1934)

Ph Eur

#### DEFINITION

Diphtheria, tetanus, pertussis (acellular, component) and poliomyelitis (inactivated) vaccine (adsorbed) is a combined vaccine containing: diphtheria formol toxoid; tetanus formol toxoid; individually purified antigenic components of *Bordetella pertussis*; suitable strains of human poliovirus types 1, 2 and 3 grown in suitable cell cultures and inactivated by a validated method; a mineral adsorbent such as aluminium hydroxide or hydrated aluminium phosphate. The formol toxoids are prepared from the toxins produced by the growth of *Corynebacterium diphtheriae* and *Clostridium tetani* respectively.

The vaccine contains either pertussis toxoid (chemically detoxified pertussis toxin) or a pertussis toxin-like protein free from toxic properties produced by expression of a genetically modified form of the corresponding gene. The vaccine may also contain filamentous haemagglutinin, pertactin (a 69 kDa outer-membrane protein) and other defined components of *B. pertussis* such as fimbrial-2 and fimbrial-3 antigens. The latter 2 antigens may be co-purified. The antigenic composition and characteristics are based on evidence of protection and freedom from unexpected reactions in the target group for which the vaccine is intended.

#### PRODUCTION

##### GENERAL PROVISIONS

The production method shall have been shown to yield consistently vaccines comparable with the vaccine of proven clinical efficacy and safety in man.

##### Specific toxicity of the diphtheria component

The production method is validated to demonstrate that the product, if tested, would comply with the following test: inject subcutaneously 5 times the single human dose stated on the label into each of 5 healthy guinea-pigs, each weighing 250-350 g, that have not previously been treated with any material that will interfere with the test. If within 42 days of the injection any of the animals shows signs of or dies from diphtheria toxæmia, the vaccine does not comply with the test. If more than 1 animal dies from non-specific causes, repeat the test once; if more than 1 animal dies in the second test, the vaccine does not comply with the test.

The content of bacterial endotoxins (2.6.14) in bulk purified diphtheria toxoid, tetanus toxoid, pertussis components and purified, inactivated monovalent poliovirus harvests is determined to monitor the purification procedure and to

limit the amount in the final vaccine. For each component, the content of bacterial endotoxins is less than the limit approved for the particular vaccine and, in any case, the contents are such that the final vaccine contains less than 100 IU per single human dose.

**Reference vaccine(s)** Provided valid assays can be performed, monocomponent reference vaccines may be used for the assays on the combined vaccine. If this is not possible because of interaction between the components of the combined vaccine or because of differences in composition between the monocomponent reference vaccine and the test vaccine, a batch of combined vaccine shown to be effective in clinical trials or a batch representative thereof is used as a reference vaccine. For the preparation of a representative batch, strict adherence to the production process used for the batch tested in clinical trials is necessary. The reference vaccine may be stabilised by a method that has been shown to have no effect on the assay procedure.

#### PRODUCTION OF THE COMPONENTS

The production of the components complies with the requirements of the monographs *Diphtheria vaccine (adsorbed)* (0443), *Tetanus vaccine (adsorbed)* (0452), *Pertussis vaccine (acellular, component, adsorbed)* (1356) and *Poliomyelitis vaccine (inactivated)* (0214).

#### FINAL BULK VACCINE

The final bulk vaccine is prepared by adsorption onto a mineral carrier such as aluminium hydroxide or hydrated aluminium phosphate, separately or together, of suitable quantities of bulk purified diphtheria toxoid, tetanus toxoid, acellular pertussis components and admixture of suitable quantities of purified monovalent harvests of human poliovirus types 1, 2 and 3 or a suitable quantity of a trivalent pool of such purified monovalent harvests. Suitable antimicrobial preservatives may be added.

Only a final bulk vaccine that complies with the following requirements may be used in the preparation of the final lot.

#### Bovine serum albumin

Determined on the poliomyelitis component by a suitable immunochemical method (2.7.1) after virus harvest and before addition of the adsorbent in the preparation of the final bulk vaccine, the amount of bovine serum albumin is such that the content in the final vaccine will be not more than 50 ng per single human dose.

#### Antimicrobial preservative

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The amount is not less than 85 per cent and not greater than 115 per cent of the intended content.

#### Sterility (2.6.1)

Carry out the test for sterility using 10 mL for each medium.

#### FINAL LOT

Only a final lot that is satisfactory with respect to the test for osmolality and with respect to each of the requirements given below under Identification, Tests and Assay may be released for use.

Provided the test for antimicrobial preservative and the assays for the diphtheria, tetanus and pertussis components have been carried out with satisfactory results on the final bulk vaccine, they may be omitted on the final lot.

Provided the free formaldehyde content has been determined on the bulk purified antigens or on the final bulk and it has been shown that the content in the final lot will not exceed 0.2 g/L, the test for free formaldehyde may be omitted on the final lot.

Provided that the determination of D-antigen content has been carried out with satisfactory results during preparation of the final bulk before addition of the adsorbent, it may be omitted on the final lot.

Provided that the *in vivo* assay for the poliomyelitis component has been carried out with satisfactory results on the final bulk vaccine, it may be omitted on the final lot.

The *in vivo* assay for the poliomyelitis component may be omitted once it has been demonstrated for a given product and for each poliovirus type that the acceptance criteria for the D-antigen determination are such that it yields the same result as the *in vivo* assay in terms of acceptance or rejection of a batch. This demonstration must include testing of subpotent batches, produced experimentally if necessary, for example by heat treatment or other means of diminishing the immunogenic activity. Where there is a significant change in the manufacturing process of the antigens or their formulation, any impact on the *in vivo* and *in vitro* assays must be evaluated, and the need for revalidation considered.

#### Osmolality (2.2.35)

The osmolality of the vaccine is within the limits approved for the particular preparation.

#### IDENTIFICATION

A. Diphtheria toxoid is identified by a suitable immunochemical method (2.7.1). The following method, applicable to certain vaccines, is given as an example. Dissolve in the vaccine to be examined sufficient sodium citrate R to give a 100 g/L solution. Maintain at 37 °C for about 16 h and centrifuge until a clear supernatant is obtained. The clear supernatant reacts with a suitable diphtheria antitoxin, giving a precipitate.

B. Tetanus toxoid is identified by a suitable immunochemical method (2.7.1). The following method, applicable to certain vaccines, is given as an example. The clear supernatant obtained as described in identification test A reacts with a suitable tetanus antitoxin, giving a precipitate.

C. The pertussis components are identified by a suitable immunochemical method (2.7.1). The following method, applicable to certain vaccines, is given as an example. The clear supernatant obtained as described in identification test A reacts with specific antisera to the pertussis components of the vaccine.

D. The vaccine is shown to contain human poliovirus types 1, 2 and 3 by a suitable immunochemical method (2.7.1) such as the determination of D-antigen by enzyme-linked immunosorbent assay (ELISA).

#### TESTS

##### Aluminium (2.5.13)

Maximum 1.25 mg per single human dose if aluminium hydroxide or hydrated aluminium phosphate is used as the adsorbent.

##### Free formaldehyde (2.4.18)

Maximum 0.2 g/L.

##### Antimicrobial preservative

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The content is not less than the minimum amount shown to be effective and is not greater than 115 per cent of the quantity stated on the label.

##### Sterility (2.6.1)

The vaccine complies with the test for sterility.

**ASSAY****Diphtheria component**

Carry out one of the prescribed methods for the assay of diphtheria vaccine (adsorbed) (2.7.6).

The lower confidence limit ( $P = 0.95$ ) of the estimated potency is not less than the minimum potency stated on the label.

Unless otherwise justified and authorised, the minimum potency stated on the label is 30 IU per single human dose.

**Tetanus component**

Carry out one of the prescribed methods for the assay of tetanus vaccine (adsorbed) (2.7.8).

The lower confidence limit ( $P = 0.95$ ) of the estimated potency is not less than 40 IU per single human dose.

**Pertussis component**

Carry out one of the prescribed methods for the assay of pertussis vaccine (acellular) (2.7.16). The vaccine complies with the limit approved for the particular product.

**Poliomyelitis component**

**D-antigen content** As a measure of consistency of production, determine the D-antigen content for human poliovirus types 1, 2 and 3 by a suitable immunochemical method (2.7.1) following desorption, using a reference preparation calibrated in European Pharmacopoeia Units of D-antigen. For each type, the content, expressed with reference to the amount of D-antigen stated on the label, is within the limits approved for the particular product.

**Poliomyelitis vaccine (inactivated) BRP** is calibrated in European Pharmacopoeia Units and intended for use in the assay of D-antigen. The European Pharmacopoeia Unit and the International Unit are equivalent.

**In vivo test** The vaccine complies with the *in vivo* assay of poliomyelitis vaccine (inactivated) (2.7.20).

**LABELLING**

The label states:

- the minimum number of International Units of diphtheria and tetanus toxoid per single human dose;
- the names and amounts of the pertussis components per single human dose;
- where applicable, that the vaccine contains a pertussis toxin-like protein produced by genetic modification;
- the types of poliovirus contained in the vaccine;
- the nominal amount of poliovirus of each type (1, 2 and 3), expressed in European Pharmacopoeia Units of D-antigen, per single human dose;
- the type of cells used for production of the poliomyelitis component;
- the name and the amount of the adsorbent;
- where applicable, that the vaccine is intended for primary vaccination of children and is not necessarily suitable for reinforcing doses or for administration to adults;
- that the vaccine must be shaken before use;
- that the vaccine is not to be frozen.

Ph Eur

## Diphtheria, Tetanus and Poliomyelitis (Inactivated) Vaccine (Adsorbed, Reduced Antigen(s) Content)

(Ph. Eur. monograph 2328)

The label may state 'Td/IPV'.

Ph Eur

**DEFINITION**

Diphtheria, tetanus and poliomyelitis (inactivated) vaccine (adsorbed, reduced antigen(s) content) is a combined vaccine containing: diphtheria formol toxoid; tetanus formol toxoid; suitable strains of human poliovirus types 1, 2 and 3 grown in suitable cell cultures and inactivated by a validated method; a mineral adsorbent such as aluminium hydroxide or hydrated aluminium phosphate.

The formol toxoids are prepared from the toxins produced by the growth of *Corynebacterium diphtheriae* and *Clostridium tetani* respectively.

The amount of diphtheria toxoid per single human dose is reduced compared to vaccines generally used for primary vaccination; the amount of tetanus toxoid may also be reduced.

**PRODUCTION****GENERAL PROVISIONS**

The production method shall have been shown to yield consistently vaccines comparable with the vaccine of proven clinical efficacy and safety in man.

**Specific toxicity of the diphtheria components**

The production method is validated to demonstrate that the product, if tested, would comply with the following test: inject subcutaneously 5 times the single human dose stated on the label into each of 5 healthy guinea-pigs, each weighing 250-350 g, that have not previously been treated with any material that will interfere with the test. If within 42 days of the injection any of the animals shows signs of or dies from diphtheria toxæmia, the vaccine does not comply with the test. If more than one animal dies from non-specific causes, repeat the test once; if more than one animal dies in the second test, the vaccine does not comply with the test.

The content of bacterial endotoxins (2.6.14) in bulk purified diphtheria toxoid, tetanus toxoid and inactivated monovalent poliovirus harvests is determined to monitor the purification procedure and to limit the amount in the final vaccine.

For each component, the content of bacterial endotoxins is less than the limit approved for the particular vaccine and, in any case, the contents are such that the final vaccine contains less than 100 IU per single human dose.

**Reference vaccine(s)** Provided valid assays can be performed, monocomponent reference vaccines may be used for the assays on the combined vaccine. If this is not possible because of interaction between the components of the combined vaccine or because of the difference in composition between the monocomponent reference vaccine and the test vaccine, a batch of combined vaccine shown to be effective in clinical trials or a batch representative thereof is used as a reference vaccine. For the preparation of a representative batch, strict adherence to the production process used for the batch tested in clinical trials is necessary. The reference vaccine may be stabilised by a method that has been shown to have no effect on the assay procedure.

**PRODUCTION OF THE COMPONENTS**

The production of the components complies with the requirements of the monographs *Diphtheria vaccine (adsorbed) (0443)*, *Tetanus vaccine (adsorbed) (0452)* and *Poliomyelitis vaccine (inactivated) (0214)*.

**FINAL BULK VACCINE**

The final bulk vaccine is prepared by adsorption onto a mineral carrier such as aluminium hydroxide or hydrated aluminium phosphate, separately or together, of suitable quantities of bulk purified diphtheria toxoid and tetanus toxoid, and an admixture of suitable quantities of purified monovalent harvests of human poliovirus types 1, 2 and 3 or a suitable quantity of a trivalent pool of such purified monovalent harvests. Suitable antimicrobial preservatives may be added.

Only a final bulk vaccine that complies with the following requirements may be used in the preparation of the final lot.

**Bovine serum albumin**

Determined on the poliomyelitis component by a suitable immunochemical method (2.7.1) after virus harvest and before addition of the adsorbent in the preparation of the final bulk vaccine, the amount of bovine serum albumin is such that the content in the final vaccine will be not more than 50 ng per single human dose.

**Antimicrobial preservative**

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The amount is not less than 85 per cent and not greater than 115 per cent of the intended content.

**Sterility (2.6.1)**

Carry out the test for sterility using 10 mL for each medium.

**FINAL LOT**

The final bulk vaccine is distributed aseptically into sterile, tamper-evident containers. The containers are closed so as to prevent contamination.

Only a final lot that is satisfactory with respect to the test for osmolality and with respect to each of the requirements given below under Identification, Tests and Assay may be released for use.

Provided the test for antimicrobial preservative and the assays for the diphtheria and tetanus components have been carried out with satisfactory results on the final bulk vaccine, they may be omitted on the final lot.

Provided the free formaldehyde content has been determined on the bulk purified antigens or on the final bulk and it has been shown that the content in the final lot will not exceed 0.2 g/L, the test for free formaldehyde may be omitted on the final lot.

Provided the determination of D-antigen content cannot be carried out on the final lot, it is carried out during preparation of the final bulk before addition of the adsorbent.

Provided the *in vivo* assay for the poliomyelitis component has been carried out with satisfactory results on the final bulk vaccine, it may be omitted on the final lot.

The *in vivo* assay for the poliomyelitis component may be omitted once it has been demonstrated for a given vaccine and for each poliovirus type that the acceptance criteria for the D-antigen determination are such that it yields the same result as the *in vivo* assay in terms of acceptance or rejection of a batch. This demonstration must include testing of subpotent batches, produced experimentally if necessary, for example by heat treatment or other means of diminishing the immunogenic activity. Where there is a significant change in the manufacturing process of the antigens or their

formulation, any impact on the *in vivo* and *in vitro* assays must be evaluated, and the need for revalidation considered.

**Osmolality (2.2.35)**

The osmolality of the vaccine is within the limits approved for the particular preparation.

**IDENTIFICATION**

A. Diphtheria toxoid is identified by a suitable immunochemical method (2.7.1). The following method, applicable to certain vaccines, is given as an example. Dissolve in the vaccine to be examined sufficient sodium citrate R to give a 100 g/L solution. Maintain at 37 °C for about 16 h and centrifuge until a clear supernatant is obtained. The clear supernatant reacts with a suitable diphtheria antitoxin, giving a precipitate. If a satisfactory result is not obtained with a vaccine adsorbed on aluminium hydroxide, carry out the test as follows. Centrifuge 15 mL of the vaccine to be examined and suspend the residue in 5 mL of a freshly prepared mixture of 1 volume of a 56 g/L solution of sodium edetate R and 49 volumes of disodium hydrogen phosphate solution R. Maintain at 37 °C for not less than 6 h and centrifuge. The clear supernatant reacts with a suitable diphtheria antitoxin, giving a precipitate.

B. Tetanus toxoid is identified by a suitable immunochemical method (2.7.1). The following method, applicable to certain vaccines, is given as an example. The clear supernatant obtained as described in identification test A reacts with a suitable tetanus antitoxin, giving a precipitate.

C. The vaccine is shown to contain human poliovirus types 1, 2 and 3 by a suitable immunochemical method (2.7.1) such as the determination of D-antigen by enzyme-linked immunosorbent assay (ELISA).

**TESTS****Aluminium (2.5.13)**

Maximum 1.25 mg per single human dose, if aluminium hydroxide or hydrated aluminium phosphate is used as the adsorbent.

**Free formaldehyde (2.4.18)**

Maximum 0.2 g/L.

**Antimicrobial preservative**

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The content is not less than the minimum amount shown to be effective and is not greater than 115 per cent of the quantity stated on the label.

**Sterility (2.6.1)**

The vaccine complies with the test for sterility.

**ASSAY****Diphtheria component**

Carry out one of the prescribed methods for the assay of diphtheria vaccine (adsorbed) (2.7.6).

The lower confidence limit ( $P = 0.95$ ) of the estimated potency is not less than 2 IU per single human dose.

**Tetanus component**

Carry out one of the prescribed methods for the assay of tetanus vaccine (adsorbed) (2.7.8).

The lower confidence limit ( $P = 0.95$ ) of the estimated potency is not less than 20 IU per single human dose.

**Poliomyelitis component**

**D-antigen content** As a measure of consistency of production, determine the D-antigen content for human poliovirus types 1, 2 and 3 by a suitable immunochemical method (2.7.1) following desorption, using a reference

preparation calibrated in European Pharmacopoeia Units of D-antigen. For each type, the content, expressed with reference to the amount of D-antigen stated on the label, is within the limits approved for the particular product.

*Poliomyelitis vaccine (inactivated) BRP* is calibrated in European Pharmacopoeia Units and intended for use in the assay of D-antigen. The European Pharmacopoeia Unit and the International Unit are equivalent.

**In vivo test** The vaccine complies with the *in vivo* assay of poliomyelitis vaccine (inactivated) (2.7.20).

#### LABELLING

The label states:

- the minimum number of International Units of diphtheria and tetanus toxoid per single human dose;
- the types of poliovirus contained in the vaccine;
- the nominal amount of poliovirus of each type (1, 2 and 3), expressed in European Pharmacopoeia Units of D-antigen, per single human dose;
- the type of cells used for production of the poliomyelitis component;
- the name and the amount of the adsorbent;
- that the vaccine must be shaken before use;
- that the vaccine is not to be frozen.

Ph Eur

## Diphtheria, Tetanus, Pertussis (Acellular, Component) and Poliomyelitis (Inactivated) Vaccine (Adsorbed, Reduced Antigen(s) Content)

(Ph. Eur. monograph 2329)

Ph Eur

#### DEFINITION

Diphtheria, tetanus, pertussis (acellular, component) and poliomyelitis (inactivated) vaccine (adsorbed, reduced antigen(s) content) is a combined vaccine containing: diphtheria formol toxoid; tetanus formol toxoid; individually purified antigenic components of *Bordetella pertussis*; suitable strains of human poliovirus types 1, 2 and 3 grown in suitable cell cultures and inactivated by a validated method; a mineral adsorbent such as aluminium hydroxide or hydrated aluminium phosphate.

The formol toxoids are prepared from the toxins produced by the growth of *Corynebacterium diphtheriae* and *Clostridium tetani* respectively.

The amount of diphtheria toxoid per single human dose is reduced compared to vaccines generally used for primary vaccination; the amounts of tetanus toxoid and pertussis components may also be reduced.

The vaccine contains either pertussis toxoid (chemically detoxified pertussis toxin) or a pertussis toxin-like protein free from toxic properties produced by expression of a genetically modified form of the corresponding gene. The vaccine may also contain filamentous haemagglutinin, pertactin (a 69 kDa outer-membrane protein) and other defined components of *B. pertussis* such as fimbrial-2 and fimbrial-3 antigens. The latter 2 antigens may be co-purified. The antigenic composition and characteristics are based on evidence of protection and freedom from unexpected

reactions in the target group for which the vaccine is intended.

#### PRODUCTION

##### GENERAL PROVISIONS

The production method shall have been shown to yield consistently vaccines comparable with the vaccine of proven clinical efficacy and safety in man.

##### Specific toxicity of the diphtheria component

The production method is validated to demonstrate that the product, if tested, would comply with the following test: inject subcutaneously 5 times the single human dose stated on the label into each of 5 healthy guinea-pigs, each weighing 250-350 g, that have not previously been treated with any material that will interfere with the test. If within 42 days of the injection any of the animals shows signs of or dies from diphtheria toxæmia, the vaccine does not comply with the test. If more than 1 animal dies from non-specific causes, repeat the test once; if more than 1 animal dies in the second test, the vaccine does not comply with the test.

The content of bacterial endotoxins (2.6.14) in bulk purified diphtheria toxoid, tetanus toxoid, pertussis components and inactivated monovalent poliovirus harvests is determined to monitor the purification procedure and to limit the amount in the final vaccine. For each component, the content of bacterial endotoxins is less than the limit approved for the particular vaccine and, in any case, the contents are such that the final vaccine contains less than 100 IU per single human dose.

**Reference vaccine(s)** Provided valid assays can be performed, monocomponent reference vaccines may be used for the assays on the combined vaccine. If this is not possible because of interaction between the components of the combined vaccine or because of differences in composition between the monocomponent reference vaccine and the test vaccine, a batch of combined vaccine shown to be effective in clinical trials or a batch representative thereof is used as a reference vaccine. For the preparation of a representative batch, strict adherence to the production process used for the batch tested in clinical trials is necessary. The reference vaccine may be stabilised by a method that has been shown to have no effect on the assay procedure.

##### PRODUCTION OF THE COMPONENTS

The production of the components complies with the requirements of the monographs *Diphtheria vaccine (adsorbed) (0443)*, *Tetanus vaccine (adsorbed) (0452)*, *Pertussis vaccine (acellular, component, adsorbed) (1356)* and *Poliomyelitis vaccine (inactivated) (0214)*.

##### FINAL BULK VACCINE

The final bulk vaccine is prepared by adsorption onto a mineral carrier such as aluminium hydroxide or hydrated aluminium phosphate, separately or together, of suitable quantities of bulk purified diphtheria toxoid, tetanus toxoid and acellular pertussis components, and an admixture of suitable quantities of purified monovalent harvests of human poliovirus types 1, 2 and 3 or a suitable quantity of a trivalent pool of such purified monovalent harvests. Suitable antimicrobial preservatives may be added.

Only a final bulk vaccine that complies with the following requirements may be used in the preparation of the final lot.

##### Bovine serum albumin

Determined on the poliomyelitis component by a suitable immunochemical method (2.7.1) after virus harvest and before addition of the adsorbent in the preparation of the final bulk vaccine, the amount of bovine serum albumin is

such that the content in the final vaccine will be not more than 50 ng per single human dose.

#### Antimicrobial preservative

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The amount is not less than 85 per cent and not greater than 115 per cent of the intended content.

#### Sterility (2.6.1)

Carry out the test for sterility using 10 mL for each medium.

#### FINAL LOT

The final bulk vaccine is distributed aseptically into sterile, tamper-evident containers. The containers are closed so as to prevent contamination.

Only a final lot that is satisfactory with respect to the test for osmolality and with respect to each of the requirements given below under Identification, Tests and Assay may be released for use.

Provided the test for antimicrobial preservative and the assays for the diphtheria, tetanus and pertussis components have been carried out with satisfactory results on the final bulk vaccine, they may be omitted on the final lot.

Provided the free formaldehyde content has been determined on the bulk purified antigens or on the final bulk and it has been shown that the content in the final lot will not exceed 0.2 g/L, the test for free formaldehyde may be omitted on the final lot.

Provided the determination of D-antigen content cannot be carried out on the final lot, it is carried out during preparation of the final bulk before addition of the adsorbent.

Provided the *in vivo* assay for the poliomyelitis component has been carried out with satisfactory results on the final bulk vaccine, it may be omitted on the final lot.

The *in vivo* assay for the poliomyelitis component may be omitted once it has been demonstrated for a given vaccine and for each poliovirus type that the acceptance criteria for the D-antigen determination are such that it yields the same result as the *in vivo* assay in terms of acceptance or rejection of a batch. This demonstration must include testing of subpotent batches, produced experimentally if necessary, for example by heat treatment or other means of diminishing the immunogenic activity. Where there is a significant change in the manufacturing process of the antigens or their formulation, any impact on the *in vivo* and *in vitro* assays must be evaluated, and the need for revalidation considered.

#### Osmolality (2.2.35)

The osmolality of the vaccine is within the limits approved for the particular preparation.

#### IDENTIFICATION

A. Diphtheria toxoid is identified by a suitable immunochemical method (2.7.1). The following method, applicable to certain vaccines, is given as an example. Dissolve in the vaccine to be examined sufficient *sodium citrate R* to give a 100 g/L solution. Maintain at 37 °C for about 16 h and centrifuge until a clear supernatant is obtained. The clear supernatant reacts with a suitable diphtheria antitoxin, giving a precipitate. If a satisfactory result is not obtained with a vaccine adsorbed on aluminium hydroxide, carry out the test as follows. Centrifuge 15 mL of the vaccine to be examined and suspend the residue in 5 mL of a freshly prepared mixture of 1 volume of a 56 g/L solution of *sodium edetate R* and 49 volumes of a *disodium hydrogen phosphate solution R*. Maintain at 37 °C for not less than 6 h and centrifuge. The clear supernatant reacts with a suitable diphtheria antitoxin, giving a precipitate.

B. Tetanus toxoid is identified by a suitable immunochemical method (2.7.1). The following method, applicable to certain vaccines, is given as an example. The clear supernatant obtained as described in identification test A reacts with a suitable tetanus antitoxin, giving a precipitate.

C. The pertussis components are identified by a suitable immunochemical method (2.7.1). The following method, applicable to certain vaccines, is given as an example. The clear supernatant obtained as described in identification test A reacts with a specific antisera to the pertussis components of the vaccine.

D. The vaccine is shown to contain human poliovirus types 1, 2 and 3 by a suitable immunochemical method (2.7.1) such as the determination of D-antigen by enzyme-linked immunosorbent assay (ELISA).

#### TESTS

##### Aluminium (2.5.13)

Maximum 1.25 mg per single human dose, if aluminium hydroxide or hydrated aluminium phosphate is used as the adsorbent.

##### Free formaldehyde (2.4.18)

Maximum 0.2 g/L.

##### Antimicrobial preservative

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The content is not less than the minimum amount shown to be effective and is not greater than 115 per cent of the quantity stated on the label.

##### Sterility (2.6.1)

The vaccine complies with the test for sterility.

#### ASSAY

##### Diphtheria component

Carry out one of the prescribed methods for the assay of diphtheria vaccine (adsorbed) (2.7.6).

The lower confidence limit ( $P = 0.95$ ) of the estimated potency is not less than 2 IU per single human dose.

##### Tetanus component

Carry out one of the prescribed methods for the assay of tetanus vaccine (adsorbed) (2.7.8).

The lower confidence limit ( $P = 0.95$ ) of the estimated potency is not less than 20 IU per single human dose.

##### Pertussis component

Carry out one of the prescribed methods for the assay of pertussis vaccine (acellular) (2.7.16). The vaccine complies with the limit approved for the particular product.

##### Poliomyelitis component

*D-antigen content* As a measure of consistency of production, determine the D-antigen content for human poliovirus types 1, 2 and 3 by a suitable immunochemical method (2.7.1) following desorption, using a reference preparation calibrated in European Pharmacopoeia Units of D-antigen. For each type, the content, expressed with reference to the amount of D-antigen stated on the label, is within the limits approved for the particular product. *Poliomyelitis vaccine (inactivated) BRP* is calibrated in European Pharmacopoeia Units and intended for use in the assay of D-antigen. The European Pharmacopoeia Unit and the International Unit are equivalent.

*In vivo test* The vaccine complies with the *in vivo* assay of poliomyelitis vaccine (inactivated) (2.7.20).

**LABELLING**

The label states:

- the minimum number of International Units of diphtheria and tetanus toxoid per single human dose;
- the names and amounts of the pertussis components per single human dose;
- where applicable, that the vaccine contains a pertussis toxin-like protein produced by genetic modification;
- the types of poliovirus contained in the vaccine;
- the nominal amount of poliovirus of each type (1, 2 and 3), expressed in European Pharmacopoeia Units of D-antigen, per single human dose;
- the type of cells used for production of the poliomyelitis component;
- the name and the amount of the adsorbent;
- that the vaccine must be shaken before use;
- that the vaccine is not to be frozen.

Ph Eur

## Diphtheria, Tetanus, Pertussis (Acellular, Component), Poliomyelitis (Inactivated) and Haemophilus Type b Conjugate Vaccine (Adsorbed)

(Ph. Eur. monograph 2065)

Ph Eur

**DEFINITION**

Diphtheria, tetanus, pertussis (acellular, component), poliomyelitis (inactivated) and haemophilus type b conjugate vaccine (adsorbed) is a combined vaccine composed of: diphtheria formol toxoid; tetanus formol toxoid; individually purified antigenic components of *Bordetella pertussis*; suitable strains of human poliovirus types 1, 2 and 3 grown in suitable cell cultures and inactivated by a suitable method; polyribosylribitol phosphate (PRP) covalently bound to a carrier protein; a mineral adsorbent such as aluminium hydroxide or hydrated aluminium phosphate. The product is presented either as a pentavalent liquid formulation in the same container, or as a tetravalent liquid formulation with the freeze-dried haemophilus component in a separate container, the contents of which are mixed with the other components immediately before use.

The formol toxoids are prepared from the toxins produced by the growth of *Corynebacterium diphtheriae* and *Clostridium tetani* respectively.

The vaccine contains either pertussis toxoid (chemically detoxified pertussis toxin) or a pertussis toxin-like protein free from toxic properties produced by expression of a genetically modified form of the corresponding gene. The acellular pertussis component may also contain filamentous haemagglutinin, pertactin (a 69 kDa outer-membrane protein) and other defined components of *B. pertussis* such as fimbrial-2 and fimbrial-3 antigens. The latter 2 antigens may be co-purified. The antigenic composition and characteristics are based on evidence of protection and freedom from unexpected reactions in the target group for which the vaccine is intended.

PRP is a linear copolymer composed of repeated units of 3-β-D-ribofuranosyl-(1→1)-ribitol-5-phosphate [(C<sub>10</sub>H<sub>19</sub>O<sub>11</sub>P)<sub>n</sub>], with a defined molecular size and derived

from a suitable strain of *Haemophilus influenzae* type b. The carrier protein, when conjugated to PRP, is capable of inducing a T-cell-dependent B-cell immune response to the polysaccharide.

**PRODUCTION****GENERAL PROVISIONS**

The production method shall have been shown to yield consistently vaccines comparable with the vaccine of proven clinical efficacy and safety in man.

**Specific toxicity of the diphtheria component**

The production method is validated to demonstrate that the product, if tested, would comply with the following test: inject subcutaneously 5 times the single human dose stated on the label into each of 5 healthy guinea-pigs, each weighing 250-350 g, that have not previously been treated with any material that will interfere with the test. If within 42 days of the injection any of the animals shows signs of or dies from diphtheria toxæmia, the vaccine does not comply with the test. If more than 1 animal dies from non-specific causes, repeat the test once; if more than 1 animal dies in the second test, the vaccine does not comply with the test.

The content of bacterial endotoxins (2.6.14) in bulk purified diphtheria toxoid, tetanus toxoid, pertussis components, purified, inactivated monovalent poliovirus harvests and bulk PRP conjugate is determined to monitor the purification procedure and to limit the amount in the final vaccine. For each component, the content of bacterial endotoxins is less than the limit approved by the competent authority for the particular vaccine.

During development studies, it shall be demonstrated that the vaccine consistently induces a T-cell-dependent B-cell immune response to PRP. If the manufacturing process is modified, it shall be demonstrated by appropriate *in vitro* methods that the characteristic properties of the conjugate are not affected.

Where the haemophilus component is presented in a separate container, and as part of consistency studies, the assays of the diphtheria, tetanus, pertussis and poliomyelitis components are carried out on a suitable number of batches of vaccine reconstituted as for use. For subsequent routine control, the assays of these components may be carried out without mixing with the haemophilus component.

Where the haemophilus component is presented in a separate container, the production method is validated to demonstrate that the haemophilus component, if tested, would comply with the test for pyrogens (2.6.8), carried out as follows: inject per kilogram of the rabbit's mass a quantity of the vaccine equivalent to: 1 µg of PRP for a vaccine with diphtheria toxoid or CRM 197 diphtheria protein as carrier; 0.1 µg of PRP for a vaccine with tetanus toxoid as carrier; 0.025 µg of PRP for a vaccine with OMP (meningococcal group B outer membrane protein complex) as carrier.

**Reference vaccine(s)** Provided valid assays can be performed, monocomponent reference vaccines may be used for the assays on the combined vaccine. If this is not possible because of interaction between the components of the combined vaccine or because of differences in composition between the monocomponent reference vaccine and the test vaccine, a batch of combined vaccine shown to be effective in clinical trials or a batch representative thereof is used as a reference vaccine. For the preparation of a representative batch, strict adherence to the production process used for the batch tested in clinical trials is necessary. The reference vaccine may be stabilised by a method that has been shown to have no effect on the assay procedure.

**PRODUCTION OF THE COMPONENTS**

The production of the components complies with the requirements of the monographs *Diphtheria vaccine (adsorbed)* (0443), *Tetanus vaccine (adsorbed)* (0452), *Pertussis vaccine (acellular, component, adsorbed)* (1356), *Polio myelitis vaccine (inactivated)* (0214) and *Haemophilus type b conjugate vaccine* (1219).

**FINAL BULKS**

The final tetravalent bulk of the diphtheria, tetanus, pertussis and poliomyelitis components is prepared by adsorption, separately or together, of suitable quantities of bulk purified diphtheria toxoid, bulk purified tetanus toxoid and bulk purified acellular pertussis components onto a mineral carrier such as aluminium hydroxide or hydrated aluminium phosphate, and admixture of suitable quantities of purified, monovalent harvests of human poliovirus types 1, 2 and 3 or a suitable quantity of a trivalent pool of such monovalent harvests. Suitable antimicrobial preservatives may be added.

Where the vaccine is presented with all 5 components in the same container, the final bulk is prepared by addition of a suitable quantity of the haemophilus bulk conjugate to the tetravalent bulk. Where the haemophilus component is presented in a separate container, the final bulk is prepared by dilution of the bulk conjugate with suitable diluents for freeze-drying. A stabiliser may be added.

Only final bulks that comply with the following requirements may be used in the preparation of the final lot.

**Bovine serum albumin**

Determined on the poliomyelitis component by a suitable immunochemical method (2.7.1) during preparation of the final bulk vaccine, before addition of the adsorbent, the amount of bovine serum albumin is such that the content in the final vaccine will be not more than 50 ng per single human dose.

**Antimicrobial preservative**

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The amount is not less than 85 per cent and not greater than 115 per cent of the intended content.

**Sterility (2.6.1)**

Carry out the test for sterility using 10 mL for each medium.

**FINAL LOT**

Where the haemophilus component is presented in a separate container, the final bulk of the haemophilus component is freeze-dried.

Only a final lot that is satisfactory with respect to the test for osmolality shown below and with respect to each of the requirements given below under Identification, Tests and Assay may be released for use.

Provided that the test for antimicrobial preservative and the assay have been carried out with satisfactory results on the final bulk vaccine, they may be omitted on the final lot.

Provided that the free formaldehyde content has been determined on the bulk purified antigens and the purified monovalent harvests or the trivalent pool of polioviruses or the final bulk and it has been shown that the content in the final lot will not exceed 0.2 g/L, the test for free formaldehyde may be omitted on the final lot.

If the *in vivo* assay for the poliomyelitis component is used, provided it has been carried out with satisfactory results on the final bulk vaccine, it may be omitted on the final lot.

The *in vivo* assay for the poliomyelitis component may be omitted once it has been demonstrated for a given product and for each poliovirus type that the acceptance criteria for

the D-antigen determination are such that it yields the same result as the *in vivo* assay in terms of acceptance or rejection of a batch. This demonstration must include testing of subpotent batches, produced experimentally if necessary, for example by heat treatment or other means of diminishing the immunogenic activity. Where there is a significant change in the manufacturing process of the antigens or their formulation, any impact on the *in vivo* and *in vitro* assays must be evaluated, and the need for revalidation considered.

**Osmolality (2.2.35)**

The osmolality of the vaccine, reconstituted where applicable, is within the limits approved for the particular preparation.

**Free PRP**

Where the haemophilus component is presented in liquid formulation, the presence of other components may interfere in the assay and it may not be possible to separate the PRP from the adjuvant. The presence of free PRP may be determined on the bulk conjugate prior to the addition of other components or on the non-adsorbed fraction in the final combination.

Where the haemophilus component is presented in a separate container, a number of methods have been used to separate free PRP from the conjugate, including precipitation, gel filtration, size-exclusion, anion-exchange and hydrophobic chromatography, ultrafiltration and ultracentrifugation. The free PRP can then be quantified by a range of techniques, including high-performance anion-exchange chromatography with pulsed amperometric detection (HPAEC-PAD) and immunoassays with anti-PRP antibodies. The amount of free PRP is not greater than that approved for the particular product.

**IDENTIFICATION**

*Identification tests A, B, C and D are carried out using the vial containing the diphtheria, tetanus, pertussis and poliomyelitis components; identification test E is carried out either on the vial containing all 5 components, or on the vial containing the haemophilus component alone.*

A. Diphtheria toxoid is identified by a suitable immunochemical method (2.7.1). The following method, applicable to certain vaccines, is given as an example. Dissolve in the vaccine to be examined sufficient sodium citrate R to give a 100 g/L solution. Maintain at 37 °C for about 16 h and centrifuge until a clear supernatant is obtained. The clear supernatant reacts with a suitable diphtheria antitoxin, giving a precipitate.

B. Tetanus toxoid is identified by a suitable immunochemical method (2.7.1). The following method, applicable to certain vaccines, is given as an example. The clear supernatant obtained during identification test A reacts with a suitable tetanus antitoxin, giving a precipitate.

C. The pertussis components are identified by a suitable immunochemical method (2.7.1). The following method, applicable to certain vaccines, is given as an example. The clear supernatant obtained during identification test A reacts with specific antisera to the pertussis components of the vaccine.

D. The vaccine is shown to contain human poliovirus types 1, 2 and 3 by a suitable immunochemical method (2.7.1), such as determination of D-antigen by enzyme-linked immunosorbent assay (ELISA).

E. The haemophilus component is identified by a suitable immunochemical method (2.7.1) for PRP.

**TESTS**

Where the haemophilus component is presented in a separate container, the tests for aluminium, free formaldehyde, antimicrobial preservative and sterility are carried out on the container with the diphtheria, tetanus, pertussis and poliomyelitis components; the tests for PRP, water, sterility and bacterial endotoxins are carried out on the container with the haemophilus component alone.

Where the haemophilus component is presented in a separate container, some tests may be carried out on the freeze-dried product rather than on the bulk conjugate where the freeze-drying process may affect the component to be tested.

**PRP**

Not less than 80 per cent of the amount of PRP stated on the label. PRP is determined either by assay of ribose (2.5.31) or phosphorus (2.5.18), by an immunochemical method (2.7.1) or by anion-exchange liquid chromatography (2.2.29) with pulsed amperometric detection.

**Aluminium (2.5.13)**

Maximum 1.25 mg per single human dose, if aluminium hydroxide or hydrated aluminium phosphate is used as the adsorbent.

**Free formaldehyde (2.4.18)**

Maximum 0.2 g/L.

**Antimicrobial preservative**

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The content is not less than the minimum amount shown to be effective and is not greater than 115 per cent of the quantity stated on the label.

**Water (2.5.12)**

Maximum 3.0 per cent for the freeze-dried haemophilus component.

**Sterility (2.6.1)**

The vaccine complies with the test for sterility.

**Bacterial endotoxins (2.6.14)**

The content is within the limits approved by the competent authority for the haemophilus component of the particular product. If any components of the vaccine prevent the determination of endotoxin, a test for pyrogens is carried out as described under General provisions.

**ASSAY****Diphtheria component**

Carry out one of the prescribed methods for the assay of diphtheria vaccine (adsorbed) (2.7.6).

Unless otherwise justified and authorised, the lower confidence limit ( $P = 0.95$ ) of the estimated potency is not less than 30 IU per single human dose.

**Tetanus component**

Carry out one of the prescribed methods for the assay of tetanus vaccine (adsorbed) (2.7.8).

The lower confidence limit ( $P = 0.95$ ) of the estimated potency is not less than 40 IU per single human dose.

**Pertussis component**

Carry out one of the prescribed methods for the assay of pertussis vaccine (acellular) (2.7.16). The vaccine complies with the limit approved for the particular product.

**Poliomyelitis component**

**D-antigen content** As a measure of consistency of production, determine the D-antigen content for human poliovirus types 1, 2 and 3 by a suitable immunochemical

method (2.7.1) following desorption, using a reference preparation calibrated in European Pharmacopoeia Units of D-antigen. For each type, the content, expressed with reference to the amount of D-antigen stated on the label, is within the limits approved for the particular product.

**Poliomyelitis vaccine (inactivated) BRP** is calibrated in European Pharmacopoeia Units and intended for use in the assay of D-antigen. The European Pharmacopoeia Unit and the International Unit are equivalent.

**In vivo test** The vaccine complies with the *in vivo* assay of poliomyelitis vaccine (inactivated) (2.7.20).

**LABELLING**

The label states:

- the minimum number of International Units of diphtheria and tetanus toxoid per single human dose;
- the names and amounts of the pertussis components per single human dose;
- where applicable, that the vaccine contains a pertussis-toxin-like protein produced by genetic modification;
- the nominal amount of poliovirus of each type (1, 2 and 3), expressed in European Pharmacopoeia Units of D-antigen, per single human dose;
- the type of cells used for production of the poliomyelitis component;
- the number of micrograms of PRP per single human dose;
- the type and nominal amount of carrier protein per single human dose;
- the name and the amount of the adsorbent;
- where applicable, that the vaccine is intended for primary vaccination of children and is not necessarily suitable for reinforcing doses or for administration to adults;
- that the vaccine must be shaken before use;
- that the vaccine is not to be frozen.

Ph Eur

## Diphtheria, Tetanus, Pertussis (Acellular, Component), Hepatitis B (rDNA), Poliomyelitis (Inactivated) and Haemophilus Type b Conjugate Vaccine (Adsorbed)

(Ph. Eur. monograph 2067)

Ph Eur

**DEFINITION**

Diphtheria, tetanus, pertussis (acellular, component), hepatitis B (rDNA), poliomyelitis (inactivated) and haemophilus type b conjugate vaccine (adsorbed) is a combined vaccine composed of: diphtheria formol toxoid; tetanus formol toxoid; individually purified antigenic components of *Bordetella pertussis*; hepatitis B surface antigen (HBsAg); human poliovirus types 1, 2 and 3 grown in suitable cell cultures and inactivated by a suitable method; polyribosylribitol phosphate (PRP) covalently bound to a carrier protein. The antigens in the vaccine may be adsorbed on a mineral carrier such as aluminium hydroxide or hydrated aluminium phosphate. The product is presented either as a hexavalent liquid formulation in the same container, or as a pentavalent liquid formulation with the

haemophilus component in a separate container, the contents of which are mixed with the other components immediately before or during use.

The formal toxoids are prepared from the toxins produced by the growth of *Corynebacterium diphtheriae* and *Clostridium tetani* respectively.

The vaccine contains either pertussis toxoid (chemically detoxified pertussis toxin) or a pertussis toxin-like protein free from toxic properties produced by expression of a genetically modified form of the corresponding gene. The acellular pertussis component may also contain filamentous haemagglutinin, pertactin (a 69 kDa outer-membrane protein) and other defined components of *B. pertussis* such as fimbrial-2 and fimbrial-3 antigens. The latter 2 antigens may be co-purified. The antigenic composition and characteristics are based on evidence of protection and freedom from unexpected reactions in the target group for which the vaccine is intended.

Hepatitis B surface antigen is a component protein of hepatitis B virus; the antigen is obtained by recombinant DNA technology.

PRP is a linear copolymer composed of repeated units of 3-β-D-ribofuranosyl-(1→1)-ribitol-5-phosphate [(C<sub>10</sub>H<sub>19</sub>O<sub>11</sub>P)<sub>n</sub>], with a defined molecular size and derived from a suitable strain of *Haemophilus influenzae* type b. The carrier protein, when conjugated to PRP, is capable of inducing a T-cell-dependent B-cell immune response to the polysaccharide.

## PRODUCTION

### GENERAL PROVISIONS

The production method shall have been shown to yield consistently vaccines comparable with the vaccine of proven clinical efficacy and safety in man.

If the vaccine is presented with the haemophilus component in a separate container, as part of consistency studies the assays of the diphtheria, tetanus, pertussis, hepatitis B and poliomyelitis components are carried out on a suitable number of batches of vaccine reconstituted as for use. For subsequent routine control, the assays of these components may be carried out without mixing with the haemophilus component.

### Specific toxicity of the diphtheria component

The production method is validated to demonstrate that the product, if tested, would comply with the following test: inject subcutaneously 5 times the single human dose stated on the label into each of 5 healthy guinea-pigs, each weighing 250-350 g, that have not previously been treated with any material that will interfere with the test. If within 42 days of the injection any of the animals shows signs of or dies from diphtheria toxæmia, the vaccine does not comply with the test. If more than 1 animal dies from non-specific causes, repeat the test once; if more than 1 animal dies in the second test, the vaccine does not comply with the test.

The content of bacterial endotoxins (2.6.14) in bulk purified diphtheria toxoid, tetanus toxoid and pertussis components, hepatitis B surface antigen, purified, inactivated monovalent poliovirus harvests and bulk PRP conjugate is determined to monitor the purification procedure and to limit the amount in the final vaccine. For each component, the content of bacterial endotoxins is not greater than the limit approved.

During development studies and wherever revalidation is necessary, a test for pyrogens in rabbits (2.6.8) is carried out by injection of a suitable dose of the final lot. The vaccine is

shown to be acceptable with respect to absence of pyrogenic activity.

During development studies, it shall be demonstrated that the vaccine consistently induces a T-cell-dependent B-cell immune response to PRP. If the manufacturing process is modified, it shall be demonstrated by appropriate *in vitro* methods that the characteristic properties of the conjugate are not affected.

The stability of the final lot and relevant intermediates is evaluated using one or more indicator tests. For the haemophilus component, such tests may include determination of molecular size, determination of free PRP in the conjugate and kinetics of depolymerisation. Taking account of the results of the stability testing, release requirements are set for these indicator tests to ensure that the vaccine will be satisfactory at the end of the period of validity.

**Reference vaccine(s)** Provided valid assays can be performed, monocomponent reference vaccines may be used for the assays on the combined vaccine. If this is not possible because of interaction between the components of the combined vaccine or because of differences in composition between the monocomponent reference vaccine and the test vaccine, a batch of combined vaccine shown to be effective in clinical trials or a batch representative thereof is used as a reference vaccine. For the preparation of a representative batch, strict adherence to the production process used for the batch tested in clinical trials is necessary. The reference vaccine may be stabilised by a method that has been shown to have no effect on the assay procedure.

### PRODUCTION OF THE COMPONENTS

The production of the components complies with the requirements of the monographs *Diphtheria vaccine (adsorbed)* (0443), *Tetanus vaccine (adsorbed)* (0452), *Pertussis vaccine (acellular, component, adsorbed)* (1356), *Hepatitis B vaccine (rDNA)* (1056), *Poliomyelitis vaccine (inactivated)* (0214) and *Haemophilus type b conjugate vaccine* (1219).

### FINAL BULK

**Vaccine with all components in the same container** The final bulk is prepared by adsorption, separately or together, of suitable quantities of bulk purified diphtheria toxoid, tetanus toxoid, acellular pertussis components and hepatitis B surface antigen onto a mineral carrier such as aluminium hydroxide or hydrated aluminium phosphate and admixture of a suitable quantity of PRP conjugate and suitable quantities of purified and inactivated, monovalent harvests of human poliovirus types 1, 2 and 3 or a suitable quantity of a trivalent pool of such monovalent harvests. Suitable antimicrobial preservatives may be added.

**Vaccine with the haemophilus component in a separate container** The final bulk of diphtheria, tetanus, pertussis, hepatitis B and poliovirus component is prepared by adsorption, separately or together, of suitable quantities of bulk purified diphtheria toxoid, tetanus toxoid, acellular pertussis components and hepatitis B surface antigen onto a mineral carrier such as aluminium hydroxide or hydrated aluminium phosphate and admixture of suitable quantities of purified and inactivated, monovalent harvests of human poliovirus types 1, 2 and 3 or a suitable pool of such monovalent harvests. This final bulk is filled separately. Suitable antimicrobial preservatives may be added. The final bulk of the haemophilus component is prepared by dilution of the bulk conjugate to the final concentration with a suitable diluent. A stabiliser may be added.

Only final bulks that comply with the following requirements may be used in the preparation of the final lot.

#### Bovine serum albumin

Determined on the poliomyelitis component by a suitable immunochemical method (2.7.1) after purification of the harvests and before preparation of the final bulk vaccine, before addition of the adsorbent, the amount of bovine serum albumin is such that the content in the final vaccine will be not more than 50 ng per single human dose.

#### Antimicrobial preservative

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The amount is not less than 85 per cent and not greater than 115 per cent of the intended content.

#### Sterility (2.6.1)

Carry out the test for sterility using 10 mL for each medium.

#### FINAL LOT

Where the haemophilus component is in a separate container, the final bulk of the haemophilus component is freeze-dried. Only a final lot that is satisfactory with respect to the test for osmolality shown below and with respect to each of the requirements given below under Identification, Tests and Assay may be released for use.

Provided that the test for osmolality, the test for antimicrobial preservative and the assays for the diphtheria, tetanus and pertussis components have been carried out with satisfactory results on the final bulk vaccine, they may be omitted on the final lot.

Provided the free formaldehyde content has been determined on the bulk purified antigens and the purified monovalent harvests or the trivalent pool of polioviruses or the final bulk and it has been shown that the content in the final lot will not exceed 0.2 g/L, the test for free formaldehyde may be omitted on the final lot.

Provided that the test for bovine serum albumin has been carried out with satisfactory results on the trivalent pool of inactivated monovalent harvests of polioviruses or on the final bulk vaccine, it may be omitted on the final lot.

If an *in vivo* assay is used for the hepatitis B component, provided it has been carried out with satisfactory results on the final bulk vaccine, it may be omitted on the final lot.

Provided the *in vivo* assay for the poliomyelitis component has been carried out with satisfactory results on the final bulk vaccine, it may be omitted on the final lot.

The *in vivo* assay for the poliomyelitis component may be omitted once it has been demonstrated for a given product and for each poliovirus type that the acceptance criteria for the D-antigen determination are such that it yields the same result as the *in vivo* assay in terms of acceptance or rejection of a batch. This demonstration must include testing of subpotent batches, produced experimentally if necessary, for example by heat treatment or other means of diminishing the immunogenic activity. Where there is a significant change in the manufacturing process of the antigens or their formulation, any impact on the *in vivo* and *in vitro* assays must be evaluated, and the need for revalidation considered.

#### Free PRP

For vaccines with all components in the same container, the free PRP content is determined on the non-absorbed fraction. Unbound PRP is determined on the haemophilus component after removal of the conjugate, for example by anion-exchange, size-exclusion or hydrophobic chromatography, ultrafiltration or other validated methods.

The amount of free PRP is not greater than that approved for the particular product.

#### Bacterial endotoxins (2.6.14)

Less than the limit approved for the product concerned.

#### Osmolality (2.2.35)

The osmolality of the vaccine, reconstituted where applicable, is within the limits approved for the particular preparation.

#### IDENTIFICATION

*If the vaccine is presented with the haemophilus component in a separate container: identification tests A, B, C, D and E are carried out using the container with the diphtheria, tetanus, pertussis, hepatitis B and poliomyelitis components; identification test F is carried out on the container with the haemophilus components.*

A. Diphtheria toxoid is identified by a suitable immunochemical method (2.7.1). The following method is given as an example. Dissolve in the vaccine to be examined sufficient sodium citrate R to give a 100 g/L solution. Maintain at 37 °C for about 16 h and centrifuge until a clear supernatant is obtained. The clear supernatant reacts with a suitable diphtheria antitoxin, giving a precipitate.

B. Tetanus toxoid is identified by a suitable immunochemical method (2.7.1). The following method is given as an example. The clear supernatant obtained during identification test A reacts with a suitable tetanus antitoxin, giving a precipitate.

C. The clear supernatant obtained during identification test A reacts with specific antisera to the pertussis components of the vaccine when examined by suitable immunochemical methods (2.7.1).

D. The hepatitis B component is identified by a suitable immunochemical method (2.7.1), for example the *in vitro* assay, or by a suitable electrophoretic method (2.2.31).

E. The vaccine is shown to contain human poliovirus types 1, 2 and 3 by a suitable immunochemical method (2.7.1), such as determination of D-antigen by enzyme-linked immunosorbent assay (ELISA).

F. The PRP and its carrier protein are identified by a suitable immunochemical method (2.7.1).

#### TESTS

*If the product is presented with the haemophilus component in a separate container, the tests for free formaldehyde, aluminium, antimicrobial preservative and sterility are carried out on the container with the diphtheria, tetanus, pertussis, poliomyelitis and hepatitis B components; the tests for PRP, water, antimicrobial preservative (where applicable), aluminium (where applicable) and sterility are carried out on the container with the haemophilus component.*

*Some tests for the haemophilus component are carried out on the freeze-dried product rather than on the bulk conjugate where the freeze-drying process may affect the component to be tested.*

#### PRP

Minimum 80 per cent of the amount of PRP stated on the label, for a vaccine with the haemophilus component in a separate container.

For a vaccine with all components in the same container: the PRP content determined on the non-absorbed fraction is not less than that approved for the product.

PRP is determined either by assay of ribose (2.5.31) or phosphorus (2.5.18), by an immunochemical method (2.7.1) or by anion-exchange liquid chromatography (2.2.29) with pulsed amperometric detection.

**Aluminium (2.5.13)**

Maximum 1.25 mg per single human dose, if aluminium hydroxide or hydrated aluminium phosphate is used as the adsorbent.

**Free formaldehyde (2.4.18)**

Maximum 0.2 g/L of free formaldehyde per single human dose.

**Antimicrobial preservative**

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The content is not less than the minimum amount shown to be effective and is not greater than 115 per cent of the quantity stated on the label.

**Water (2.5.12)**

Maximum 3.0 per cent for the freeze-dried haemophilus component.

**Sterility (2.6.1)**

The vaccine complies with the test for sterility.

**ASSAY****Diphtheria component**

Carry out one of the prescribed methods for the assay of diphtheria vaccine (adsorbed) (2.7.6).

The lower confidence limit ( $P = 0.95$ ) of the estimated potency is not less than the minimum potency stated on the label.

Unless otherwise justified and authorised, the minimum potency stated on the label is 30 IU per single human dose.

**Tetanus component**

Carry out one of the prescribed methods for the assay of tetanus vaccine (adsorbed) (2.7.8).

The lower confidence limit ( $P = 0.95$ ) of the estimated potency is not less than 40 IU per single human dose.

**Pertussis component**

Carry out one of the prescribed methods for the assay of pertussis vaccine (acellular) (2.7.16). The vaccine complies with the limit approved for the particular product.

**Hepatitis B component**

The vaccine complies with the assay of hepatitis B vaccine (2.7.15).

**Poliomyelitis component**

**D-antigen content** As a measure of consistency of production, determine the D-antigen content for human poliovirus types 1, 2 and 3 by a suitable immunochemical method (2.7.1) following desorption, using a reference preparation calibrated in European Pharmacopoeia Units of D-antigen. For each type, the content, expressed with reference to the amount of D-antigen stated on the label, is within the limits approved for the particular product. **Poliomyelitis vaccine (inactivated)** BRP is calibrated in European Pharmacopoeia Units and intended for use in the assay of D-antigen. The European Pharmacopoeia Unit and the International Unit are equivalent.

**In vivo test** The vaccine complies with the *in vivo* assay of poliomyelitis vaccine (inactivated) (2.7.20).

**LABELLING**

The label states:

- the minimum number of International Units of diphtheria and tetanus toxoid per single human dose;
- the names and amounts of the pertussis components per single human dose;
- where applicable, that the vaccine contains a pertussis toxin-like protein produced by genetic modification;

- the amount of HBsAg per single human dose;
- the nominal amount of poliovirus of each type (1, 2 and 3), expressed in European Pharmacopoeia Units of D-antigen, per single human dose;
- the types of cells used for production of the poliomyelitis and the hepatitis B components;
- the number of micrograms of PRP per single human dose;
- the type and nominal amount of carrier protein per single human dose;
- the name and the amount of the adsorbent;
- where applicable, that the vaccine is intended for primary vaccination of children and is not necessarily suitable for reinforcing doses or for administration to adults;
- that the vaccine must be shaken before use;
- that the vaccine is not to be frozen.

Ph Eur

## Diphtheria, Tetanus, Pertussis (Whole Cell), Poliomyelitis (Inactivated) and Haemophilus Type b Conjugate Vaccine (Adsorbed)

Diphtheria, Tetanus, Pertussis, Poliomyelitis (Inactivated) and Haemophilus Type b Conjugate Vaccine (Adsorbed)

(Ph. Eur. monograph 2066)

The label may state 'DTwP/IPV/Hib'.

Ph Eur

**DEFINITION**

Diphtheria, tetanus, pertussis (whole cell), poliomyelitis (inactivated) and haemophilus type b conjugate vaccine (adsorbed) is a combined vaccine composed of: diphtheria formol toxoid; tetanus formol toxoid; an inactivated suspension of *Bordetella pertussis*; suitable strains of human poliovirus types 1, 2 and 3 grown in suitable cell cultures and inactivated by a suitable method; polyribosylribitol phosphate (PRP) covalently bound to a carrier protein; a mineral adsorbent such as aluminium hydroxide or hydrated aluminium phosphate. The product is presented with the haemophilus component in a separate container, the contents of which are mixed with the other components immediately before use.

The formol toxoids are prepared from the toxins produced by the growth of *Corynebacterium diphtheriae* and *Clostridium tetani* respectively.

PRP is a linear copolymer composed of repeated units of 3-β-D-ribofuranosyl-(1 → 1)-ribitol-5-phosphate [(C<sub>10</sub>H<sub>19</sub>O<sub>11</sub>P)<sub>n</sub>], with a defined molecular size and derived from a suitable strain of *Haemophilus influenzae* type b. The carrier protein, when conjugated to PRP, is capable of inducing a T-cell-dependent B-cell immune response to the polysaccharide.

**PRODUCTION****GENERAL PROVISIONS**

The production method shall have been shown to yield consistently vaccines comparable with the vaccine of proven clinical efficacy and safety in man.

During development studies, it shall be demonstrated that the vaccine consistently induces a T-cell-dependent B-cell immune response to PRP. If the manufacturing process is modified, it shall be demonstrated by appropriate *in vitro* methods that the characteristic properties of the conjugate are not affected.

As part of consistency studies the assays of the diphtheria, tetanus, pertussis and poliomyelitis components are carried out on a suitable number of batches of vaccine reconstituted as for use. For subsequent routine control, the assays of these components may be carried out without mixing with the haemophilus component.

For the haemophilus component, the production method is validated to demonstrate that the haemophilus component, if tested, would comply with the test for pyrogens (2.6.8), carried out as follows: inject per kilogram of the rabbit's mass a quantity of the vaccine equivalent to: 1 µg of PRP for a vaccine with diphtheria toxoid or CRM 197 diphtheria protein as carrier; 0.1 µg of PRP for a vaccine with tetanus toxoid as carrier; 0.025 µg of PRP for a vaccine with OMP (meningococcal group B outer membrane protein complex) as carrier.

**Reference vaccine(s)** Provided valid assays can be performed, monocomponent reference vaccines may be used for the assays on the combined vaccine. If this is not possible because of interaction between the components of the combined vaccine or because of the difference in composition between monocomponent reference vaccine and the test vaccine, a batch of combined vaccine shown to be effective in clinical trials or a batch representative thereof is used as a reference vaccine. For the preparation of a representative batch, strict adherence to the production process used for the batch tested in clinical trials is necessary. The reference vaccine may be stabilised by a method that has been shown to have no effect on the assay procedure.

#### Specific toxicity of the diphtheria component

The production method is validated to demonstrate that the product, if tested, would comply with the following test: inject subcutaneously 5 times the single human dose stated on the label into each of 5 healthy guinea-pigs, each weighing 250-350 g, that have not previously been treated with any material that will interfere with the test. If within 42 days of the injection any of the animals shows signs of or dies from diphtheria toxæmia, the vaccine does not comply with the test. If more than 1 animal dies from non-specific causes, repeat the test once; if more than 1 animal dies in the second test, the vaccine does not comply with the test.

#### PRODUCTION OF THE COMPONENTS

The production of the components complies with the requirements of the monographs *Diphtheria vaccine (adsorbed)* (0443), *Tetanus vaccine (adsorbed)* (0452), *Pertussis vaccine (whole cell, adsorbed)* (0161), *Poliomyelitis vaccine (inactivated)* (0214) and *Haemophilus type b conjugate vaccine* (1219).

#### FINAL BULKS

The final bulk of the diphtheria, tetanus, pertussis and poliomyelitis components is prepared by adsorption, separately or together, of suitable quantities of bulk purified diphtheria toxoid, and bulk purified tetanus toxoid onto a mineral carrier such as aluminium hydroxide or hydrated aluminium phosphate and admixture of suitable quantities of an inactivated suspension of *B. pertussis* and of purified, monovalent harvests of human poliovirus types 1, 2 and 3 or a suitable quantity of a trivalent pool of such monovalent harvests. Suitable antimicrobial preservatives may be added.

The final bulk of the haemophilus component is prepared by dilution of the bulk conjugate to the final concentration with a suitable diluent. A stabiliser may be added.

Only final bulks that comply with the following requirements may be used in the preparation of the final lot.

#### Bovine serum albumin

Determined on the poliomyelitis component by a suitable immunochemical method (2.7.1) during preparation of the final bulk vaccine, before addition of the adsorbent, the amount of bovine serum albumin is such that the content in the final vaccine will be not more than 50 ng per single human dose.

#### Antimicrobial preservative

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The amount is not less than 85 per cent and not greater than 115 per cent of the intended content.

#### Sterility (2.6.1)

Carry out the test for sterility using 10 mL for each medium.

#### FINAL LOT

The final bulk of the haemophilus component is freeze-dried. Only a final lot that is satisfactory with respect to the test for osmolality shown below and with respect to each of the requirements given below under Identification, Tests and Assay may be released for use.

Provided the tests for specific toxicity of the pertussis component and antimicrobial preservative, and the assays for the diphtheria, tetanus and pertussis components have been carried out with satisfactory results on the final bulk vaccine, they may be omitted on the final lot.

Provided the free formaldehyde content has been determined on the bulk purified antigens, the inactivated *B. pertussis* suspension and the purified monovalent harvests or the trivalent pool of polioviruses or on the final bulk and it has been shown that the content in the final lot will not exceed 0.2 g/L, the test for free formaldehyde may be omitted on the final lot.

Provided the *in vivo* assay for the poliomyelitis component has been carried out with satisfactory results on the final bulk vaccine, it may be omitted on the final lot.

The *in vivo* assay for the poliomyelitis component may be omitted once it has been demonstrated for a given product and for each poliovirus type that the acceptance criteria for the D-antigen determination are such that it yields the same result as the *in vivo* assay in terms of acceptance or rejection of a batch. This demonstration must include testing of subpotent batches, produced experimentally if necessary, for example by heat treatment or other means of diminishing the immunogenic activity. Where there is a significant change in the manufacturing process of the antigens or their formulation, any impact on the *in vivo* and *in vitro* assays must be evaluated, and the need for revalidation considered.

#### Osmolality (2.2.35)

The osmolality of the vaccine, reconstituted where applicable, is within the limits approved for the particular preparation.

#### Free PRP

Unbound PRP is determined on the haemophilus component after removal of the conjugate, for example by anion-exchange, size-exclusion or hydrophobic chromatography, ultrafiltration or other validated methods. The amount of free PRP is not greater than that approved for the particular product.

**IDENTIFICATION**

Identification tests A, B, C and D are carried out using the vial containing the diphtheria, tetanus, pertussis and poliomyelitis components; identification test E is carried out on the vial containing the haemophilus component.

A. Diphtheria toxoid is identified by a suitable immunochemical method (2.7.1). The following method, applicable to certain vaccines, is given as an example. Dissolve in the vaccine to be examined sufficient sodium citrate R to give a 100 g/L solution. Maintain at 37 °C for about 16 h and centrifuge until a clear supernatant is obtained. The clear supernatant reacts with a suitable diphtheria antitoxin, giving a precipitate.

B. Tetanus toxoid is identified by a suitable immunochemical method (2.7.1). The following method, applicable to certain vaccines, is given as an example. The clear supernatant obtained during identification test A reacts with a suitable tetanus antitoxin, giving a precipitate.

C. The centrifugation residue obtained in identification A may be used. Other suitable methods for separating the bacteria from the adsorbent may also be used. Identify pertussis vaccine by agglutination of the bacteria from the resuspended precipitate by antisera specific to *B. pertussis* or by the assay of the pertussis component prescribed under Assay.

D. The vaccine is shown to contain human poliovirus types 1, 2 and 3 by a suitable immunochemical method (2.7.1), such as determination of D-antigen by enzyme-linked immunosorbent assay (ELISA).

E. The haemophilus component is identified by a suitable immunochemical method (2.7.1) for PRP.

**TESTS**

The tests for specific toxicity of the pertussis component, aluminium, free formaldehyde, antimicrobial preservative and sterility are carried out on the container with diphtheria, tetanus, pertussis and poliomyelitis components; the tests for PRP, water, sterility and bacterial endotoxins are carried out on the container with the haemophilus component.

Some tests for the haemophilus component may be carried out on the freeze-dried product rather than on the bulk conjugate where the freeze-drying process may affect the component to be tested.

**Specific toxicity of the pertussis component**

Use not fewer than 5 healthy mice each weighing 14–16 g, for the vaccine group and for the saline control. Use mice of the same sex or distribute males and females equally between the groups. Allow the animals access to food and water for at least 2 h before injection and during the test. Inject each mouse of the vaccine group intraperitoneally with 0.5 mL, containing a quantity of the vaccine equivalent to not less than half the single human dose. Inject each mouse of the control group with 0.5 mL of a 9 g/L sterile solution of sodium chloride R, preferably containing the same amount of antimicrobial preservative as that injected with the vaccine. Weigh the groups of mice immediately before the injection and 72 h and 7 days after the injection. The vaccine complies with the test if: (a) at the end of 72 h the total mass of the group of vaccinated mice is not less than that preceding the injection; (b) at the end of 7 days the average increase in mass per vaccinated mouse is not less than 60 per cent of that per control mouse; and (c) not more than 5 per cent of the vaccinated mice die during the test. The test may be repeated and the results of the tests combined.

**PRP**

Minimum 80 per cent of the amount of PRP stated on the label. PRP is determined either by assay of ribose (2.5.31) or phosphorus (2.5.18), by an immunochemical method (2.7.1) or by anion-exchange liquid chromatography (2.2.29) with pulsed amperometric detection.

**Aluminium (2.5.13)**

Maximum 1.25 mg per single human dose, if aluminium hydroxide or hydrated aluminium phosphate is used as the adsorbent.

**Free formaldehyde (2.4.18)**

Maximum 0.2 g/L.

**Antimicrobial preservative**

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The content is not less than the minimum amount shown to be effective and is not greater than 115 per cent of the quantity stated on the label.

**Water (2.5.12)**

Maximum 3.0 per cent for the haemophilus component.

**Sterility (2.6.1)**

The vaccine complies with the test for sterility.

**Bacterial endotoxins (2.6.14)**

The content is within the limits approved by the competent authority for the haemophilus component of the particular product. If any components of the vaccine prevent the determination of endotoxin, a test for pyrogens is carried out as described under General provisions.

**ASSAY****Diphtheria component**

Carry out one of the prescribed methods for the assay of diphtheria vaccine (adsorbed) (2.7.6).

The lower confidence limit ( $P = 0.95$ ) of the estimated potency is not less than 30 IU per single human dose.

**Tetanus component**

Carry out one of the prescribed methods for the assay of tetanus vaccine (adsorbed) (2.7.8).

If the test is carried out in guinea-pigs, the lower confidence limit ( $P = 0.95$ ) of the estimated potency is not less than 40 IU per single human dose; if the test is carried out in mice, the lower confidence limit ( $P = 0.95$ ) of the estimated potency is not less than 60 IU per single human dose.

**Pertussis component**

Carry out the assay of pertussis vaccine (whole cell) (2.7.7).

The estimated potency is not less than 4.0 IU per single human dose and the lower confidence limit ( $P = 0.95$ ) of the estimated potency is not less than 2.0 IU per single human dose.

**Poliomyelitis component**

**D-antigen content** As a measure of consistency of production, determine the D-antigen content for human poliovirus types 1, 2 and 3 by a suitable immunochemical method (2.7.1) following desorption using a reference preparation calibrated in European Pharmacopoeia Units of D-antigen. For each type, the content, expressed with reference to the amount of D-antigen stated on the label, is within the limits approved for the particular product.

**Poliomyelitis vaccine (inactivated) BRP** is calibrated in European Pharmacopoeia Units and intended for use in the assay of D-antigen. The European Pharmacopoeia Unit and the International Unit are equivalent.

**In vivo test** The vaccine complies with the *in vivo* assay of poliomyelitis vaccine (inactivated) (2.7.20).

**LABELLING**

The label states:

- the minimum number of International Units of diphtheria and tetanus toxoid per single human dose;
- the minimum number of International Units of pertussis vaccine per single human dose;
- the nominal amount of poliovirus of each type (1, 2 and 3), expressed in European Pharmacopoeia Units of D-antigen, per single human dose;
- the type of cells used for production of the poliomyelitis component;
- the number of micrograms of PRP per single human dose;
- the type and nominal amount of carrier protein per single human dose;
- the name and the amount of the adsorbent;
- where applicable, that the vaccine is intended for primary vaccination of children and is not necessarily suitable for reinforcing doses or for administration to adults;
- that the vaccine must be shaken before use;
- that the vaccine is not to be frozen.

Ph Eur

## Diphtheria, Tetanus, Pertussis (Whole Cell) and Poliomyelitis (Inactivated) Vaccine (Adsorbed)

Diphtheria, Tetanus, Pertussis and Poliomyelitis (Inactivated) Vaccine (Adsorbed)

(Ph. Eur. monograph 2061)

The label may state 'DTwP/IPV'.

Ph Eur

**DEFINITION**

Diphtheria, tetanus, pertussis (whole cell) and poliomyelitis (inactivated) vaccine (adsorbed) is a combined vaccine containing: diphtheria formol toxoid; tetanus formol toxoid; an inactivated suspension of *Bordetella pertussis*; suitable strains of human poliovirus types 1, 2 and 3 grown in suitable cell cultures and inactivated by a validated method; a mineral adsorbent such as aluminium hydroxide or hydrated aluminium phosphate.

The formol toxoids are prepared from the toxins produced by the growth of *Corynebacterium diphtheriae* and *Clostridium tetani* respectively.

**PRODUCTION****GENERAL PROVISIONS**

The production method shall have been shown to yield consistently vaccines comparable with the vaccine of proven clinical efficacy and safety in man.

**Specific toxicity of the diphtheria component**

The production method is validated to demonstrate that the product, if tested, would comply with the following test: inject subcutaneously 5 times the single human dose stated on the label into each of 5 healthy guinea-pigs, each weighing 250-350 g, that have not previously been treated with any material that will interfere with the test. If within 42 days of the injection any of the animals shows signs of or dies from diphtheria toxæmia, the vaccine does not comply with the test. If more than 1 animal dies from non-specific causes, repeat the test once; if more than 1 animal dies in the second test, the vaccine does not comply with the test.

**Reference vaccine(s)** Provided valid assays can be performed, monocomponent reference vaccines may be used for the assays on the combined vaccine. If this is not possible because of interaction between the components of the combined vaccine or because of the difference in composition between monocomponent reference vaccine and the test vaccine, a batch of combined vaccine shown to be effective in clinical trials or a batch representative thereof is used as a reference vaccine. For the preparation of a representative batch, strict adherence to the production process used for the batch tested in clinical trials is necessary. The reference vaccine may be stabilised by a method that has been shown to have no effect on the assay procedure.

**PRODUCTION OF THE COMPONENTS**

The production of the components complies with the requirements of the monographs *Diphtheria vaccine (adsorbed)* (0443), *Tetanus vaccine (adsorbed)* (0452), *Pertussis vaccine (whole cell, adsorbed)* (0161) and *Poliomyelitis vaccine (inactivated)* (0214).

**FINAL BULK VACCINE**

The final bulk vaccine is prepared by adsorption onto a mineral carrier such as aluminium hydroxide or hydrated aluminium phosphate, separately or together, of suitable quantities of bulk purified diphtheria toxoid and bulk purified tetanus toxoid and admixture of suitable quantities of an inactivated suspension of *B. pertussis* and purified monovalent harvests of human poliovirus types 1, 2 and 3 or a suitable quantity of a trivalent pool of such purified monovalent harvests. Suitable antimicrobial preservatives may be added. Only a final bulk vaccine that complies with the following requirements may be used in the preparation of the final lot.

**Bovine serum albumin**

Determined on the poliomyelitis component by a suitable immunochemical method (2.7.1) during preparation of the final bulk vaccine, before addition of the adsorbent, the amount of bovine serum albumin is such that the content in the final vaccine will be not more than 50 ng per single human dose.

**Antimicrobial preservative**

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The amount is not less than 85 per cent and not greater than 115 per cent of the intended content.

**Sterility (2.6.1)**

Carry out the test for sterility using 10 mL for each medium.

**FINAL LOT**

Only a final lot that is satisfactory with respect to the test for osmolality and with respect to each of the requirements given below under Identification, Tests and Assay may be released for use.

Provided that the tests for specific toxicity of the pertussis component and antimicrobial preservative, and the assays for the diphtheria, tetanus and pertussis components have been carried out with satisfactory results on the final bulk vaccine, they may be omitted on the final lot.

Provided that the free formaldehyde content has been determined on the bulk purified antigens, the inactivated *B. pertussis* suspension and the purified monovalent harvests or the trivalent pool of polioviruses or on the final bulk and it has been shown that the content in the final lot will not exceed 0.2 g/L, the test for free formaldehyde may be omitted on the final lot.

Provided that the *in vivo* assay for the poliomyelitis component has been carried out with satisfactory results on the final bulk vaccine, it may be omitted on the final lot.

The *in vivo* assay for the poliomyelitis component may be omitted once it has been demonstrated for a given product and for each poliovirus type that the acceptance criteria for the D-antigen determination are such that it yields the same result as the *in vivo* assay in terms of acceptance or rejection of a batch. This demonstration must include testing of subpotent batches, produced experimentally if necessary, for example by heat treatment or other means of diminishing the immunogenic activity. Where there is a significant change in the manufacturing process of the antigens or their formulation, any impact on the *in vivo* and *in vitro* assays must be evaluated, and the need for revalidation considered.

#### Osmolality (2.2.35)

The osmolality of the vaccine is within the limits approved for the particular preparation.

#### IDENTIFICATION

A. Diphtheria toxoid is identified by a suitable immunochemical method (2.7.1). The following method, applicable to certain vaccines, is given as an example.

Dissolve in the vaccine to be examined sufficient sodium citrate R to give a 100 g/L solution. Maintain at 37 °C for about 16 h and centrifuge until a clear supernatant is obtained. The clear supernatant reacts with a suitable diphtheria antitoxin, giving a precipitate.

B. Tetanus toxoid is identified by a suitable immunochemical method (2.7.1). The following method, applicable to certain vaccines, is given as an example. The clear supernatant obtained during identification test A reacts with a suitable tetanus antitoxin, giving a precipitate.

C. The centrifugation residue obtained in identification A may be used. Other suitable methods for separating the bacteria from the adsorbent may also be used. Identify pertussis vaccine by agglutination of the bacteria from the resuspended precipitate by antisera specific to *B. pertussis* or by the assay of the pertussis component prescribed under Assay.

D. The vaccine is shown to contain human poliovirus types 1, 2 and 3 by a suitable immunochemical method (2.7.1) such as the determination of D-antigen by enzyme-linked immunosorbent assay (ELISA).

#### TESTS

##### Specific toxicity of the pertussis component

Use not fewer than 5 healthy mice each weighing 14–16 g for the vaccine group and for the saline control. Use mice of the same sex or distribute males and females equally between the groups. Allow the animals access to food and water for at least 2 h before injection and during the test. Inject each mouse of the vaccine group intraperitoneally with 0.5 mL, containing a quantity of the vaccine equivalent to not less than half the single human dose. Inject each mouse of the control group with 0.5 mL of a 9 g/L sterile solution of sodium chloride R, preferably containing the same amount of antimicrobial preservative as that injected with the vaccine. Weigh the groups of mice immediately before the injection and 72 h and 7 days after the injection. The vaccine complies with the test if: (a) at the end of 72 h the total mass of the group of vaccinated mice is not less than that preceding the injection; (b) at the end of 7 days the average increase in mass per vaccinated mouse is not less than 60 per cent of that per control mouse; and (c) not more than 5 per cent of the vaccinated mice die during the test.

The test may be repeated and the results of the tests combined.

#### Aluminium (2.5.13)

Maximum 1.25 mg per single human dose, if aluminium hydroxide or hydrated aluminium phosphate is used as the adsorbent.

#### Free formaldehyde (2.4.18)

Maximum 0.2 g/L.

#### Antimicrobial preservative

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The content is not less than the minimum amount shown to be effective and is not greater than 115 per cent of the quantity stated on the label.

#### Sterility (2.6.1)

The vaccine complies with the test for sterility.

#### ASSAY

##### Diphtheria component

Carry out one of the prescribed methods for the assay of diphtheria vaccine (adsorbed) (2.7.6).

The lower confidence limit ( $P = 0.95$ ) of the estimated potency is not less than 30 IU per single human dose.

##### Tetanus component

Carry out one of the prescribed methods for the assay of tetanus vaccine (adsorbed) (2.7.8).

If the test is carried out in guinea pigs, the lower confidence limit ( $P = 0.95$ ) of the estimated potency is not less than 40 IU per single human dose; if the test is carried out in mice, the lower confidence limit ( $P = 0.95$ ) of the estimated potency is not less than 60 IU per single human dose.

##### Pertussis component

Carry out the assay of pertussis vaccine (whole cell) (2.7.7).

The estimated potency is not less than 4.0 IU per single human dose and the lower confidence limit ( $P = 0.95$ ) of the estimated potency is not less than 2.0 IU per single human dose.

##### Poliomyelitis component

**D-antigen content** As a measure of consistency of production, determine the D-antigen content for human poliovirus types 1, 2 and 3 by a suitable immunochemical method (2.7.1) following desorption, using a reference preparation calibrated in European Pharmacopoeia Units of D-antigen. For each type, the content, expressed with reference to the amount of D-antigen stated on the label, is within the limits approved for the particular product.

**Poliomyelitis vaccine (inactivated) BRP** is calibrated in European Pharmacopoeia Units and intended for use in the assay of D-antigen. The European Pharmacopoeia Unit and the International Unit are equivalent.

**In vivo test** The vaccine complies with the *in vivo* assay of poliomyelitis vaccine (inactivated) (2.7.20).

#### LABELLING

The label states:

- the minimum number of International Units of diphtheria and tetanus toxoid per single human dose;
- the minimum number of International Units of pertussis vaccine per single human dose;
- the nominal amount of poliovirus of each type (1, 2 and 3), expressed in European Pharmacopoeia Units of D-antigen, per single human dose;
- the type of cells used for production of the poliomyelitis component;
- the name and the amount of the adsorbent;

- where applicable, that the vaccine is intended for primary vaccination of children and is not necessarily suitable for reinforcing doses or for administration to adults;
- that the vaccine must be shaken before use;
- that the vaccine is not to be frozen.

Ph Eur

## Haemophilus Type b Conjugate Vaccine

(Ph. Eur. monograph 1219)

The label may state 'Hib'.

Ph Eur

### DEFINITION

Haemophilus type b conjugate vaccine is a liquid or freeze-dried preparation of a polysaccharide, derived from a suitable strain of *Haemophilus influenzae* type b, covalently bound to a carrier protein. The polysaccharide, polyribosylribitol phosphate, referred to as PRP, is a linear copolymer composed of repeated units of 3-β-D-ribofuranosyl-(1→1)-ribitol-5-phosphate [(C<sub>10</sub>H<sub>19</sub>O<sub>12</sub>P)<sub>n</sub>], with a defined molecular size. The carrier protein, when conjugated to PRP, is capable of inducing a T-cell-dependent B-cell immune response to the polysaccharide.

### PRODUCTION

#### GENERAL PROVISIONS

The production method shall have been shown to yield consistently haemophilus type b conjugate vaccines of adequate safety and immunogenicity in man. The production of PRP and of the carrier protein are based on seed-lot systems.

The production method is validated to demonstrate that the product, if tested, would comply with the test for pyrogens (2.6.8), carried out as follows: inject per kilogram of the rabbit's mass a quantity of the vaccine equivalent to: 1 µg of PRP for a vaccine with diphtheria toxoid or CRM 197 diphtheria protein as carrier; 0.1 µg of PRP for a vaccine with tetanus toxoid as carrier; 0.025 µg of PRP for a vaccine with OMP (meningococcal group B outer membrane protein complex) as carrier.

During development studies, it shall be demonstrated that the vaccine consistently induces a T-cell-dependent B-cell immune response to PRP. If the manufacturing process is modified, it shall be demonstrated by appropriate *in vitro* methods that the characteristic properties of the vaccine are not affected.

The stability of the final lot and relevant intermediates is evaluated using one or more indicator tests. Such tests may include determination of molecular size, determination of free PRP in the conjugate and the immunogenicity test in mice. Taking account of the results of the stability testing, release requirements are set for these indicator tests to ensure that the vaccine will be satisfactory at the end of the period of validity.

#### BACTERIAL SEED LOTS

The seed lots of *H. influenzae* type b are shown to be free from contamination by methods of suitable sensitivity. These may include inoculation into suitable media, examination of colony morphology, microscopic examination of Gram-stained smears and culture agglutination with suitable specific antisera.

No complex products of animal origin are included in the medium used for preservation of strain viability, either for freeze-drying or for frozen storage.

It is recommended that PRP produced by the seed lot be characterised using nuclear magnetic resonance spectrometry (2.2.33).

#### H. INFLUENZAE TYPE B POLYSACCHARIDE (PRP)

*H. influenzae* type b is grown in a liquid medium that does not contain high-molecular-mass polysaccharides; if any ingredient of the medium contains blood-group substances, the process shall be validated to demonstrate that after the purification step they are no longer detectable. The bacterial purity of the culture is verified by methods of suitable sensitivity. These may include inoculation into suitable media, examination of colony morphology, microscopic examination of Gram-stained smears and culture agglutination with suitable specific antisera. The culture may be inactivated. PRP is separated from the culture medium and purified by a suitable method. Volatile matter, including water, in the purified polysaccharide is determined by a suitable method; the result is used to calculate the results of certain tests with reference to the dried substance, as prescribed below.

Only PRP that complies with the following requirements may be used in the preparation of the conjugate.

#### Identification

PRP is identified by an immunochemical method (2.7.1) or other suitable method, for example <sup>1</sup>H nuclear magnetic resonance spectrometry (2.2.33).

#### Molecular-size or molecular-mass distribution

Molecular-size or molecular-mass distribution is determined by size-exclusion chromatography (2.2.30) combined with an appropriate detection system. Where applicable, the molecular-size distribution is also determined after chemical modification of the polysaccharide. An acceptable value is established for the PRP polysaccharide. Each batch must be shown to comply with this limit.

#### Ribose (2.5.31)

Within the limits approved by the competent authority for the particular product, calculated with reference to the dried substance.

#### Phosphorus (2.5.18)

Within the limits approved by the competent authority for the particular product, calculated with reference to the dried substance.

#### Protein (2.5.16)

Maximum 1.0 per cent, calculated with reference to the dried substance. Use sufficient PRP to allow detection of proteins at concentrations of 1 per cent or greater.

#### Nucleic acid (2.5.17)

Maximum 1.0 per cent, calculated with reference to the dried substance.

#### Bacterial endotoxins (2.6.14)

Less than 10 IU per microgram of PRP.

#### Residual reagents

Where applicable, tests are carried out to determine residues of reagents used during inactivation and purification. An acceptable value for each reagent is established for the particular product and each batch of PRP must be shown to comply with this limit. Where validation studies have demonstrated removal of a residual reagent, the test on PRP may be omitted.

**CARRIER PROTEIN**

The production and characteristics of the carrier proteins are described in general chapter 5.2.11. *Carrier proteins for the production of conjugated polysaccharide vaccines for human use.* Only a carrier protein that complies with the requirements of this chapter may be used in the preparation of the conjugate.

**BULK CONJUGATE**

PRP is chemically modified to enable conjugation; it is usually partly depolymerised either before or during this procedure. Reactive functional groups or spacers may be introduced into the appropriate carrier protein or PRP prior to conjugation. As a measure of consistency, the extent of derivatisation is monitored. The conjugate is obtained by the covalent binding of PRP and the appropriate carrier protein. Where applicable, unreacted but potentially reactogenic functional groups are made unreactive by means of capping agents; the conjugate is purified to remove reagents.

Only a bulk conjugate that complies with the following requirements may be used in the preparation of the final bulk vaccine. For each test and for each particular product, limits of acceptance are established and each batch of conjugate must be shown to comply with these limits. For a freeze-dried vaccine, some of the tests may be carried out on the final lot rather than on the bulk conjugate where the freeze-drying process may affect the component being tested.

**PRP**

The PRP content is determined either by assay of ribose (2.5.31) or phosphorus (2.5.18), by an immunochemical method (2.7.1) or by anion-exchange liquid chromatography (2.2.29) with pulsed amperometric detection.

**Protein**

The protein content is determined by a suitable chemical method (for example, 2.5.16).

**PRP-to-protein ratio**

Determine the ratio by calculation.

**Molecular-size or molecular-mass distribution**

Molecular-size or molecular-mass distribution is determined by size-exclusion chromatography (2.2.30) combined with an appropriate detection system. An acceptable value is established for the bulk conjugate. Each batch must be shown to comply with this limit.

**Free PRP**

A number of methods are used to separate free PRP from the conjugate, including precipitation, gel filtration, size-exclusion, anion-exchange and hydrophobic chromatography, ultrafiltration and ultracentrifugation. The free PRP can then be quantified by a range of techniques, including high-performance anion-exchange chromatography with pulsed amperometric detection (HPAEC-PAD) and immunoassays with anti-PRP antibodies.

**Free carrier protein**

Determine the content by a suitable method, either directly or by deriving the content by calculation from the results of other tests. The amount is within the limits approved for the particular product.

**Unreacted functional groups**

No unreacted functional groups are detectable in the bulk conjugate unless process validation has shown that unreacted functional groups detectable at this stage are removed during the subsequent manufacturing process (for example, owing to short half-life).

**Residual reagents**

Removal of residual reagents such as cyanide, EDAC (ethyl(dimethylamino)propylcarbodiimide) and phenol is confirmed by suitable tests or by validation of the process.

**Sterility (2.6.1)**

Carry out the test using for each medium 10 mL or the equivalent of 100 doses, whichever is less.

**FINAL BULK VACCINE**

An adjuvant, an antimicrobial preservative and a stabiliser may be added to the bulk conjugate before dilution to the final concentration with a suitable diluent.

Only a final bulk vaccine that complies with the following requirements may be used in the preparation of the final lot.

**Antimicrobial preservative**

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical or physico-chemical method. The content is not less than 85 per cent and not greater than 115 per cent of the intended amount.

**Sterility (2.6.1)**

It complies with the test for sterility, carried out using 10 mL for each medium.

**FINAL LOT**

Only a final lot that is satisfactory with respect to each of the following requirements and the requirements given below under Identification and Tests may be released for use. Provided the test for antimicrobial preservative has been carried out on the final bulk vaccine, it may be omitted on the final lot.

**pH (2.2.3)**

The pH of the vaccine, reconstituted if necessary, is within the limits approved for the particular product.

**Free PRP**

A number of methods are used to separate free PRP from the conjugate, including precipitation, gel filtration, size-exclusion, anion-exchange and hydrophobic chromatography, ultrafiltration and ultracentrifugation. The free PRP can then be quantified by a range of techniques, including HPAEC-PAD and immunoassays with anti-PRP antibodies. The amount of free PRP is not greater than that approved for the particular product.

**IDENTIFICATION**

The vaccine is identified by a suitable immunochemical method (2.7.1) for PRP.

**TESTS****PRP**

Minimum 80 per cent of the amount of PRP stated on the label. PRP is determined either by assay of ribose (2.5.31) or phosphorus (2.5.18), by an immunochemical method (2.7.1) or by anion-exchange liquid chromatography (2.2.29) with pulsed amperometric detection.

**Aluminium (2.5.13)**

Maximum 1.25 mg per single human dose, if aluminium hydroxide or hydrated aluminium phosphate is used as the adsorbent.

**Antimicrobial preservative**

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical or physico-chemical method. The content is not less than the minimum amount shown to be effective and not greater than 115 per cent of the quantity stated on the label.

**Water (2.5.12)**

Maximum 3.0 per cent for freeze-dried vaccines.

**Sterility (2.6.1)**

It complies with the test for sterility.

**Bacterial endotoxins (2.6.14)**

The content is within the limits approved by the competent authority for the particular product. If any components of the vaccine prevent the determination of endotoxin, a test for pyrogens is carried out as described under General provisions.

**LABELLING**

The label states:

- the number of micrograms of PRP per single human dose;
- the type and nominal amount of carrier protein per single human dose.

Ph Eur

## Haemophilus Type b and Meningococcal Group C Conjugate Vaccine

(Ph. Eur. monograph 2622)

Ph Eur

**DEFINITION**

Haemophilus type b and meningococcal group C conjugate vaccine is a combined vaccine composed of a preparation of a polysaccharide derived from a suitable strain of *Haemophilus influenzae* type b covalently bound to a carrier protein and a preparation of purified capsular polysaccharide derived from a suitable strain of *Neisseria meningitidis* group C covalently bound to a carrier protein. The haemophilus type b polysaccharide, polyribosylribitol phosphate (referred to as PRP), is a linear copolymer composed of repeating units of 3-β-D-ribofuranosyl-(1→1)-ribitol-5-phosphate [(C<sub>10</sub>H<sub>19</sub>O<sub>12</sub>P)<sub>n</sub>], with a defined molecular size. Meningococcal group C polysaccharide consists of partly O-acetylated or O-deacetylated repeating units of sialic acids, linked with 2α→9 glycosidic bonds. The carrier proteins, when conjugated to PRP and group C polysaccharide, are capable of inducing a T-cell-dependent B-cell immune response to the polysaccharide.

**PRODUCTION****GENERAL PROVISIONS**

The production method shall have been shown to consistently yield combined haemophilus type b and meningococcal group C conjugate vaccines of adequate safety and immunogenicity in man. The production of PRP, group C polysaccharide and the carrier protein(s) are based on seed-lot systems.

During development studies and wherever revalidation is necessary, a test for pyrogens (2.6.8) is carried out by injection of a suitable dose of the final lot as follows: inject, per kilogram of the rabbit's mass, a quantity of the vaccine equivalent to 0.1 µg of PRP. The vaccine is shown to be acceptable with respect to absence of pyrogenic activity.

During development studies and wherever revalidation of the manufacturing process is necessary, it shall be demonstrated by tests in animals that the vaccine consistently induces a T-cell-dependent B-cell immune response.

The stability of the final lot and relevant intermediates is evaluated using 1 or more indicator tests. Such tests may include determination of molecular size, determination of free

polysaccharide in the conjugate and the immunogenicity test in mice.

**BACTERIAL SEED LOTS**

The bacterial strains used for master seed lots shall be identified by historical records that include information on their origin and the tests used to characterise the strain. Cultures from the working seed lot shall have the same characteristics as the strain that was used to prepare the master seed lot.

The seed lots are shown to be free from contamination by methods of suitable sensitivity. These may include inoculation into suitable media, examination of colony morphology, microscopic examination of Gram-stained smears and culture agglutination with suitable specific antisera.

No complex products of animal origin are included in the medium used for preservation of strain viability, either for freeze-drying or for frozen storage.

It is recommended that PRP produced by the seed lot be characterised using nuclear magnetic resonance spectrometry (2.2.33).

**PRODUCTION OF THE COMPONENTS**

The production of the bulks and bulk conjugate components complies with the requirements of the monographs *Haemophilus type b conjugate vaccine (1219)*, *Meningococcal group C conjugate vaccine (2112)* and the general chapter 5.2.11. *Carrier proteins for the production of conjugated polysaccharide vaccines for human use*.

**FINAL BULK VACCINE**

Only a final bulk vaccine that complies with the following requirement and is within the limits approved for the particular product may be used in the preparation of the final lot.

**Sterility (2.6.1)**

It complies with the test for sterility, carried out using 10 mL for each medium.

**FINAL LOT**

Only a final lot that is satisfactory with respect to each of the requirements given below under Identification, Tests and Assay may be released for use.

**IDENTIFICATION**

Both antigens are identified by a suitable immunochemical method (2.7.1) for PRP and group C polysaccharide or other suitable method.

**TESTS****pH (2.2.3)**

The pH of the vaccine, reconstituted if necessary, is within the limits approved for the particular product.

**Water (2.5.12)**

Maximum 3.0 per cent for freeze-dried vaccines.

**Free PRP**

A number of methods are used to separate free PRP from the conjugate, including precipitation, gel filtration, size-exclusion, anion-exchange and hydrophobic chromatography, ultrafiltration and ultracentrifugation. The free PRP can then be quantified by a range of techniques, including high-performance anion-exchange chromatography with pulsed amperometric detection (HPAEC-PAD) and immunoassays (2.7.1) with anti-PRP antibodies. The amount of free PRP is not greater than that approved for the particular product.

**Free saccharide**

Unbound group C polysaccharide is determined after removal of the conjugate, for example by anion-exchange

liquid chromatography, size-exclusion or hydrophobic chromatography, ultrafiltration or other validated methods. The amount of free group C polysaccharide is not greater than that approved for the particular product.

#### **Sterility (2.6.1)**

It complies with the test for sterility.

#### **Bacterial endotoxins (2.6.14)**

The content is within the limits approved by the competent authority for the particular product.

#### **ASSAY**

##### **PRP**

Minimum 80 per cent of the amount of PRP stated on the label. PRP is determined either by assay of ribose (2.5.31) or phosphorus (2.5.18), by an immunochemical method (2.7.1) or by anion-exchange liquid chromatography (2.2.29) with pulsed amperometric detection.

##### **Saccharide**

Minimum 80 per cent of the amount of group C polysaccharide stated on the label. The group C polysaccharide content is determined by a suitable validated assay, for example sialic acid assay (2.5.23) or anion-exchange liquid chromatography (2.2.29) with pulsed amperometric detection.

#### **LABELLING**

The label states:

- the number of micrograms of PRP and group C polysaccharide per single human dose;
- the type and nominal amount of carrier protein per single human dose.

Ph Eur

## Inactivated Hepatitis A Vaccine

(Hepatitis A Vaccine (Inactivated, Adsorbed),  
Ph. Eur. monograph 1107)

The label may state 'HepA'.

Ph Eur

#### **DEFINITION**

Hepatitis A vaccine (inactivated, adsorbed) is a suspension consisting of a suitable strain of hepatitis A virus grown in cell cultures, inactivated by a validated method and adsorbed on a mineral carrier.

#### **PRODUCTION**

##### **GENERAL PROVISIONS**

Production of the vaccine is based on a virus seed-lot system and a cell-bank system. The production method shall have been shown to consistently yield vaccines that comply with the requirements for immunogenicity, safety and stability.

Unless otherwise justified and authorised, the virus in the final vaccine shall not have undergone more passages from the master seed lot than were used to prepare the vaccine shown in clinical studies to be satisfactory with respect to safety and efficacy.

**Reference preparation** A part of a batch shown to be at least as immunogenic in animals as a batch that, in clinical studies in young healthy adults, produced not less than 95 per cent seroconversion, corresponding to a level of neutralising antibody accepted to be protective, after a full-course primary immunisation is used as a reference preparation. An antibody

level of 20 mIU/mL determined by enzyme-linked immunosorbent assay is recognised as being protective.

#### **SUBSTRATE FOR VIRUS PROPAGATION**

The virus is propagated in a human diploid cell line (5.2.3) or in a continuous cell line approved by the competent authority.

#### **SEED LOTS**

The strain of hepatitis A virus used to prepare the master seed lot shall be identified by historical records that include information on the origin of the strain and its subsequent manipulation.

Only a seed lot that complies with the following requirements may be used for virus propagation.

#### **Identification**

Each master and working seed lot is identified as hepatitis A virus using specific antibodies.

#### **Virus concentration**

The virus concentration of each master and working seed lot is determined to monitor consistency of production.

#### **Extraneous agents**

The working seed lot complies with the requirements for seed lots for virus vaccines (2.6.16). In addition, if primary monkey cells have been used for isolation of the strain, measures are taken to ensure that the strain is not contaminated with simian viruses such as simian immunodeficiency virus and filoviruses.

#### **VIRUS PROPAGATION AND HARVEST**

All processing of the cell bank and subsequent cell cultures is done under aseptic conditions in an area where no other cells are being handled. Animal serum (but not human serum) may be used in the cell culture media. Serum and trypsin used in the preparation of cell suspensions and media are shown to be free from extraneous agents. The cell culture media may contain a pH indicator, such as phenol red, and antibiotics at the lowest effective concentration. Not less than 500 mL of the cell cultures employed for vaccine production is set aside as uninfected cell cultures (control cells). Multiple harvests from the same production cell culture may be pooled and considered as a single harvest.

Only a single harvest that complies with the following requirements may be used in the preparation of the vaccine. When the determination of the ratio of virus concentration to antigen content has been carried out on a suitable number of single harvests to demonstrate production consistency, it may subsequently be omitted as a routine test.

#### **Identification**

The test for antigen content also serves to identify the single harvest.

#### **Bacterial and fungal contamination**

The single harvest complies with the test for sterility (2.6.1), carried out using 10 mL for each medium.

#### **Mycoplasmas (2.6.7)**

The single harvest complies with the test for mycoplasmas, carried out using 1 mL for each medium.

#### **Control cells**

The control cells of the production cell culture comply with a test for identification and the requirements for extraneous agents (2.6.16).

#### **Antigen content**

Determine the hepatitis A antigen content by a suitable immunochemical method (2.7.1) to monitor production consistency; the content is within the limits approved for the particular product.

**Ratio of virus concentration to antigen content**

The consistency of the ratio of the concentration of infectious virus, determined by a suitable cell culture method, to antigen content is established by validation on a suitable number of single harvests.

**PURIFICATION AND PURIFIED HARVEST**

The harvest, which may be a pool of several single harvests, is purified by validated methods. If continuous cell lines are used for production, the purification process shall have been shown to reduce consistently the level of host-cell DNA.

Only a purified harvest that complies with the following requirements may be used in the preparation of the inactivated harvest.

**Virus concentration**

The concentration of infectious virus in the purified harvest is determined by a suitable cell culture method to monitor production consistency and as a starting point for monitoring the inactivation curve.

**Antigen:total protein ratio**

Determine the hepatitis A virus antigen content by a suitable immunochemical method (2.7.1). Determine the total protein by a validated method. The ratio of hepatitis A virus antigen content to total protein content is within the limits approved for the particular product.

**Bovine serum albumin**

Not more than 50 ng in the equivalent of a single human dose, determined by a suitable immunochemical method (2.7.1). Where appropriate in view of the manufacturing process, other suitable protein markers may be used to demonstrate effective purification.

**Residual host-cell DNA**

If a continuous cell line is used for virus propagation, the content of residual host-cell DNA, determined using a suitable method, is not greater than 100 pg in the equivalent of a single human dose.

**Residual chemicals**

If chemical substances are used during the purification process, tests for these substances are carried out on the purified harvest (or on the inactivated harvest), unless validation of the process has demonstrated total clearance. The concentration must not exceed the limits approved for the particular product.

**INACTIVATION AND INACTIVATED HARVEST**

Several purified harvests may be pooled before inactivation. In order to avoid interference with the inactivation process, virus aggregation must be prevented or aggregates must be removed immediately before and/or during the inactivation process. The virus suspension is inactivated by a validated method; the method shall have been shown to be consistently capable of inactivating hepatitis A virus without destroying the antigenic and immunogenic activity; for each inactivation procedure, an inactivation curve is plotted representing residual live virus concentration measured at not fewer than 3 points in time (for example, on days 0, 1 and 2 of the inactivation process). If formaldehyde is used for inactivation, the presence of excess free formaldehyde is verified at the end of the inactivation process.

Only an inactivated harvest that complies with the following requirements may be used in the preparation of the final bulk vaccine.

**Inactivation**

Carry out an amplification test for residual infectious hepatitis A virus by inoculating a quantity of the inactivated harvest equivalent to 5 per cent of the batch or, if the harvest

contains the equivalent of 30 000 doses or more, not less than 1500 doses of vaccine into cell cultures of the same type as those used for production of the vaccine; incubate for a total of not less than 70 days making not fewer than one passage of cells within that period. At the end of the incubation period, carry out a test of suitable sensitivity for residual infectious virus. No evidence of hepatitis A virus multiplication is found in the samples taken at the end of the inactivation process. Use infectious virus inocula concurrently as positive controls to demonstrate cellular susceptibility and absence of interference.

**Sterility (2.6.1)**

The inactivated viral harvest complies with the test for sterility, carried out using 10 mL for each medium.

**Bacterial endotoxins (2.6.14)**

Less than 2 IU in the equivalent of a single human dose.

**Antigen content**

Determine the hepatitis A virus antigen content by a suitable immunochemical method (2.7.1).

**Residual chemicals**

See under Purification and purified harvest.

**FINAL BULK VACCINE**

The final bulk vaccine is prepared from one or more inactivated harvests. Approved adjuvants, stabilisers and antimicrobial preservatives may be added.

Only a final bulk vaccine that complies with the following requirements may be used in the preparation of the final lot.

**Sterility (2.6.1)**

The final bulk vaccine complies with the test for sterility, carried out using 10 mL for each medium.

**Antimicrobial preservative**

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical or physico-chemical method. The amount is not less than 85 per cent and not greater than 115 per cent of the intended amount.

**FINAL LOT**

The final bulk vaccine is distributed aseptically into sterile containers. The containers are then closed so as to avoid contamination.

Only a final lot that complies with each of the requirements given below under Identification, Tests and Assay may be released for use. Provided that the tests for free formaldehyde (where applicable) and antimicrobial preservative content (where applicable) have been carried out on the final bulk vaccine with satisfactory results, these tests may be omitted on the final lot. If the assay is carried out using mice or other animals, then provided it has been carried out with satisfactory results on the final bulk vaccine, it may be omitted on the final lot.

**IDENTIFICATION**

The assay (2.7.14) serves also to identify the vaccine.

**TESTS****Aluminium (2.5.13)**

Maximum 1.25 mg per single human dose, if aluminium hydroxide or hydrated aluminium phosphate is used as the adsorbent.

**Free formaldehyde (2.4.18)**

Maximum 0.2 g/L.

**Antimicrobial preservative**

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical or physico-chemical method. The amount is not less than the minimum amount

shown to be effective and is not greater than 115 per cent of that stated on the label.

#### **Sterility (2.6.1)**

The vaccine complies with the test for sterility.

#### **ASSAY**

The vaccine complies with the assay of hepatitis A vaccine (2.7.14).

#### **LABELLING**

The label states the biological origin of the cells used for the preparation of the vaccine.

Ph Eur

## Hepatitis A Vaccine (Inactivated Virosome)

(Ph. Eur. monograph 1935)

The label may state 'HepA'.

Ph Eur

#### **DEFINITION**

Hepatitis A vaccine (inactivated, virosome) is a suspension of a suitable strain of hepatitis A virus grown in cell cultures and inactivated by a validated method. Virosomes composed of influenza proteins of a strain approved for the particular product and phospholipids are used as adjuvants.

#### **PRODUCTION**

##### **GENERAL PROVISIONS**

The production method shall have been shown to yield consistently vaccines comparable with the vaccine of proven clinical efficacy and safety in man.

**Reference preparation** A reference preparation of inactivated hepatitis A antigen is calibrated against a batch of hepatitis A vaccine (inactivated, virosome) that, in clinical studies in young healthy adults, produced not less than 95 per cent seroconversion, corresponding to a level of neutralising antibody accepted to be protective, after a full-course primary immunisation. An antibody level not less than 20 mIU/mL determined by enzyme-linked immunosorbent assay is recognised as being protective.

##### **PREPARATION OF HEPATITIS A ANTIGEN**

Production of the hepatitis A antigen is based on a virus seed-lot system and a cell-bank system. The production method shall have been shown to consistently yield vaccines that comply with the requirements for immunogenicity, safety and stability.

Unless otherwise justified and authorised, the virus in the final vaccine shall not have undergone more passages from the master seed lot than were used to prepare the vaccine shown in clinical studies to be satisfactory with respect to safety and efficacy.

##### **SUBSTRATE FOR PROPAGATION OF HEPATITIS A VIRUS**

The virus is propagated in a human diploid cell line (5.2.3).

##### **SEED LOTS OF HEPATITIS A VIRUS**

The strain of hepatitis A virus used to prepare the master seed lot shall be identified by historical records that include information on the origin of the strain and its subsequent manipulation.

Only a seed lot that complies with the following requirements may be used for virus propagation.

#### **Identification**

Each master and working seed lot is identified as hepatitis A virus using specific antibodies.

#### **Virus concentration**

The virus concentration of each master and working seed lot is determined to monitor consistency of production.

#### **Extraneous agents**

The working seed lot complies with the requirements for seed lots for virus vaccines (2.6.16).

#### **PROPAGATION AND HARVEST OF HEPATITIS A VIRUS**

All processing of the cell bank and subsequent cell cultures is done under aseptic conditions in an area where no other cells are handled. Animal serum (but not human serum) may be used in the cell culture media. Serum and trypsin used in the preparation of cell suspensions and media are shown to be free from extraneous agents. The cell culture media may contain a pH indicator such as phenol red and antibiotics at the lowest effective concentration. Not less than 500 mL of the cell cultures employed for vaccine production is set aside as uninfected cell cultures (control cells). Multiple harvests from the same production cell culture may be pooled and considered as a single harvest.

Only a single harvest that complies with the following requirements may be used in the preparation of the vaccine. When the determination of the ratio of virus concentration to antigen content has been carried out on a suitable number of single harvests to demonstrate consistency, it may subsequently be omitted as a routine test.

#### **Identification**

The test for antigen content also serves to identify the single harvest.

#### **Bacterial and fungal contamination**

The single harvest complies with the test for sterility (2.6.1), carried out using 10 mL for each medium.

#### **Mycoplasmas (2.6.7)**

The single harvest complies with the test for mycoplasmas.

#### **Control cells**

The control cells of the production cell culture comply with a test for identity and the requirements for extraneous agents (2.6.16).

#### **Antigen content**

Determine the hepatitis A antigen content by a suitable immunochemical method (2.7.1) to monitor production consistency; the content is within the limits approved for the particular product.

#### **Ratio of virus concentration to antigen content**

The consistency of the ratio of the concentration of infectious virus, as determined by a suitable cell culture method, to antigen content is established by validation on a suitable number of single harvests.

#### **PURIFICATION AND PURIFIED HARVEST OF HEPATITIS A VIRUS**

The harvest, which may be a pool of several single harvests, is purified by validated methods. If continuous cell lines are used for production, the purification process shall have been shown to reduce consistently the level of host-cell DNA.

Only a purified harvest that complies with the following requirements may be used in the preparation of the inactivated harvest.

#### **Virus concentration**

The concentration of infective virus in the purified harvest is determined by a suitable cell culture method to monitor

production consistency and as a starting point for monitoring the inactivation curve.

#### Ratio of antigen to total protein

Determine the hepatitis A virus antigen content by a suitable immunochemical method (2.7.1). Determine the total protein by a validated method. The ratio of hepatitis A virus antigen content to total protein content is within the limits approved for the particular product.

#### Bovine serum albumin

Maximum 50 ng per single human dose if foetal bovine serum is used, determined by a suitable immunochemical method (2.7.1). Where appropriate in view of the manufacturing process, other suitable protein markers may be used to demonstrate effective purification.

#### Residual chemicals

If chemical substances are used during the purification process, tests for these substances are carried out on the purified harvest (or on the inactivated harvest), unless validation of the process has demonstrated total clearance. The concentration must not exceed the limits approved for the particular product.

#### INACTIVATION AND INACTIVATED HARVEST OF HEPATITIS A VIRUS

Several purified harvests may be pooled before inactivation. In order to avoid interference with the inactivation process, virus aggregation must be prevented or aggregates must be removed immediately before and/or during the inactivation process. The virus suspension is inactivated by a validated method; the method shall have been shown to be consistently capable of inactivating hepatitis A virus without destroying the antigenic and immunogenic activity; for each inactivation procedure, an inactivation curve is plotted representing residual live virus concentration measured on at least 3 occasions (for example, on days 0, 1 and 2 of the inactivation process). If formaldehyde is used for inactivation, the presence of excess free formaldehyde is verified at the end of the inactivation process.

Only an inactivated harvest that complies with the following requirements may be used in the preparation of the final bulk vaccine.

#### Inactivation

Carry out an amplification test for residual infectious hepatitis A virus by inoculating a quantity of the inactivated harvest equivalent to 5 per cent of the batch or, if the harvest contains the equivalent of 30 000 doses or more, not less than 1500 doses of vaccine into cell cultures of the same type as those used for production of the vaccine; incubate for a total of not less than 70 days making not fewer than 1 passage of cells within that period. At the end of the incubation period, carry out a test of suitable sensitivity for residual infectious virus. No evidence of hepatitis A virus multiplication is found in the samples taken at the end of the inactivation process. Use infective virus inocula concurrently as positive controls to demonstrate cellular susceptibility and absence of interference.

#### Sterility (2.6.1)

The inactivated viral harvest complies with the test for sterility, carried out using 10 mL for each medium.

#### Bacterial endotoxins (2.6.14)

Less than 2 IU of endotoxin in the equivalent of a single human dose.

#### Antigen content

Determine the hepatitis A virus antigen content by a suitable immunochemical method (2.7.1).

#### Residual chemicals

See under Purification and purified harvest.

#### PREPARATION OF INACTIVATED INFLUENZA VIRUS

The production of influenza viruses is based on a seed-lot system. Working seed lots represent not more than 15 passages from the approved reassorted virus or the approved virus isolate. The final production represents 1 passage from the working seed lot. The strain of influenza virus to be used is approved by the competent authority.

#### SUBSTRATE FOR PROPAGATION OF INFLUENZA VIRUS

Influenza virus seed to be used in the production of vaccine is propagated in fertilised eggs from chicken flocks free from specified pathogens (5.2.2) or in suitable cell cultures (5.2.4), such as chick-embryo fibroblasts or chick kidney cells obtained from chicken flocks free from specified pathogens (5.2.2). For production, the virus is grown in the allantoic cavity of fertilised hens' eggs from healthy flocks.

#### SEED LOTS OF INFLUENZA VIRUS

The haemagglutinin and neuraminidase antigens of each seed lot are identified as originating from the correct strain of influenza virus by suitable methods.

Only a working virus seed lot that complies with the following requirements may be used in the preparation of the monovalent pooled harvest.

#### Bacterial and fungal contamination

Carry out the test for sterility (2.6.1), using 10 mL for each medium.

#### Mycoplasmas (2.6.7)

Carry out the test for mycoplasmas, using 10 mL.

#### PROPAGATION AND HARVEST OF INFLUENZA VIRUS

An antimicrobial agent may be added to the inoculum. After incubation at a controlled temperature, the allantoic fluids are harvested and combined to form the monovalent pooled harvest. An antimicrobial agent may be added at the time of harvest. At no stage in the production is penicillin or streptomycin used.

#### POOLED HARVEST OF INFLUENZA VIRUS

To limit the possibility of contamination, inactivation is initiated as soon as possible after preparation. The virus is inactivated by a method that has been demonstrated on 3 consecutive batches to be consistently effective for the manufacturer. The inactivation process shall have been shown to be capable of inactivating the influenza virus without destroying antigenicity of haemagglutinin. The inactivation process shall also have been shown to be capable of inactivating avian leucosis viruses and mycoplasmas. If the monovalent pooled harvest is stored after inactivation, it is held at a temperature of  $5 \pm 3$  °C. If formaldehyde solution is used, the concentration does not exceed 0.2 g/L of CH<sub>2</sub>O at any time during inactivation; if betapropiolactone is used, the concentration does not exceed 0.1 per cent V/V at any time during inactivation.

Only a pooled harvest that complies with the following requirements may be used in the preparation of the virosomes.

#### Haemagglutinin antigen

Determine the content of haemagglutinin antigen by an immunodiffusion test (2.7.1), by comparison with a haemagglutinin antigen reference preparation or with an antigen preparation calibrated against it. Carry out the test at 20-25 °C.

**Sterility (2.6.1)**

Carry out the test for sterility, using 10 mL for each medium.

**Viral inactivation**

Inoculate 0.2 mL of the harvest into the allantoic cavity of each of 10 fertilised eggs and incubate at 33-37 °C for 3 days. The test is not valid unless at least 8 of the 10 embryos survive. Harvest 0.5 mL of the allantoic fluid from each surviving embryo and pool the fluids. Inoculate 0.2 mL of the pooled fluid into a further 10 fertilised eggs and incubate at 33-37 °C for 3 days. The test is not valid unless at least 8 of the 10 embryos survive. Harvest about 0.1 mL of the allantoic fluid from each surviving embryo and examine each individual harvest by a haemagglutination test. If haemagglutination is found for any of the fluids, carry out for that fluid a further passage in eggs and test for haemagglutination; no haemagglutination occurs.

**Ovalbumin**

Maximum 1 µg of ovalbumin in the equivalent of 1 human dose, determined by a suitable technique using a suitable reference preparation of ovalbumin.

**Antimicrobial preservative**

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The content is not less than 85 per cent and not greater than 115 per cent of the intended amount.

**Residual chemicals**

Tests are carried out on the monovalent pooled harvest for the chemicals used for inactivation, the limits being approved by the competent authority.

**PREPARATION OF VIROSOMES**

Inactivated influenza virions are solubilised using a suitable detergent and are purified by high-speed centrifugation in order to obtain supernatants containing mainly influenza antigens. After the addition of suitable phospholipids, virosomes are formed by removal of the detergent either by adsorption chromatography or another suitable technique. Only virosomes that comply with the following requirements may be used in the preparation of the final bulk vaccine.

**Haemagglutinin content**

Determine the content of haemagglutinin antigen by an immunodiffusion test (2.7.1), by comparison with a haemagglutinin antigen reference preparation or with an antigen preparation calibrated against it.

**Phospholipids**

The content and identity of the phospholipids are determined by suitable immunochemical or physico-chemical methods.

**Ratio of phospholipid to haemagglutinin**

The ratio of phospholipid content to haemagglutinin content is within the limits approved for the particular product.

**Residual chemicals**

Tests are carried out for the chemicals used during the process. The concentration of each residual chemical is within the limits approved for the particular product.

**FINAL BULK VACCINE**

The bulk vaccine is prepared by adding virosomes to inactivated hepatitis A viruses to yield an approved hepatitis A antigen:haemagglutinin ratio. Several bulks may be pooled, and approved stabilisers and antimicrobial preservatives may be added.

Only a final bulk vaccine that complies with the following requirements may be used in the preparation of the final lot.

**Protein content**

The amount of protein is determined using a suitable technique, the limits being approved by the competent authority.

**Phospholipids**

The content and identity of the phospholipids are determined by suitable immunochemical or physico-chemical methods. The amount of phospholipids complies with the limits approved for the particular product.

**Haemagglutinin content**

Determine the content of haemagglutinin antigen by an immunodiffusion test (2.7.1). The amount of haemagglutinin must not exceed the limits approved for the particular product.

**Hepatitis A antigen content**

Determine the hepatitis A antigen content by a suitable immunochemical method. The amount of antigen must not exceed the limits approved for the particular product.

**Ratio of hepatitis A antigen to haemagglutinin**

The ratio of hepatitis A antigen content to haemagglutinin content is within the limits approved for the particular product.

**Ovalbumin**

Maximum 1 µg of ovalbumin per human dose, determined by a suitable technique using a suitable reference preparation of ovalbumin.

**Virosome size**

The size distribution of the virosome-hepatitis A virus mixture is within the limits approved for the particular product.

**Sterility (2.6.1)**

The final bulk vaccine complies with the test for sterility, carried out using 10 mL for each medium.

**Antimicrobial preservative**

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical or physico-chemical method. The amount is not less than 85 per cent and not greater than 115 per cent of the intended amount.

**Residual chemicals**

If chemical substances are used during the formulation process, tests for these substances are carried out, the limits being approved by the competent authority.

**FINAL LOT**

The final bulk vaccine is distributed aseptically into sterile containers. The containers are then closed so as to avoid contamination.

Only a final lot that complies with each of the requirements given below under Identification, Tests and Assay may be released for use. Provided that the tests for free formaldehyde (where applicable) and antimicrobial preservative content (where applicable) have been carried out on the final bulk vaccine with satisfactory results, these tests may be omitted on the final lot. If the assay is carried out *in vivo*, provided it has been carried out with satisfactory results on the final bulk vaccine, it may be omitted on the final lot.

**IDENTIFICATION**

The assay (2.7.14) serves also to identify the vaccine.

**TESTS****Free formaldehyde (2.4.18)**

Maximum 0.2 g/L.

**Antimicrobial preservative**

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical or physico-chemical method. The amount is not less than the minimum amount shown to be effective and is not greater than 115 per cent of that stated on the label.

**Sterility (2.6.1)**

The vaccine complies with the test for sterility.

**Bacterial endotoxins (2.6.14)**

Less than 2 IU of endotoxin per human dose.

**ASSAY**

The vaccine complies with the assay of hepatitis A vaccine (2.7.14, Method A).

**LABELLING**

The label states:

- the biological origin of the cells used for the preparation of the vaccine;
- that the carrier contains influenza proteins prepared in eggs;
- that the vaccine is to be shaken before use;
- that the vaccine is not to be frozen.

Ph Eur

## Hepatitis A (Inactivated Adsorbed) and Typhoid Polysaccharide Vaccine

(Ph. Eur. monograph 2597)

The label may state 'HepA/Typhoid'.

Ph Eur

**DEFINITION**

Hepatitis A (inactivated, adsorbed) and typhoid polysaccharide vaccine is a suspension consisting of a suitable strain of hepatitis A virus, grown in cell cultures and inactivated by a validated method, and of purified Vi capsular polysaccharide obtained from *Salmonella typhi* Ty 2 strain or some other suitable strain that has the capacity to produce Vi polysaccharide.

The hepatitis A antigen is adsorbed on a mineral carrier, such as aluminium hydroxide, and the Vi capsular polysaccharide consists of partly 3-O-acetylated repeated units of 2-acetylaminio-2-deoxy-D-galactopyranuronic acid with  $\alpha$ -(1→4) linkages.

The product is presented either as a liquid mixture containing the hepatitis A component and the typhoid Vi polysaccharide component or as 2 separate liquids, one containing the hepatitis A component and the other the typhoid Vi polysaccharide component, which are mixed together immediately before use.

**PRODUCTION****GENERAL PROVISIONS**

The 2 components are prepared as described in the monographs *Hepatitis A vaccine (inactivated, adsorbed)* (1107) and *Typhoid polysaccharide vaccine* (1160) and comply with the requirements prescribed therein.

**Reference preparation** The hepatitis A reference preparation is part of a representative batch shown to be at least as immunogenic in animals as a batch that, in clinical studies in young healthy adults, produced not less than 95 per cent seroconversion, corresponding to a level of neutralising

antibody accepted to be protective, after a full-course primary immunisation. An antibody level not less than 20 mIU/mL determined by enzyme-linked immunosorbent assay is recognised as being protective.

**FINAL BULKS**

The hepatitis A final bulk is prepared from 1 or more inactivated harvests of hepatitis A virus. Approved adjuvants, stabilisers and antimicrobial preservatives may be added.

The Vi polysaccharide final bulk is prepared from 1 or more batches of purified Vi polysaccharide which are dissolved in a suitable solvent, which may contain an antimicrobial preservative, so that the volume corresponding to 1 dose contains 25 µg of polysaccharide and the solution is isotonic with blood (250-350 mosmol/kg).

Where the vaccine is presented as a liquid mixture of both components, the final bulk is prepared by addition of a suitable quantity of the Vi capsular polysaccharide bulk to the hepatitis A bulk.

Only final bulks that comply with the following requirements may be used in the preparation of the final lot.

**Antimicrobial preservative**

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical or physico-chemical method. The amount is not less than 85 per cent and not greater than 115 per cent of the intended amount.

**Sterility (2.6.1)**

Carry out the test for sterility using 10 mL for each medium.

**FINAL LOT**

The final bulks are distributed aseptically into sterile containers. The containers are then closed so as to avoid contamination.

Only a final lot that complies with each of the requirements given below under Identification, Tests and Assay may be released for use. Provided that the tests for free formaldehyde (where applicable), antimicrobial preservative (where applicable) and bacterial endotoxins have been carried out on the final bulks with satisfactory results, they may be omitted on the final lot. If the assay of the hepatitis A component is carried out *in vivo*, then provided it has been carried out with satisfactory results on the final bulk containing the hepatitis A component, it may be omitted on the final lot.

**CHARACTERS**

If the vaccine is presented as 2 separate liquids, test A is carried out using the hepatitis A component and test B is carried out using the typhoid Vi polysaccharide component. Test C is carried out if the vaccine is presented as a liquid mixture of both components or immediately after mixing both components if the vaccine is presented as 2 separate liquids.

- A. Whitish, cloudy suspension.
- B. Clear, colourless liquid, free from visible particles.
- C. Turbid liquid with a slow settling white deposit.

**IDENTIFICATION**

If the vaccine is presented as 2 separate liquids, identification test A is carried out using the hepatitis A component and identification test B is carried out using the typhoid Vi polysaccharide component. If the vaccine is presented as a liquid mixture, tests A and B are carried out.

- A. The assay (2.7.14) serves also to identify the vaccine.
- B. Typhoid Vi polysaccharide is identified by a suitable immunochemical method (2.7.1) using specific antibodies.

**TESTS**

If the vaccine is presented as 2 separate liquids, the tests for pH, antimicrobial preservative and bacterial endotoxins are carried out on both components; the test for aluminium is carried out using the hepatitis A component and the test for O-acetyl groups is carried out using the typhoid Vi polysaccharide component; the tests for pH, free formaldehyde, osmolality and sterility are carried out immediately after mixing both components. If the vaccine is presented as a liquid mixture, the test for O-acetyl groups is carried out before the 2 components are mixed.

**pH (2.2.3)**

6.8 to 7.8 for the hepatitis A component and 6.5 to 7.5 for the typhoid Vi polysaccharide component; 6.6 to 7.6 for the vaccine presented as a liquid mixture or immediately after mixing both components if the vaccine is presented as 2 separate liquids.

**Aluminium (2.5.13)**

Maximum 1.25 mg per single human dose, if aluminium hydroxide is used as the adsorbent.

**Free formaldehyde (2.4.18)**

Maximum 0.2 g/L.

**Antimicrobial preservative**

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical or physico-chemical method. The amount is not less than the minimum amount shown to be effective and is not greater than 115 per cent of the amount stated on the label.

**Sterility (2.6.1)**

The vaccine complies with the test for sterility.

**Osmolality (2.2.35)**

Where applicable, the osmolality of the vaccine is within the limits approved for the particular product.

**Bacterial endotoxins (2.6.14)**

The bacterial endotoxins content is less than 2 IU per human dose for the hepatitis A component and within the limit approved for the typhoid Vi polysaccharide component. If the vaccine is presented as a liquid mixture of hepatitis A component and typhoid Vi polysaccharide component the bacterial endotoxins content is within the limit approved for the specific product.

**O-Acetyl groups (2.5.19)**

0.085  $\mu\text{mol}$  ( $\pm$  25 per cent) per dose (25  $\mu\text{g}$  of polysaccharide).

**ASSAY****Hepatitis A component**

The vaccine complies with the assay of hepatitis A vaccine (2.7.14).

**Typhoid Vi polysaccharide component**

Determine Vi polysaccharide by a suitable immunochemical method (2.7.1), using a reference purified polysaccharide. The estimated amount of polysaccharide per dose is 80 per cent to 120 per cent of the content stated on the label. The confidence limits ( $P = 0.95$ ) of the estimated amount of polysaccharide are not less than 80 per cent and not more than 120 per cent.

**LABELLING**

The label states:

- the amount of hepatitis A virus antigen per human dose;
- the number of micrograms of polysaccharide per human dose (25  $\mu\text{g}$ );
- the total quantity of polysaccharide in the container;
- the type of cells used for production of the vaccine;
- the name and amount of the adsorbent used;

- that the vaccine must be shaken before use;
- that the vaccine must not be frozen.

Ph Eur

## Hepatitis A (Inactivated) and Hepatitis B (rDNA) Vaccine

(Hepatitis A (Inactivated) and Hepatitis B (rDNA) Vaccine (Adsorbed), Ph. Eur. monograph 1526)

The label may state 'HepA/HepB'.

Ph Eur

**DEFINITION**

Hepatitis A (inactivated) and hepatitis B (rDNA) vaccine (adsorbed) is a suspension consisting of a suitable strain of hepatitis A virus, grown in cell cultures and inactivated by a validated method, and of hepatitis B surface antigen (HBsAg), a component protein of hepatitis B virus obtained by recombinant DNA technology; the antigens are adsorbed on a mineral carrier, such as aluminium hydroxide or hydrated aluminium phosphate.

**PRODUCTION****GENERAL PROVISIONS**

The two components are prepared as described in the monographs on *Hepatitis A vaccine (inactivated, adsorbed)* (1107) and *Hepatitis B vaccine (rDNA)* (1056) and comply with the requirements prescribed therein.

**Reference preparation** The reference preparation is part of a representative batch shown to be at least as immunogenic in animals as a batch that, in clinical studies in young healthy adults, produced not less than 95 per cent seroconversion, corresponding to a level of neutralising antibody recognised to be protective, after a full-course primary immunisation. For hepatitis A, an antibody level not less than 20 mIU/mL determined by enzyme-linked immunosorbent assay is recognised as being protective. For hepatitis B, an antibody level not less than 10 mIU/mL against HBsAg is recognised as being protective.

**FINAL BULK VACCINE**

The final bulk vaccine is prepared from one or more inactivated harvests of hepatitis A virus and one or more batches of purified antigen.

Only a final bulk vaccine that complies with the following requirements may be used in the preparation of the final lot.

**Antimicrobial preservative**

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical or physico-chemical method. The amount is not less than 85 per cent and not greater than 115 per cent of the intended amount.

**Sterility (2.6.1)**

The final bulk vaccine complies with the test for sterility, carried out using 10 mL for each medium.

**FINAL LOT**

Only a final lot that complies with each of the requirements given below under Identification, Tests and Assay may be released for use. Provided that the tests for free formaldehyde (where applicable) and antimicrobial preservative content (where applicable) have been carried out on the final bulk vaccine with satisfactory results, they may be omitted on the final lot. If the assay of the hepatitis A and/or the hepatitis B component is carried out *in vivo*, then provided it has been

carried out with satisfactory results on the final bulk vaccine, it may be omitted on the final lot.

#### IDENTIFICATION

##### Hepatitis A component

The assay (2.7.14) serves also to identify the vaccine.

##### Hepatitis B component

The assay (2.7.15) or, where applicable, the electrophoretic profile, serves also to identify the vaccine.

#### TESTS

##### Aluminium (2.5.13)

Maximum 1.25 mg per single human dose, if aluminium hydroxide or hydrated aluminium phosphate is used as the adsorbent.

##### Free formaldehyde (2.4.18)

Maximum 0.2 g/L.

##### Antimicrobial preservative

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical or physico-chemical method. The amount is not less than the minimum amount shown to be effective and is not greater than 115 per cent of that stated on the label.

##### Sterility (2.6.1)

The vaccine complies with the test for sterility.

##### Bacterial endotoxins (2.6.14)

Less than 2 IU per human dose.

#### ASSAY

##### Hepatitis A component

The vaccine complies with the assay of hepatitis A vaccine (2.7.14).

##### Hepatitis B component

The vaccine complies with the assay of hepatitis B vaccine (rDNA) (2.7.15).

#### LABELLING

The label states:

- the amount of hepatitis A virus antigen and hepatitis B surface antigen per container;
- the type of cells used for production of the vaccine;
- the name and amount of the adsorbent used;
- that the vaccine must be shaken before use;
- that the vaccine must not be frozen.

Ph Eur

## Hepatitis B Vaccine (rDNA)

(Ph. Eur. monograph 1056)

The label may state 'HepB'.

Ph Eur

#### DEFINITION

Hepatitis B vaccine (rDNA) is a preparation of hepatitis B surface antigen (HBsAg), a component protein of hepatitis B virus; the antigen may be adsorbed on a mineral carrier such as aluminium hydroxide or hydrated aluminium phosphate. The vaccine may also contain the adjuvant 3-O-desacyl-4'-monophosphoryl lipid A. The antigen is obtained by recombinant DNA technology.

#### PRODUCTION

##### GENERAL PROVISIONS

The vaccine shall have been shown to induce specific, protective antibodies in man. The production method shall

have been shown to yield consistently vaccines that comply with the requirements for immunogenicity and safety.

Hepatitis B vaccine (rDNA) is produced by the expression of the viral gene coding for HBsAg in yeast (*Saccharomyces cerevisiae*) or mammalian cells (Chinese hamster ovary (CHO) cells or other suitable cell lines), purification of the resulting HBsAg and the rendering of this antigen into an immunogenic preparation. The suitability and safety of the cells are approved by the competent authority.

The vaccine may contain the product of the S gene (major protein), a combination of the S gene and pre-S2 gene products (middle protein) or a combination of the S gene, the pre-S2 gene and pre-S1 gene products (large protein).

*Reference preparation* Part of a representative batch shown to be at least as immunogenic in animals as a batch that, in clinical studies in young, healthy adults, produced not less than 95 per cent seroconversion, corresponding to a level of HBsAg neutralising antibody recognised to be protective, after a full-course primary immunisation. An antibody level not less than 10 mIU/mL is recognised as being protective.

#### CHARACTERISATION OF THE SUBSTANCE

Development studies are carried out to characterise the antigen. The complete protein, lipid and carbohydrate structure of the antigen is established. The morphological characteristics of the antigen particles are established by electron microscopy. The mean buoyant density of the antigen particles is determined by a physico-chemical method, such as gradient centrifugation. The antigenic epitopes are characterised. The protein fraction of the antigen is characterised in terms of the primary structure (for example, by determination of the amino-acid composition, by partial amino-acid sequence analysis and by peptide mapping).

#### CULTURE AND HARVEST

Identity, microbial purity, plasmid retention and consistency of yield are determined at suitable production stages. If mammalian cells are used, tests for extraneous agents and mycoplasmas are performed in accordance with general chapter 2.6.16. *Tests for extraneous agents in viral vaccines for human use*, but using 200 mL of harvest in the test in cell culture for other extraneous agents.

#### PURIFIED ANTIGEN

Only a purified antigen that complies with the following requirements may be used in the preparation of the final bulk vaccine.

##### Total protein

The total protein is determined by a validated method. The content is within the limits approved for the specific product.

##### Antigen content and identification

The quantity and specificity of HBsAg is determined in comparison with the International Standard for HBsAg subtype *ad* or an in-house reference, by a suitable immunochemical method (2.7.1) such as radio-immunoassay (RIA), enzyme-linked immunosorbent assay (ELISA), immunoblot (preferably using a monoclonal antibody directed against a protective epitope) or single radial diffusion. The antigen/protein ratio is within the limits approved for the specific product.

The molecular weight of the major band revealed following sodium dodecyl sulfate polyacrylamide gel electrophoresis (SDS-PAGE) performed under reducing conditions corresponds to the value expected from the known nucleic acid and polypeptide sequences and possible glycosylation.

**Antigenic purity**

The purity of the antigen is determined by comparison with a reference preparation using liquid chromatography or other suitable methods such as SDS-PAGE with staining by acid blue 92 and silver. A suitable method is sensitive enough to detect a potential contaminant at a concentration of 1 per cent of total protein. Not less than 95 per cent of the total protein consists of hepatitis B surface antigen.

**Composition**

The content of proteins, lipids, nucleic acids and carbohydrates is determined.

**Host-cell- and vector-derived DNA**

If mammalian cells are used for production, not more than 10 µg of DNA in the quantity of purified antigen equivalent to a single human dose of vaccine.

**Caesium**

If a caesium salt is used during production, a test for residual caesium is carried out on the purified antigen. The content is within the limits approved for the specific product.

**Sterility (2.6.1)**

The purified antigen complies with the test, carried out using 10 mL for each medium.

Additional tests on the purified antigen may be required depending on the production method used: for example, a test for residual animal serum where mammalian cells are used for production or tests for residual chemicals used during extraction and purification.

**ADSORBED 3-O-DESACYL-4'-MONOPHOSPHORYL LIPID A BULK**

If 3-O-desacyl-4'-monophosphoryl lipid A is included in the vaccine it complies with the monograph *3-O-desacyl-4'-monophosphoryl lipid A (2537)*. Where 3-O-desacyl-4'-monophosphoryl lipid A liquid bulk is adsorbed prior to inclusion in the vaccine, the adsorbed 3-O-desacyl-4'-monophosphoryl lipid A bulk complies with the following requirements.

**Degree of adsorption of 3-O-desacyl-4'-monophosphoryl lipid A**

The content of non-adsorbed 3-O-desacyl-4'-monophosphoryl lipid A in the adsorbed 3-O-desacyl-4'-monophosphoryl lipid A bulk is determined by a suitable method, for example gas chromatographic quantification of the *3-O-desacyl-4'-monophosphoryl lipid A (2537)* fatty acids in the supernatant, evaporated to dryness, after centrifugation.

**pH (2.2.3)**

The pH is within the limits approved for the particular preparation.

**Sterility (2.6.1)**

It complies with the test, carried out using 10 mL for each medium.

**FINAL BULK VACCINE**

An antimicrobial preservative, a mineral carrier, such as aluminium hydroxide or hydrated aluminium phosphate, and the adjuvant 3-O-desacyl-4'-monophosphoryl lipid A may be included in the formulation of the final bulk.

Only a final bulk vaccine that complies with the following requirements may be used in the preparation of the final lot.

**Antimicrobial preservative**

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical or physico-chemical method. The amount is not less than 85 per cent and not greater than 115 per cent of the intended amount.

**Sterility (2.6.1)**

The final bulk vaccine complies with the test, carried out using 10 mL for each medium.

**FINAL LOT**

Only a final lot that complies with each of the requirements given below under Identification, Tests and Assay may be released for use. Provided that the tests for free formaldehyde (where applicable) and antimicrobial preservative content (where applicable) have been carried out on the final bulk vaccine with satisfactory results, they may be omitted on the final lot. If the assay is carried out *in vivo*, then provided it has been carried out with satisfactory results on the final bulk vaccine, it may be omitted on the final lot.

**Degree of adsorption**

The degree of adsorption of the antigen and, where applicable, 3-O-desacyl-4'-monophosphoryl lipid A is assessed.

**IDENTIFICATION**

The assay or, where applicable, the electrophoretic profile, serves also to identify the vaccine. In addition, where applicable, the test for 3-O-desacyl-4'-monophosphoryl lipid A content also serves to identify the 3-O-desacyl-4'-monophosphoryl lipid A-containing vaccine.

**TESTS****Aluminium (2.5.13)**

Maximum 1.25 mg per single human dose, if aluminium hydroxide or hydrated aluminium phosphate is used as the adsorbent.

**3-O-Desacyl-4'-monophosphoryl lipid A**

Minimum 80 per cent and maximum 120 per cent of the intended amount.

Where applicable, determine the content of 3-O-desacyl-4'-monophosphoryl lipid A by a suitable method, for example gas chromatography (2.2.28).

**Free formaldehyde (2.4.18)**

Maximum 0.2 g/L.

**Antimicrobial preservative**

Where applicable, determine the content of antimicrobial preservative by a suitable chemical or physico-chemical method. The amount is not less than the minimum amount shown to be effective and is not greater than 115 per cent of that stated on the label.

**Sterility (2.6.1)**

The vaccine complies with the test.

**Pyrogens (2.6.8)**

The vaccine complies with the test for pyrogens. Inject the equivalent of one human dose into each rabbit or, if the vaccine contains 3-O-desacyl-4'-monophosphoryl lipid A, inject per kilogram of the rabbit's mass an amount of the vaccine containing 2.5 µg of 3-O-desacyl-4'-monophosphoryl lipid A.

**ASSAY**

The vaccine complies with the assay of hepatitis B vaccine (rDNA) (2.7.15).

**LABELLING**

The label states:

- the amount of HBsAg per container;
- the type of cells used for production of the vaccine;
- the name and amount of the adjuvant and/or adsorbent used;
- that the vaccine must be shaken before use;
- that the vaccine must not be frozen.

## Inactivated Influenza Vaccine (Whole Virion)

(Influenza Vaccine (Whole Virion, Inactivated),  
Ph. Eur. monograph 0159)

The label may state 'Flu'.

When Inactivated Influenza Vaccine or Influenza Vaccine is prescribed or demanded and the form is not stated, Inactivated Influenza Vaccine (Whole Virion), Inactivated Influenza Vaccine (Split Virion) or Inactivated Influenza Vaccine (Surface Antigen) may be dispensed or supplied.

Ph Eur

### DEFINITION

Influenza vaccine (whole virion, inactivated) is a sterile, aqueous suspension of a strain or strains of influenza virus, type A or B, or a mixture of strains of the 2 types grown individually in fertilised hens' eggs and inactivated in such a manner that their antigenic properties are retained. The stated amount of haemagglutinin antigen for each strain present in the vaccine is 15 µg per dose, unless clinical evidence supports the use of a different amount.

The vaccine is a slightly opalescent liquid.

### PRODUCTION

#### CHOICE OF VACCINE STRAIN

The World Health Organization (WHO) reviews the world epidemiological situation annually and if necessary recommends the strains that correspond to this epidemiological evidence.

Such strains are used in accordance with the regulations in force in the signatory States of the Convention on the Elaboration of a European Pharmacopoeia. It is now common practice to use reassorted strains giving high yields of the appropriate surface antigens. The origin and passage history of virus strains shall be approved by the competent authority.

#### SUBSTRATE FOR VIRUS PROPAGATION

Influenza virus seed to be used in the production of vaccine is propagated in fertilised eggs from chicken flocks free from specified pathogens (SPF) (5.2.2) or in suitable cell cultures (5.2.4), such as chick-embryo fibroblasts or chick kidney cells obtained from SPF chicken flocks (5.2.2). For production, the virus of each strain is grown in the allantoic cavity of fertilised hens' eggs from healthy flocks.

#### VIRUS SEED LOT

The production of vaccine is based on a seed-lot system established by subculture of the candidate vaccine virus (CVV). This CVV is the approved virus isolate or reassorted virus supplied by WHO designated laboratories, or established by vaccine manufacturers. Working seed lots represent not more than 15 passages from the CVV. The final vaccine represents 1 passage from the working seed lot. The haemagglutinin and neuraminidase antigens of each seed lot are identified as originating from the correct strain of influenza virus by suitable methods.

Only a working virus seed lot that complies with the following requirements may be used in the preparation of the monovalent pooled harvest.

#### Bacterial and fungal contamination

Carry out the test for sterility (2.6.1), using 10 mL for each medium.

#### Mycoplasmas (2.6.7)

Carry out the test for mycoplasmas, using 10 mL.

### VIRUS PROPAGATION AND HARVEST

An antimicrobial agent may be added to the inoculum. After incubation at a controlled temperature, the allantoic fluids are harvested and combined to form a monovalent pooled harvest. An antimicrobial agent may be added at the time of harvest. At no stage in the production is penicillin or streptomycin used.

### MONOVALENT POOLED HARVEST

To limit the possibility of contamination, inactivation is initiated as soon as possible after preparation. The virus is inactivated by a method that has been demonstrated on 3 consecutive batches to be consistently effective for the manufacturer. The inactivation process shall have been shown to be capable of inactivating the influenza virus without destroying its antigenicity; the process should cause minimum alteration of the haemagglutinin and neuraminidase antigens. The inactivation process shall also have been shown to be capable of inactivating avian leucosis viruses and mycoplasmas. If the monovalent pooled harvest is stored after inactivation, it is held at  $5 \pm 3$  °C.

If formaldehyde solution is used, the concentration does not exceed 0.2 g/L of CH<sub>2</sub>O at any time during inactivation; if betapropiolactone is used, the concentration does not exceed 0.1 per cent V/V at any time during inactivation.

Before or after the inactivation process, the monovalent pooled harvest is concentrated and purified by high-speed centrifugation or other suitable method.

Only a monovalent pooled harvest that complies with the following requirements may be used in the preparation of the final bulk vaccine.

#### Haemagglutinin antigen

Determine the content of haemagglutinin antigen by an immunodiffusion test (2.7.1), by comparison with a haemagglutinin antigen reference preparation or with an antigen preparation calibrated against it<sup>1</sup>. Carry out the test at 20-25 °C.

#### Neuraminidase antigen

The presence and type of neuraminidase antigen are confirmed by suitable enzymatic or immunological methods on the first 3 monovalent pooled harvests from each working seed lot.

#### Sterility (2.6.1)

Carry out the test for sterility, using 10 mL for each medium.

#### Residual infectious virus

Carry out the test described below under Tests.

#### FINAL BULK VACCINE

Appropriate quantities of the monovalent pooled harvests are blended to make the final bulk vaccine.

Only a final bulk vaccine that complies with the following requirements may be used in the preparation of the final lot.

#### Antimicrobial preservative

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The content is not less than 85 per cent and not greater than 115 per cent of the intended amount.

#### Sterility (2.6.1)

Carry out the test for sterility using 10 mL for each medium.

<sup>1</sup> Reference haemagglutinin antigens are available from the National Institute for Biological Standards and Control, Blanche Lane, South Mimms, Potters Bar, Hertfordshire EN6 3QG, Great Britain.

**FINAL LOT**

The final bulk vaccine is distributed aseptically into sterile, tamper-evident containers. The containers are closed so as to prevent contamination.

Only a final lot that is satisfactory with respect to each of the requirements given below under Tests and Assay may be released for use. Provided that the test for residual infectious virus has been performed with satisfactory results on each monovalent pooled harvest and that the tests for free formaldehyde, ovalbumin and total protein have been performed with satisfactory results on the final bulk vaccine, they may be omitted on the final lot.

**IDENTIFICATION**

The assay serves to confirm the antigenic specificity of the vaccine.

**TESTS****Residual infectious virus**

Inoculate 0.2 mL of the vaccine into the allantoic cavity of each of 10 fertilised eggs and incubate at 33-37 °C for 3 days. The test is not valid unless at least 8 of the 10 embryos survive. Harvest 0.5 mL of the allantoic fluid from each surviving embryo and pool the fluids. Inoculate 0.2 mL of the pooled fluid into a further 10 fertilised eggs and incubate at 33-37 °C for 3 days. The test is not valid unless at least 8 of the 10 embryos survive. Harvest about 0.1 mL of the allantoic fluid from each surviving embryo and examine each individual harvest for live virus by a haemagglutination test. If haemagglutination is found for any of the fluids, carry out for that fluid a further passage in eggs and test for haemagglutination; no haemagglutination occurs.

**Antimicrobial preservative**

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The content is not less than the minimum amount shown to be effective and is not greater than 115 per cent of the quantity stated on the label.

**Free formaldehyde (2.4.18)**

Maximum 0.2 g/L, where applicable.

**Ovalbumin**

Not more than the quantity stated on the label and in any case not more than 1 µg per human dose, determined by a suitable immunochemical method (2.7.1) using a suitable reference preparation of ovalbumin.

**Total protein**

Not more than 6 times the total haemagglutinin content of the vaccine as determined in the assay, but in any case, not more than 100 µg of protein per virus strain per human dose and not more than a total of 300 µg of protein per human dose.

**Sterility (2.6.1)**

It complies with the test for sterility.

**Bacterial endotoxins (2.6.14)**

Less than 100 IU per human dose.

**ASSAY**

Determine the content of haemagglutinin antigen by an immunodiffusion test (2.7.1), by comparison with a haemagglutinin antigen reference preparation or with an antigen preparation calibrated against it<sup>1</sup>. Carry out the test at 20-25 °C. The confidence limits ( $P = 0.95$ ) are not less

than 80 per cent and not more than 125 per cent of the estimated haemagglutinin antigen content. The lower confidence limit ( $P = 0.95$ ) is not less than 80 per cent of the amount stated on the label for each strain.

**LABELLING**

The label states:

- that the vaccine has been prepared on eggs;
- the strain or strains of influenza virus used to prepare the vaccine;
- the method of inactivation;
- the haemagglutinin antigen content, in micrograms per virus strain per dose;
- the maximum amount of ovalbumin;
- the season during which the vaccine is intended to protect.

Ph Eur

**Influenza Vaccine (Live, Nasal)**

(Ph. Eur. monograph 2772)

Ph Eur

**DEFINITION**

Influenza vaccine (live, nasal) is an aqueous suspension of a live attenuated strain or strains of influenza virus, type A or B, or a mixture of strains of the 2 types grown individually in fertilised hens' eggs. The vaccine is presented in a form suitable for nasal administration. The vaccine is a colourless slightly opalescent liquid and may contain white particles.

**PRODUCTION****GENERAL PROVISIONS**

Production of the vaccine is based on a virus seed-lot system. The production method shall have been shown to consistently yield influenza vaccine (live) that complies with the requirements for immunogenicity, safety and stability.

**CHOICE OF VACCINE STRAIN**

The World Health Organization reviews the world epidemiological situation annually and if necessary recommends new strains corresponding to this epidemiological evidence.

Such strains are used in accordance with the regulations in force in the signatory States of the Convention on the Elaboration of a European Pharmacopoeia.

The attenuated donor virus strain and the attenuated vaccine virus strain may be generated by the manufacturer itself by classical reassortment methods or reverse genetics (e.g. plasmid rescue). The wild type virus strains used for the production of the attenuated vaccine virus seed lots must have been approved by the competent authority.

The complete history of production of the attenuated vaccine virus strain including description of the derivation of the seeds from the attenuated donor virus strain(s) and the WHO recommended wild virus strain(s) shall be approved by the competent authority.

During development studies and whenever a new HA subtype of influenza A virus (i.e. non-H1, non-H3 subtype) or a new influenza B virus type differing from the currently circulating genetic lineages is included in the vaccine, the neurovirulence of the master virus seed lots is assessed using suitable animal models (e.g. in mice) with the attenuated donor virus strain as a comparator. The new strain shall not be more neurovirulent than the comparator.

<sup>1</sup> Reference haemagglutinin antigens are available from the National Institute for Biological Standards and Control, Blanche Lane, South Mimms, Potters Bar, Hertfordshire EN6 3QG, Great Britain.

Genotypic and phenotypic characterisations of attenuated donor virus strain(s) are undertaken using techniques for identification of attenuation markers and nucleotide sequences.

#### **SUBSTRATE FOR VIRUS PROPAGATION**

Influenza virus seed and all vaccine batches are propagated in fertilised eggs from chicken flocks free from specified pathogens (SPF) (5.2.2).

#### **VIRUS SEED LOTS**

The production of vaccine is based on a seed-lot system. The attenuated donor virus strains and the wild-type virus strains used for the production of the attenuated master seed lots are identified by historical records that include information on their origins and the tests used in their characterisations.

Only an attenuated master donor virus strain that has been demonstrated by a suitable method (e.g. multiplex PCR assay) to be free from human respiratory pathogens which are able to replicate in eggs could be used for the production of attenuated master virus seed lots. This assay is omitted if reverse genetics method (e.g. plasmid rescue) is used.

The production of the attenuated master virus seed lot must be approved by the competent authority. The attenuated master virus seed lot must have the same characteristics as the attenuated donor virus strain. The number of passages required to produce the attenuated master virus seed lot from the attenuated donor virus strain is limited and approved by the competent authority. Unless otherwise justified and authorised, the inoculum for infecting the eggs used in the production of a vaccine lot shall be a virus harvest without intermediate passage, so that no vaccine virus is more than 1 passage from an attenuated master virus seed lot that has passed all safety tests.

Each virus seed lot used for propagation must have been filtrated through a bacteria retentive filter.

The attenuated master virus seed lot must express the haemagglutinin and neuraminidase from the wild type virus strain and other proteins from the attenuated donor virus strain.

The attenuated master virus seed lot characterisation shall include the following tests:

- genotype analyses using validated nucleic acid amplification techniques (2.6.21);
- virus sequencing of the seed lot and comparison of the coding sequences as follows; the sequences of the haemagglutinin and neuraminidase genes with those of the recommended strains and the sequences of the 6 remaining genes with those of the attenuated donor strain;
- genetic stability by sequencing, cold adapted and temperature sensitive phenotypes determination and attenuation test upon several passages in the substrate.

Only an attenuated master virus seed lot that complies with the following requirements may be used in the preparation of the harvest.

#### **Identification**

For each attenuated master virus seed lot, the haemagglutinin and neuraminidase antigens are identified using suitable methods.

#### **Cold adapted and temperature sensitive phenotype**

For each attenuated master virus seed lot a test is carried out in cell cultures to demonstrate the cold adapted and temperature sensitive phenotypes of the seed lot.

The attenuated master virus seed lot complies with the test:

- For the cold adaptation, if the loss of virus titre between the incubation at + 25 °C and + 33 °C is not more than 2.0 log<sub>10</sub> of infectious units as expressed in fluorescent focus units (FFU).
- For the temperature sensitivity, if the loss of virus titre between the incubation at + 33 °C and +37 °C (for strains B) or 39 °C (for strains A) is not less than 2.0 log<sub>10</sub> of infectious units as expressed in FFU.

#### **Attenuation**

For each attenuated master virus seed lot, an *in vivo* attenuation test is carried out on ferrets. The conditions of the test such as inoculation dose and observation period are established in validation studies. The attenuation test is performed by intranasal inoculation of ferrets, free from antibodies against influenza virus, with the attenuated master virus seed lot. The animals are monitored for a defined number of days post-inoculation for signs of influenza-like illness, including nasal discharge, frequent sneezing, severe lethargy, or fever.

At the conclusion of the monitoring period, animals are euthanized. Nasal turbinate and lung tissues are collected and analysed for the presence of infectious virus using a suitable infectivity assay.

For a master virus seed lot to be identified as attenuated, the virus must be detected in samples of nasal turbinate tissues and samples from lung tissues from individual animals, and must demonstrate that the virus growth is restricted or shows no virus replication. In addition, there are no signs of influenza-like illness in the inoculated animals.

#### **Virus concentration**

The virus concentration of each attenuated master virus seed lot is determined by titration in cell cultures using a suitable validated *in vitro* cell-based assay (e.g. fluorescent focus assay) to monitor the consistency of production.

#### **Extraneous agents (2.6.16)**

Each attenuated master virus seed lot complies with the requirements for virus seed lots.

#### **Avian leucosis viruses**

For each attenuated master virus seed lot, the absence of avian leucosis viruses is verified using a suitable method.

#### **PROPAGATION AND HARVEST**

All processing of the fertilised eggs is done under aseptic conditions in an area where no other infectious agents or cells are handled at the same time. After inoculation and incubation at a controlled temperature, only eggs containing living and typical chick embryos are harvested.

The percentage of rejected eggs is recorded. After homogenisation and clarification by centrifugation, the clarified allantoic fluid is tested as described below and kept at -70 °C or colder until further processing. No human protein is added to the virus suspension at any stage during production. If stabilisers are added, they shall have been shown to have no antigenic or sensitising properties for man.

Only a single harvest or a monovalent pooled harvest that complies with the following requirements may be used in the preparation of the monovalent bulk.

#### **Extraneous agents (2.6.16)**

Each single harvest or monovalent pooled harvest complies with the tests for extraneous agents with the exception of the tests for mycobacteria and sterility which are not required at this stage of production.

**Avian leucosis viruses**

For each single harvest or monovalent pooled harvest, the absence of avian leucosis viruses is verified using a suitable method.

**Microbiological contamination**

The bioburden test using a membrane filtration is carried out on each single harvest or on each monovalent pooled harvest to determine the total viable aerobic count and to verify the absence of yeast and mould using selective media. The total viable aerobic count is within the limit approved by the competent authority. Verification of absence of *Vibrio*, *Shigella* and *Salmonella* is carried out using supplementary specific validated techniques approved by the competent authority.

**MONOVALENT BULK**

Monovalent bulks are prepared by pooling a number of satisfactory single harvests or monovalent pooled harvests of the same virus type. The monovalent bulk is concentrated and purified by high-speed centrifugation or another suitable method then filtered through a bacteria retentive filter.

Only a monovalent bulk that complies with the following requirements may be used in the preparation of the final bulk vaccine.

**Identification**

Each monovalent bulk is identified as influenza virus of the given type using suitable haemagglutinin type specific assay.

**Virus concentration**

The virus concentration of each monovalent bulk is determined by titration using a suitable validated *in vitro* assay (e.g. fluorescent focus assay).

**Cold adapted and temperature sensitive phenotype**

Each monovalent bulk complies with the test as described under Virus seed lots.

**Attenuation test**

The attenuation test is performed by intranasal inoculation of ferrets, free from antibodies against influenza virus, with each monovalent bulk test sample as described under Virus seed lots.

If sufficient consistency data are available, and approved by the competent authority, only the first 3 monovalent bulks following the introduction of a new attenuated master virus seed lot are tested on ferrets.

Wherever possible, in accordance with the provisions of the European Convention for the Protection of Vertebrate Animals used for Experimental and Other Scientific Purposes, manufacturers are encouraged to develop validated *in vitro* alternative methods to the animal test for monovalent bulks using appropriate tools such as molecular methods or other suitable methods for determination of viral attenuation markers.

**Genotyping**

The genotype of each monovalent bulk is verified using suitable validated nucleic acid amplification techniques (2.6.21).

**Bacterial and fungal contamination**

Each monovalent bulk complies with the test for sterility (2.6.1), carried out using 10 mL of each medium.

**Total protein content**

Maximum 0.25 mg per human dose before the addition of any stabiliser.

**FINAL BULK VACCINE**

A final bulk vaccine is formulated aseptically from appropriate quantities of the monovalent bulks of each virus strain. The final bulk vaccine is distributed aseptically into

sterile, tamper-evident containers. Where a final bulk vaccine is formulated as a release intermediate, it complies with the following requirements and is within the limits approved for the particular product. A suitable stabiliser may be added.

Only a final bulk vaccine that complies with the following requirements may be used in the preparation of the final lot.

**Bacterial and fungal contamination**

The final bulk vaccine complies with the test for sterility (2.6.1), carried out using 10 mL for each medium.

**FINAL LOT**

An approved minimum virus concentration for release of the product is established for each virus strain to ensure, in light of stability data, that the minimum concentration stated on the label will be present at the end of the period of validity.

Only a final lot that is satisfactory with respect to each of the requirements given below under Identification, Tests and Assay may be released for use.

**Thermal stability**

Maintain not fewer than 3 containers of the final lot at an elevated temperature for a defined period of time, using conditions found suitable for the particular product as approved by the competent authority. Determine the virus concentration as described under Assay in parallel for the heated vaccine and for vaccine maintained at the temperature recommended for storage. For each virus strain, the virus concentration of the containers that have been heated does not decrease by more than an approved amount during the period of exposure.

**IDENTIFICATION**

The assay serves to confirm the antigenic specificity of the vaccine.

**TESTS****Ovalbumin**

Not more than the quantity stated on the label and in any case not more than 1 µg per human dose, determined by a suitable immunochemical method (2.7.1) using a suitable reference preparation of ovalbumin.

**Total protein**

Not more than the quantity stated on the label and in any case not more than 2.2 mg per human dose.

**Bacterial and fungal contamination**

It complies with the test for sterility (2.6.1).

**Bacterial endotoxins (2.6.14)**

Less than 6 IU per single human dose.

**ASSAY**

Titrate the vaccine for infective virus in cell cultures using at least 3 separate containers of vaccine and inoculating a suitable number of wells for each dilution step.

Titrate 1 container of an appropriate virus reference preparation in triplicate to validate each assay. The virus concentration of the reference preparation is monitored using a control chart and a titre is established for each virus strain on a historical basis by each laboratory. If the vaccine contains more than one influenza virus strain, titrate each virus strain separately, using an appropriate type-specific antiserum.

Calculate the individual virus concentration for each container of vaccine and for each replicate of the reference preparation as well as the corresponding combined virus concentrations, using the usual statistical methods (for example, 5.3). For each virus strain, the combined virus concentration for the 3 containers of vaccine is within the range stated on the label.

The assay is not valid if:

- for each virus strain, the confidence interval ( $P = 0.95$ ) of the estimated virus concentration of the reference preparation for the 3 replicates combined is greater than  $\pm 0.3 \log_{10}$  infectious units as expressed in FFU;
- for each virus strain, the virus concentration of the reference preparation differs by more than  $0.5 \log_{10}$  infectious units as expressed in FFU from the established value.

The assay is repeated if the confidence interval ( $P = 0.95$ ) of the combined virus concentration of the vaccine is greater than  $\pm 0.3 \log_{10}$  infectious units as expressed in FFU; data obtained from valid assays only are combined by the usual statistical methods (for example, 5.3) to calculate the virus concentration of the sample. The confidence interval ( $P = 0.95$ ) of the combined virus concentration is not greater than  $\pm 0.3 \log_{10}$  infectious units as expressed in FFU.

#### LABELLING

The label states:

- that the vaccine has been prepared in eggs;
- the strain or strains of influenza virus used in preparation of the vaccine;
- the minimum and maximum virus strain concentration per human dose;
- the maximum amount of ovalbumin;
- the season during which the vaccine is intended to protect.

Ph Eur

## Influenza Vaccine (Whole Virion Inactivated Prepared in Cell Cultures)

(Ph. Eur. monograph 2308)

Ph Eur

#### DEFINITION

Influenza vaccine (whole virion, inactivated, prepared in cell cultures) is a sterile, aqueous suspension of a strain or strains of influenza virus, type A or B, or a mixture of strains of the 2 types grown individually in cell cultures and inactivated in such a manner that their antigenic properties are retained. The stated amount of haemagglutinin antigen for each strain present in the vaccine is  $15 \mu\text{g}$  per dose, unless clinical evidence supports the use of a different amount. The vaccine is a slightly opalescent or opalescent liquid. The vaccine may contain an adjuvant. This monograph applies to vaccines produced in diploid or continuous cell lines of mammalian origin.

#### PRODUCTION

##### GENERAL PROVISIONS

Production of the vaccine is based on a virus seed-lot system and a cell-bank system. The production method shall have been shown to yield consistently vaccines that comply with the requirements for immunogenicity, safety and stability.

The production method is validated to demonstrate suitable reduction of residual host-cell protein. With the agreement of the competent authority and for each specific product, routine testing for residual host-cell proteins may be omitted based on the results of validation studies for the product. Guidance on the principles of such validation studies is given, for example, in the monograph *Products of recombinant*

*DNA technology (0784)*, in particular in the sections 'Validation of the production process - Extraction and purification' and 'Production consistency - Host-cell-derived proteins'.

#### CHOICE OF VACCINE STRAIN

The World Health Organization (WHO) reviews the world epidemiological situation annually and if necessary recommends new strains corresponding to this epidemiological evidence.

Such strains are used in accordance with the regulations in force in the signatory states of the Convention on the Elaboration of a European Pharmacopoeia. It is now common practice to use reassorted strains giving high yields of the appropriate surface antigens. The origin and passage history of virus strains shall be approved by the competent authority.

#### SUBSTRATE FOR VIRUS PROPAGATION

Influenza virus used in the preparation of seed lots is propagated in fertilised eggs from chicken flocks free from specified pathogens (SPF) (5.2.2) or in suitable cell cultures (5.2.3), such as chick-embryo fibroblasts, chick kidney cells obtained from SPF chicken flocks (5.2.2), or a diploid or continuous cell line. The final passage for establishment of the working seed lot is prepared in the cell line used for routine production. For this production, the virus of each strain is propagated in a diploid or continuous cell line (5.2.3).

#### VIRUS SEED LOT

The production of vaccine is based on a seed-lot system established by subculture of the candidate vaccine virus (CVV). This CVV is the approved virus isolate or reassorted virus supplied by WHO designated laboratories, or established by vaccine manufacturers. Each of the strains of influenza virus used shall be identified by historical records that include information on the origin of the strain and its subsequent manipulation. Working seed lots represent not more than 15 passages from the CVV. The final vaccine represents 1 passage from the working seed lot.

Only a seed lot that complies with the following requirements may be used for virus propagation.

#### Identification

The haemagglutinin and neuraminidase antigens of each master and working seed lot are identified as originating from the correct strain of influenza virus by suitable methods.

#### Virus concentration

The virus concentration of each working seed lot is determined. Where applicable, the virus concentration of each master seed lot is determined.

#### Extraneous agents (2.6.16)

The working seed lots comply with the requirements for seed lots. It is recognised that due to a seasonal change in one or more of the influenza vaccine strains, timely testing of a virus seed for extraneous agents using *in vitro* tests in cell culture and *in vivo* tests may be problematic (e.g. duration of *in vivo* tests, timely availability of specific neutralising antisera). In agreement with the competent authority, and in light of a risk assessment, rapid assays (e.g. multiplex PCR; high-throughput sequencing methods) may be applied following validation.

Such risk assessment and validation includes more general considerations on potential contaminants of the virus isolates, the susceptibility of the cell substrate to such viruses and the capacity of the production process for viral removal or inactivation; validation also includes comparative data on

testing of seeds using *in vitro* tests in cell culture and/or *in vivo* tests according to general chapter 2.6.16 and the proposed rapid assays. Each rapid assay must be shown to be suitable for its intended use by appropriate analytical validation. The risk assessment is reviewed when new information becomes available on potential viral contaminants. Where PCR is used, the justification of the chosen panel of extraneous agents tested for is provided to the competent authority within the annual update. This update also includes vaccine strain-specific aspects such as specific PCR inhibitory effects.

If an agent is detected in a virus seed and the mammalian cells used for production are shown to be susceptible to this agent, the virus seed is not used for vaccine production.

If an agent is detected in a virus seed and the mammalian cells are not susceptible to the agent, validation of the production process to demonstrate removal or inactivation of the agent is carried out. If removal or inactivation cannot be demonstrated, the inactivated monovalent harvest is tested to demonstrate absence of any contaminant identified in the virus seed.

#### **PROPAGATION AND SINGLE HARVEST**

All processing of the cell bank and subsequent cell cultures is done under aseptic conditions in an area where no other cells are being handled at the same time. Approved animal serum (but not human serum) may be used in the cell culture media. Serum and trypsin used in the preparation of cell suspensions or media are shown to be free from extraneous agents. The cell culture media may contain a pH indicator, such as phenol red, and antibiotics at the lowest effective concentration. A sufficient quantity of the cell cultures employed for vaccine production are set aside as uninfected cell cultures (control cells).

Only a single harvest that complies with the following requirements may be used in the preparation of the vaccine.

##### **Identification**

The test for antigen content also serves to identify the single harvest.

##### **Bacterial and fungal contamination**

Carry out the test for sterility (2.6.1), using 10 mL for each medium.

##### **Mycoplasmas (2.6.7)**

Carry out the test for mycoplasmas, using 10 mL for each medium.

##### **Control cells**

The control cells of the production cell culture comply with a test for identification and the requirements for extraneous agents (2.6.16).

##### **Haemagglutinin antigen**

Determine the haemagglutinin antigen content by a suitable immunochemical method (2.7.1).

#### **INACTIVATED AND PURIFIED MONOVALENT HARVEST**

The harvest, which may be a pool of several single harvests of the same strain, is inactivated and purified by validated methods. Before or after the inactivation process, the monovalent harvest is concentrated and purified by high-speed centrifugation or another suitable method.

The influenza virus is inactivated by a method that has been demonstrated on 3 consecutive batches to be consistently effective for the manufacturer. The inactivation process shall have been shown to be capable of inactivating the influenza virus without destroying its antigenicity; the process is

designed so as to cause minimum alteration of the haemagglutinin and neuraminidase antigens.

If continuous cell lines are used for production, the purification process shall have been validated to reduce consistently host-cell DNA to a suitable level.

Only an inactivated, purified monovalent harvest that complies with the following requirements may be used in the preparation of the final bulk vaccine.

##### **Haemagglutinin antigen**

Determine the haemagglutinin antigen content by a suitable immunochemical method (2.7.1).

##### **Antigen/total protein ratio**

Determine the haemagglutinin antigen content by a suitable immunodiffusion test. Determine the total protein by a validated method. The ratio of haemagglutinin antigen content to total protein content is within the limits approved for the particular product.

##### **Neuraminidase antigen**

The presence and type of neuraminidase antigen are confirmed by suitable enzymatic or immunological methods on the first 3 monovalent harvests from each working seed lot.

##### **Sterility (2.6.1)**

Carry out the test for sterility, using 10 mL for each medium.

##### **Residual infectious virus**

Carry out the test described below under Tests.

#### **FINAL BULK VACCINE**

Appropriate quantities of the inactivated, purified monovalent pooled harvests are blended to make the final bulk vaccine.

An adjuvant may be added.

Only a final bulk vaccine that complies with the following requirements may be used in the preparation of the final lot.

##### **Antimicrobial preservative**

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The content is not less than 85 per cent and not greater than 115 per cent of the intended amount.

##### **Sterility (2.6.1)**

Carry out the test for sterility, using 10 mL for each medium.

##### **Residual host-cell DNA**

If a continuous cell line is used for virus propagation, the content of residual host-cell DNA, determined using a suitable method, is not greater than 10 ng in the equivalent of a single human dose.

#### **FINAL LOT**

The final bulk vaccine is distributed aseptically into sterile, tamper-evident containers. The containers are closed so as to prevent contamination.

Only a final lot that is satisfactory with respect to each of the requirements given below under Tests and Assay may be released for use. Provided that the test for residual infectious virus has been performed with satisfactory results on each inactivated and purified monovalent harvest and that the tests for free formaldehyde, bovine serum albumin and total protein have been performed with satisfactory results on the final bulk vaccine, they may be omitted on the final lot.

If the vaccine contains an adjuvant, suitable tests for identity and other relevant quality criteria are carried out on the final lot. These tests may include chemical and physical analysis, determination of particle size and determination of the number of particles per unit volume.

**IDENTIFICATION**

The assay serves to confirm the antigenic specificity of the vaccine.

**TESTS****Residual infectious virus**

Carry out an amplification test for residual infectious influenza virus by inoculating not less than 4 mL of the vaccine into cell cultures of the same type as used for production of the vaccine; incubate for not less than 7 days at  $32 \pm 2$  °C. Inoculate not less than 10 mL of the cell culture harvested medium into a new semi-confluent cell culture and incubate as before. At the end of the incubation period, examine for live virus by a haemagglutination test. If haemagglutination is found for any of the fluids, carry out for that fluid a further passage on cell cultures and test for haemagglutination; no haemagglutination occurs.

**Antimicrobial preservative**

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The content is not less than the minimum amount shown to be effective and is not greater than 115 per cent of the quantity stated on the label.

**Free formaldehyde (2.4.18)**

Maximum 0.2 g/L, where applicable.

**Bovine serum albumin**

Maximum 50 ng per human dose, determined by a suitable immunochemical method (2.7.1).

**Total protein**

Not more than 6 times the total haemagglutinin content of the vaccine as determined in the assay, but in any case, not more than 100 µg of protein per virus strain per human dose.

**Sterility (2.6.1)**

It complies with the test for sterility.

**Bacterial endotoxins (2.6.14)**

Less than 25 IU per human dose.

**ASSAY**

Determine the content of haemagglutinin antigen by an immunodiffusion test (2.7.1), by comparison with a haemagglutinin antigen reference preparation<sup>1</sup> or with an antigen preparation calibrated against it. Carry out the test at 20–25 °C. The confidence limits ( $P = 0.95$ ) are not less than 80 per cent and not more than 125 per cent of the estimated content. The lower confidence limit ( $P = 0.95$ ) is not less than 80 per cent of the amount stated on the label for each strain.

**LABELLING**

The label states:

- the biological origin of the cells used for the preparation of the vaccine;
- the strain or strains of influenza virus used to prepare the vaccine;
- the method of inactivation;
- the haemagglutinin antigen content, in micrograms per virus strain per dose;
- the season during which the vaccine is intended to protect;
- where applicable, the name and the quantity of adjuvant used.

Ph Eur

<sup>1</sup> Reference haemagglutinin antigens are available from the National Institute for Biological Standards and Control, Blanche Lane, South Mimms, Potters Bar, Hertfordshire EN6 3QG, Great Britain.

**Inactivated Influenza Vaccine (Split Virion)**

(Influenza Vaccine (Split Virion, Inactivated),  
Ph. Eur. monograph 0158)

The label may state 'Flu'.

When Inactivated Influenza Vaccine or Influenza Vaccine is prescribed or demanded and the form is not stated, Inactivated Influenza Vaccine (Whole Virion), Inactivated Influenza Vaccine (Split Virion) or Inactivated Influenza Vaccine (Surface Antigen) may be dispensed or supplied.

Ph Eur

**DEFINITION**

Influenza vaccine (split virion, inactivated) is a sterile, aqueous suspension of a strain or strains of influenza virus, type A or B, or a mixture of strains of the 2 types grown individually in fertilised hens' eggs, inactivated and treated so that the integrity of the virus particles has been disrupted without diminishing the antigenic properties of the haemagglutinin and neuraminidase antigens. The stated amount of haemagglutinin antigen for each strain present in the vaccine is 15 µg per dose, unless clinical evidence supports the use of a different amount.

The vaccine is a slightly opalescent liquid.

**PRODUCTION****CHOICE OF VACCINE STRAIN**

The World Health Organization (WHO) reviews the world epidemiological situation annually and if necessary recommends the strains that correspond to this epidemiological evidence.

Such strains are used in accordance with the regulations in force in the signatory States of the Convention on the Elaboration of a European Pharmacopoeia. It is now common practice to use reassorted strains giving high yields of the appropriate surface antigens. The origin and passage history of virus strains shall be approved by the competent authority.

**SUBSTRATE FOR VIRUS PROPAGATION**

Influenza virus seed to be used in the production of vaccine is propagated in fertilised eggs from chicken flocks free from specified pathogens (SPF) (5.2.2) or in suitable cell cultures (5.2.4), such as chick-embryo fibroblasts or chick kidney cells obtained from SPF chicken flocks (5.2.2). For production, the virus of each strain is grown in the allantoic cavity of fertilised hens' eggs from healthy flocks.

**VIRUS SEED LOT**

The production of vaccine is based on a seed-lot system established by subculture of the candidate vaccine virus (CVV). This CVV is the approved virus isolate or reassorted virus supplied by WHO designated laboratories, or established by vaccine manufacturers. Working seed lots represent not more than 15 passages from the CVV. The final vaccine represents 1 passage from the working seed lot. The haemagglutinin and neuraminidase antigens of each seed lot are identified as originating from the correct strain of influenza virus by suitable methods.

Only a working virus seed lot that complies with the following requirements may be used in the preparation of the monovalent pooled harvest.

**Bacterial and fungal contamination**

Carry out the test for sterility (2.6.1), using 10 mL for each medium.

**Mycoplasmas (2.6.7)**

Carry out the test for mycoplasmas, using 10 mL.

**VIRUS PROPAGATION AND HARVEST**

An antimicrobial agent may be added to the inoculum. After incubation at a controlled temperature, the allantoic fluids are harvested and combined to form a monovalent pooled harvest. An antimicrobial agent may be added at the time of harvest. At no stage in the production is penicillin or streptomycin used.

**MONOVALENT POOLED HARVEST**

To limit the possibility of contamination, inactivation is initiated as soon as possible after preparation. The virus is inactivated by a method that has been demonstrated on 3 consecutive batches to be consistently effective for the manufacturer. The inactivation process shall have been shown to be capable of inactivating the influenza virus without destroying its antigenicity; the process should cause minimum alteration of the haemagglutinin and neuraminidase antigens. The inactivation process shall also have been shown to be capable of inactivating avian leucosis viruses and mycoplasmas. If the monovalent pooled harvest is stored after inactivation, it is held at  $5 \pm 3^\circ\text{C}$ .

If formaldehyde solution is used, the concentration does not exceed 0.2 g/L of  $\text{CH}_2\text{O}$  at any time during inactivation; if betapropiolactone is used, the concentration does not exceed 0.1 per cent *V/V* at any time during inactivation.

Before or after the inactivation procedure, the monovalent pooled harvest is concentrated and purified by high-speed centrifugation or other suitable method and the virus particles are disrupted into component subunits by the use of approved procedures. For each new strain, a validation test is carried out to show that the monovalent bulk consists predominantly of disrupted virus particles.

Only a monovalent pooled harvest that complies with the following requirements may be used in the preparation of the final bulk vaccine.

**Haemagglutinin antigen**

Determine the content of haemagglutinin antigen by an immunodiffusion test (2.7.1), by comparison with a haemagglutinin antigen reference preparation or with an antigen preparation calibrated against it<sup>1</sup>. Carry out the test at 20-25 °C.

For some vaccines, the physical form of the haemagglutinin particles prevents quantitative determination by immunodiffusion after inactivation of the virus. For these vaccines, a determination of haemagglutinin antigen is made on the monovalent pooled harvest before inactivation. The production process is validated to demonstrate suitable conservation of haemagglutinin antigen and a suitable tracer is used for formulation, for example, protein content.

**Neuraminidase antigen**

The presence and type of neuraminidase antigen are confirmed by suitable enzymatic or immunological methods on the first 3 monovalent pooled harvests from each working seed lot.

**Sterility (2.6.1)**

Carry out the test for sterility, using 10 mL for each medium.

**Residual infectious virus**

Carry out the test described below under Tests.

**Chemicals used for disruption**

Tests are carried out on the monovalent pooled harvest for the chemicals used for disruption, the limits being approved by the competent authority.

**FINAL BULK VACCINE**

Appropriate quantities of the monovalent pooled harvests are blended to make the final bulk vaccine.

Only a final bulk vaccine that complies with the following requirements may be used in the preparation of the final lot.

**Antimicrobial preservative**

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The content is not less than 85 per cent and not greater than 115 per cent of the intended amount.

**Sterility (2.6.1)**

Carry out the test for sterility, using 10 mL for each medium.

**FINAL LOT**

The final bulk vaccine is distributed aseptically into sterile, tamper-evident containers. The containers are closed so as to prevent contamination.

Only a final lot that is satisfactory with respect to each of the requirements given below under Tests and Assay may be released for use. Provided that the test for residual infectious virus has been performed with satisfactory results on each monovalent pooled harvest and that the tests for free formaldehyde, ovalbumin and total protein have been performed with satisfactory results on the final bulk vaccine, they may be omitted on the final lot.

**IDENTIFICATION**

The assay serves to confirm the antigenic specificity of the vaccine.

**TESTS****Residual infectious virus**

Inoculate 0.2 mL of the vaccine into the allantoic cavity of each of 10 fertilised eggs and incubate at 33-37 °C for 3 days. The test is not valid unless at least 8 of the 10 embryos survive. Harvest 0.5 mL of the allantoic fluid from each surviving embryo and pool the fluids. Inoculate 0.2 mL of the pooled fluid into a further 10 fertilised eggs and incubate at 33-37 °C for 3 days. The test is not valid unless at least 8 of the 10 embryos survive. Harvest about 0.1 mL of the allantoic fluid from each surviving embryo and examine each individual harvest for live virus by a haemagglutination test. If haemagglutination is found for any of the fluids, carry out for that fluid a further passage in eggs and test for haemagglutination; no haemagglutination occurs.

**Antimicrobial preservative**

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The content is not less than the minimum amount shown to be effective and is not greater than 115 per cent of the quantity stated on the label.

**Free formaldehyde (2.4.18)**

Maximum 0.2 g/L, where applicable.

**Ovalbumin**

Not more than the quantity stated on the label and in any case not more than 1 µg per human dose, determined by a suitable immunochemical method (2.7.1) using a suitable reference preparation of ovalbumin.

**Total protein**

Not more than 6 times the total haemagglutinin content of the vaccine as determined in the assay, but in any case, not

<sup>1</sup> Reference haemagglutinin antigens are available from the National Institute for Biological Standards and Control, Blanche Lane, South Mimms, Potters Bar, Hertfordshire EN6 3QG, Great Britain.

more than 100 µg of protein per virus strain per human dose and not more than a total of 300 µg of protein per human dose.

#### **Sterility (2.6.1)**

It complies with the test for sterility.

#### **Bacterial endotoxins (2.6.14)**

Less than 100 IU per human dose.

#### **ASSAY**

Determine the content of haemagglutinin antigen by an immunodiffusion test (2.7.1), by comparison with a haemagglutinin antigen reference preparation or with an antigen preparation calibrated against it<sup>(1)</sup>. Carry out the test at 20-25 °C. The confidence limits ( $P = 0.95$ ) are not less than 80 per cent and not more than 125 per cent of the estimated haemagglutinin antigen content. The lower confidence limit ( $P = 0.95$ ) is not less than 80 per cent of the amount stated on the label for each strain.

For some vaccines, quantitative determination of haemagglutinin antigen with respect to available reference preparations is not possible. An immunological identification of the haemagglutinin antigen and a semi-quantitative determination are carried out instead by suitable methods.

#### **LABELLING**

The label states:

- that the vaccine has been prepared on eggs;
- the strain or strains of influenza virus used to prepare the vaccine;
- the method of inactivation;
- the haemagglutinin antigen content in micrograms per virus strain per dose;
- the maximum amount of ovalbumin;
- the season during which the vaccine is intended to protect.

Ph Eur

## **Inactivated Influenza Vaccine (Surface Antigen)**

(Influenza Vaccine (Surface Antigen, Inactivated),  
Ph. Eur. monograph 0869)

The label may state 'Flu' or 'Flu(adj)' as appropriate.

When Inactivated Influenza Vaccine or Influenza Vaccine is prescribed or demanded and the form is not stated, Inactivated Influenza Vaccine (Whole Virion), Inactivated Influenza Vaccine (Split Virion) or Inactivated Influenza Vaccine (Surface Antigen) may be dispensed or supplied.

Ph Eur

#### **DEFINITION**

Influenza vaccine (surface antigen, inactivated) is a sterile suspension of a strain or strains of influenza virus, type A or B, or a mixture of strains of the 2 types grown individually in fertilised hens' eggs, inactivated and treated so that the preparation consists predominantly of haemagglutinin and neuraminidase antigens, without diminishing the antigenic properties of these antigens. The stated amount of haemagglutinin antigen for each strain present in the vaccine is 15 µg per dose, unless clinical evidence supports the use of a different amount. The vaccine may contain an adjuvant.

#### **PRODUCTION**

##### **CHOICE OF VACCINE STRAIN**

The World Health Organization (WHO) reviews the world epidemiological situation annually and if necessary recommends the strains that correspond to this epidemiological evidence.

Such strains are used in accordance with the regulations in force in the signatory states of the Convention on the Elaboration of a European Pharmacopoeia. It is now common practice to use reassorted strains giving high yields of the appropriate surface antigens. The origin and passage history of virus strains shall be approved by the competent authority.

##### **SUBSTRATE FOR VIRUS PROPAGATION**

Influenza virus seed to be used in the production of vaccine is propagated in fertilised eggs from chicken flocks free from specified pathogens (SPF) (5.2.2) or in suitable cell cultures (5.2.4), such as chick-embryo fibroblasts or chick kidney cells obtained from SPF chicken flocks (5.2.2). For production, the virus of each strain is grown in the allantoic cavity of fertilised hens' eggs from healthy flocks.

##### **VIRUS SEED LOT**

The production of vaccine is based on a seed-lot system established by subculture of the candidate vaccine virus (CVV). This CVV is the approved virus isolate or reassorted virus supplied by WHO designated laboratories, or established by vaccine manufacturers. Working seed lots represent not more than 15 passages from the CVV. The final vaccine represents 1 passage from the working seed lot. The haemagglutinin and neuraminidase antigens of each seed lot are identified as originating from the correct strain of influenza virus by suitable methods.

Only a working virus seed lot that complies with the following requirements may be used in the preparation of the monovalent pooled harvest.

##### **Bacterial and fungal contamination**

Carry out the test for sterility (2.6.1), using 10 mL for each medium.

##### **Mycoplasmas (2.6.7)**

Carry out the test for mycoplasmas, using 10 mL.

##### **VIRUS PROPAGATION AND HARVEST**

An antimicrobial agent may be added to the inoculum. After incubation at a controlled temperature, the allantoic fluids are harvested and combined to form a monovalent pooled harvest. An antimicrobial agent may be added at the time of harvest. At no stage in the production is penicillin or streptomycin used.

##### **MONOVALENT POOLED HARVEST**

To limit the possibility of contamination, inactivation is initiated as soon as possible after preparation. The virus is inactivated by a method that has been demonstrated on 3 consecutive batches to be consistently effective for the manufacturer. The inactivation process shall have been shown to be capable of inactivating the influenza virus without destroying its antigenicity; the process should cause minimum alteration of the haemagglutinin and neuraminidase antigens. The inactivation process shall also have been shown to be capable of inactivating avian leucosis viruses and mycoplasmas. If the monovalent pooled harvest is stored after inactivation, it is held at  $5 \pm 3$  °C. If formaldehyde solution is used, the concentration does not exceed 0.2 g/L of CH<sub>2</sub>O at any time during inactivation; if betapropiolactone is used, the concentration does not exceed 0.1 per cent *V/V* at any time during inactivation.

Before or after the inactivation process, the monovalent pooled harvest is concentrated and purified by high-speed centrifugation or other suitable method. Virus particles are disrupted into component subunits by approved procedures and further purified so that the monovalent bulk consists mainly of haemagglutinin and neuraminidase antigens.

Only a monovalent pooled harvest that complies with the following requirements may be used in the preparation of the final bulk vaccine.

#### Haemagglutinin antigen

Determine the content of haemagglutinin antigen by an immunodiffusion test (2.7.1), by comparison with a haemagglutinin antigen reference preparation or with an antigen preparation calibrated against it<sup>1</sup>. Carry out the test at 20-25 °C.

#### Neuraminidase antigen

The presence and type of neuraminidase antigen are confirmed by suitable enzymatic or immunological methods on the first 3 monovalent pooled harvests from each working seed lot.

#### Sterility (2.6.1)

Carry out the test for sterility, using 10 mL for each medium.

#### Residual infectious virus

Carry out the test described below under Tests.

#### Purity

The purity of the monovalent pooled harvest is examined by polyacrylamide gel electrophoresis or by other approved techniques. Mainly haemagglutinin and neuraminidase antigens shall be present.

#### Chemicals used for disruption and purification

Tests are carried out on the monovalent pooled harvest for the chemicals used for disruption and purification, the limits being approved by the competent authority.

#### FINAL BULK VACCINE

Appropriate quantities of the monovalent pooled harvests are blended to make the final bulk vaccine. An adjuvant may be added.

Only a final bulk vaccine that complies with the following requirements may be used in the preparation of the final lot.

#### Antimicrobial preservative

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The content is not less than 85 per cent and not greater than 115 per cent of the intended amount.

#### Sterility (2.6.1)

Carry out the test for sterility, using 10 mL for each medium.

#### FINAL LOT

The final bulk vaccine is distributed aseptically into sterile, tamper-evident containers. The containers are closed so as to prevent contamination.

Only a final lot that is satisfactory with respect to each of the requirements given below under Tests and Assay may be released for use. Provided that the test for residual infectious virus has been performed with satisfactory results on each monovalent pooled harvest and that the tests for free formaldehyde, ovalbumin and total protein have been

performed with satisfactory results on the final bulk vaccine, they may be omitted on the final lot.

If the ovalbumin and formaldehyde content cannot be determined on the final lot, owing to interference from the adjuvant, they are determined on the monovalent pooled harvest, the acceptance limits being set to ensure that the limits for the final product will not be exceeded.

If the vaccine contains an adjuvant, suitable tests for identity and other relevant quality criteria are carried out on the final lot. These tests may include chemical and physical analysis, determination of particle size and determination of the number of particles per unit volume.

#### IDENTIFICATION

The assay serves to confirm the antigenic specificity of the vaccine.

#### TESTS

##### Residual infectious virus

Inoculate 0.2 mL of the vaccine into the allantoic cavity of each of 10 fertilised eggs and incubate at 33-37 °C for 3 days. The test is not valid unless at least 8 of the 10 embryos survive. Harvest 0.5 mL of the allantoic fluid from each surviving embryo and pool the fluids. Inoculate 0.2 mL of the pooled fluid into a further 10 fertilised eggs and incubate at 33-37 °C for 3 days. The test is not valid unless at least 8 of the 10 embryos survive. Harvest about 0.1 mL of the allantoic fluid from each surviving embryo and examine each individual harvest for live virus by a haemagglutination test. If haemagglutination is found for any of the fluids, carry out for that fluid a further passage in eggs and test for haemagglutination; no haemagglutination occurs.

##### Antimicrobial preservative

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The content is not less than the minimum amount shown to be effective and is not greater than 115 per cent of the quantity stated on the label.

##### Free formaldehyde (2.4.13)

Maximum 0.2 g/L, where applicable.

##### Ovalbumin

Not more than the quantity stated on the label and in any case not more than 1 µg per human dose, determined by a suitable immunochemical method (2.7.1) using a suitable reference preparation of ovalbumin.

##### Total protein

Not more than 40 µg of protein other than haemagglutinin per virus strain per human dose and not more than a total of 120 µg of protein other than haemagglutinin per human dose.

##### Sterility

It complies with the test for sterility (2.6.1).

##### Bacterial endotoxins (2.6.14)

Less than 100 IU per human dose.

#### ASSAY

Determine the content of haemagglutinin antigen by an immunodiffusion test (2.7.1), by comparison with a haemagglutinin antigen reference preparation or with an antigen preparation calibrated against it<sup>1</sup>. Carry out the test at 20-25 °C. The confidence limits ( $P = 0.95$ ) are not less than 80 per cent and not more than 125 per cent of the estimated content. The lower confidence limit ( $P = 0.95$ ) haemagglutinin antigen is not less than 80 per cent of the amount stated on the label for each strain.

<sup>1</sup> Reference haemagglutinin antigens are available from the National Institute for Biological Standards and Control, Blanche Lane, South Mimms, Potters Bar, Hertfordshire EN6 3QG, Great Britain.

**LABELLING***The label states:*

- that the vaccine has been prepared on eggs;
- the strain or strains of influenza virus used to prepare the vaccine;
- the method of inactivation;
- the haemagglutinin antigen content, in micrograms per virus strain per dose;
- the season during which the vaccine is intended to protect;
- the maximum amount of ovalbumin;
- where applicable, the name and the quantity of adjuvant used.

*Ph Eur*

## Influenza Vaccine (Surface Antigen, Inactivated, Prepared in Cell Cultures)

*(Ph. Eur. monograph 2149)**Ph Eur***DEFINITION**

Influenza vaccine (surface antigen, inactivated, prepared in cell cultures) is a sterile, aqueous suspension of a strain or strains of influenza virus, type A or B, or a mixture of strains of the 2 types grown individually in cell cultures, inactivated and treated so that the preparation consists predominantly of haemagglutinin and neuraminidase antigens, preserving adequate antigenic properties of these antigens. The stated amount of haemagglutinin antigen for each strain present in the vaccine is 15 µg per dose, unless clinical evidence supports the use of a different amount. The vaccine is a clear or slightly opalescent liquid. The vaccine may contain an adjuvant. This monograph applies to vaccines produced in diploid or continuous cell lines of mammalian origin.

**PRODUCTION****GENERAL PROVISIONS**

Production of the vaccine is based on a virus seed-lot system and a cell-bank system. The production method shall have been shown to yield consistently vaccines that comply with the requirements for immunogenicity, safety and stability.

The production method is validated to demonstrate suitable reduction of residual host-cell protein. With the agreement of the competent authority and for each specific product, routine testing for residual host-cell proteins may be omitted based on the results of validation studies for the product. Guidance on the principles of such validation studies is given, for example, in the monograph *Products of recombinant DNA technology (0784)*, in particular in the sections 'Validation of the production process - Extraction and purification' and 'Production consistency - Host-cell-derived proteins'.

**CHOICE OF VACCINE STRAIN**

The World Health Organization (WHO) reviews the world epidemiological situation annually and if necessary recommends new strains corresponding to this epidemiological evidence.

Such strains are used in accordance with the regulations in force in the signatory states of the Convention on the Elaboration of a European Pharmacopoeia. It is now common practice to use reassorted strains giving high yields

of the appropriate surface antigens. The origin and passage history of virus strains shall be approved by the competent authority.

**SUBSTRATE FOR VIRUS PROPAGATION**

Influenza virus used in the preparation of seed lots is propagated in fertilised eggs from chicken flocks free from specified pathogens (SPF) (5.2.2) or in suitable cell cultures (5.2.3), such as chick-embryo fibroblasts, chick kidney cells obtained from SPF chicken flocks (5.2.2), or a diploid or continuous cell line. The final passage for establishment of the working seed lot is prepared in the cell line used for routine production. For this production, the virus of each strain is propagated in a diploid or continuous cell line (5.2.3).

**VIRUS SEED LOT**

The production of vaccine is based on a seed-lot system established by subculture of the candidate vaccine virus (CVV). This CVV is the approved virus isolate or reassorted virus supplied by WHO designated laboratories, or established by vaccine manufacturers. Each of the strains of influenza virus used shall be identified by historical records that include information on the origin of the strain and its subsequent manipulation. Working seed lots represent not more than 15 passages from the CVV. The final vaccine represents 1 passage from the working seed lot.

Only a seed lot that complies with the following requirements may be used for virus propagation.

**Identification**

The haemagglutinin and neuraminidase antigens of each master and working seed lot are identified as originating from the correct strain of influenza virus by suitable methods.

**Virus concentration**

The virus concentration of each working seed lot is determined. Where applicable, the virus concentration of each master seed lot is determined.

**Extraneous agents (2.6.16)**

The working seed lots comply with the requirements for seed lots. It is recognised that due to a seasonal change in one or more of the influenza vaccine strains, timely testing of a virus seed for extraneous agents using *in vitro* tests in cell culture and *in vivo* tests may be problematic (e.g. duration of *in vivo* tests, timely availability of specific neutralising antisera). In agreement with the competent authority, and in light of a risk assessment, rapid assays (e.g. multiplex PCR; high-throughput sequencing methods) may be applied following validation.

Such risk assessment and validation includes more general considerations on potential contaminants of the virus isolates, the susceptibility of the cell substrate to such viruses and the capacity of the production process for viral removal or inactivation; validation also includes comparative data on testing of seeds using *in vitro* tests in cell culture and/or *in vivo* tests according to general chapter 2.6.16 and the proposed rapid assays. Each rapid assay must be shown to be suitable for its intended use by appropriate analytical validation. The risk assessment is reviewed when new information becomes available on potential viral contaminants. Where PCR is used, the justification of the chosen panel of extraneous agents tested for is provided to the competent authority within the annual update. This update also includes vaccine strain-specific aspects such as specific PCR inhibitory effects.

If an agent is detected in a virus seed and the mammalian cells used for production are shown to be susceptible to this agent, the virus seed is not used for vaccine production.

If an agent is detected in a virus seed and the mammalian cells are not susceptible to the agent, validation of the production process to demonstrate removal or inactivation of the agent is carried out. If removal or inactivation cannot be demonstrated, the inactivated monovalent harvest is tested to demonstrate absence of any contaminant identified in the virus seed.

#### **PROPAGATION AND SINGLE HARVEST**

All processing of the cell bank and subsequent cell cultures is done under aseptic conditions in an area where no other cells are being handled at the same time. Approved animal serum (but not human serum) may be used in the cell culture media. Serum and trypsin used in the preparation of cell suspensions or media are shown to be free from extraneous agents. The cell culture media may contain a pH indicator, such as phenol red, and antibiotics at the lowest effective concentration. Not less than 500 mL of the cell cultures employed for vaccine production are set aside as uninfected cell cultures (control cells).

Only a single harvest that complies with the following requirements may be used in the preparation of the vaccine.

#### **Identification**

The test for antigen content also serves to identify the single harvest.

#### **Bacterial and fungal contamination**

Carry out the test for sterility (2.6.1), using 10 mL for each medium.

#### **Mycoplasmas (2.6.7)**

Carry out the test for mycoplasmas, using 10 mL for each medium.

#### **Control cells**

The control cells of the production cell culture comply with a test for identification and the requirements for extraneous agents (2.6.16).

#### **Haemagglutinin antigen**

Determine the haemagglutinin antigen content by a suitable immunochemical method (2.7.1).

#### **INACTIVATED AND PURIFIED MONOVALENT HARVEST**

The harvest, which may be a pool of several single harvests of the same strain, is inactivated and purified by validated methods. Before or after the inactivation process, the monovalent harvest is concentrated and purified by high-speed centrifugation or another suitable method.

The influenza virus is inactivated by a method that has been demonstrated on 3 consecutive batches to be consistently effective for the manufacturer. The inactivation process shall have been shown to be capable of inactivating the influenza virus without destroying its antigenicity; the process is designed so as to cause minimum alteration of the haemagglutinin and neuraminidase antigens.

Virus particles are disrupted into component subunits by approved procedures and further purified so that the monovalent bulk consists mainly of haemagglutinin and neuraminidase antigens.

If continuous cell lines are used for production, the purification process shall have been validated to reduce consistently host-cell DNA to a suitable level.

Only an inactivated, purified monovalent harvest that complies with the following requirements may be used in the preparation of the final bulk vaccine.

#### **Haemagglutinin antigen**

Determine the haemagglutinin antigen content by a suitable immunochemical method (2.7.1).

#### **Antigen/total protein ratio**

Determine the haemagglutinin antigen content by a suitable immunodiffusion test. Determine the total protein by a validated method. The ratio of haemagglutinin antigen content to total protein content is within the limits approved for the particular product.

#### **Neuraminidase antigen**

The presence and type of neuraminidase antigen are confirmed by suitable enzymatic or immunological methods on the first 3 monovalent harvests from each working seed lot.

#### **Sterility (2.6.1)**

Carry out the test for sterility, using 10 mL for each medium.

#### **Residual infectious virus**

Carry out the test described below under Tests.

#### **Purity**

The purity of the monovalent harvest is examined by polyacrylamide gel electrophoresis or by other approved techniques. Mainly haemagglutinin and neuraminidase antigens are present.

#### **Chemicals used for disruption and purification**

Tests are carried out on the monovalent harvest for the chemicals used for disruption and purification, unless validation of the process has demonstrated total clearance. The concentration must not exceed the limits approved by the competent authority for the particular product.

#### **FINAL BULK VACCINE**

Appropriate quantities of the inactivated, purified monovalent pooled harvests are blended to make the final bulk vaccine. An adjuvant may be added.

Only a final bulk vaccine that complies with the following requirements may be used in the preparation of the final lot.

#### **Antimicrobial preservative**

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The content is not less than 85 per cent and not greater than 115 per cent of the intended amount.

#### **Sterility (2.6.1)**

Carry out the test for sterility, using 10 mL for each medium.

#### **Residual host-cell DNA**

If a continuous cell line is used for virus propagation, the content of residual host-cell DNA, determined using a suitable method, is not greater than 10 ng in the equivalent of a single human dose.

#### **FINAL LOT**

The final bulk vaccine is distributed aseptically into sterile, tamper-evident containers. The containers are closed so as to prevent contamination.

Only a final lot that is satisfactory with respect to each of the requirements given below under Tests and Assay may be released for use. Provided that the test for residual infectious virus has been performed with satisfactory results on each inactivated and purified monovalent harvest and that the tests for free formaldehyde, bovine serum albumin and total

protein have been performed with satisfactory results on the final bulk vaccine, they may be omitted on the final lot.

If the vaccine contains an adjuvant, suitable tests for identity and other relevant quality criteria are carried out on the final lot. These tests may include chemical and physical analysis, determination of particle size and determination of the number of particles per unit volume.

#### IDENTIFICATION

The assay serves to confirm the antigenic specificity of the vaccine.

#### TESTS

##### Residual infectious virus

Carry out an amplification test for residual infectious influenza virus by inoculating not less than 0.2 mL of the vaccine into cell cultures of the same type as used for production of the vaccine; incubate for not less than 4 days at 37 °C. Inoculate not less than 0.2 mL of the cell culture harvested medium into a new semiconfluent cell culture and incubate as before. At the end of the incubation period, examine for live virus by a haemagglutination test. If haemagglutination is found for any of the fluids, carry out for that fluid a further passage on cell cultures and test for haemagglutination; no haemagglutination occurs.

##### Antimicrobial preservative

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The content is not less than the minimum amount shown to be effective and is not greater than 115 per cent of the quantity stated on the label.

##### Free formaldehyde (2.4.13)

Maximum 0.2 g/L, where applicable.

##### Bovine serum albumin

Maximum 50 ng per human dose, determined by a suitable immunochemical method (2.7.1).

##### Total protein

Maximum 40 µg of protein other than haemagglutinin per virus strain per human dose.

##### Sterility (2.6.1)

It complies with the test for sterility.

##### Bacterial endotoxins (2.6.14)

Less than 25 IU per human dose.

#### ASSAY

Determine the content of haemagglutinin antigen by an immunodiffusion test (2.7.1), by comparison with a haemagglutinin antigen reference preparation<sup>1</sup> or with an antigen preparation calibrated against it. Carry out the test at 20–25 °C. The confidence limits ( $P = 0.95$ ) are not less than 80 per cent and not more than 125 per cent of the estimated content. The lower confidence limit ( $P = 0.95$ ) is not less than 80 per cent of the amount stated on the label for each strain.

#### LABELLING

The label states:

- the biological origin of the cells used for the preparation of the vaccine;
- the strain or strains of influenza virus used to prepare the vaccine;
- the method of inactivation;

- the haemagglutinin antigen content, in micrograms per virus strain per dose;
- the season during which the vaccine is intended to protect;
- where applicable, the name and the quantity of adjuvant used.

Ph Eur

## Influenza Vaccine (Surface Antigen, Inactivated, Virosome)

(Ph. Eur. monograph 2053)

The label may state 'Flu'.

Ph Eur

#### DEFINITION

Influenza vaccine (surface antigen, inactivated, virosome) is a sterile, aqueous suspension of a strain or strains of influenza virus, type A or B, or a mixture of strains of the 2 types grown individually in fertilised hens' eggs, inactivated and treated so that the preparation consists predominantly of haemagglutinin and neuraminidase antigens reconstituted to virosomes and without diminishing the antigenic properties of the antigens. The stated amount of haemagglutinin antigen for each strain present in the vaccine is 15 µg per dose, unless clinical evidence supports the use of a different amount.

The vaccine is a slightly opalescent liquid.

#### PRODUCTION

##### CHOICE OF VACCINE STRAIN

The World Health Organization (WHO) reviews the world epidemiological situation annually and if necessary recommends the strains that correspond to this epidemiological evidence.

Such strains are used in accordance with the regulations in force in the signatory states of the Convention on the Elaboration of a European Pharmacopoeia. It is now common practice to use reassorted strains giving high yields of the appropriate surface antigens. The origin and passage history of virus strains shall be approved by the competent authority.

##### SUBSTRATE FOR VIRUS PROPAGATION

Influenza virus seed to be used in the production of vaccine is propagated in fertilised eggs from chicken flocks free from specified pathogens (SPF) (5.2.2) or in suitable cell cultures (5.2.4), such as chick-embryo fibroblasts or chick kidney cells obtained from SPF chicken flocks (5.2.2). For production, the virus of each strain is grown in the allantoic cavity of fertilised hens' eggs from healthy flocks.

##### VIRUS SEED LOT

The production of vaccine is based on a seed lot system established by subculture of the candidate vaccine virus (CVV). This CVV is the approved virus isolate or reassorted virus supplied by WHO designated laboratories, or established by vaccine manufacturers. Working seed lots represent not more than 15 passages from the CVV. The final vaccine represents 1 passage from the working seed lot. The haemagglutinin and neuraminidase antigens of each seed lot are identified as originating from the correct strain of influenza virus by suitable methods.

<sup>1</sup> Reference haemagglutinin antigens are available from the National Institute for Biological Standards and Control, Blanche Lane, South Mimms, Potters Bar, Hertfordshire EN6 3QG, Great Britain.

Only a working virus seed lot that complies with the following requirements may be used in the preparation of the monovalent pooled harvest.

#### **Bacterial and fungal contamination**

Carry out the test for sterility (2.6.1), using 10 mL for each medium.

#### **Mycoplasmas (2.6.7)**

Carry out the test for mycoplasmas, using 10 mL.

#### **VIRUS PROPAGATION AND HARVEST**

An antimicrobial agent may be added to the inoculum. After incubation at a controlled temperature, the allantoic fluids are harvested and combined to form a monovalent pooled harvest. An antimicrobial agent may be added at the time of harvest.

#### **MONOVALENT POOLED HARVEST**

To limit the possibility of contamination, inactivation is initiated as soon as possible after preparation. The virus is inactivated by a method that has been demonstrated on 3 consecutive batches to be consistently effective for the manufacturer. The inactivation process shall have been shown to be capable of inactivating the influenza virus without destroying its antigenicity; the process is designed so as to cause minimum alteration of the haemagglutinin and neuraminidase antigens. The inactivation process shall also have been shown to be capable of inactivating avian leucosis viruses and mycoplasmas. If the monovalent pooled harvest is stored after inactivation, it is held at a temperature of  $5 \pm 3$  °C. If formaldehyde solution is used, the concentration does not exceed 0.2 g/L of CH<sub>2</sub>O at any time during inactivation; if betapropiolactone is used, the concentration does not exceed 0.1 per cent *V/V* at any time during inactivation.

Before or after the inactivation process, the monovalent pooled harvest is concentrated and purified by high-speed centrifugation or another suitable method.

Only a monovalent pooled harvest that complies with the following requirements may be used for the preparation of virosomes.

Provided the tests for haemagglutinin antigen, neuraminidase antigen and residual infectious virus have been carried out with satisfactory results on the monovalent virosomal preparation, they may be omitted on the monovalent pooled harvest when the manufacturing process is continuous between the monovalent pooled harvest and the monovalent virosomal preparation.

#### **Haemagglutinin antigen**

Determine the content of haemagglutinin antigen by an immunodiffusion test (2.7.1), by comparison with a haemagglutinin antigen reference preparation<sup>1</sup> or with an antigen preparation calibrated against it. Carry out the test at 20-25 °C.

#### **Neuraminidase antigen**

The presence and type of neuraminidase antigen are confirmed by suitable enzymatic or immunological methods on the first 3 monovalent pooled harvests from each working seed lot.

#### **Residual infectious virus**

Carry out the test described under Tests.

#### **PREPARATION OF MONOVALENT VIROSOMES**

Virus particles are disrupted into component subunits by approved procedures and further purified so that the monovalent bulk consists mainly of haemagglutinin and neuraminidase antigens. Additional phospholipids may be added and virosomes may be formed by removal of the detergent either by adsorption chromatography or another suitable technique. Several monovalent virosomal preparations may be pooled.

Only a monovalent virosomal preparation that complies with the following requirements may be used in the preparation of the final bulk vaccine.

#### **Haemagglutinin antigen**

Determine the content of haemagglutinin antigen by an immunodiffusion test (2.7.1), by comparison with a haemagglutinin antigen reference preparation<sup>1</sup> or with an antigen preparation calibrated against it. Carry out the test at 20-25 °C.

#### **Neuraminidase antigen**

The presence and type of neuraminidase antigen are confirmed by suitable enzymatic or immunological methods on the first 3 virosomal preparations from each working seed lot.

#### **Residual infectious virus**

Carry out the test described under Tests. Provided this test has been carried out with satisfactory results on the monovalent pooled harvest, it may be omitted on the preparation of monovalent virosomes.

#### **Sterility (2.6.1)**

Carry out the test for sterility, using 10 mL for each medium.

#### **Purity**

The purity of the monovalent virosomal preparation is examined by polyacrylamide gel electrophoresis (2.2.31) or by other approved techniques. Mainly haemagglutinin and neuraminidase antigens are present.

#### **Chemicals used for disruption and purification**

Tests for the chemicals used for disruption and purification are carried out on the monovalent virosomal preparation, the limits being approved by the competent authority.

#### **Phospholipids**

The content and identity of the phospholipids are determined by suitable immunochemical or physico-chemical methods.

#### **Ratio of haemagglutinin to phospholipid**

The ratio of haemagglutinin content to phospholipid content is within the limits approved for the particular product.

#### **Virosome size**

The average virosome diameter, determined by a suitable method such as photon-correlation spectroscopy, is not less than 100 nm and not greater than 300 nm.

The polydispersity index is not greater than 0.4.

#### **FINAL BULK VACCINE**

Appropriate quantities of the monovalent virosomal preparations are blended to make the final bulk vaccine.

Only a final bulk vaccine that complies with the following requirements may be used in the preparation of the final lot.

#### **Antimicrobial preservative**

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical or physico-chemical method. The content is not less than 85 per cent and not greater than 115 per cent of the intended amount.

<sup>1</sup> Reference haemagglutinin antigens are available from the National Institute for Biological Standards and Control, Blanche Lane, South Mimms, Potters Bar, Hertfordshire EN6 3QG, Great Britain.

**Sterility (2.6.1)**

Carry out the test for sterility, using 10 mL for each medium.

**FINAL LOT**

The final bulk vaccine is distributed aseptically into sterile, tamper-evident containers. The containers are closed so as to prevent contamination.

Only a final lot that is satisfactory with respect to each of the requirements given under Tests and Assay may be released for use. Provided that the test for residual infectious virus has been performed with satisfactory results on each monovalent pooled harvest or, where appropriate, on the monovalent virosomal preparations, and that the tests for phospholipids, ratio of haemagglutinin to phospholipid, free formaldehyde, ovalbumin and total protein have been performed with satisfactory results on the final bulk vaccine, they may be omitted on the final lot.

**IDENTIFICATION**

The assay serves to confirm the antigenic specificity of the vaccine.

**TESTS****Residual infectious virus**

Inoculate 0.2 mL of the vaccine into the allantoic cavity of each of 10 fertilised eggs and incubate at 33-37 °C for 3 days. The test is not valid unless at least 8 of the 10 embryos survive. Harvest 0.5 mL of the allantoic fluid from each surviving embryo and pool the fluids. Inoculate 0.2 mL of the pooled fluid into a further 10 fertilised eggs and incubate at 33-37 °C for 3 days. The test is not valid unless at least 8 of the 10 embryos survive. Harvest about 0.1 mL of the allantoic fluid from each surviving embryo and examine each individual harvest for live virus by a haemagglutination test. If haemagglutination is found for any of the fluids, carry out for that fluid a further passage in eggs and test for haemagglutination; no haemagglutination occurs.

**pH (2.2.3)**

6.5 to 7.8

**Phospholipids**

The content and identity of the phospholipids is determined by a suitable immunochemical or physico-chemical method.

**Ratio of haemagglutinin to phospholipid**

The ratio of haemagglutinin content to phospholipid content is within the limits approved for the particular product.

**Antimicrobial preservative**

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical or physico-chemical method. The content is not less than the minimum amount shown to be effective and is not greater than 115 per cent of the quantity stated on the label.

**Free formaldehyde (2.4.18)**

Maximum 0.2 g/L, where applicable.

**Ovalbumin**

Not more than the quantity stated on the label and in any case not more than 1 µg per human dose, determined by a suitable immunochemical method (2.7.1) using a suitable reference preparation of ovalbumin.

**Total protein**

Not more than 40 µg of protein other than haemagglutinin per virus strain per human dose, and not more than a total of 120 µg of protein other than haemagglutinin per human dose.

**Sterility (2.6.1)**

It complies with the test for sterility.

**Virosome size**

The average virosome diameter, determined by a suitable method such as photon-correlation spectroscopy, is not less than 100 nm and not greater than 300 nm.

The polydispersity index is not greater than 0.4.

**Bacterial endotoxins (2.6.14)**

Less than 100 IU per human dose.

**ASSAY**

Determine the content of haemagglutinin antigen by an immunodiffusion test (2.7.1), by comparison with a haemagglutinin antigen reference preparation<sup>1</sup> or with an antigen preparation calibrated against it. Carry out the test at 20-25 °C. The confidence limits ( $P = 0.95$ ) are not less than 80 per cent and not more than 125 per cent of the estimated haemagglutinin antigen content. The lower confidence limit ( $P = 0.95$ ) is not less than 80 per cent of the amount stated on the label for each strain.

**LABELLING**

The label states:

- that the vaccine has been prepared on eggs;
- the strain or strains of influenza virus used to prepare the vaccine;
- the method of inactivation;
- the haemagglutinin antigen content, in micrograms per virus strain per dose;
- the maximum amount of ovalbumin;
- the season during which the vaccine is intended to protect.

Ph Eur

**Measles Vaccine, Live**

(Measles Vaccine (Live), Ph. Eur. monograph 0213)

The label may state 'Measles'.

Ph Eur

**DEFINITION**

Measles vaccine (live) is a freeze-dried preparation of a suitable attenuated strain of measles virus. The vaccine is reconstituted immediately before use, as stated on the label, to give a clear liquid that may be coloured owing to the presence of a pH indicator.

**PRODUCTION**

The production of vaccine is based on a virus seed-lot system and, if the virus is propagated in human diploid cells, a cell-bank system. The production method shall have been shown to yield consistently live measles vaccines of adequate immunogenicity and safety in man. Unless otherwise justified and authorised, the virus in the final vaccine shall have undergone no more passages from the master seed lot than were used to prepare the vaccine shown in clinical studies to be satisfactory with respect to safety and efficacy; even with authorised exceptions, the number of passages beyond the level used for clinical studies shall not exceed 5.

The potential neurovirulence of the vaccine strain is considered during preclinical development, based on available epidemiological data on neurovirulence and neurotropism, primarily for the wild-type virus. In light of this, a risk

<sup>1</sup> Reference haemagglutinin antigens are available from the National Institute for Biological Standards and Control, Blanche Lane, South Mimms, Potters Bar, Hertfordshire EN6 3QG, Great Britain.

analysis is carried out. Where necessary and if available, a test is carried out on the vaccine strain using an animal model that differentiates wild-type and attenuated virus; tests on strains of intermediate attenuation may also be needed.

#### **STRATE FOR VIRUS PROPAGATION**

The virus is propagated in human diploid cells (5.2.3) or in cultures of chick-embryo cells derived from a chicken flock free from specified pathogens (5.2.2).

#### **SEED LOT**

The strain of measles virus used shall be identified by historical records that include information on the origin of the strain and its subsequent manipulation. Virus seed lots are prepared in large quantities and stored at temperatures below  $-20^{\circ}\text{C}$  if freeze-dried, or below  $-60^{\circ}\text{C}$  if not freeze-dried.

Only a seed lot that complies with the following requirements may be used for virus propagation.

#### **Identification**

The master and working seed lots are identified as measles virus by serum neutralisation in cell culture, using specific antibodies.

#### **Virus concentration**

The virus concentration of the master and working seed lots is determined to monitor consistency of production.

#### **Extraneous agents (2.6.16)**

The working seed lot complies with the requirements for seed lots.

#### **PROPAGATION AND HARVEST**

All processing of the cell bank and subsequent cell cultures is done under aseptic conditions in an area where no other cells are handled during production. Suitable animal (but not human) serum may be used in the growth medium, but the final medium for maintaining cells during virus multiplication does not contain animal serum. Serum and trypsin used in the preparation of cell suspensions and culture media are shown to be free from extraneous agents. The cell culture medium may contain a pH indicator such as phenol red and suitable antibiotics at the lowest effective concentration. It is preferable to have a substrate free from antibiotics during production. Not less than 500 mL of the production cell cultures is set aside as uninfected cell cultures (control cells). The viral suspensions are harvested at a time appropriate to the strain of virus being used.

Only a single harvest that complies with the following requirements may be used in the preparation of the final bulk vaccine.

#### **Identification**

The single harvest contains virus that is identified as measles virus by serum neutralisation in cell culture, using specific antibodies.

#### **Virus concentration**

The virus concentration in the single harvest is determined as prescribed under Assay to monitor consistency of production and to determine the dilution to be used for the final bulk vaccine.

#### **Extraneous agents (2.6.16)**

The single harvest complies with the tests for extraneous agents.

#### **Control cells**

If human diploid cells are used for production, the control cells comply with a test for identification. They comply with the tests for extraneous agents (2.6.16).

#### **FINAL BULK VACCINE**

Virus harvests that comply with the above tests are pooled and clarified to remove cells. A suitable stabiliser may be added and the pooled harvests diluted as appropriate.

Only a final bulk vaccine that complies with the following requirement may be used in the preparation of the final lot.

#### **Bacterial and fungal contamination**

The final bulk vaccine complies with the test for sterility (2.6.1), carried out using 10 mL for each medium.

#### **FINAL LOT**

A minimum virus concentration for release of the product is established such as to ensure, in light of stability data, that the minimum concentration stated on the label will be present at the end of the period of validity.

Only a final lot that complies with the requirements for minimum virus concentration for release, with the following requirement for thermal stability and with each of the requirements given below under Identification and Tests may be released for use. Provided that the test for bovine serum albumin has been carried out with satisfactory results on the final bulk vaccine, it may be omitted on the final lot.

#### **Thermal stability**

Maintain at least 3 vials of the final lot of freeze-dried vaccine in the dry state at  $37 \pm 1^{\circ}\text{C}$  for 7 days. Determine the virus concentration as described under Assay in parallel for the heated vaccine and for vaccine stored at the temperature recommended for storage. The virus concentration of the heated vaccine is not more than  $1.0 \log_{10}$  lower than that of the unheated vaccine.

#### **IDENTIFICATION**

When the vaccine reconstituted as stated on the label is mixed with specific measles antibodies, it is no longer able to infect susceptible cell cultures.

#### **TESTS**

##### **Bacterial and fungal contamination**

The reconstituted vaccine complies with the test for sterility (2.6.1).

##### **Bovine serum albumin**

Not more than 50 ng per single human dose, determined by a suitable immunochemical method (2.7.1).

##### **Water (2.5.12)**

Not more than 3.0 per cent, determined by the semi-micro determination of water.

#### **ASSAY**

Titrate the vaccine for infective virus, using at least 3 separate vials of vaccine and inoculating a suitable number of wells for each dilution step. Titrate 1 vial of an appropriate virus reference preparation in triplicate to validate each assay. The virus concentration of the reference preparation is monitored using a control chart and a titre is established on a historical basis by each laboratory. The relation with the appropriate European Pharmacopoeia Biological Reference Preparation is established and monitored at regular intervals if a manufacturer's reference preparation is used. Calculate the individual virus concentration for each vial of vaccine and for each replicate of the reference preparation as well as the corresponding combined virus concentrations, using the usual statistical methods (for example, 5.3). The combined estimate of the virus concentration for the 3 vials of vaccine is not less than that stated on the label; the minimum virus concentration stated on the label is not less than  $3.0 \log_{10}$  CCID<sub>50</sub> per single human dose.

The assay is not valid if:

- the confidence interval ( $P = 0.95$ ) of the estimated virus concentration of the reference preparation for the 3 replicates combined is greater than  $\pm 0.3 \log_{10} \text{CCID}_{50}$ ;
- the virus concentration of the reference preparation differs by more than  $0.5 \log_{10} \text{CCID}_{50}$  from the established value.

The assay is repeated if the confidence interval ( $P = 0.95$ ) of the combined virus concentration of the vaccine is greater than  $\pm 0.3 \log_{10} \text{CCID}_{50}$ ; data obtained from valid assays only are combined by the usual statistical methods (for example, 5.3) to calculate the virus concentration of the sample. The confidence interval ( $P = 0.95$ ) of the combined virus concentration is not greater than  $\pm 0.3 \log_{10} \text{CCID}_{50}$ .

*Measles vaccine (live) BRP* is suitable for use as a reference preparation.

Where justified and authorised, different assay designs may be used; this may imply the application of different validity and acceptance criteria. However, the vaccine must comply if tested as described above.

#### LABELLING

The label states:

- the strain of virus used for the preparation of the vaccine;
- the type and origin of the cells used for the preparation of the vaccine;
- the minimum virus concentration;
- that contact between the vaccine and disinfectants is to be avoided.

Ph Eur

## Measles, Mumps and Rubella Vaccine, Live

(*Measles, Mumps and Rubella Vaccine (Live)*,  
Ph. Eur. monograph 1057)

The label may state 'MMR'.

Ph Eur

#### DEFINITION

Measles, mumps and rubella vaccine (live) is a freeze-dried preparation of suitable attenuated strains of measles virus, mumps virus and rubella virus.

The vaccine is reconstituted immediately before use, as stated on the label, to give a clear liquid that may be coloured owing to the presence of a pH indicator.

#### PRODUCTION

The 3 components are prepared as described in the monographs *Measles vaccine (live)* (0213), *Mumps vaccine (live)* (0538) and *Rubella vaccine (live)* (0162) and comply with the requirements prescribed therein.

#### FINAL BULK VACCINE

Virus harvests for each component are pooled and clarified to remove cells. A suitable stabiliser may be added and the pooled harvests diluted as appropriate. Suitable quantities of the pooled harvest for each component are mixed.

Only a final bulk vaccine that complies with the following requirement may be used in the preparation of the final lot.

#### Bacterial and fungal contamination

Carry out the test for sterility (2.6.1), using 10 mL for each medium.

#### FINAL LOT

For each component, a minimum virus concentration for release of the product is established such as to ensure, in light of stability data, that the minimum concentration stated on the label will be present at the end of the period of validity.

Only a final lot that complies with the requirements for minimum virus concentration of each component for release, with the following requirement for thermal stability and with each of the requirements given below under Identification and Tests may be released for use. Provided that the tests for bovine serum albumin and, where applicable, for ovalbumin have been carried out with satisfactory results on the final bulk vaccine, they may be omitted on the final lot.

#### Thermal stability

Maintain at least 3 vials of the final lot of freeze-dried vaccine in the dry state at  $37 \pm 1^\circ\text{C}$  for 7 days. Determine the virus concentration as described under Assay in parallel for the heated vaccine and for vaccine stored at the temperature recommended for storage. For each component, the virus concentration of the heated vaccine is not more than  $1.0 \log_{10}$  lower than that of the unheated vaccine.

#### IDENTIFICATION

When the vaccine reconstituted as stated on the label is mixed with antibodies specific for measles virus, mumps virus and rubella virus, it is no longer able to infect cell cultures susceptible to these viruses. When the vaccine reconstituted as stated on the label is mixed with quantities of specific antibodies sufficient to neutralise any 2 viral components, the 3<sup>rd</sup> viral component infects susceptible cell cultures.

#### TESTS

##### Bacterial and fungal contamination

The reconstituted vaccine complies with the test for sterility (2.6.1).

##### Bovine serum albumin

Not more than 50 ng per single human dose, determined by a suitable immunochemical method (2.7.1).

##### Ovalbumin

If the mumps component is produced in chick embryos, the vaccine contains not more than 1 µg of ovalbumin per single human dose, determined by a suitable immunochemical method (2.7.1).

##### Water (2.5.12)

Not more than 3.0 per cent, determined by the semi-micro determination of water.

#### ASSAY

The cell lines and/or neutralising antisera are chosen to ensure that each component is assayed without interference from the other 2 components.

Titrate the vaccine for infective measles, mumps and rubella virus, using at least 3 separate vials of vaccine and inoculating a suitable number of wells for each dilution step. Titrate 1 vial of the appropriate virus reference preparation in triplicate to validate each assay. The virus concentration of the reference preparation is monitored using a control chart and a titre is established on a historical basis by each laboratory. The relation with the appropriate European Pharmacopoeia Biological Reference Preparation is established and monitored at regular intervals if a manufacturer's reference preparation is used. Calculate the individual virus concentration for each vial of vaccine and for each replicate of the reference preparation as well as the

corresponding combined virus concentrations, using the usual statistical methods (for example, 5.3).

The combined estimates of the measles, mumps and rubella virus concentrations for the 3 vials of vaccine are not less than that stated on the label; the minimum measles virus concentration stated on the label is not less than  $3.0 \log_{10}$  CCID<sub>50</sub> per single human dose; the minimum mumps virus concentration stated on the label is not less than  $3.7 \log_{10}$  CCID<sub>50</sub> per single human dose; the minimum rubella virus concentration stated on the label is not less than  $3.0 \log_{10}$  CCID<sub>50</sub> per single human dose.

The assay is not valid if:

- the confidence interval ( $P = 0.95$ ) of the estimated virus concentration of the reference preparation for the 3 replicates combined is greater than  $\pm 0.3 \log_{10}$  CCID<sub>50</sub>;
- the virus concentration of the reference preparation differs by more than  $0.5 \log_{10}$  CCID<sub>50</sub> from the established value.

The assay is repeated if the confidence interval ( $P = 0.95$ ) of the combined virus concentration of the vaccine is greater than  $\pm 0.3 \log_{10}$  CCID<sub>50</sub>; data obtained from valid assays only are combined by the usual statistical methods (for example, 5.3) to calculate the virus concentration of the sample. The confidence interval ( $P = 0.95$ ) of the combined virus concentration is not greater than  $\pm 0.3 \log_{10}$  CCID<sub>50</sub>.

*Measles vaccine (live) BRP* is suitable for use as a reference preparation.

*Mumps vaccine (live) BRP* is suitable for use as a reference preparation.

*Rubella vaccine (live) BRP* is suitable for use as a reference preparation.

Where justified and authorised, different assay designs may be used; this may imply the application of different validity and acceptance criteria. However, the vaccine must comply if tested as described above.

#### LABELLING

*The label states:*

- the strains of virus used in the preparation of the vaccine;
- where applicable, that chick embryos have been used for the preparation of the vaccine;
- the type and origin of the cells used for the preparation of the vaccine;
- the minimum virus concentration for each component of the vaccine;
- that contact between the vaccine and disinfectants is to be avoided.

Ph Eur

## Measles, Mumps, Rubella and ; Varicella Vaccine (Live)

(Ph. Eur. monograph 2442)

The label may state 'MMRVar'.

Ph Eur

#### DEFINITION

Measles, mumps, rubella and varicella vaccine (live) is a freeze-dried preparation of suitable attenuated strains of measles virus, mumps virus, rubella virus and human herpesvirus 3. The vaccine is reconstituted immediately before use, as stated on the label, to give a clear liquid that may be coloured owing to the presence of a pH indicator.

#### PRODUCTION

The 4 components are prepared as described in the monographs *Measles vaccine (live) (0213)*, *Mumps vaccine (live) (0538)*, *Rubella vaccine (live) (0162)* and *Varicella vaccine (live) (0648)* and comply with the requirements prescribed therein.

#### FINAL BULK VACCINE

Virus harvests for each component are pooled and clarified to remove cells. A suitable stabiliser may be added and for each component the pooled harvests diluted as appropriate. Suitable quantities of the pooled harvest for each component are mixed.

Only a final bulk vaccine that complies with the following requirement may be used in the preparation of the final lot.

#### Bacterial and fungal contamination

Carry out the test for sterility (2.6.1), using 10 mL for each medium.

#### FINAL LOT

For each component, a minimum virus concentration for release of the product is established such as to ensure, in light of stability data, that the minimum concentration stated on the label will be present at the end of the period of validity. The final bulk vaccine is distributed aseptically into sterile, tamper-evident containers and freeze-dried to a moisture content shown to be favourable to the stability of the vaccine. The containers are then closed so as to prevent contamination and the introduction of moisture.

Only a final lot that complies with the requirements for minimum virus concentration of each component for release, with the following requirements for thermal stability, bovine serum albumin and water, and with each of the requirements given under Identification and Tests may be released for use. Provided that the test for bovine serum albumin has been carried out with satisfactory results on the final bulk vaccine, it may be omitted on the final lot.

#### Thermal stability

For the measles, mumps and rubella components maintain at least 3 containers of the final lot of freeze-dried vaccine in the dry state at  $37 \pm 1$  °C for 7 days. Determine the virus concentration as described under Assay in parallel for the heated vaccine and for vaccine stored at the temperature recommended for storage. For each component, the virus concentration of the heated vaccine is not more than  $1.0 \log_{10}$  lower than that of the unheated vaccine.

#### Bovine serum albumin

Not more than the amount approved by the competent authority, determined by a suitable immunochemical method (2.7.1).

#### Water (2.5.12)

Not more than the amount shown to ensure stability of the vaccines as approved by the competent authority, determined by the semi-micro determination of water.

#### IDENTIFICATION

When the vaccine reconstituted as stated on the label is mixed with antibodies specific for measles virus, mumps virus, rubella virus and human herpesvirus 3, it is no longer able to infect cell cultures susceptible to these viruses. When the vaccine reconstituted as stated on the label is mixed with quantities of specific antibodies sufficient to neutralise any 3 viral components, the 4<sup>th</sup> viral component infects susceptible cell cultures.

**TESTS****Bacterial and fungal contamination**

The reconstituted vaccine complies with the test for sterility (2.6.1).

**ASSAY**

The cell lines and/or neutralising antisera are chosen to ensure that each component is assayed without interference from the other 3 components.

Titrate the vaccine for infective measles virus, mumps virus, rubella virus and human herpesvirus 3 using at least 3 separate containers of vaccine and inoculating a suitable number of wells for each dilution step. Titrate 1 container of the appropriate virus reference preparation in triplicate to validate each assay. The virus concentration of the reference preparation is monitored using a control chart and a titre is established on a historical basis by each laboratory. Unless otherwise justified and authorised, for the measles, mumps, rubella and human herpesvirus 3 viruses the relation with the appropriate European Pharmacopoeia Biological Reference Preparation is established and monitored at regular intervals if a manufacturer's reference preparation is used. Calculate the individual virus concentration for each container of vaccine and for each replicate of the reference preparation as well as the corresponding combined virus concentrations, using the usual statistical methods (for example, 5.3).

The combined estimates of the measles virus, mumps virus, rubella virus and human herpesvirus 3 concentrations for the 3 containers of vaccine are not less than that stated on the label; the minimum measles virus concentration stated on the label is not less than  $3.0 \log_{10}$  CCID<sub>50</sub> per single human dose; the minimum mumps virus concentration stated on the label is not less than  $3.7 \log_{10}$  CCID<sub>50</sub> per single human dose; the minimum rubella virus concentration stated on the label is not less than  $3.0 \log_{10}$  CCID<sub>50</sub> per single human dose.

The assay is not valid if:

- the confidence interval ( $P = 0.95$ ) of the estimated virus concentration of the reference preparation for the 3 replicates combined is greater than  $\pm 0.3 \log_{10}$  CCID<sub>50</sub> (measles virus, mumps virus and rubella virus) or  $\pm 0.3 \log_{10}$  PFU (human herpesvirus 3);
- the virus concentration of the reference preparation differs by more than  $0.5 \log_{10}$  CCID<sub>50</sub> (measles virus, mumps virus and rubella virus) or  $0.5 \log_{10}$  PFU (human herpesvirus 3) from the established value.

The assay is repeated if the confidence interval ( $P = 0.95$ ) of the combined virus concentration of the vaccine is greater than  $\pm 0.3 \log_{10}$  CCID<sub>50</sub> (measles virus, mumps virus and rubella virus) or  $\pm 0.3 \log_{10}$  PFU (human herpesvirus 3); data obtained from valid assays only are combined by using the usual statistical methods (for example, 5.3) to calculate the virus concentration of the sample. The confidence interval ( $P = 0.95$ ) of the combined virus concentration is not greater than  $\pm 0.3 \log_{10}$  CCID<sub>50</sub> (measles virus, mumps virus and rubella virus) or  $\pm 0.3 \log_{10}$  PFU (human herpesvirus 3).

*Measles vaccine (live) BRP* is suitable for use as a reference preparation.

*Mumps vaccine (live) BRP* is suitable for use as a reference preparation.

*Rubella vaccine (live) BRP* is suitable for use as a reference preparation.

*Varicella vaccine (live) BRP* is suitable for use as a reference preparation.

Where justified and authorised, different assay designs may be used; this may imply the application of different validity and acceptance criteria. However, the vaccine must comply if tested as described above.

**LABELLING**

*The label states:*

- the strains of virus used in the preparation of the vaccine;
- the type and origin of the cells used for the preparation of the vaccine;
- the minimum virus concentration for each component of the vaccine;
- that contact between the vaccine and disinfectants is to be avoided.

Ph Eur

## Meningococcal Group A, C, W135 and Y Conjugate Vaccine

(Ph. Eur. monograph 3066)

The label may state 'MenACWY'.

Ph Eur

**DEFINITION**

Meningococcal group A, C, W135 and Y conjugate vaccine is a freeze-dried preparation, or a preparation consisting of freeze-dried and liquid components, of purified capsular polysaccharides covalently linked to a carrier protein.

The polysaccharides are obtained from suitable strains of *Neisseria meningitidis* group A, group C, group W135 and group Y that are capable of consistently producing polysaccharides.

*N. meningitidis* Group A polysaccharide consists of partly *O*-acetylated repeating units of *N*-acetylmannosamine, linked with  $\alpha$ -(1→6) phosphodiester bonds.

*N. meningitidis* Group C polysaccharide consists of partly *O*-acetylated repeating units of sialic acid, linked with  $\alpha$ -(2→9) glycosidic bonds.

*N. meningitidis* Group W135 polysaccharide consists of partly *O*-acetylated alternating units of sialic acid and *D*-galactose, linked with  $\alpha$ -(2→6) and  $\alpha$ -(1→4) glycosidic bonds.

*N. meningitidis* Group Y polysaccharide consists of partly *O*-acetylated alternating units of sialic acid and *D*-glucose, linked with  $\alpha$ -(2→6) and  $\alpha$ -(1→4) glycosidic bonds.

The carrier protein used may vary for the various polysaccharide conjugates contained in a multivalent vaccine.

**PRODUCTION****GENERAL PROVISIONS**

The production method shall have been shown to yield consistently meningococcal group A, C, W135 and Y conjugate vaccines of adequate safety and immunogenicity in man. The production of the meningococcal polysaccharides and of the carrier protein(s) is based on a seed-lot system.

The production method is validated to demonstrate that the product, if tested, would comply with the test for pyrogens (2.6.8).

During development studies, it shall be demonstrated that the vaccine consistently induces a T-cell-dependent B-cell immune response to each polysaccharide. If the manufacturing process is modified, it shall be demonstrated

by appropriate *in vitro* methods that the characteristic properties of the vaccine are not affected.

The stability of the conjugated bulks and/or final lot and meningococcal polysaccharides is evaluated using suitable indicator tests. Such tests may include determination of molecular size, quantification of polysaccharide content and free polysaccharide content in the conjugate.

#### **PRODUCTION OF THE COMPONENTS**

The production of the seed lots and bulk polysaccharides complies with the requirements of the monograph *Meningococcal polysaccharide vaccine (0250)*.

The production of the carrier protein(s) complies with the requirements of the general chapter 5.2.11. *Carrier proteins for the production of conjugated polysaccharide vaccines for human use*.

#### **PURIFIED POLYSACCHARIDES**

The polysaccharides are purified, after dissociation of the complex of polysaccharide and cetrimonium bromide, using suitable procedures to remove successively nucleic acids, proteins and lipopolysaccharides.

The final purification step consists of ethanol precipitation of the polysaccharides, which are then dried *in vacuo* and stored at  $-20^{\circ}\text{C}$ . The loss on drying is determined by thermogravimetry (2.2.34) or another suitable method and the value is used to calculate the results of the other chemical tests with reference to the dried substance.

Only purified polysaccharides that comply with the following requirements may be used in the preparation of the conjugate.

##### **Protein (2.5.16)**

Maximum 10 mg per gram of purified polysaccharide, calculated with reference to the dried substance.

##### **Nucleic acids (2.5.17)**

Maximum 10 mg per gram of purified polysaccharide, calculated with reference to the dried substance.

##### **O-Acetyl groups (2.5.19)**

Minimum 2 mmol per gram of purified polysaccharide for group A, minimum 1.5 mmol per gram of purified polysaccharide for group C, minimum 0.3 mmol per gram of purified polysaccharide for groups W135 and Y, all calculated with reference to the dried substance.

##### **Phosphorus (2.5.18)**

Minimum 80 mg per gram of purified polysaccharide for group A, calculated with reference to the dried substance.

##### **Sialic acid (2.5.23)**

Minimum 800 mg per gram of purified polysaccharide for group C and minimum 560 mg per gram of purified polysaccharide for groups W135 and Y, all calculated with reference to the dried substance, using *N-acetylneuraminic acid R* to prepare the reference solution.

##### **Calcium**

If a calcium salt is used during purification, a determination of calcium is carried out on the purified polysaccharide; the content is within the limits approved for the particular product.

##### **Residual reagents**

Where applicable, suitable tests are carried out to determine residues of reagents used during inactivation and purification. An acceptable value for each reagent is established for the particular product and each batch of polysaccharide must be shown to comply with this limit. Where validation studies have demonstrated removal of residual reagents, the test on purified polysaccharides may be omitted.

##### **Molecular-size or molecular-mass distribution**

The molecular-size or molecular-mass distribution is determined by size-exclusion chromatography (2.2.30) combined with an appropriate detection system.

An acceptable value is established for each purified polysaccharide. Each batch must be shown to comply with this limit.

##### **Identification and serological specificity**

The identity and serological specificity are determined by a suitable immunochemical method (2.7.1) or another suitable method, for example  $^1\text{H}$  nuclear magnetic resonance spectrometry (2.2.33). Identity and purity of each polysaccharide shall be confirmed; it shall be shown that there is not more than 1 per cent *m/m* of group-heterologous *N. meningitidis* polysaccharide.

##### **Bacterial endotoxins (2.6.14)**

The content is within the limits approved by the competent authority for the particular product.

##### **Water (2.5.12)**

Where applicable, the values are within the limits approved for each group, determined by a suitable method.

##### **MODIFIED MENINGOCOCCAL POLYSACCHARIDES**

Before conjugation, the polysaccharides can be depolymerised by chemical or mechanical means followed by a concentration step to obtain polysaccharides of a desired molecular size range. Polysaccharides or depolymerised polysaccharides are modified by an activation process.

##### **MONOVALENT BULK CONJUGATE**

The conjugate is obtained by the covalent binding of activated polysaccharides to the appropriate carrier protein.

Only a bulk conjugate that complies with the following requirements may be used in the preparation of the final bulk vaccine. For each test, limits of acceptance are established and each batch of conjugate must be shown to comply with these limits.

##### **Saccharide**

The polysaccharide content is determined by a suitable physical or chemical method or by an immunochemical method (2.7.1). The value complies with the requirement approved for each conjugate.

##### **Protein**

The protein content is determined by a suitable physical or chemical method (for example, 2.5.16). The value complies with the requirement approved for each conjugate.

##### **Saccharide-to-protein ratio**

Determine the ratio by calculation. The value complies with the requirement approved for each conjugate.

##### **Free saccharide**

The free polysaccharide content is determined after separation from the conjugate, for example by anion-exchange, size-exclusion or hydrophobic chromatography, ultrafiltration, or other validated methods. The value complies with the requirement approved for each conjugate.

##### **Free carrier protein**

The free carrier protein content is determined by a suitable method, either directly or by calculation from the results of other tests. The value complies with the requirement approved for each conjugate.

##### **Residual reagents**

Where applicable, suitable tests are carried out to determine residues of reagents used during conjugation. An acceptable value for each reagent is established for the particular product and each batch of monovalent bulk conjugate must

be shown to comply with this limit. Where validation studies have demonstrated removal of residual reagents, the test on monovalent bulk conjugate may be omitted.

#### Molecular size or molecular-mass distribution

The molecular-size or molecular-mass distribution is determined by size-exclusion chromatography (2.2.30) combined with an appropriate detection system.

An acceptable value is established for each conjugate. Each batch must be shown to comply with this limit.

#### Identification

Each polysaccharide conjugate is identified by an immunochemical method (2.7.1) or another suitable method.

#### FINAL BULK VACCINE

Where a final bulk vaccine is formulated as a release intermediate, it complies with the following requirement and is within the limits approved for the particular product.

Only a final bulk vaccine that complies with the following requirement may be used in the preparation of the final lot.

#### Sterility (2.6.1)

It complies with the test for sterility, carried out using 10 mL or the equivalent of 100 doses for each medium, whichever is less.

#### FINAL LOT

Only a final lot that is within the limits approved for the particular product and is satisfactory with respect to each of the requirements given below under Identification, Tests and Assay may be released for use.

#### IDENTIFICATION

Conjugate from each group present in the vaccine is identified by a suitable immunochemical method (2.7.1).

#### TESTS

##### Free saccharide

The free polysaccharide content for each group is determined by a suitable physico-chemical (for example liquid chromatography (2.2.29)) or immunochemical (for example enzyme-linked immunosorbent assay (ELISA) (2.7.1)) method. The free polysaccharide content is within the limits approved by the competent authority for the particular product. Where justified and authorised, the test may be carried out on the monovalent bulk conjugate only.

##### Molecular-size or molecular-mass distribution

The molecular-size or molecular-mass distribution is determined by size-exclusion chromatography (2.2.30) combined with an appropriate detection system.

An acceptable value is established for each conjugate. Where justified and authorised, the test may be carried out on the monovalent bulk conjugate only.

##### Sterility (2.6.1)

It complies with the test for sterility.

#### ASSAY

##### Saccharide

The total polysaccharide content for each group is determined by a suitable physico-chemical (for example liquid chromatography (2.2.29)) or immunochemical (for example enzyme-linked immunosorbent assay (ELISA) (2.7.1)) method.

The content of each group is within the limits approved by the competent authority for the particular product.

#### LABELLING

The label states:

— the nominal amount of polysaccharide for each group (A, C, W135 and Y) per single human dose;

— the type and amount of carrier protein per single human dose.

Ph Eur

## Meningococcal Group C Conjugate Vaccine

(Ph. Eur. monograph 2112)

The label may state 'MenC(conj)'.

Ph Eur

#### DEFINITION

Meningococcal group C conjugate vaccine is a liquid or freeze-dried preparation of purified capsular polysaccharide derived from a suitable strain of *Neisseria meningitidis* group C covalently linked to a carrier protein. Meningococcal group C polysaccharide consists of partly O-acetylated or O-deacetylated repeating units of sialic acids, linked with 2 $\alpha$ -9 glycosidic bonds. The carrier protein, when conjugated to group C polysaccharide, is capable of inducing a T-cell-dependent B-cell immune response to the polysaccharide. The vaccine may contain an adjuvant.

#### PRODUCTION

##### GENERAL PROVISIONS

The production method shall consistently have been shown to yield meningococcal group C conjugate vaccines of satisfactory immunogenicity and safety in man.

The production of meningococcal group C polysaccharide and of the carrier protein are based on seed-lot systems.

During development studies and wherever revalidation is necessary, a test for pyrogens in rabbits (2.6.8) is carried out by injection of a suitable dose of the final lot. The vaccine is shown to be acceptable with respect to absence of pyrogenic activity.

During development studies and wherever revalidation of the manufacturing process is necessary, it shall be demonstrated by tests in animals that the vaccine consistently induces a T-cell-dependent B-cell immune response.

The stability of the final lot and relevant intermediates is evaluated using 1 or more indicator tests. Such tests may include determination of molecular size, determination of free saccharide in the conjugate or an immunogenicity test in animals.

##### BACTERIAL SEED LOTS

The bacterial strains used for master seed lots shall be identified by historical records that include information on their origin and the tests used to characterise the strain. Cultures from the working seed lot shall have the same characteristics as the strain that was used to prepare the master seed lot.

Purity of bacterial cultures is verified by methods of suitable sensitivity. These may include inoculation into suitable media, examination of colony morphology, microscopic examination of Gram-stained smears and culture agglutination with suitable specific antisera.

##### MENINGOCOCCAL GROUP C POLYSACCHARIDE

*N. meningitidis* is grown in a liquid medium that does not contain high-molecular-mass polysaccharides and is free from ingredients that will form a precipitate upon addition of cetyltrimethylammonium bromide (CTAB). The culture may be inactivated by heat and filtered before the polysaccharide is precipitated by addition of CTAB. The precipitate is

further purified using suitable methods to remove nucleic acids, proteins and lipopolysaccharides and the final purification step consists of ethanol precipitation. An *O*-deacetylation step may also be included. Volatile matter, including water, in the purified polysaccharide is determined by a suitable method such as thermogravimetry (2.2.34). The value is used to calculate the results of other tests with reference to the dried substance, as prescribed below.

Only meningococcal group C polysaccharide that complies with the following requirements may be used in the preparation of the conjugate.

#### Protein (2.5.16)

Maximum 1.0 per cent, calculated with reference to the dried substance.

#### Nucleic acid (2.5.17)

Maximum 1.0 per cent, calculated with reference to the dried substance.

#### *O*-acetyl groups

Examine by a suitable method (for example 2.5.19).

An acceptable value is established for the particular product and each batch of meningococcal group C polysaccharide must be shown to comply with this limit.

#### Sialic acid (2.5.23)

Minimum 0.800 g of sialic acid per gram of meningococcal group C polysaccharide using *N*-acetylneuraminic acid *R* to prepare the reference solution.

#### Residual reagents

Where applicable, tests are carried out to determine residues of reagents used during inactivation and purification.

An acceptable value for each reagent is established for the particular product and each batch of meningococcal group C polysaccharide must be shown to comply with this limit.

Where validation studies have demonstrated removal of a residual reagent, the test on purified meningococcal group C polysaccharide may be omitted.

#### Molecular-size or molecular-mass distribution

Molecular-size or molecular-mass distribution is determined by size-exclusion chromatography (2.2.30) combined with an appropriate detection system. Where applicable, the molecular-size distribution is also determined after chemical modification of the polysaccharide. An acceptable value is established for the meningococcal group C polysaccharide. Each batch must be shown to comply with this limit.

#### Identification and serological specificity

The identity and serological specificity are determined by a suitable immunochemical method (2.7.1) or other suitable method, for example <sup>1</sup>H nuclear magnetic resonance spectrometry (2.2.33).

#### Bacterial endotoxins (2.6.14)

Less than 100 IU per microgram of meningococcal group C polysaccharide.

#### CARRIER PROTEIN

The production and characteristics of the carrier proteins are described in general chapter 5.2.11. *Carrier proteins for the production of conjugated polysaccharide vaccines for human use*. Only a carrier protein that complies with the requirements of this chapter may be used in the preparation of the conjugate.

#### BULK CONJUGATE

Meningococcal group C polysaccharide is chemically modified to enable conjugation; it is usually partly depolymerised either before or during this procedure. The conjugate is obtained by the covalent binding of activated meningococcal group C oligosaccharide and the

appropriate carrier protein. The conjugate purification procedures are designed to remove residual reagents used for conjugation. The removal of residual reagents and reaction by-products is confirmed by suitable tests or by validation of the purification process.

Only a bulk conjugate that complies with the following requirements may be used in the preparation of the final bulk vaccine. For each test and for each particular product, limits of acceptance are established and each batch of conjugate must be shown to comply with these limits.

#### Molecular-size or molecular-mass distribution

Molecular-size or molecular-mass distribution is determined by size-exclusion chromatography (2.2.30) combined with an appropriate detection system. An acceptable value is established for the bulk conjugate. Each batch must be shown to comply with this limit.

#### Saccharide

The saccharide content is determined by a suitable validated assay (for example 2.5.23). Anion-exchange liquid chromatography (2.2.29) with pulsed amperometric detection may also be used for determination of saccharide content. An acceptable value is established for the particular product and each batch of bulk conjugate must be shown to comply with this limit.

#### Protein

The protein content is determined by a suitable chemical method (for example 2.5.16). An acceptable value is established for the particular product and each batch of bulk conjugate must be shown to comply with this limit.

#### Saccharide-to-protein ratio

Determine the ratio by calculation.

#### Free saccharide

Unbound saccharide is determined after removal of the conjugate, for example by anion-exchange liquid chromatography, size-exclusion or hydrophobic chromatography, ultrafiltration or other validated methods. An acceptable value is established for the particular product and each batch of bulk conjugate must be shown to comply with this limit.

#### Free carrier protein

Determine the content, either directly by a suitable method or by deriving the content by calculation from the results of other tests. An acceptable value is established for the particular product and each batch of bulk conjugate must be shown to comply with this limit.

#### Residual reagents

Removal of residual reagents such as cyanide is confirmed by suitable tests or by validation of the process.

#### Sterility (2.6.1)

It complies with the test for sterility, carried out using 10 mL for each medium or the equivalent of 100 doses, whichever is less.

#### FINAL BULK VACCINE

An adjuvant and a stabiliser may be added to the bulk conjugate before dilution to the final concentration with a suitable diluent.

Only a final bulk vaccine that complies with the following requirement and is within the limits approved for the particular product may be used in the preparation of the final lot.

#### Sterility (2.6.1)

It complies with the test for sterility, carried out using 10 mL for each medium.

**FINAL LOT**

Only a final lot that is within the limits approved for the particular product and is satisfactory with respect to each of the requirements given below under Identification, Tests and Assay may be released for use.

**IDENTIFICATION**

The vaccine is identified by a suitable immunochemical method (2.7.1).

**TESTS****pH (2.2.3)**

The pH of the vaccine, reconstituted if necessary, is within the limits approved for the particular product.

**Aluminium (2.5.13)**

Maximum 1.25 mg per single human dose, if aluminium hydroxide or hydrated aluminium phosphate is used as the adsorbent.

**Water (2.5.12)**

Maximum 3.0 per cent for freeze-dried vaccines.

**Free saccharide**

Unbound saccharide is determined after removal of the conjugate, for example by anion-exchange liquid chromatography, size-exclusion or hydrophobic chromatography, ultrafiltration or other validated methods. An acceptable value consistent with adequate immunogenicity, as shown in clinical trials, is established for the particular product and each final lot must be shown to comply with this limit.

**Sterility (2.6.1)**

It complies with the test for sterility.

**Bacterial endotoxins (2.6.14)**

Less than 25 IU per single human dose.

**ASSAY****Saccharide**

Minimum 80 per cent of the amount of meningococcal group C polysaccharide stated on the label. The saccharide content is determined by a suitable validated assay, for example sialic acid assay (2.5.23) or anion-exchange liquid chromatography (2.2.29) with pulsed amperometric detection.

**LABELLING**

The label states:

- the number of micrograms of meningococcal group C polysaccharide per single human dose;
- the type and nominal amount of carrier protein per single human dose.

Ph Eur

## Meningococcal Polysaccharide Vaccine

(Ph. Eur. monograph 0250)

The label may state 'Men' plus relevant antigen. For example, 'MenAC'.

Ph Eur

**DEFINITION**

Meningococcal polysaccharide vaccine is a freeze-dried preparation of one or more purified capsular polysaccharides obtained from one or more suitable strains of *Neisseria meningitidis* group A, group C, group Y and group W135 that are capable of consistently producing polysaccharides.

*N. meningitidis* group A polysaccharide consists of partly O-acetylated repeating units of N-acetylmannosamine, linked with 1 $\alpha$ -6 phosphodiester bonds.

*N. meningitidis* group C polysaccharide consists of partly O-acetylated repeating units of sialic acid, linked with 2 $\alpha$ -9 glycosidic bonds.

*N. meningitidis* group Y polysaccharide consists of partly O-acetylated alternating units of sialic acid and D-glucose, linked with 2 $\alpha$ -6 and 1 $\alpha$ -4 glycosidic bonds.

*N. meningitidis* group W135 polysaccharide consists of partly O-acetylated alternating units of sialic acid and D-galactose, linked with 2 $\alpha$ -6 and 1 $\alpha$ -4 glycosidic bonds.

The polysaccharide component or components stated on the label together with calcium ions and residual moisture account for over 90 per cent of the mass of the preparation.

**PRODUCTION**

Production of the meningococcal polysaccharides is based on a seed-lot system. The production method shall have been shown to yield consistently meningococcal polysaccharide vaccines of satisfactory immunogenicity and safety in man.

**SEED LOTS**

The strains of *N. meningitidis* used for the master seed lots shall be identified by historical records that include information on their origin and by their biochemical and serological characteristics.

Cultures from each working seed lot shall have the same characteristics as the strain that was used to prepare the master seed lot. The strains have the following characteristics:

- colonies obtained from a culture are rounded, uniform in shape and smooth with a mucous, opalescent, greyish appearance;
- Gram staining reveals characteristic Gram-negative diplococci in 'coffee-bean' arrangement;
- the oxidase test is positive;
- the culture utilises glucose and maltose;
- suspensions of the culture agglutinate with suitable specific antisera.

Purity of bacterial strains used for the seed lots is verified by methods of suitable sensitivity. These may include inoculation into suitable media, examination of colony morphology, microscopic examination of Gram-stained smears and culture agglutination with suitable specific antisera.

**PROPAGATION AND HARVEST**

The working seed lots are cultured on solid media that do not contain blood-group substances or ingredients of mammalian origin. The inoculum may undergo 1 or more subcultures in liquid medium before being used for inoculating the final medium. The liquid media used and the final medium are semi-synthetic and free from substances precipitated by cetrimonium bromide (hexadecyltrimethylammonium bromide) and do not contain blood-group substances or high-molecular-mass polysaccharides.

The bacterial purity of the culture is verified by methods of suitable sensitivity. These may include inoculation into suitable media, examination of colony morphology, microscopic examination of Gram-stained smears and culture agglutination with suitable specific antisera.

The cultures are centrifuged and the polysaccharides precipitated from the supernatant by addition of cetrimonium bromide. The precipitate obtained is harvested and may be stored at -20 °C awaiting further purification.

**PURIFIED POLYSACCHARIDES**

The polysaccharides are purified, after dissociation of the complex of polysaccharide and cetrimonium bromide, using suitable procedures to remove successively nucleic acids, proteins and lipopolysaccharides.

The final purification step consists of ethanol precipitation of the polysaccharides which are then dried and stored at  $-20^{\circ}\text{C}$ . The loss on drying is determined by thermogravimetry (2.2.34) and the value is used to calculate the results of the other chemical tests with reference to the dried substance.

Only purified polysaccharides that comply with the following requirements may be used in the preparation of the final bulk vaccine.

**Protein (2.5.16)**

Not more than 10 mg of protein per gram of purified polysaccharide, calculated with reference to the dried substance.

**Nucleic acids (2.5.17)**

Not more than 10 mg of nucleic acids per gram of purified polysaccharide, calculated with reference to the dried substance.

**O-Acetyl groups (2.5.19)**

Not less than 2 mmol of O-acetyl groups per gram of purified polysaccharide for group A, not less than 1.5 mmol per gram of polysaccharide for group C, not less than 0.3 mmol per gram of polysaccharide for groups Y and W135, all calculated with reference to the dried substance.

**Phosphorus (2.5.18)**

Not less than 80 mg of phosphorus per gram of group A purified polysaccharide, calculated with reference to the dried substance.

**Sialic acid (2.5.23)**

Not less than 800 mg of sialic acid per gram of group C polysaccharide and not less than 560 mg of sialic acid per gram of purified polysaccharide for groups Y and W135, all calculated with reference to the dried substance. Use the following reference solutions.

Group C polysaccharide: a 150 mg/L solution of *N*-acetylneuraminic acid R.

Group Y polysaccharide: a solution containing 95 mg/L of *N*-acetylneuraminic acid R and 55 mg/L of glucose R.

Group W135 polysaccharide: a solution containing 95 mg/L of *N*-acetylneuraminic acid R and 55 mg/L of galactose R.

**Calcium**

If a calcium salt is used during purification, a determination of calcium is carried out on the purified polysaccharide; the content is within the limits approved for the particular product.

**Molecular-size or molecular-mass distribution**

Molecular-size or molecular-mass distribution is determined by size-exclusion chromatography (2.2.30) combined with an appropriate detection system. An acceptable value is established for each purified polysaccharide. Each batch must be shown to comply with this limit.

**Identification and serological specificity**

The identity and serological specificity are determined by a suitable immunochemical method (2.7.1). Identity and purity of each polysaccharide shall be confirmed; it shall be shown that there is not more than 1 per cent *m/m* of group-heterologous *N. meningitidis* polysaccharide.

**Pyrogens (2.6.8)**

The polysaccharide complies with the test for pyrogens. Inject into each rabbit per kilogram of body mass 1 mL of a solution containing 0.025  $\mu\text{g}$  of purified polysaccharide per millilitre.

**FINAL BULK VACCINE**

One or more purified polysaccharides of 1 or more *N. meningitidis* groups are dissolved in a suitable solvent that may contain a stabiliser. When dissolution is complete, the solution is filtered through a bacteria-retentive filter.

Only a final bulk vaccine that complies with the following requirement may be used in the preparation of the final lot.

**Sterility (2.6.1)**

The final bulk vaccine complies with the test for sterility, carried out using 10 mL for each medium.

**FINAL LOT**

The final bulk vaccine is distributed aseptically into sterile containers. The containers are then closed so as to avoid contamination.

Only a final lot that is satisfactory with respect to each of the requirements prescribed below under Identification, Tests and Assay may be released for use.

**CHARACTERS**

A white or cream-coloured powder or pellet, freely soluble in water.

**IDENTIFICATION**

Carry out an identification test for each polysaccharide present in the vaccine by a suitable immunochemical method (2.7.1).

**TESTS****Molecular-size or molecular-mass distribution**

Molecular-size or molecular-mass distribution is determined by size-exclusion chromatography (2.2.30) combined with an appropriate detection system. An acceptable value is established for each purified polysaccharide. Each batch must be shown to comply with this limit.

**Water (2.5.12)**

Not more than 3.0 per cent.

**Sterility (2.6.1)**

It complies with the test for sterility.

**Pyrogens (2.6.8)**

It complies with the test for pyrogens. Inject per kilogram of the rabbit's mass 1 mL of a solution containing:

- 0.025  $\mu\text{g}$  of polysaccharide for a monovalent vaccine;
- 0.050  $\mu\text{g}$  of polysaccharide for a divalent vaccine;
- 0.10  $\mu\text{g}$  of polysaccharide for a tetravalent vaccine.

**ASSAY**

Carry out an assay of each polysaccharide present in the vaccine.

For a divalent vaccine (group A + group C), use measurement of phosphorus (2.5.18) to determine the content of polysaccharide A and measurement of sialic acid (2.5.23) to determine the content of polysaccharide C. To determine sialic acid, use as reference solution a 150 mg/L solution of *N*-acetylneuraminic acid R.

For a tetravalent vaccine (group A + group C + group Y + group W135) a suitable immunochemical method (2.7.1) is used with a reference preparation of purified polysaccharide for each group.

The vaccine contains not less than 70 per cent and not more than 130 per cent of the quantity of each polysaccharide stated on the label.

**LABELLING**

The label states:

- the group or groups of polysaccharides (A, C, Y or W135) present in the vaccine;
- the number of micrograms of polysaccharide per single human dose.

Ph Eur

**Mumps Vaccine, Live**

(Mumps Vaccine (Live), Ph. Eur. monograph 0538)

The label may state 'Mumps'.

Ph Eur

**DEFINITION**

Mumps vaccine (live) is a freeze-dried preparation of a suitable attenuated strain of mumps virus. The vaccine is reconstituted immediately before use, as stated on the label, to give a clear liquid that may be coloured owing to the presence of a pH indicator.

**PRODUCTION**

The production of vaccine is based on a virus seed-lot system and, if the virus is propagated in human diploid cells, a cell-bank system. The production method shall have been shown to yield consistently live mumps vaccines of adequate immunogenicity and safety in man. Unless otherwise justified and authorised, the virus in the final vaccine shall have undergone no more passages from the master seed lot than were used to prepare the vaccine shown in clinical studies to be satisfactory with respect to safety and efficacy.

The potential neurovirulence of the vaccine strain is considered during preclinical development, based on available epidemiological data on neurovirulence and neurotropism, primarily for the wild-type virus. In light of this, a risk analysis is carried out. Where necessary and if available, a test is carried out on the vaccine strain using an animal model that differentiates wild-type and attenuated virus; tests on strains of intermediate attenuation may also be needed.

**SUBSTRATE FOR VIRUS PROPAGATION**

The virus is propagated in human diploid cells (5.2.3) or in chick-embryo cells or in the amniotic cavity of chick embryos derived from a chicken flock free from specified pathogens (5.2.2).

**SEED LOT**

The strain of mumps virus used shall be identified by historical records that include information on the origin of the strain and its subsequent manipulation. Virus seed lots are prepared in large quantities and stored at temperatures below  $-20\text{ }^{\circ}\text{C}$  if freeze-dried, or below  $-60\text{ }^{\circ}\text{C}$  if not freeze-dried.

Only a seed lot that complies with the following requirements may be used for virus propagation.

**Identification**

The master and working seed lots are identified as mumps virus by serum neutralisation in cell culture, using specific antibodies.

**Virus concentration**

The virus concentration of the master and working seed lots is determined to ensure consistency of production.

**Extraneous agents (2.6.16)**

The working seed lot complies with the requirements for seed lots.

**PROPAGATION AND HARVEST**

All processing of the cell bank and subsequent cell cultures is done under aseptic conditions in an area where no other cells are handled during the production. Suitable animal (but not human) serum may be used in the culture media. Serum and trypsin used in the preparation of cell suspensions and culture media are shown to be free from extraneous agents. The cell culture medium may contain a pH indicator such as phenol red and suitable antibiotics at the lowest effective concentration. It is preferable to have a substrate free from antibiotics during production. Not less than 500 mL of the production cell cultures is set aside as uninfected cell cultures (control cells). If the virus is propagated in chick embryos, 2 per cent but not less than 20 eggs are set aside as uninfected control eggs. The viral suspensions are harvested at a time appropriate to the strain of virus being used.

Only a single harvest that complies with the following requirements may be used in the preparation of the final bulk vaccine.

**Identification**

The single harvest contains virus that is identified as mumps virus by serum neutralisation in cell culture, using specific antibodies.

**Virus concentration**

The virus concentration in the single harvest is determined as prescribed under Assay to monitor consistency of production and to determine the dilution to be used for the final bulk vaccine.

**Extraneous agents (2.6.16)**

The single harvest complies with the tests for extraneous agents.

**Control cells or eggs**

If human diploid cells are used for production, the control cells comply with a test for identification; the control cells and the control eggs comply with the tests for extraneous agents (2.6.16).

**FINAL BULK VACCINE**

Single harvests that comply with the above tests are pooled and clarified to remove cells. A suitable stabiliser may be added and the pooled harvests diluted as appropriate.

Only a final bulk vaccine that complies with the following requirement may be used in the preparation of the final lot.

**Bacterial and fungal contamination**

The final bulk vaccine complies with the test for sterility (2.6.1), carried out using 10 mL for each medium.

**FINAL LOT**

A minimum virus concentration for release of the product is established such as to ensure, in light of stability data, that the minimum concentration stated on the label will be present at the end of the period of validity.

Only a final lot that complies with the requirements for minimum virus concentration for release, with the following requirement for thermal stability and with each of the requirements given below under Identification and Tests may be released for use. Provided that the tests for bovine serum albumin and, where applicable, for ovalbumin have been carried out with satisfactory results on the final bulk vaccine, they may be omitted on the final lot.

**Thermal stability**

Maintain at least 3 vials of the final lot of freeze-dried vaccine in the dry state at  $37 \pm 1\text{ }^{\circ}\text{C}$  for 7 days. Determine the virus concentration as described under Assay in parallel for the heated vaccine and for vaccine stored at the

temperature recommended for storage. The virus concentration of the heated vaccine is not more than 1.0 log<sub>10</sub> lower than that of the unheated vaccine.

#### IDENTIFICATION

When the vaccine reconstituted as stated on the label is mixed with specific mumps antibodies, it is no longer able to infect susceptible cell cultures.

#### TESTS

##### Bacterial and fungal contamination

The reconstituted vaccine complies with the test for sterility (2.6.1).

##### Bovine serum albumin

Not more than 50 ng per single human dose, determined by a suitable immunochemical method (2.7.1).

##### Ovalbumin

If the vaccine is produced in chick embryos, it contains not more than 1 µg of ovalbumin per single human dose, determined by a suitable immunochemical method (2.7.1).

##### Water (2.5.12)

Not more than 3.0 per cent, determined by the semi-micro determination of water.

#### ASSAY

Titrate the vaccine for infective virus, using at least 3 separate vials of vaccine and inoculating a suitable number of wells for each dilution step. Titrate 1 vial of an appropriate virus reference preparation in triplicate to validate each assay. The virus concentration of the reference preparation is monitored using a control chart and a titre is established on a historical basis by each laboratory. The relation with the appropriate European Pharmacopoeia Biological Reference Preparation is established and monitored at regular intervals if a manufacturer's reference preparation is used. Calculate the individual virus concentration for each vial of vaccine and for each replicate of the reference preparation as well as the corresponding combined virus concentrations, using the usual statistical methods (for example, 5.3). The combined estimate of the virus concentration for the 3 vials of vaccine is not less than that stated on the label; the minimum virus concentration stated on the label is not less than 3.7 log<sub>10</sub> CCID<sub>50</sub> per single human dose.

The assay is not valid if:

- the confidence interval ( $P = 0.95$ ) of the estimated virus concentration of the reference preparation for the 3 replicates combined is greater than  $\pm 0.3 \log_{10}$  CCID<sub>50</sub>;
- the virus concentration of the reference preparation differs by more than 0.5 log<sub>10</sub> CCID<sub>50</sub> from the established value.

The assay is repeated if the confidence interval ( $P = 0.95$ ) of the combined virus concentration of the vaccine is greater than  $\pm 0.3 \log_{10}$  CCID<sub>50</sub>; data obtained from valid assays only are combined by the usual statistical methods (for example, 5.3) to calculate the virus concentration of the sample. The confidence interval ( $P = 0.95$ ) of the combined virus concentration is not greater than  $\pm 0.3 \log_{10}$  CCID<sub>50</sub>.

*Mumps vaccine (live) BRP* is suitable for use as a reference preparation.

Where justified and authorised, different assay designs may be used; this may imply the application of different validity and acceptance criteria. However, the vaccine must comply if tested as described above.

#### LABELLING

The label states:

- the strain of virus used for the preparation of the vaccine;
- that the vaccine has been prepared in chick embryos or the type and origin of cells used for the preparation of the vaccine;
- the minimum virus concentration;
- that contact between the vaccine and disinfectants is to be avoided.

Ph Eur

## Human Papillomavirus Vaccine (rDNA)

(Ph. Eur. monograph 2441)

The label may state 'HPV'.

Ph Eur

#### DEFINITION

Human papillomavirus vaccine (rDNA) is a preparation of purified virus-like particles (VLPs) composed of the major capsid protein (L1) of one or more human papillomavirus (HPV) genotypes; the antigens may be adsorbed on a mineral carrier such as aluminium hydroxide or hydrated aluminium phosphate. The vaccine may also contain the adjuvant 3-*O*-desacyl-4'-monophosphoryl lipid A. The antigens are obtained by recombinant DNA technology.

#### PRODUCTION

##### GENERAL PROVISIONS

The vaccine shall have been shown to induce specific neutralising antibodies in man. The production method shall have been shown to yield consistently vaccines comparable in quality with the vaccine of proven clinical efficacy and safety in man.

The vaccine is produced by the expression of the viral genes coding for the capsid proteins in yeast or in an insect cell/baculovirus expression vector system, purification of the resulting VLPs and the rendering of these particles into an immunogenic preparation. The suitability and safety of the expression systems are approved by the competent authority. Production of the vaccine is based on a seed lot/cell bank system. Unless otherwise justified and authorised, the virus and cells used for vaccine production shall not have undergone more passages from the master seed lot/cell bank than was used to prepare the vaccine shown in clinical studies to be satisfactory with respect to safety and efficacy.

*Reference preparation* A batch of vaccine shown to be effective in clinical trials or a batch representative thereof is used as a reference vaccine. The reference vaccine is preferably stabilised and the stabilisation method shall have been shown to have no significant effect on the assay validity.

##### CHARACTERISATION

Characterisation of the VLPs is performed on lots produced during vaccine development, including the process validation batches. Characterisation includes protein composition, for example using techniques such as sodium dodecyl sulfate polyacrylamide gel electrophoresis (SDS-PAGE) and Western blotting or mass spectrometry, peptide mapping and/or terminal amino acid sequence analysis. Morphological characteristics of the VLPs and degree of aggregation are determined to confirm the presence of the conformational epitopes that are essential for efficacy. VLP characterisation may be done by atomic force microscopy and transmission

electron microscopy, dynamic light scattering, epitope mapping and reactivity with neutralising monoclonal antibodies. In addition, the protein, lipid, nucleic acid and carbohydrate content are measured where applicable. The level of residual host-cell protein derived from insect cells meets acceptable safety criteria as set by the competent authority.

#### **CELL BANKS AND SEED LOTS**

**Production in recombinant yeast cells** Only cell banks that have been satisfactorily characterised for identity, microbial purity, growth characteristics and stability shall be used for production. Gene homogeneity is studied for the master and working cell banks. A full description of the biological characteristics of the host cell and expression vectors is given. The physiological measures used to promote and control the expression of the cloned gene in the host cell are described in detail. This includes genetic markers of the host cell, the construction, genetics and structure of the expression vector, and the origin and identification of the gene that is being cloned. The nucleotide sequence of the gene insert and of adjacent segments of the vector and restriction-enzyme mapping of the vector containing the gene insert are provided. Data that demonstrates the stability of the expression system during storage of the recombinant working cell bank up to or beyond the passage level used for production is provided.

**Production in an insect cell/baculovirus expression vector system**

- **Insect cell substrate.** Only cell banks that have been satisfactorily characterised for identity, purity, growth characteristics, stability, extraneous agents and tumorigenicity shall be used for production. Such characterisation is performed at suitable stages of production in accordance with general chapters 5.2.3, *Cell substrates for the production of vaccines for human use* and 2.6.16, *Tests for extraneous agents in viral vaccines for human use*. Special attention is given to insect-borne viruses, in particular insect-borne potential human pathogens (e.g. arboviruses). Adventitious infectious agents of insect cells may be without cytopathic effect. Tests therefore include nucleic acid amplification techniques, and other tests such as electron microscopy and co-cultivation.
- **Recombinant baculovirus.** The use of the recombinant baculovirus vector is based on a seed-lot system with a defined number of passages between the original virus and the master and the working seed-lots, as approved by the competent authorities. The recombinant baculovirus expression vector contains the coding sequence of the HPV L1 antigen. Segments of the expression construct are analysed using nucleic acid amplification techniques in conjunction with other tests performed on the purified recombinant protein for assuring the quality and consistency of the expressed HPV L1 antigens. The recombinant baculovirus used in the production of HPV vaccines is identified by historical records, which include information on the origin and identity of the gene being cloned as well as the construction, genetics and structure of the baculovirus expression vector(s). The genetic stability of the expression construct is demonstrated from the baculovirus master seed up to at least the highest level used in production and preferably beyond this level.

Recombinant baculovirus seed lots are prepared in large quantities and stored at temperatures favourable for stability. Only a seed lot that complies with the following requirements may be used for virus propagation.

#### **Identification**

The master and working seed lots are identified by the HPV type of the inserted gene of origin, by an appropriate method such as nucleic acid amplification techniques (NAT) (2.6.21).

#### **Virus concentration**

The virus concentration of the master and working seed lots is determined to monitor consistency of production.

#### **Extraneous agents (2.6.16)**

The working seed lot complies with the requirements for seed lots and control cells. Special attention is given to *Spiroplasma* spp. and insect-borne viruses, in particular insect-borne potential human pathogens (e.g. arboviruses).

#### **PROPAGATION AND HARVEST**

All processing of the cell banks and baculovirus seed lots and subsequent cell cultures is done under aseptic conditions in an area where no other cells are being handled.

Where justified and authorised for production in an insect cell/baculovirus expression vector system, a stored virus intermediate culture that complies with the 5 following tests may be used for virus propagation.

#### **Identification**

Each stored virus intermediate culture is identified by HPV type, by an immunological assay using specific antibodies or by a molecular identity test such as NAT (2.6.21).

#### **Bacterial and fungal contamination**

Each stored virus intermediate culture complies with the test for sterility (2.6.1), carried out using 10 mL for each medium.

#### **Virus concentration**

The virus concentration of each stored baculovirus intermediate culture is determined by a suitable method such as plaque assay or NAT (2.6.21) in order to monitor consistency of production.

#### **Extraneous agents (2.6.16)**

Each stored virus intermediate culture complies with the tests for extraneous agents.

#### **Control cells**

The control cells of the production cell culture from which each stored virus intermediate is derived comply with a test for identity and with the requirements for extraneous agents (2.6.16).

**Production in recombinant yeast cells** Identity, microbial purity, plasmid retention and consistency of yield are determined at suitable production stages.

**Production in an insect cell/baculovirus expression vector system**

Insect cell cultures are inoculated with recombinant baculovirus at a defined multiplicity of infection as approved by the competent authority. Several single harvests may be pooled before testing. No antibiotics are added at the time of harvesting or at any later stage of manufacturing.

#### **SINGLE HARVESTS**

Only a single harvest or a pool of single harvests that complies with the following requirements may be used in the preparation of the purified monovalent antigen.

#### **Identification**

Each single harvest is identified as the appropriate HPV type by immunological assay or by a molecular biology-based assay, for example hybridisation or polymerase chain reaction (PCR).

#### **Bacterial and fungal contamination**

In case of production in an insect cell/baculovirus expression vector system the single harvest complies with the test for

sterility (2.6.1). In case of production in yeast cells the single harvest is tested for culture purity by inoculation of suitable medium to ensure no growth other than the host organism.

#### **Extraneous agents (2.6.16)**

In case of production in an insect cell/baculovirus expression vector system the single harvest complies with the tests for extraneous agents. Special attention is given to insect-borne viruses as mentioned under Cell banks and seed lots.

#### **Control cells**

In case of production in an insect cell/baculovirus expression vector system the control cells comply with a test for identification and with the requirements for extraneous agents (2.6.16). Special attention is given to insect-borne viruses as mentioned under Cell banks and seed lots.

#### **PURIFIED MONOVALENT ANTIGEN**

Harvests are purified using validated methods. When an insect cell/baculovirus expression vector system substrate is used, the production process is validated for its capacity to eliminate (by removal and/or inactivation) adventitious viruses and recombinant baculoviruses.

Only a purified monovalent antigen that complies with the following requirements may be used in the preparation of the final bulk. In agreement with the competent authority one or more of the tests mentioned below may be omitted if performed on the adsorbed monovalent antigen.

#### **Total protein**

The total protein is determined by a validated method. The content is within the limits approved for the particular product.

#### **Antigen content and identification**

The quantity and specificity of each antigen type is determined by a suitable immunochemical method (2.7.1) such as radio-immunoassay (RIA), enzyme-linked immunosorbent assay (ELISA), immunoblot (preferably using a monoclonal antibody directed against a protective epitope) or single radial diffusion. The antigen/protein ratio may be determined and is within the limits approved for the particular product.

#### **Antigenic purity**

The purity of each purified monovalent antigen is determined by a suitable method, such as SDS-PAGE with quantification by densitometric analysis, the limit of detection being 1 per cent of impurities or better with respect to total protein. A reference preparation is used to validate each test. The protein purity is calculated as the ratio of the L1 protein-related bands relative to the total protein bands, expressed as a percentage. For the genotypes included in the vaccine, the value calculated for purity is within the limits approved for the particular product.

#### **Percent intact L1 monomer**

The antigenic purity assay serves also to assess the integrity of the L1 monomer. The percent intact L1 monomer is the ratio of the intact L1 monomer to the total protein, expressed as a percentage.

#### **VLP size and structure**

The size and structure of the VLPs is established and monitored by a suitable method such as dynamic light scattering. The size is within the limits approved for the particular product.

#### **Composition**

The protein, lipid, nucleic acid and carbohydrate contents are determined, where applicable.

#### **Host-cell and vector-derived DNA**

Maximum 10 ng of DNA in a quantity of purified antigen equivalent to a single human dose of vaccine, determined in each monovalent purified antigen by sensitive methods.

#### **Residual host-cell proteins**

Tests for residual host-cell proteins are carried out.

The content is within the limits approved for the particular product.

#### **Chemicals used for disruption and purification**

Tests for the chemicals used for purification or other stages of production are carried out. The content is within the limits approved for the particular products.

#### **Sterility (2.6.1)**

Each purified monovalent antigen complies with the test, carried out using 10 mL for each medium.

#### **ADSORBED MONOVALENT ANTIGEN**

The purified monovalent antigens may be adsorbed onto a mineral vehicle such as an aluminium salt.

Only an adsorbed monovalent antigen that complies with the following requirements may be used in the preparation of the final bulk.

#### **Sterility (2.6.1)**

Each adsorbed monovalent antigen complies with the test, carried out using 10 mL for each medium.

#### **Bacterial endotoxins (2.6.14)**

Each adsorbed monovalent antigen is tested for bacterial endotoxins. The content is within the limits approved for the particular product.

#### **Antigen content and identification**

Each antigen type is identified by a suitable immunochemical method (2.7.1) such as radio-immunoassay (RIA), enzyme-linked immunosorbent assay (ELISA), immunoblot (preferably using a monoclonal antibody directed against a protective epitope) or single radial diffusion. The antigen/protein ratio is determined.

#### **Mineral vehicle concentration.**

Where applicable, each adsorbed monovalent antigen is tested for the content of mineral vehicle. The content is within the limits approved for the particular product.

#### **ADSORBED 3-O-DESACYL-4'-MONOPHOSPHORYL LIPID A BULK**

If 3-O-desacyl-4'-monophosphoryl lipid A is included in the vaccine it complies with the monograph 3-O-desacyl-4'-monophosphoryl lipid A (2537). Where 3-O-desacyl-4'-monophosphoryl lipid A is adsorbed prior to inclusion in the vaccine, the adsorbed 3-O-desacyl-4'-monophosphoryl lipid A bulk complies with the following requirements.

#### **Degree of adsorption of 3-O-desacyl-4'-monophosphoryl lipid A**

The content of non-adsorbed 3-O-desacyl-4'-monophosphoryl lipid A in the adsorbed 3-O-desacyl-4'-monophosphoryl lipid A bulk is determined by a suitable method, for example gas chromatographic quantification of the 3-O-desacyl-4'-monophosphoryl lipid A (2537) fatty acids in the supernatant, evaporated to dryness, after centrifugation.

#### **pH (2.2.3)**

The pH is within the limits approved for the particular preparation.

#### **Sterility (2.6.1)**

It complies with the test, carried out using 10 mL for each medium.

**FINAL BULK VACCINE**

The final bulk vaccine is prepared directly from each purified monovalent antigen HPV type or adsorbed purified monovalent antigen HPV type. An antimicrobial preservative, a mineral vehicle such as an aluminium salt and the adjuvant 3-*O*-desacyl-4'-monophosphoryl lipid A may be included in the formulation of the final bulk.

Only a final bulk that complies with the following requirements may be used in the preparation of the final lot.

**Antimicrobial preservative**

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical or physico-chemical method. The amount is not less than 85 per cent and not greater than 115 per cent of the intended content.

**Sterility (2.6.1)**

The final bulk vaccine complies with the test, carried out using 10 mL for each medium.

**FINAL LOT**

Only a final lot that complies with each of the requirements given below under Identification, Tests and Assay may be released for use. Provided that the test for antimicrobial preservative content (where applicable) has been carried out with satisfactory results on the final bulk vaccine, it may be omitted on the final lot. If an *in vivo* assay is carried out, then provided it has been carried out with satisfactory results on the final bulk vaccine, it may be omitted on the final lot.

**Adjuvants**

If the vaccine contains an adjuvant, the amount is determined and shown to be within acceptable limits with respect to the expected amount. A suitable method for 3-*O*-desacyl-4'-monophosphoryl lipid A is, for example, gas chromatography.

**Degree of adsorption**

The degree of adsorption of each antigen and, where applicable, 3-*O*-desacyl-4'-monophosphoryl lipid A is assessed.

**IDENTIFICATION**

The vaccine is shown to contain the different types of HPV antigen by a suitable immunochemical method (2.7.1).

The *in vivo* assay may serve to identify the vaccine.

In addition, where applicable, the test for 3-*O*-desacyl-4'-monophosphoryl lipid A content also serves to identify the 3-*O*-desacyl-4'-monophosphoryl lipid A-containing vaccine.

**TESTS****Aluminium (2.5.13)**

Maximum 1.25 mg per single human dose, if aluminium hydroxide or hydrated aluminium phosphate is used as the adsorbent.

**3-*O*-Desacyl-4'-monophosphoryl lipid A**

Minimum 80 per cent and maximum 120 per cent of the intended amount.

Where applicable, determine the content of 3-*O*-desacyl-4'-monophosphoryl lipid A by a suitable method, for example gas chromatography (2.2.28).

**Antimicrobial preservative**

Where applicable, determine the content of antimicrobial preservative by a suitable chemical or physico-chemical method. The amount is not less than the minimum amount shown to be effective and is not greater than 115 per cent of that stated on the label.

**Sterility (2.6.1)**

The vaccine complies with the test.

**Bacterial endotoxins (2.6.14)**

Maximum 5 IU per single human dose. If the adjuvant prevents the determination of endotoxin, a suitable in-process test is carried out.

**ASSAY**

The assay is performed by an *in vivo* test or an *in vitro* test having acceptance criteria established by correlation studies against an *in vivo* test.

***In vivo* test**

A suitable *in vivo* assay method consists of the injection of not fewer than 3 dilutions of the vaccine to be examined and of a reference vaccine preparation, using for each dilution a group of a suitable number of female mice of a suitable strain. The vaccine is diluted in a solution of sodium chloride R containing the aluminium adjuvant used for the vaccine production. The mice are 6-8 weeks old at the time of injection, and each mouse is given a 0.5 mL injection. A preimmunisation serum sample is taken prior to inoculation, and a final serum sample is taken at a defined time between days 21 and 28. Assay the individual sera for specific neutralising antibodies against each HPV type by a suitable immunochemical method (2.7.1).

The test is not valid unless:

- for both the vaccine to be examined and the reference vaccine, the ED<sub>50</sub> lies between the smallest and the largest doses given to the animals;
- the statistical analysis shows no significant deviation from linearity or parallelism;
- the confidence limits ( $P = 0.95$ ) are within the limits approved for the particular product.

***In vitro* test**

Carry out an immunochemical determination (2.7.1) of each antigen genotype content. Enzyme-linked immunosorbent assay (ELISA) and radio-immunoassay (RIA) using monoclonal antibodies specific for protection-inducing epitopes of the L1 protein have been shown to be suitable. Suitable numbers of dilutions of the vaccine to be examined and a manufacturer's reference preparation are used and a suitable model is used to analyse the data. For each type, the antigen content is within the limits approved for the particular product.

**LABELLING**

The label states:

- the amount of L1 proteins and the genotype of HPV contained in the vaccine;
- the cell substrate used for production of the vaccine;
- the name and amount of the adjuvant and/or adsorbent used;
- that the vaccine must not be frozen.

Ph Eur

**Pertussis Vaccine (Whole Cell, Adsorbed)**

(Ph. Eur. monograph 0161)

The label may state 'WP'.

Ph Eur

**DEFINITION**

Pertussis vaccine (whole cell, adsorbed) is a sterile suspension of inactivated whole cells of one or more strains of *Bordetella pertussis*, treated to minimise toxicity and retain potency.

The vaccine contains a mineral adsorbent such as hydrated aluminium phosphate or aluminium hydroxide.

## PRODUCTION

### GENERAL PROVISIONS

The production process shall have been shown to yield consistently vaccines comparable with the vaccine of proven clinical efficacy and safety in man.

Levels of pertussis toxin, active heat-labile toxin (dermonecrotic toxin) or tracheal cytotoxin must be comparable to the levels present in the vaccine of proven clinical efficacy and safety in man and be approved by the competent authority.

### CHOICE OF VACCINE STRAIN

The vaccine consists of a mixture of one or more strains of *B. pertussis*. Strains of *B. pertussis* used in preparing vaccines are well characterised and chosen in such a way that the final vaccine contains predominantly phase I cells that display fimbriae 2 and 3, as determined by an agglutination test or other suitable immunochemical method (2.7.1).

### SEED LOTS

The production of pertussis vaccine is based on a seed-lot system.

The strains of *B. pertussis* used are identified by a full historical record, including information on the origin of the strain and its subsequent manipulation, characteristics on isolation, and particularly on all tests carried out periodically to verify the strain's characters.

The media chosen for growing *B. pertussis* are carefully selected and enable the micro-organism to retain phase I characteristics.

When animal blood or animal blood products are used, they are removed by washing the harvested bacteria.

Human blood or human blood products are not used in any culture media for propagating bacteria, either for seed or for vaccine.

### PROPAGATION AND HARVEST

Each strain is grown separately from the working seed lot.

Cultures are checked at different stages of fermentation (subcultures and main culture) for purity, identity, cell opacity and pH. Unsatisfactory cultures must be discarded.

Production cultures are shown to be consistent in respect of growth rate, pH and yield of cells or cell products.

The bacteria are harvested and may be washed to remove substances derived from the medium and suspended in a 9 g/L solution of sodium chloride or other suitable isotonic solution.

### MONOVALENT CELL HARVEST

Consistency of production is monitored in respect of growth rate, pH, yield and demonstration of characteristics of phase I organisms in the culture, such as presence of fimbriae 2 and 3 and haemolytic activity. Single harvests are not used for the final bulk vaccine unless they have been shown to contain *B. pertussis* cells with the same characteristics with regard to growth and agglutinogens as the parent strain, and to be free from contaminating bacteria and fungi.

Only a monovalent harvest that complies with the following requirements may be used in further production.

#### Purity

Samples of single harvests taken before inactivation are examined by microscopy of Gram-stained smears or by inoculation into appropriate culture media or by another suitable procedure.

#### Opacity

The opacity of each single harvest is measured not later than 2 weeks after harvest and before the bacterial suspension has been subjected to any process capable of altering its opacity, by comparison with the International Reference Preparation of Opacity, and used as the basis of calculation for subsequent stages in vaccine preparation. The equivalence in International Units of the International Reference Preparation is stated by the World Health Organization.

A spectrophotometric method validated against the opacity reference preparation may be used and absorbance may, for example, be measured at 600 nm (2.2.25).

### INACTIVATION AND DETOXIFICATION OF *B. PERTUSSIS* SUSPENSION

Inactivation is initiated as soon as possible after taking samples of single harvests for purity control and opacity measurement. The bacteria are killed and detoxified in controlled conditions by means of a suitable chemical agent or by heating or by a combination of these methods. The suspension is maintained at  $5 \pm 3$  °C for a suitable period to diminish its toxicity.

Only an inactivated monovalent cell bulk that complies with established specifications for the following tests may be used in the preparation of the final bulk.

#### Residual live *B. pertussis*

Inactivation of the whole cells of *B. pertussis* is verified by a suitable culture medium.

#### Pertussis toxin

Presence of pertussis toxin is measured by a CHO cell culture assay using a semi-quantitative technique and range determined for the particular product.

#### pH (2.2.3)

Within the range approved for the particular product.

#### Identification

Verified by agglutination assay or suitable immunodiffusion assay.

#### Sterility (2.6.1)

It complies with the test for sterility, carried out using 10 mL for each medium.

#### Opacity

The opacity of each single harvest is measured in the final phase, at the end of the main fermentation process, by comparison with the International Reference Preparation of Opacity. The equivalence in International Units of the International Reference Preparation is stated by the World Health Organization. The absorbance, for example measured at 600 nm (2.2.25), is within the range approved for the particular product.

### FINAL BULK

The final bulk vaccine is prepared by aseptically mixing suitable quantities of the inactivated single harvests.

If 2 or more strains of *B. pertussis* are used, the composition of consecutive lots of the final bulk vaccine shall be consistent with respect to the proportion of each strain as measured in opacity units. The bacterial concentration of the final bulk vaccine does not exceed that corresponding to an opacity of 20 IU per single human dose. The opacity measured on the single harvests is used to calculate the bacterial concentration in the final bulk. A mineral adsorbent such as hydrated aluminium phosphate or aluminium hydroxide is added to the cell suspension. Suitable antimicrobial preservatives may be added. Phenol is not used as a preservative.

Only a final bulk that complies with the following requirements may be used in the preparation of the final lot.

#### Fimbriae

Each bulk is examined, before adsorbent is added, for the presence of fimbriae 2 and 3 to ensure that appropriate expression has occurred during bacterial growth.

#### Sterility (2.6.1)

It complies with the test for sterility, carried out using 10 mL for each medium.

#### Antimicrobial preservative

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical or physico-chemical method. The amount is not less than 85 per cent and not greater than 115 per cent of the intended amount.

#### FINAL LOT

The final bulk is mixed to homogeneity and filled aseptically into suitable containers.

Only a final lot that is within the limits approved for the particular product and is satisfactory with respect to each of the requirements given below under Identification, Tests and Assay may be released for use. Provided the tests for specific toxicity, free formaldehyde and antimicrobial preservative and the determination of potency have been carried out with satisfactory results on the final bulk vaccine, they may be omitted on the final lot.

#### IDENTIFICATION

Dissolve in the vaccine to be examined sufficient *sodium citrate R* to give a 100 g/L solution. Maintain at 37 °C for about 16 h and centrifuge to obtain a bacterial precipitate. Identity of pertussis vaccine is based on an immunological reaction, for example agglutination of the resuspended bacteria with a specific anti-pertussis serum or another suitable immunochemical method (2.7.1).

#### TESTS

##### Specific toxicity

Use not fewer than 5 healthy mice each weighing 14-16 g for the vaccine group and for the saline control. Use mice of the same sex or distribute males and females equally between the groups. Inject each mouse of the vaccine group intraperitoneally with 0.5 mL, containing a quantity of the vaccine equivalent to not less than half the single human dose. Inject each mouse of the control group with 0.5 mL of a 9 g/L sterile solution of *sodium chloride R*, preferably containing, where applicable, the same amount of antimicrobial preservative as that injected with the vaccine. Weigh the groups of mice immediately before the injection and 72 h and 7 days after the injection. The vaccine complies with the test if: (a) at the end of 72 h the average weight of the group of vaccinated mice is not less than that preceding the injection; (b) at the end of 7 days the average increase in mass per vaccinated mouse is not less than 60 per cent of that per control mouse; and (c) not more than 5 per cent of the vaccinated mice die during the test. If the test is carried out using 5 mice and 1 vaccinated mouse dies, the test may be repeated using 15 mice and the results of both tests combined.

##### Aluminium (2.5.13)

Maximum 1.25 mg per single human dose, if aluminium hydroxide or hydrated aluminium phosphate is used as the adsorbent.

##### Free formaldehyde (2.4.18)

Maximum 0.2 g/L, where applicable.

#### Antimicrobial preservative

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The content is not less than the minimum amount shown to be effective and is not greater than 115 per cent of the quantity stated on the label.

#### Sterility (2.6.1)

It complies with the test for sterility.

#### ASSAY

Carry out the assay of pertussis vaccine (whole cell) (2.7.7).

The estimated potency is not less than 4.0 IU per single human dose and the lower confidence limit ( $P = 0.95$ ) of the estimated potency is not less than 2.0 IU per single human dose.

#### LABELLING

The label states:

- the minimum number of International Units per single human dose;
- the method used for inactivation;
- the name and the amount of the adsorbent;
- that the vaccine must be shaken before use;
- that the vaccine is not to be frozen.

Ph Eur

## Adsorbed Pertussis Vaccine (Acellular Component)

(*Pertussis Vaccine (Acellular, Component, Adsorbed)*,  
Ph. Eur. monograph 1356)

Ph Eur

#### DEFINITION

Pertussis vaccine (acellular, component, adsorbed) is a preparation of individually prepared and purified antigenic components of *Bordetella pertussis* adsorbed on a mineral carrier such as aluminium hydroxide or hydrated aluminium phosphate.

The vaccine contains either pertussis toxoid (chemically detoxified pertussis toxin) or a pertussis toxin-like protein free from toxic properties, produced by expression of a genetically modified form of the corresponding gene. The vaccine may also contain filamentous haemagglutinin, pertactin (a 69 kDa outer-membrane protein) and other defined components of *B. pertussis* such as fimbrial-2 and fimbrial-3 antigens. The latter 2 antigens may be co-purified. The antigenic composition and characteristics are based on evidence of protection and freedom from unexpected reactions in the target group for which the vaccine is intended.

#### PRODUCTION

##### GENERAL PROVISIONS

The production method shall have been shown to yield consistently vaccines comparable with the vaccine of proven clinical efficacy and safety in man.

Where a genetically modified form of *B. pertussis* is used, production consistency and genetic stability shall be established in conformity with the requirements of the monograph *Products of recombinant DNA technology (0784)*.

*Reference vaccine* A batch of vaccine shown to be effective in clinical trials or a batch representative thereof is used as a reference vaccine. For the preparation of a representative batch, strict adherence to the production process used for the

batch tested in clinical trials is necessary. The reference vaccine is preferably stabilised by a method that has been shown to have no significant effect on the assay procedure when the stabilised and non-stabilised batches are compared.

#### CHARACTERISATION OF COMPONENTS

During development of the vaccine, the production process shall be validated to demonstrate that it yields consistently individual components that comply with the following requirements; after demonstration of consistency, the tests need not be applied routinely to each batch.

##### Adenylate cyclase

Not more than 500 ng in the equivalent of 1 dose of the final vaccine, determined by immunoblot analysis or another suitable method.

##### Tracheal cytotoxin

Not more than 2 pmol in the equivalent of 1 dose of the final vaccine, determined by a suitable method such as a biological assay or liquid chromatography (2.2.29).

##### Absence of residual dermonecrotic toxin

Inject intradermally into each of 3 unweaned mice, in a volume of 0.1 mL, the amount of component or antigenic fraction equivalent to 1 dose of the final vaccine. Observe for 48 h. No dermonecrotic reaction is demonstrable.

##### Specific properties

The components of the vaccine are analysed by one or more of the methods shown below in order to determine their identity and specific properties (activity per unit amount of protein) in comparison with reference preparations.

**Pertussis toxin** Chinese hamster ovary (CHO) cell-clustering effect and haemagglutination as *in vitro* methods; lymphocytosis-promoting activity and insulin secretory activity as *in vivo* methods. The toxin shows ADP-ribosyl transferase activity using transducin as the acceptor.

**Filamentous haemagglutinin** Haemagglutination and inhibition by a specific antibody.

**Pertactin, fimbrial-2 and fimbrial-3 antigens** Reactivity with specific antibodies.

**Pertussis toxoid** The toxoid induces in animals the production of antibodies capable of inhibiting all the properties of pertussis toxin.

#### PURIFIED COMPONENTS

Production of each component is based on a seed-lot system. The seed cultures from which toxin is prepared are managed to conserve or, where necessary, restore toxinogenicity by deliberate selection.

None of the media used at any stage contains blood or blood products of human origin. Media used for the preparation of seed lots and inocula may contain blood or blood products of animal origin.

Pertussis toxin and, where applicable, filamentous haemagglutinin and pertactin are purified and, after appropriate characterisation, detoxified using suitable chemical reagents. The detoxification process for the pertussis toxin is validated to demonstrate its ability to consistently produce antigens that are immunogenic and stably detoxified. Other components such as fimbrial-2 and fimbrial-3 antigens are purified either separately or together, characterised and shown to be free from toxic substances. The purification procedure is validated to demonstrate appropriate clearance of substances used during culture or purification.

The content of bacterial endotoxins (2.6.14) is determined to monitor the purification procedure and to limit the amount

in the final vaccine. The limits applied for the individual components are such that the final vaccine contains less than 100 IU per single human dose.

Before detoxification, the purity of the components is determined by a suitable method such as polyacrylamide gel electrophoresis (PAGE) or liquid chromatography. SDS-PAGE or immunoblot analysis with specific monoclonal or polyclonal antibodies may be used to characterise subunits. Requirements are established for each individual product.

Only purified components that comply with the following requirements may be used in the preparation of the final bulk vaccine.

##### Sterility (2.6.1)

Carry out the test for sterility using for each medium a quantity of purified component equivalent to not less than 100 doses.

##### Residual pertussis toxin (2.6.33)

The limit is approved by the competent authority.

##### Residual detoxifying agents and other reagents

The content of residual detoxifying agents and other reagents is determined and shown to be below approved limits unless validation of the process has demonstrated acceptable clearance.

##### Antigen content

Determine the antigen content by a suitable immunochemical method (2.7.1) and protein nitrogen by sulfuric acid digestion (2.5.9) or another suitable method. The ratio of antigen content to protein nitrogen is within the limits established for the product.

#### FINAL BULK VACCINE

The vaccine is prepared by adsorption of suitable quantities of purified components, separately or together, onto aluminium hydroxide or hydrated aluminium phosphate. A suitable antimicrobial preservative may be added.

Only a final bulk vaccine that complies with the following requirements may be used in the preparation of the final lot.

##### Antimicrobial preservative

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical or physico-chemical method. The amount is not less than 85 per cent and not greater than 115 per cent of the intended content.

##### Sterility (2.6.1)

Carry out the test for sterility using 10 mL for each medium.

#### FINAL LOT

Only a final lot that is satisfactory with respect to each of the requirements given below under Identification, Tests and Assay may be released for use. Provided the tests for antimicrobial preservative and free formaldehyde, and the assay have been carried out with satisfactory results on the final bulk vaccine, they may be omitted on the final lot.

#### IDENTIFICATION

Subject the vaccine to a suitable desorption procedure such as the following: dissolve in the vaccine to be examined sufficient sodium citrate R to give a 10 g/L solution; maintain at 37 °C for about 16 h and centrifuge until a clear supernatant is obtained. Examined by a suitable immunochemical method (2.7.1), the clear supernatant reacts with specific antisera to the components stated on the label.

#### TESTS

##### Aluminium (2.5.13)

Maximum 1.25 mg per single human dose, if aluminium hydroxide or hydrated aluminium phosphate is used as the adsorbent.

**Free formaldehyde (2.4.18)**

Maximum 0.2 g/L.

**Antimicrobial preservative**

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical or physico-chemical method. The amount is not less than the minimum amount shown to be effective and is not greater than 115 per cent of the quantity stated on the label.

**Sterility (2.6.1)**

The vaccine complies with the test for sterility.

**ASSAY**

Carry out one of the prescribed methods for the assay of pertussis vaccine (acellular) (2.7.16). The vaccine complies with the limit approved for the particular product.

**LABELLING**

The label states:

- the names and amounts of the antigenic components present in the vaccine;
- where applicable, that the vaccine contains a pertussis toxin-like protein produced by genetic modification;
- the name and amount of the adsorbent;
- that the vaccine must be shaken before use;
- that the vaccine is not to be frozen.

Ph Eur

## Adsorbed Pertussis Vaccine (Acellular, Co-purified)

(*Pertussis Vaccine (Acellular, Co-purified, Adsorbed)*,  
Ph. Eur. monograph 1595)

Ph Eur

**DEFINITION**

Pertussis vaccine (acellular, co-purified, adsorbed) is a preparation of antigenic components of *Bordetella pertussis* adsorbed on a mineral carrier such as aluminium hydroxide or hydrated aluminium phosphate.

The vaccine contains an antigenic fraction purified without separation of the individual components. The antigenic fraction is composed of pertussis toxoid (chemically detoxified pertussis toxin), filamentous haemagglutinin, pertactin (a 69 kDa outer-membrane protein) and other defined components of *B. pertussis* such as fimbrial-2 and fimbrial-3 antigens. The antigenic composition and characteristics are based on evidence of protection and freedom from unexpected reactions in the target group for which the vaccine is intended.

**PRODUCTION****GENERAL PROVISIONS**

The production method shall have been shown to yield consistently vaccines comparable with the vaccine of proven clinical efficacy and safety in man.

**Reference vaccine** A batch of vaccine shown to be effective in clinical trials or a batch representative thereof is used as a reference vaccine. For the preparation of a representative batch, strict adherence to the production process used for the batch tested in clinical trials is necessary. The reference vaccine is preferably stabilised, by a method that has been shown to have no significant effect on the assay procedure when the stabilised and non-stabilised batches are compared.

**CHARACTERISATION OF COMPONENTS**

During development of the vaccine, the production process shall be validated to demonstrate that it yields consistently an antigenic fraction that complies with the following requirements; after demonstration of consistency, the tests need not be applied routinely to each batch.

**Adenylate cyclase**

Not more than 500 ng in the equivalent of 1 dose of the final vaccine, determined by immunoblot analysis or another suitable method.

**Tracheal cytotoxin**

Not more than 2 pmol in the equivalent of 1 dose of the final vaccine, determined by a suitable method such as a biological assay or liquid chromatography (2.2.29).

**Absence of residual dermonecrotic toxin**

Inject intradermally into each of 3 unweaned mice, in a volume of 0.1 mL, the amount of antigenic fraction equivalent to 1 dose of the final vaccine. Observe for 48 h. No dermonecrotic reaction is demonstrable.

**Specific properties**

The antigenic fraction is analysed by one or more of the methods shown below in order to determine the identity and specific properties (activity per unit amount of protein) of its components in comparison with reference preparations.

**Pertussis toxin** Chinese hamster ovary (CHO) cell-clustering effect and haemagglutination as *in vitro* methods; lymphocytosis-promoting activity and insulin secretory activity as *in vivo* methods. The toxin shows ADP-ribosyl transferase activity using transducin as the acceptor.

**Filamentous haemagglutinin** Haemagglutination and inhibition by a specific antibody.

**Pertactin, fimbrial-2 and fimbrial-3 antigens** Reactivity with specific antibodies.

**Pertussis toxoid** The toxoid induces in animals the production of antibodies capable of inhibiting all the properties of pertussis toxin.

**PURIFIED ANTIGENIC FRACTION**

Production of the antigenic fraction is based on a seed-lot system. The seed cultures are managed to conserve or, where necessary, restore toxinogenicity by deliberate selection.

None of the media used at any stage contains blood or blood products of human origin. Media used for the preparation of seed batches and inocula may contain blood or blood products of animal origin.

The antigenic fraction is purified and, after appropriate characterisation, detoxified using suitable reagents.

The detoxification process for the pertussis toxin is validated to demonstrate its ability to consistently produce antigens that are immunogenic and stably detoxified. The purification procedure is validated to demonstrate appropriate clearance of substances used during culture or purification.

The content of bacterial endotoxins (2.6.14) is determined to monitor the purification procedure and to limit the amount in the final vaccine. The limits applied are such that the final vaccine contains not more than 100 IU per single human dose.

Before detoxification, the purity of the antigenic fraction is determined by a suitable method such as polyacrylamide gel electrophoresis (PAGE) or liquid chromatography. SDS-PAGE or immunoblot analysis with specific monoclonal or polyclonal antibodies may be used to characterise subunits. Requirements are established for each individual product.

Only a purified antigenic fraction that complies with the following requirements may be used in the preparation of the final bulk vaccine.

#### **Sterility (2.6.1)**

Carry out the test for sterility using for each medium a quantity of purified antigenic fraction equivalent to not less than 100 doses of the final vaccine.

#### **Residual pertussis toxin (2.6.33)**

The limit is approved by the competent authority.

#### **Residual detoxifying agents and other reagents**

The content of residual detoxifying agents and other reagents is determined and shown to be below approved limits unless validation of the process has demonstrated acceptable clearance.

#### **Antigen content**

Determine the complete quantitative antigen composition of the antigenic fraction by suitable immunochemical methods (2.7.1) and protein nitrogen by sulfuric acid digestion (2.5.9) or another suitable method. The ratio of total antigen content to protein nitrogen is within the limits established for the product.

#### **FINAL BULK VACCINE**

The vaccine is prepared by adsorption of a suitable quantity of the antigenic fraction onto aluminium hydroxide or hydrated aluminium phosphate. A suitable antimicrobial preservative may be added.

Only a final bulk vaccine that complies with the following requirements may be used in the preparation of the final lot.

#### **Antimicrobial preservative**

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical or physico-chemical method. The amount is not less than 85 per cent and not greater than 115 per cent of the intended content.

#### **Sterility (2.6.1)**

Carry out the test for sterility using 10 mL for each medium.

#### **FINAL LOT**

Only a final lot that is satisfactory with respect to each of the requirements given below under Identification, Tests and Assay may be released for use.

Provided the tests for antimicrobial preservative and free formaldehyde, and the assay have been carried out with satisfactory results on the final bulk vaccine, they may be omitted on the final lot.

#### **IDENTIFICATION**

Subject the vaccine to a suitable desorption procedure such as the following: dissolve in the vaccine to be examined sufficient sodium citrate R to give a 10 g/L solution; maintain at 37 °C for about 16 h and centrifuge until a clear supernatant is obtained. Examined by a suitable immunochemical method (2.7.1), the clear supernatant reacts with specific antisera to the components in the vaccine.

#### **TESTS**

##### **Antimicrobial preservative**

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical or physico-chemical method. The amount is not less than the minimum amount shown to be effective and is not greater than 115 per cent of the quantity stated on the label.

##### **Aluminium (2.5.13)**

Maximum 1.25 mg per single human dose, if aluminium hydroxide or hydrated aluminium phosphate is used as the adsorbent.

##### **Free formaldehyde (2.4.18)**

Maximum 0.2 g/L.

##### **Sterility (2.6.1)**

The vaccine complies with the test for sterility.

#### **ASSAY**

Carry out one of the prescribed methods for the assay of pertussis vaccine (acellular) (2.7.16). The vaccine complies with the limit approved for the particular product.

#### **LABELLING**

The label states:

- the names and amounts of the antigenic components present in the vaccine;
- the name and amount of the adsorbent;
- that the vaccine must be shaken before use;
- that the vaccine is not to be frozen.

Ph Eur

## **Pneumococcal Polysaccharide Vaccine**

(Ph. Eur. monograph 0966)

The label may state 'Pneumo'.

Ph Eur

#### **DEFINITION**

Pneumococcal polysaccharide vaccine consists of a mixture of equal parts of purified capsular polysaccharide antigens prepared from suitable pathogenic strains of *Streptococcus pneumoniae* whose capsules have been shown to be made up of polysaccharides that are capable of inducing satisfactory levels of specific antibodies in man. It contains the 23 immunochemically different capsular polysaccharides listed in Table 0966.-1.

The vaccine is a clear, colourless liquid.

#### **PRODUCTION**

Production of the vaccine is based on a seed-lot system for each type. The production method shall have been shown to yield consistently pneumococcal polysaccharide vaccines of adequate safety and immunogenicity in man.

#### **MONOVALENT BULK POLYSACCHARIDES**

The bacteria are grown in a suitable liquid medium that does not contain blood-group substances or high-molecular-mass polysaccharides. The bacterial purity of the culture is verified and the culture is inactivated with phenol. Impurities are removed by such techniques as fractional precipitation, enzymatic digestion and ultrafiltration. The polysaccharide is obtained by fractional precipitation, washed, and dried in a vacuum to a residual moisture content shown to be favourable to the stability of the polysaccharide. The residual moisture content is determined by drying under reduced pressure over diphosphorus pentoxide or by thermogravimetric analysis and the value obtained is used to calculate the results of the tests shown below with reference to the dried substance. The monovalent bulk polysaccharide is stored at a suitable temperature in conditions that avoid the uptake of moisture.

Only a monovalent bulk polysaccharide that complies with the following requirements may be used in the preparation of the final bulk vaccine. Percentage contents of components, determined by the methods prescribed below, are shown in Table 0966.-1.

Table 0966.-1 – Percentage contents of components of monovalent bulk polysaccharides

Molecular type*	Protein	Nucleic acids	Total nitrogen	Phosphorus	Uronic acids	Hexosamines	Methyl-pentoses	O-acetyl Groups
1	≤ 2	≤ 2	3.5-6	0-1.5	≥ 45			≥ 1.8
2	≤ 2	≤ 2	0-1	0-1.0	≥ 15		≥ 38	
3	≤ 5	≤ 2	0-1	0-1.0	≥ 40			
4	≤ 3	≤ 2	4-6	0-1.5		≥ 40		
5	≤ 7.5	≤ 2	2.5-6.0	≤ 2	≥ 12	≥ 20		
6B	≤ 2	≤ 2	0-2	2.5-5.0			≥ 15	
7F	≤ 5	≤ 2	1.5-4.0	0-1.0			≥ 13	
8	≤ 2	≤ 2	0-1	0-1.0	≥ 25			
9N	≤ 2	≤ 1	2.2-4	0-1.0	≥ 20	≥ 28		
9V	≤ 2	≤ 2	0.5-3	0-1.0	≥ 15	≥ 13		
10A	≤ 7	≤ 2	0.5-3.5	1.5-3.5		≥ 12		
11A	≤ 3	≤ 2	0-2.5	2.0-5.0				≥ 9
12F	≤ 3	≤ 2	3-5	0-1.0		≥ 25		
14	≤ 5	≤ 2	1.5-4	0-1.0		≥ 20		
15B	≤ 3	≤ 2	1-3	2.0-4.5		≥ 15		
17A or 17F	≤ 2	≤ 2	0-1.5	0-3.5			≥ 20	
18C	≤ 3	≤ 2	0-1	2.4-4.9			≥ 14	
19A	≤ 2	≤ 2	0.6-3.5	3.0-7.0		≥ 12	≥ 20	
19F	≤ 3	≤ 2	1.4-3.5	3.0-5.5		≥ 12.5	≥ 20	
20	≤ 2	≤ 2	0.5-2.5	1.5-4.0		≥ 12		
22F	≤ 2	≤ 2	0-2	0-1.0	≥ 15		≥ 25	
23F	≤ 2	≤ 2	0-1	3.0-4.5			≥ 37	
33F	≤ 2.5	≤ 2	0-2	0-1.0				

\* The different types are indicated using the Danish nomenclature.

#### Protein (2.5.16)

#### Nucleic acids (2.5.17)

#### Total nitrogen (2.5.9)

#### Phosphorus (2.5.18)

#### Molecular-size or molecular-mass distribution

Molecular-size or molecular-mass distribution is determined by size-exclusion chromatography (2.2.30) combined with an appropriate detection system. An acceptable value is established for each purified polysaccharide. Each batch must be shown to comply with this limit.

#### Uronic acids (2.5.22)

#### Hexosamines (2.5.20)

#### Methylpentoses (2.5.21)

#### O-Acetyl groups (2.5.19)

#### Identification (2.7.1)

Confirm the identity of the monovalent bulk polysaccharide by double immunodiffusion or electroimmunodiffusion (except for polysaccharides 7F, 14 and 33F), using specific antisera.

#### Specificity

No reaction occurs when the antigens are tested against all the antisera specific for the other polysaccharides of the

vaccine, including factor sera for distinguishing types within groups. The polysaccharides are tested at a concentration of 50 µg/mL using a method capable of detecting 0.5 µg/mL.

#### FINAL BULK VACCINE

The final bulk vaccine is obtained by aseptically mixing the different polysaccharide powders. The uniform mixture is aseptically dissolved in a suitable isotonic solution so that one human dose of 0.50 mL contains 25 µg of each polysaccharide. An antimicrobial preservative may be added. The solution is sterilised by filtration through a bacteria-retentive filter.

Only a final bulk vaccine that complies with the following requirements may be used in the preparation of the final lot.

#### Antimicrobial preservative

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The content is not less than 85 per cent and not greater than 115 per cent of the intended amount.

#### Sterility (2.6.1)

The final bulk vaccine complies with the test for sterility, using 10 mL for each medium.

#### FINAL LOT

The final bulk vaccine is distributed aseptically into sterile, tamper-evident containers.

Only a final lot that is satisfactory with respect to each of the requirements given below under Identification, Tests and Assay may be released for use. Provided that the tests for phenol and for antimicrobial preservative have been carried out with satisfactory results on the final bulk vaccine, they may be omitted on the final lot. When consistency of production has been established on a suitable number of consecutive batches, the assay may be replaced by a qualitative test that identifies each polysaccharide, provided that an assay has been performed on each monovalent bulk polysaccharide used in the preparation of the final lot.

#### IDENTIFICATION

The assay serves also to identify the vaccine.

#### TESTS

##### pH (2.2.3)

The pH of the vaccine is 4.5 to 7.4.

##### Antimicrobial preservative

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The content is not less than the minimum amount shown to be effective and is not greater than 115 per cent of the quantity stated on the label.

##### Phenol (2.5.15)

Not more than 2.5 g/L.

##### Sterility (2.6.1)

It complies with the test for sterility.

##### Pyrogens (2.6.8)

It complies with the test for pyrogens. Inject per kilogram of the rabbit's mass 1 mL of a dilution of the vaccine containing 2.5 µg/mL of each polysaccharide.

#### ASSAY

Determine the content of each polysaccharide by a suitable immunochemical method (2.7.1), using antisera specific for each polysaccharide contained in the vaccine, including factor sera for types within groups, and purified polysaccharides of each type as standards.

The vaccine contains not less than 70 per cent and not more than 130 per cent of the quantity stated on the label for each polysaccharide. The confidence limits ( $P = 0.95$ ) are not less than 80 per cent and not more than 120 per cent of the estimated content.

#### LABELLING

The label states:

- the number of micrograms of each polysaccharide per single human dose;
- the total amount of polysaccharide in the container.

Ph Eur

## Pneumococcal Polysaccharide Conjugate Vaccine (Adsorbed)

(Ph. Eur. monograph 2150)

The label may state 'Pneumo(conj)'.

Ph Eur

#### DEFINITION

Pneumococcal polysaccharide conjugate vaccine (adsorbed) is a sterile suspension of purified capsular polysaccharides obtained from *Streptococcus pneumoniae* serotypes individually conjugated to a carrier protein. The carrier protein used may vary for the various polysaccharide conjugates contained in a

multivalent vaccine. The vaccine may be adsorbed on a suitable adjuvant or adsorbant.

Each serotype, produced from suitable pathogenic strains of *S. pneumoniae*, is grown in an appropriate medium.

The individual polysaccharides are purified through suitable purification methods (for example centrifugation, precipitation, ultrafiltration and column chromatography).

Each polysaccharide has a defined composition and a defined molecular size range.

The choice of polysaccharide depends on the frequency of the serotypes responsible for acute pathologies and their geographical distribution. The vaccine contains immunochemically different capsular polysaccharides.

#### PRODUCTION

##### GENERAL PROVISIONS

The production method shall have been shown to yield consistently *S. pneumoniae* conjugate vaccines of adequate safety and immunogenicity in man. The production of polysaccharides and of the carrier(s) is based on a seed-lot system.

During development studies and wherever revalidation is necessary, a test for pyrogens in rabbits (2.6.8) is carried out. The vaccine is shown to be acceptable with respect to absence of pyrogenic activity.

During development studies and whenever revalidation of the manufacturing process is necessary, it shall be demonstrated by tests in animals that the vaccine consistently induces a T-cell-dependent B-cell immune response.

The stability of the conjugated bulk and/or final lot and pneumococcal saccharide is evaluated using suitable indicator tests. Such tests may include determination of molecular size, quantification of saccharide content and free polysaccharide content in the conjugate.

##### BACTERIAL SEED LOTS

The bacterial strains used for master seed lots shall be identified by historical records that include information on their origin and the tests used to characterise the strain.

Cultures obtained from the working seed lot shall have the same characteristics as the strain that was used to prepare the master seed lot.

Purity of bacterial cultures is verified by methods of suitable sensitivity. These may include inoculation into suitable media, examination of colony morphology, microscopic examination of Gram-stained smears and culture agglutination with suitable specific antisera.

##### PNEUMOCOCCAL POLYSACCHARIDES

Each strain of *S. pneumoniae* serotypes is individually grown in a liquid medium that does not contain high-molecular-mass polysaccharides; if any ingredient of the medium contains blood-group substances, the process is validated to demonstrate that after the purification step they are no longer detectable. The bacterial purity of the culture is verified by suitable methods. The culture is then inactivated. Each polysaccharide is separated from the liquid culture and purified by suitable methods. Volatile matter, including water, in the purified polysaccharide is determined by a suitable method such as thermogravimetry (2.2.34), semi-micro determination of water (2.5.12) or, where applicable, determination of solvent and/or alcohol content by spectrometry. The values are used to calculate the results of other chemical tests with reference to the dried substance, as prescribed below.

Only polysaccharides that comply with the following requirements may be used in the preparation of the conjugate.

#### Identification

Each polysaccharide is identified by an immunochemical method (2.7.1) or other suitable methods, for example <sup>1</sup>H nuclear magnetic resonance spectrometry (2.2.33).

#### Protein (2.5.16)

Depending on the serotype used, not more than the limit approved for the product, calculated with reference to the dried substance.

#### Nucleic acid (2.5.17)

Depending on the serotype used, not more than the limit approved for the product, calculated with reference to the dried substance.

#### Molecular-size or molecular-mass distribution

Molecular-size or molecular-mass distribution is determined by size-exclusion chromatography (2.2.30) combined with an appropriate detection system. An acceptable value is established for each pneumococcal polysaccharide. Each batch must be shown to comply with this limit.

#### Bacterial endotoxins (2.6.14)

Less than 0.5 IU per microgram of polysaccharide.

#### Residual reagents

Where applicable, suitable tests are carried out to determine residues of reagents used during inactivation and purification. An acceptable value for each reagent is established for the particular product and each batch of polysaccharide must be shown to comply with this limit. Where validation studies have demonstrated removal of residual reagents, the test on polysaccharides may be omitted.

#### Water

Where applicable, the values are within the limits approved for each serotype, determined by a suitable method.

Depending on the chemical composition of a pneumococcal polysaccharide serotype, not all of the following tests may be applicable. The values are within the limits approved. Suitable limits for some pneumococcal polysaccharide serotypes are given in the monograph *Pneumococcal polysaccharide vaccine (0966)*.

#### Total nitrogen (2.5.9)

#### Phosphorus (2.5.18)

#### Uronic acids (2.5.22)

#### Hexosamines (2.5.20)

#### Methylpentoses (2.5.21)

#### O-Acetyl groups (2.5.19)

#### MODIFIED PNEUMOCOCCAL POLYSACCHARIDES

Before conjugation, the polysaccharide can be depolymerised by chemical or mechanical means followed by a concentration step to obtain polysaccharides of a desired molecular size range. Polysaccharides or depolymerised polysaccharides are modified by an activation process.

Only modified polysaccharides that comply with the following requirements may be used in the preparation of the conjugate.

#### Molecular-size or molecular-mass distribution

In the case of a size-reduced modified pneumococcal polysaccharide, the molecular-size or molecular-mass distribution is determined by size-exclusion chromatography (2.2.30) combined with an appropriate detection system. An acceptable value is established for each modified

pneumococcal polysaccharide. Each batch must be shown to comply with this limit.

#### Degree of oxidation

Where applicable, the degree of oxidation is represented by the ratio of moles of saccharide repeat unit per mole of aldehyde and determined by a suitable method. The values are within the limits approved for each serotype.

#### CARRIER PROTEIN

The production and characteristics of the carrier proteins are described in general chapter 5.2.11. *Carrier proteins for the production of conjugated polysaccharide vaccines for human use*. Only a carrier protein that complies with the requirements of this chapter may be used in the preparation of the conjugate.

#### MONOVALENT BULK CONJUGATE

The conjugate is obtained by the covalent binding of activated polysaccharides to the appropriate carrier protein.

The conjugate purification procedures are designed to remove residual reagents used for conjugation. The removal of residual reagents is confirmed by suitable tests or by validation of the purification process.

Only a bulk conjugate that complies with the following requirements may be used in the preparation of the final bulk vaccine. For each test, limits of acceptance are established and each batch of conjugate must be shown to comply with these limits.

#### Saccharide

The polysaccharide content is determined by a suitable physical or chemical method or by an immunochemical method (2.7.1). The value complies with the requirement approved for each serotype.

#### Protein

The protein content is determined by a suitable physical or chemical method (for example, 2.5.16). The value complies with the requirement approved for each serotype.

#### Saccharide-to-protein ratio

Determine the saccharide-to-protein ratio by calculation. The value complies with the requirement approved for each serotype.

#### Free saccharide

Unbound polysaccharide is determined after removal of the conjugate, for example by anion-exchange, size-exclusion or hydrophobic chromatography, ultrafiltration, or other validated methods. A value consistent with adequate immunogenicity as shown in clinical trials is established for each serotype and each lot must be shown to comply with this limit.

#### Free carrier protein

Determine the content by a suitable method, either directly or by deriving the content by calculation from the results of other tests. The value complies with the requirement approved for each serotype.

#### Molecular-size or molecular-mass distribution

Molecular-size or molecular-mass distribution is determined by size-exclusion chromatography (2.2.30) combined with an appropriate detection system. An acceptable value is established for the bulk conjugate of each polysaccharide. Each batch must be shown to comply with this limit.

#### Residual reagents

Where applicable, suitable tests are carried out to determine residues of reagents used during inactivation and purification. An acceptable value for each reagent is established for the particular product and each batch of conjugate must be shown to comply with this limit. Where validation studies

have demonstrated removal of residual reagents, the test on conjugate polysaccharides may be omitted.

#### **Sterility (2.6.1)**

It complies with the test for sterility, carried out using 10 mL for each medium or the equivalent of 100 doses for each medium, whichever is less.

#### **Bacterial endotoxins (2.6.14)**

Less than 0.75 IU per microgram of polysaccharide.

#### **ADSORBED MONOVALENT BULK CONJUGATE**

An aluminium-containing adjuvant may be added to each of the monovalent bulk conjugates prior to formulation of the final bulk. Once the conjugates are adsorbed on a sterile adjuvant, sterility is assured by aseptic processing.

Only an adsorbed monovalent bulk conjugate that complies with the following requirements may be used in the preparation of the final bulk vaccine.

#### **Identification**

Each adsorbed polysaccharide conjugate is identified by an immunochemical method (2.7.1) or other suitable methods.

#### **Sterility (2.6.1)**

It complies with the test for sterility, carried out using 10 mL or the equivalent of 100 doses for each medium, whichever is less.

#### **Saccharide**

The polysaccharide content is determined by a suitable physical or chemical method or by an immunochemical method (2.7.1). The value complies with the requirement approved for each serotype.

#### **Free saccharide**

Centrifuge the adsorbed monovalent bulk conjugate. In the supernatant the unbound polysaccharide is determined after removal of the conjugate, for example by anion-exchange, size-exclusion or hydrophobic liquid chromatography, ultrafiltration, or other validated methods. An acceptable value consistent with adequate immunogenicity as shown in clinical trials is established for each serotype and each lot must be shown to comply with this limit.

#### **Degree of adsorption**

The degree of adsorption of each polysaccharide conjugate is assessed.

#### **FINAL BULK VACCINE**

A final bulk vaccine may be formulated from the individually adsorbed monovalent bulk conjugates, or from the mixture of the monovalent bulk conjugates that is adsorbed on an aluminium-containing adjuvant.

Where a final bulk vaccine is formulated as a release intermediate, it complies with the following requirements and is within the limits approved for the particular product.

Only a final bulk vaccine that complies with the following requirements may be used in the preparation of the final lot.

#### **Sterility (2.6.1)**

It complies with the test for sterility, carried out using 10 mL or the equivalent of 100 doses for each medium, whichever is less.

#### **FINAL LOT**

Only a final lot that is within the limits approved for the particular product and is satisfactory with respect to each of the requirements given below under Identification, Tests and Assay may be released for use.

#### **IDENTIFICATION**

Each polysaccharide present in the vaccine is identified by a suitable immunochemical method (2.7.1).

#### **TESTS**

##### **Aluminium (2.5.13)**

Maximum 1.25 mg per single human dose.

##### **Sterility (2.6.1)**

It complies with the test for sterility.

##### **Bacterial endotoxins (2.6.14)**

Less than 12.5 IU per single human dose, unless otherwise justified and authorised.

#### **ASSAY**

##### **Saccharide content**

The polysaccharide content for each serotype is determined by a suitable immunochemical method (for example, nephelometry assay or enzyme-linked immunosorbent assay (ELISA)). The vaccine contains not less than 70 per cent and not more than 130 per cent of the quantity stated on the label for each polysaccharide. The confidence limits ( $P = 0.95$ ) are not less than 80 per cent and not more than 120 per cent of the estimated content.

#### **LABELLING**

The label states:

- the pneumococcal serotype and carrier protein present in each single human dose;
- the number of micrograms of each polysaccharide per single human dose;
- the type and nominal amount of carrier protein per single human dose;
- if applicable, the name and amount of adsorbent;
- if applicable, that the vaccine must be shaken before use;
- if applicable, that the vaccine must not be frozen.

Ph Eur

## **Inactivated Poliomyelitis Vaccine**

(Poliomyelitis Vaccine (Inactivated), Ph. Eur. monograph 0214)

The label may state 'IPV'.

Ph Eur

#### **DEFINITION**

Poliomyelitis vaccine (inactivated) is a liquid preparation of suitable strains of human poliovirus types 1, 2 and 3 grown in suitable cell cultures and inactivated by a validated method. It is a clear liquid that may be coloured owing to the presence of a pH indicator.

#### **PRODUCTION**

The production method shall have been shown to yield consistently vaccines of acceptable safety and immunogenicity in man.

Production of the vaccine is based on a virus seed-lot system. Cell lines are used according to a cell-bank system.

If primary, secondary or tertiary monkey kidney cells are used, production complies with the requirements indicated below.

Unless otherwise justified and authorised, the virus in the final vaccine shall not have undergone more passages from the master seed lot than was used to prepare the vaccine shown in clinical studies to be satisfactory with respect to safety and efficacy.

**SUBSTRATE FOR VIRUS PROPAGATION**

The virus is propagated in a human diploid cell line (5.2.3), in a continuous cell line (5.2.3) or in primary, secondary or tertiary monkey kidney cells.

**Primary, secondary or tertiary monkey kidney cells**

The following special requirements for the substrate for virus propagation apply to primary, secondary or tertiary monkey kidney cells.

*Monkeys used in the preparation of kidney cell cultures for production and control of the vaccine* The animals used are of a species approved by the competent authority, in good health and, unless otherwise justified and authorised, have not been previously employed for experimental purposes. Kidney cells used for vaccine production and control are derived from monitored, closed colonies of monkeys bred in captivity, not from animals caught in the wild; a previously approved seed lot prepared using virus passaged in cells from wild monkeys may, subject to approval by the competent authority, be used for vaccine production if historical data on safety justify this.

*Monitored, closed colonies of monkeys* The monkeys are kept in groups in cages. Freedom from extraneous agents is achieved by the use of animals maintained in closed colonies that are subject to continuous and systematic veterinary and laboratory monitoring for the presence of infectious agents. The supplier of animals is certified by the competent authority. Each monkey is tested serologically at regular intervals during a quarantine period of not less than 6 weeks imposed before entering the colony, and then during its stay in the colony.

The monkeys used are shown to be tuberculin-negative and free from antibodies to simian virus 40 (SV40) and simian immunodeficiency virus. The blood sample used in testing for SV40 antibodies must be taken as close as possible to the time of removal of the kidneys. If *Macaca* sp. monkeys are used for production, the monkeys are also shown to be free from antibodies to herpesvirus B (cercopithecine herpesvirus 1) infection. Human herpesvirus 1 has been used as an indicator for freedom from herpesvirus B antibodies on account of the danger of handling herpesvirus B (cercopithecine herpesvirus 1).

Monkeys from which kidneys are to be removed are thoroughly examined, particularly for evidence of tuberculosis and herpesvirus B (cercopithecine herpesvirus 1) infection. If a monkey shows any pathological lesion relevant to the use of its kidneys in the preparation of a seed lot or vaccine, it is not to be used nor are any of the remaining monkeys of the group concerned unless it is evident that their use will not impair the safety of the product.

All the operations described in this section are conducted outside the area where the vaccine is produced.

*Monkey cell cultures for vaccine production* Kidneys that show no pathological signs are used for preparing cell cultures. Each group of cell cultures derived from a single monkey forms a separate production cell culture giving rise to a separate single harvest.

The primary monkey kidney cell suspension complies with the test for mycobacteria (2.6.2); disrupt the cells before carrying out the test.

If secondary or tertiary cells are used, it shall be demonstrated by suitable validation tests that cell cultures beyond the passage level used for production are free from tumorigenicity.

**SEED LOTS**

Each of the 3 strains of poliovirus used shall be identified by historical records that include information on the origin of the strain and its subsequent manipulation.

Only a working seed lot that complies with the following requirements may be used for virus propagation.

**Identification**

Each working seed lot is identified as human poliovirus types 1, 2 or 3 by virus neutralisation in cell cultures using specific antibodies.

**Virus concentration**

The virus concentration of each working seed lot is determined to define the quantity of virus to be used for inoculation of production cell cultures.

**Extraneous agents**

The working seed lot complies with the requirements for seed lots for virus vaccines (2.6.16). In addition, if primary, secondary or tertiary monkey kidney cells have been used for isolation of the strain, measures are taken to ensure that the strain is not contaminated with simian viruses such as simian immunodeficiency virus, simian virus 40, filoviruses and herpesvirus B (cercopithecine herpesvirus 1). A working seed lot produced in primary, secondary or tertiary monkey kidney cells complies with the requirements given below under Virus propagation and harvest for single harvests produced in such cells.

**VIRUS PROPAGATION AND HARVEST**

All processing of the cell bank and cell cultures is done under aseptic conditions in an area where no other cells or viruses are being handled. Approved animal serum (but not human serum) may be used in the cell culture media. Serum and trypsin used in the preparation of cell suspensions and media are shown to be free from extraneous agents. The cell culture media may contain a pH indicator such as phenol red and approved antibiotics at the lowest effective concentration. Not less than 500 mL of the cell cultures employed for vaccine production is set aside as uninfected cell cultures (control cells); where continuous cell lines in a fermenter are used for production,  $200 \times 10^6$  cells are set aside to prepare control cells; where primary, secondary or tertiary monkey kidney cells are used for production, a cell sample equivalent to at least 500 mL of the cell suspension, at the concentration employed for vaccine production, is taken to prepare control cells.

Only a single harvest that complies with the following requirements may be used in the preparation of the vaccine. The tests for identification and bacterial and fungal contamination may be carried out instead on the purified, pooled monovalent harvest. After demonstration of consistency of production at the stage of the single harvest, the test for virus concentration may be carried out instead on the purified, pooled monovalent harvest.

**Control cells**

The control cells of the production cell culture comply with a test for identification (if a cell-bank system is used for production) and with the requirements for extraneous agents (2.6.16; where primary, secondary or tertiary monkey kidney cells are used, the tests in cell cultures are carried out as shown below under Test in rabbit kidney cell cultures and Test in cercopithecus kidney cell cultures).

*Test in rabbit kidney cell cultures* Test a sample of at least 10 mL of the pooled supernatant fluid from the control cultures for the absence of herpesvirus B (cercopithecine herpesvirus 1) and other viruses by inoculation onto rabbit

kidney cell cultures. The dilution of supernatant in the nutrient medium is not greater than 1/4 and the area of the cell layer is at least 3 cm<sup>2</sup> per millilitre of inoculum. Set aside one or more containers of each batch of cells with the same medium as non-inoculated control cells. Incubate the cultures at 37 °C and observe for at least 2 weeks. The test is not valid if more than 20 per cent of the control cell cultures are discarded for non-specific, accidental reasons.

**Test in cercopithecus kidney cell cultures** Test a sample of at least 10 mL of the pooled supernatant fluid from the control cultures for the absence of SV40 virus and other extraneous agents by inoculation onto cell cultures prepared from the kidneys of cercopithecus monkeys, or other cells shown to be at least as sensitive for SV40, by the method described under Test in rabbit kidney cell cultures. The test is not valid if more than 20 per cent of the control cell cultures are discarded for non-specific, accidental reasons.

#### Identification

The single harvest is identified as containing human poliovirus types 1, 2 or 3 by virus neutralisation in cell cultures using specific antibodies.

#### Virus concentration

The virus concentration of each single harvest is determined by titration of infectious virus in cell cultures.

#### Bacterial and fungal contamination

The single harvest complies with the test for sterility (2.6.1), carried out using 10 mL for each medium.

#### Mycoplasmas (2.6.7)

The single harvest complies with the test for mycoplasmas, carried out using 10 mL.

#### Test in rabbit kidney cell cultures

Where primary, secondary or tertiary monkey kidney cells are used for production, test a sample of at least 10 mL of the single harvest for the absence of herpesvirus B (cercopithecine herpesvirus 1) and other viruses by inoculation onto rabbit kidney cell cultures as described above for the control cells.

#### Test in cercopithecus kidney cell cultures

Where primary, secondary or tertiary monkey kidney cells are used for production, test a sample of at least 10 mL of the single harvest for the absence of SV40 virus and other extraneous agents. Neutralise the sample by a high-titre antiserum against the specific type of poliovirus. Test the sample in primary cercopithecus kidney cell cultures or cells that have been demonstrated to be at least as susceptible for SV40. Incubate the cultures at 37 °C and observe for 14 days. At the end of this period, make at least one subculture of fluid in the same cell culture system and observe both primary cultures and subcultures for an additional 14 days.

#### PURIFICATION AND PURIFIED MONOVALENT HARVEST

Several single harvests of the same type may be pooled and may be concentrated. The monovalent harvest or pooled monovalent harvest is purified by validated methods. If continuous cell lines are used for production, the purification process shall have been shown to reduce consistently the content of substrate-cell DNA to not more than 100 pg per single human dose.

Only a purified monovalent harvest that complies with the following requirements may be used for the preparation of the inactivated monovalent harvest.

#### Identification

The virus is identified by virus neutralisation in cell cultures using specific antibodies or by determination of D-antigen.

#### Virus concentration

The virus concentration is determined by titration of infectious virus.

#### Specific activity

The ratio of the virus concentration or the D-antigen content, determined by a suitable immunochemical method (2.7.1), to the total protein content (specific activity) of the purified monovalent harvest is within the limits approved for the particular product.

#### INACTIVATION AND INACTIVATED MONOVALENT HARVEST

Several purified monovalent harvests of the same type may be mixed before inactivation. To avoid failures in inactivation caused by the presence of virus aggregates, filtration is carried out before and during inactivation; inactivation is started within a suitable period, preferably not more than 24 h and in any case not more than 72 h, of the prior filtration. The virus suspension is inactivated by a validated method that has been shown to inactivate poliovirus without destruction of immunogenicity; during validation studies, an inactivation curve with at least 4 points (for example, time 0 h, 24 h, 48 h and 96 h) is established showing the decrease in concentration of live virus with time. If formaldehyde is used for inactivation, the presence of an excess of formaldehyde at the end of the inactivation period is verified. The inactivation kinetics tests mentioned below are carried out on each batch to ensure consistency of the inactivation process.

Only an inactivated monovalent harvest that complies with the following requirements may be used in the preparation of a trivalent pool of inactivated monovalent harvests or a final bulk vaccine.

#### Test for effective inactivation

After neutralisation of the formaldehyde with sodium bisulfite (where applicable), verify the absence of residual live poliovirus by inoculation on suitable cell cultures of 2 samples of each inactivated monovalent harvest, corresponding to at least 1500 human doses. Cells used for the test must be of optimal sensitivity regarding residual infectious poliovirus, for example kidney cells from certain monkey species (*Macaca*, *Cercopithecus* or *Papio*), or Hep-2 cells. If other cells are used, they must have been shown to possess at least the same sensitivity as those specified above. Take one sample not later than 3/4 of the way through the inactivation period and the other at the end. Inoculate the samples in cell cultures such that the dilution of vaccine in the nutrient medium is not greater than 1/4 and the area of the cell layer is at least 3 cm<sup>2</sup> per millilitre of inoculum. Set aside one or more containers with the same medium as non-inoculated control cells. Observe the cell cultures for at least 3 weeks. Make not fewer than 2 passages from each container, one at the end of the observation period and the other 1 week before; for the passages, use cell culture supernatant and inoculate as for the initial sample. Observe the subcultures for at least 2 weeks. No sign of poliovirus multiplication is present in the cell cultures. At the end of the observation period, test the susceptibility of the cell culture used by inoculation of live poliovirus of the same type as that present in the inactivated monovalent harvest.

#### Inactivation kinetics

Kinetics of inactivation are established and approved by the competent authority. Adequate data on inactivation kinetics

are obtained and consistency of the inactivation process is monitored.

#### **Sterility (2.6.1)**

The inactivated monovalent harvest complies with the test for sterility, carried out using 10 mL for each medium.

#### **D-antigen content**

The content of D-antigen determined by a suitable immunochemical method (2.7.1) is within the limits approved for the particular preparation.

#### **FINAL BULK VACCINE**

The final bulk vaccine is prepared directly from the inactivated monovalent harvests of human poliovirus types 1, 2 and 3 or from a trivalent pool of inactivated monovalent harvests. A suitable stabiliser and a suitable antimicrobial preservative may be added.

Only a final bulk vaccine that complies with the following requirements may be used in the preparation of the final lot.

#### **Sterility (2.6.1)**

The final bulk vaccine complies with the test for sterility, carried out using 10 mL for each medium.

#### **Antimicrobial preservative**

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical or physico-chemical method. The amount is not less than 85 per cent and not greater than 115 per cent of the intended amount.

#### **FINAL LOT**

Only a final lot that complies with each of the requirements given below under Identification, Tests and Assay may be released for use. Provided that the tests for free formaldehyde and antimicrobial preservative and the *in vivo* assay have been performed with satisfactory results on the final bulk vaccine, they may be omitted on the final lot.

The *in vivo* assay may be omitted once it has been demonstrated for a given product and for each poliovirus type that the acceptance criteria for the D-antigen determination are such that it yields the same result as the *in vivo* assay in terms of acceptance or rejection of a batch. This demonstration must include testing of subpotent batches, produced experimentally if necessary, for example by heat treatment or other means of diminishing the immunogenic activity. Where there is a significant change in the manufacturing process of the antigens or their formulation, any impact on the *in vivo* and *in vitro* assays must be evaluated, and the need for revalidation considered.

Provided that the protein content has been determined on the purified monovalent harvests or on the inactivated monovalent harvests and that it has been shown that the content in the final lot will not exceed 10 µg per single human dose, the test for protein content may be omitted on the final lot.

Provided that the test for bovine serum albumin has been performed with satisfactory results on the trivalent pool of inactivated monovalent harvests or on the final bulk vaccine, it may be omitted on the final lot.

#### **IDENTIFICATION**

The vaccine is shown to contain human poliovirus types 1, 2 and 3 by a suitable immunochemical method (2.7.1) such as the determination of D-antigen by enzyme-linked immunosorbent assay (ELISA).

#### **TESTS**

##### **Free formaldehyde (2.4.18)**

Maximum 0.2 g/L.

#### **Antimicrobial preservative**

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical or physico-chemical method. The amount is not less than the minimum amount shown to be effective and is not greater than 115 per cent of that stated on the label.

#### **Protein content (2.5.33, Method 2)**

Maximum 10 µg per single human dose.

#### **Bovine serum albumin**

Maximum 50 ng per single human dose, determined by a suitable immunochemical method (2.7.1).

#### **Sterility (2.6.1)**

It complies with the test.

#### **Bacterial endotoxins (2.6.14)**

Less than 5 IU per single human dose.

#### **ASSAY**

##### **D-antigen content**

As a measure of consistency of production, determine the D-antigen content for human poliovirus types 1, 2 and 3 by a suitable immunochemical method (2.7.1) using a reference preparation calibrated in European Pharmacopoeia Units of D-antigen. For each type, the content, expressed with reference to the amount of D-antigen stated on the label, is within the limits approved for the particular product.

*Poliomyelitis vaccine (inactivated) BRP* is calibrated in European Pharmacopoeia Units and intended for use in the assay of D-antigen. The European Pharmacopoeia Unit and the International Unit are equivalent.

##### **In vivo test**

The vaccine complies with the *in vivo* assay of poliomyelitis vaccine (inactivated) (2.7.20).

#### **LABELLING**

The label states:

- the types of poliovirus contained in the vaccine;
- the nominal amount of virus of each type (1, 2 and 3), expressed in European Pharmacopoeia Units of D-antigen, per single human dose;
- the cell substrate used to prepare the vaccine.

Ph Eur

## **Poliomyelitis Vaccine, Live (Oral)**

(*Poliomyelitis Vaccine (Oral)*, Ph. Eur. monograph 0215)

The label may state 'OPV'.

Ph Eur

#### **DEFINITION**

Oral poliomyelitis vaccine is a preparation of approved strains of live attenuated poliovirus type 1, 2 or 3 grown in *in vitro* cultures of approved cells, containing either a single type, a combination of type 1 and type 3 or a combination of the 3 types of Sabin strains, presented in a form suitable for oral administration.

The vaccine is a clear liquid that may be coloured owing to the presence of a pH indicator.

#### **PRODUCTION**

The vaccine strains and the production method shall have been shown to consistently yield vaccines that are both immunogenic and safe in man.

The production of vaccine is based on a virus seed-lot system. Cell lines are used according to a cell-bank system. If primary monkey kidney cell cultures are used, production complies with the requirements indicated below. Unless otherwise justified and authorised, the virus in the final vaccine shall not have undergone more than 2 passages from the master seed lot.

#### REFERENCE STANDARDS

The International Standards for poliovirus type 1 (Sabin), poliovirus type 2 (Sabin) for MAPREC (Mutant Analysis by PCR and Restriction Enzyme Cleavage) assays and poliovirus type 3 (Sabin) synthetic DNA for MAPREC assays are suitable for use in the tests for genetic markers and the molecular tests for consistency of production.

Reference preparations of each poliovirus type at the Sabin Original + 2 passage level, namely WHO (SO + 2)/I for type 1 virus, WHO (SO + 2)/II for type 2 virus and WHO (SO + 2)/III for type 3 virus are available for comparison of the *in vivo* neurovirulence with that of homotypic vaccines. Requests for the WHO reference preparations for *in vivo* neurovirulence tests are to be directed to the World Health Organization (WHO), Biologicals, Geneva, Switzerland.

A suitable reference preparation is to be included in each test.

#### SUBSTRATE FOR VIRUS PROPAGATION

The virus is propagated in human diploid cells (5.2.3), in continuous cell lines (5.2.3) or in primary monkey kidney cell cultures (including serially passaged cells from primary monkey kidney cells).

#### Primary monkey kidney cell cultures

*The following special requirements for the substrate for virus propagation apply to primary monkey kidney cell cultures.*

*Monkeys used for preparation of primary monkey kidney cell cultures and for testing of virus* If the vaccine is prepared in primary monkey kidney cell cultures, animals of a species approved by the competent authority, in good health, kept in closed or intensively monitored colonies and not previously employed for experimental purposes shall be used.

The monkeys shall be kept in well-constructed and adequately ventilated animal rooms in cages spaced as far apart as possible. Adequate precautions shall be taken to prevent cross-infection between cages. Not more than 2 monkeys shall be housed per cage and cage-mates shall not be interchanged. The monkeys shall be kept in the country of manufacture of the vaccine in quarantine groups for a period of not less than 6 weeks before use. A quarantine group is a colony of selected, healthy monkeys kept in one room, with separate feeding and cleaning facilities, and having no contact with other monkeys during the quarantine period. If at any time during the quarantine period the overall death rate of a shipment consisting of one or more groups reaches 5 per cent (excluding deaths from accidents or where the cause was specifically determined not to be an infectious disease), monkeys from that entire shipment shall continue in quarantine from that time for a minimum of 6 weeks.

The groups shall be kept continuously in isolation, as in quarantine, even after completion of the quarantine period, until the monkeys are used. After the last monkey of a group has been taken, the room that housed the group shall be thoroughly cleaned and decontaminated before being used for a fresh group. If kidneys from near-term monkeys are used, the mother is quarantined for the term of pregnancy.

Monkeys from which kidneys are to be removed shall be anaesthetised and thoroughly examined, particularly for

evidence of tuberculosis and cercopithecoid herpesvirus 1 (B virus) infection.

If a monkey shows any pathological lesion relevant to the use of its kidneys in the preparation of a seed lot or vaccine, it shall not be used, nor shall any of the remaining monkeys of the quarantine group concerned be used unless it is evident that their use will not impair the safety of the product.

All the operations described in this section shall be conducted outside the areas where the vaccine is produced.

The monkeys used shall be shown to be free from antibodies to simian virus 40 (SV40), simian immunodeficiency virus and spumaviruses. The blood sample used in testing for SV40 antibodies must be taken as close as possible to the time of removal of the kidneys. If *Macaca* spp. are used for production, the monkeys shall also be shown to be free from antibodies to cercopithecoid herpesvirus 1 (B virus). Human herpesvirus has been used as an indicator for freedom from B virus antibodies on account of the danger of handling cercopithecoid herpesvirus 1 (B virus). Monkeys used for the production of new seed lots are shown to be free from antibodies to simian cytomegalovirus (sCMV).

#### Primary monkey kidney cell cultures for vaccine production

Kidneys that show no pathological signs are used for preparing cell cultures. If the monkeys are from a colony maintained for vaccine production, serially passaged monkey kidney cell cultures from primary monkey kidney cells may be used for virus propagation, otherwise the monkey kidney cells are not propagated in series. Virus for the preparation of vaccine is grown by aseptic methods in such cultures. If animal serum is used in the propagation of the cells, the maintenance medium after virus inoculation shall contain no added serum.

Each group of cell cultures derived from a single monkey or from foetuses from no more than 10 near-term monkeys is prepared and tested as an individual group.

#### VIRUS SEED LOTS

The strains of poliovirus used shall be identified by historical records that include information on the origin and subsequent manipulation of the strains.

Working seed lots are prepared by a single passage from a master seed lot and at an approved passage level from the original Sabin virus. Virus seed lots are prepared in large quantities and stored at a temperature below  $-60^{\circ}\text{C}$ .

Only a virus seed lot that complies with the following requirements may be used for virus propagation.

#### Identification

Each working seed lot is identified as poliovirus of the given type, using specific antibodies.

#### Virus concentration

Determined by the method described below, the virus concentration is the basis for the quantity of virus used in the neurovirulence test.

#### Extraneous agents (2.6.16)

If the working seed lot is produced in human diploid cells or in a continuous cell line, it complies with the requirements for seed lots for virus vaccines. If the working seed lot is produced in primary monkey kidney cell cultures, it complies with the requirements given below under Virus propagation and harvest, and under Monovalent bulk.

In addition to the requirements in chapter 2.6.16, for vaccines produced in cell lines and when the seed lot was produced in primary monkey kidney cell cultures, a validated test for sCMV is performed.

Working seed lots shall be free from detectable DNA sequences from SV40.

#### Neurovirulence

Each master and working seed lot complies with the test for neurovirulence of poliomyelitis vaccine (oral) in transgenic mice or monkeys. Suitable procedures for the tests in mice (*Neurovirulence test of types 1, 2 or 3 live poliomyelitis vaccine (oral) in transgenic mice susceptible to poliovirus*) and in monkeys (*Neurovirulence test of types 1, 2 or 3 live poliomyelitis vaccine (oral) in monkeys*) are available from the WHO.

In addition, at least the first 3 consecutive batches of monovalent bulk prepared from a new seed lot shall be shown to comply with the test for neurovirulence of poliomyelitis vaccine (oral) before the seed lot is deemed suitable for use. Furthermore, the seed lots shall cease to be used in vaccine production if the frequency of failure of the monovalent bulks produced from it is greater than predicted statistically. This statistical prediction is calculated after each test on the basis of all the monovalent bulks tested; it is equal to the probability of false rejection on the occasion of a first test (i.e. 1 per cent), the probability of false rejection on retest being negligible.

#### Phenotypic or genotypic markers

Each virus seed lot complies with the requirements of the MAPREC assay. A validated MAPREC assay is carried out for each master and working seed lot to establish a profile (i.e. percentage of mutant content). A suitable procedure (*Mutant analysis by PCR and restriction enzyme cleavage (MAPREC) for oral poliovirus (Sabin) vaccine types 1, 2 or 3*) is available from the WHO. Pending validation of MAPREC assays, each master and working seed lot is tested for its replicating properties at temperatures ranging from 36 °C to 40 °C as described under Monovalent bulk.

#### VIRUS PROPAGATION AND HARVEST

All processing of the cell banks and subsequent cell cultures is done under aseptic conditions in an area where no other cells are handled during the production. Suitable animal (but not human) serum may be used in the culture media, but the final medium for maintaining cell growth during virus multiplication does not contain animal serum. Serum and trypsin used in the preparation of cell suspensions and media are shown to be free from live extraneous agents. The cell-culture medium may contain a pH indicator such as phenol red and suitable antibiotics at the lowest effective concentration. It is preferable to have a substrate free from antibiotics during production. On the day of inoculation with the virus working seed lot, not less than 5 per cent or 1000 mL (whichever is lower) of the cell cultures employed for vaccine production are set aside as uninfected cell cultures (control cells). Special requirements, given below, apply to control cells when the vaccine is produced in primary monkey kidney cell cultures. The virus suspension is harvested no later than 4 days after virus inoculation. After inoculation of the production cell culture with the virus working seed lot, inoculated cells are maintained at a fixed temperature, shown to be suitable, within the range 33-35 °C; the temperature is maintained constant to  $\pm 0.5$  °C; control cell cultures are maintained at 33-35 °C for the relevant incubation periods.

Only a single virus harvest that complies with the following requirements may be used in the preparation of the monovalent bulk.

#### Virus concentration

The virus concentration of virus harvests is determined as prescribed under Assay to monitor consistency of production

and to determine the dilution to be used for the final bulk vaccine.

#### Molecular tests for consistency of production

A validated MAPREC assay is performed on each virus harvest unless otherwise authorised and justified.

The acceptance/rejection criteria for consistency of production are determined for each manufacturer and for each working seed. These criteria are periodically reviewed and updated to the satisfaction of the competent authority. An investigation of consistency occurs if a virus harvest gives results that are inconsistent with previous production history.

#### Control cells

The control cells of the production cell culture from which the virus harvest is derived comply with a test for identity and with the requirements for extraneous agents (2.6.16) or, where primary monkey kidney cell cultures are used, as shown below.

#### Primary monkey kidney cell cultures

*The following special requirements apply to virus propagation and harvest in primary monkey kidney cell cultures.*

**Cell cultures** On the day of inoculation with the virus working seed lot, each cell culture is examined for degeneration caused by an infective agent. If, in this examination, evidence is found of the presence in a cell culture of any extraneous agent, the entire group of cultures concerned shall be rejected.

On the day of inoculation with the virus working seed lot, a sample of at least 30 mL of the pooled fluid removed from the cell cultures of the kidneys of each single monkey or from foetuses from not more than 10 near-term monkeys is divided into 2 equal portions. 1 portion of the pooled fluid is tested in monkey kidney cell cultures prepared from the same species, but not the same animal, as that used for vaccine production. The other portion of the pooled fluid is, where necessary, tested in monkey kidney cell cultures from another species so that tests on the pooled fluids are done in cell cultures from at least 1 species known to be sensitive to SV40. The pooled fluid is inoculated into bottles of these cell cultures in such a way that the dilution of the pooled fluid in the nutrient medium does not exceed 1 in 4. The area of the cell sheet is at least 3 cm<sup>2</sup>/mL of pooled fluid. At least 1 bottle of each type of cell culture remains uninoculated to serve as a control. If the monkey species used for vaccine production is known to be sensitive to SV40, a test in a 2<sup>nd</sup> species is not required. Animal serum may be used in the propagation of the cells, provided that it does not contain SV40 antibody, but the maintenance medium after inoculation of test material contains no added serum except as described below.

The cultures are incubated at a temperature of 35-37 °C and are observed for a total period of at least 4 weeks. During this observation period and after not less than 2 weeks' incubation, at least 1 subculture of fluid is made from each of these cultures in the same cell culture system.

The subcultures are also observed for at least 2 weeks.

Serum may be added to the original culture at the time of subculturing, provided that the serum does not contain SV40 antibody.

Fluorescent-antibody techniques may be useful for detecting SV40 and other viruses in the cells.

A further sample of at least 10 mL of the pooled fluid is tested for cercopithecoid herpesvirus 1 (B virus) and other viruses in rabbit kidney cell cultures. Serum used in the nutrient medium of these cultures shall have been shown to

be free from inhibitors of B virus. Human herpesvirus has been used as an indicator for freedom from B virus inhibitors on account of the danger of handling cercopithecid herpesvirus 1 (B virus). The sample is inoculated into bottles of these cell cultures in such a way that the dilution of the pooled fluid in the nutrient medium does not exceed 1 in 4. The area of the cell sheet is at least 3 cm<sup>2</sup>/mL of pooled fluid. At least 1 bottle of the cell cultures remains uninoculated to serve as a control.

The cultures are incubated at a temperature of 35-37 °C and observed for at least 2 weeks.

A further sample of 10 mL of the pooled fluid removed from the cell cultures on the day of inoculation with the seed lot virus is tested for the presence of extraneous agents by inoculation into human cell cultures sensitive to measles virus.

The tests are not valid if more than 20 per cent of the culture vessels have been discarded for non-specific accidental reasons by the end of the respective test periods.

If, in these tests, evidence is found of the presence of an extraneous agent, the single harvest from the whole group of cell cultures concerned is rejected.

If the presence of cercopithecid herpesvirus 1 (B virus) is demonstrated, the manufacture of oral poliomyelitis vaccine shall be discontinued and the competent authority shall be informed. Manufacturing shall not be resumed until a thorough investigation has been completed and precautions have been taken against any reappearance of the infection, and then only with the approval of the competent authority.

If these tests are not done immediately, the samples of pooled cell-culture fluid shall be kept at a temperature of -60 °C or below, with the exception of the sample for the test for B virus, which may be held at 4 °C, provided that the test is done not more than 7 days after it has been taken.

**Control cell cultures** On the day of inoculation with the virus working seed lot, 25 per cent (but not more than 2.5 L) of the cell suspension obtained from the kidneys of each single monkey or from not more than 10 near-term monkeys is taken to prepare uninoculated control cell cultures. These control cell cultures are incubated in the same conditions as the inoculated cultures for at least 2 weeks and are examined during this period for evidence of cytopathic changes.

The tests are not valid if more than 20 per cent of the control cell cultures have been discarded for non-specific, accidental reasons. At the end of the observation period, the control cell cultures are examined for degeneration caused by an infectious agent. If this examination or any of the tests required in this section shows evidence of the presence in a control culture of any extraneous agent, the poliovirus grown in the corresponding inoculated cultures from the same group shall be rejected.

**Tests for haemadsorbing viruses** At the time of harvest or within 4 days of inoculation of the production cultures with the virus working seed lot, a sample of 4 per cent of the control cell cultures is taken and tested for haemadsorbing viruses. At the end of the observation period, the remaining control cell cultures are similarly tested. The tests are carried out as described in chapter 2.6.16.

**Tests for other extraneous agents** At the time of harvest, or within 7 days of the day of inoculation of the production cultures with the working seed lot, a sample of at least 20 mL of the pooled fluid from each group of control cultures is taken and tested in 2 kinds of monkey kidney cell culture, as described above.

At the end of the observation period for the original control cell cultures, similar samples of the pooled fluid are taken and the tests referred to in this section in the 2 kinds of monkey kidney cell culture and in the rabbit cell cultures are repeated, as described above under Cell cultures.

If the presence of cercopithecid herpesvirus 1 (B virus) is demonstrated, the production cell cultures shall not be used and the measures concerning vaccine production described above must be undertaken.

The fluids collected from the control cell cultures at the time of virus harvest and at the end of the observation period may be pooled before testing for extraneous agents. A sample of 2 per cent of the pooled fluid is tested in each of the cell culture systems specified.

#### Single harvests

**Tests for neutralised single harvests in primary monkey kidney cell cultures** A sample of at least 10 mL of each single harvest is neutralised by a type-specific poliomyelitis antiserum prepared in animals other than monkeys. In preparing antisera for this purpose, the immunising antigens used shall be prepared in non-simian cells.

Half of the neutralised suspension (corresponding to at least 5 mL of single harvest) is tested in monkey kidney cell cultures prepared from the same species, but not the same animal, as that used for vaccine production. The other half of the neutralised suspension is tested, if necessary, in monkey kidney cell cultures from another species so that the tests on the neutralised suspension are done in cell cultures from at least 1 species known to be sensitive to SV40.

The neutralised suspensions are inoculated into bottles of these cell cultures in such a way that the dilution of the suspension in the nutrient medium does not exceed 1 in 4. The area of the cell sheet is at least 3 cm<sup>2</sup>/mL of neutralised suspension. At least 1 bottle of each type of cell culture remains uninoculated to serve as a control and is maintained by nutrient medium containing the same concentration of the specific antiserum used for neutralisation.

Animal serum may be used in the propagation of the cells, provided that it does not contain SV40 antibody, but the maintenance medium, after the inoculation of the test material, contains no added serum other than the poliovirus neutralising antiserum, except as described below.

The cultures are incubated at a temperature of 35-37 °C and observed for a total period of at least 4 weeks. During this observation period and after not less than 2 weeks' incubation, at least 1 subculture of fluid is made from each of these cultures in the same cell-culture system.

The subcultures are also observed for at least 2 weeks.

Serum may be added to the original cultures at the time of subculturing, provided that the serum does not contain SV40 antibody.

Additional tests are made for extraneous agents on a further sample of the neutralised single harvests by inoculation of 10 mL into human cell cultures sensitive to measles virus. This test is also validated for the detection of sCMV.

Fluorescent-antibody techniques may be useful for detecting SV40 and other viruses in the cells.

The tests are not valid if more than 20 per cent of the culture vessels have been discarded for non-specific accidental reasons by the end of the respective test periods. If any cytopathic changes occur in any of the cultures, the causes of these changes are investigated. If the cytopathic changes are shown to be due to unneutralised poliovirus, the test is repeated. If there is evidence of the presence of SV40

or other extraneous agents attributable to the single harvest, that single harvest is rejected.

#### **MONOVALENT BULK**

Monovalent bulks may be prepared by pooling a number of satisfactory single harvests of the same virus type. Monovalent bulks from continuous cell lines may be purified. Each monovalent bulk is filtered through a bacteria-retentive filter.

Only a monovalent bulk that complies with the following requirements may be used in the preparation of the final bulk vaccine.

#### **Identification**

Each monovalent bulk is identified as poliovirus of the given type, using specific antibodies.

#### **Virus concentration**

The virus concentration is determined by the method described below and serves as the basis for calculating the dilutions for preparation of the final bulk, for the quantity of virus used in the neurovirulence test and to establish and monitor production consistency.

#### **Phenotypic or genotypic markers**

A validated MAPREC assay is carried out for Sabin poliovirus types 1, 2 or 3 using the procedure as described under Virus seed lots. In this analysis, the amount of mutation at positions 480 and 525 of the genome (480-A; 525-C) for type 1, position 481 of the genome (481-G) for type 2, and position 472 of the genome (472-C) for type 3 is estimated and expressed as a ratio relative to the International Standard for MAPREC analysis of each related poliovirus type (Sabin). As the MAPREC assay for type 3 poliovirus (Sabin) is highly predictive of *in vivo* neurovirulence, a poliovirus type 3 monovalent bulk found to have a level of mutation greater than 1.0 per cent fails the assay.

For the monovalent bulk of poliovirus types 1 or 2, the limits for the level of mutation are approved by the competent authority.

Acceptance/rejection criteria for assessment of consistency of production are determined for each manufacturer and for each working seed lot by agreement with the competent authority. These criteria are updated as each new bulk is prepared and analysed. An investigation of consistency occurs if a monovalent bulk gives results that are inconsistent with previous production history.

If a filtered monovalent bulk of poliovirus (Sabin) fails the MAPREC assay then this triggers an investigation of the consistency of the manufacturing process. In the case of a new working seed lot, this investigation also includes a consideration of the suitability of this seed lot.

Monovalent bulks passing the MAPREC assay are subsequently tested for *in vivo* neurovirulence.

Pending validation of MAPREC assays, monovalent bulks are tested for the virus property of reproducing at temperatures of 36 °C and 40 °C. A ratio of the replication capacities of the virus in the monovalent bulk is obtained over a temperature range between 36 °C and 40 °C in comparison with the seed lot or a reference preparation for the marker tests and with appropriate rct/40- and rct/40+ strains of poliovirus of the same type. The incubation temperatures used in this test are controlled to within  $\pm 0.1$  °C. The monovalent bulk passes the test if, for both the virus in the harvest and the appropriate reference material, the titre determined at 36 °C is at least 5.0 log<sub>10</sub> greater than that determined at 40 °C. If growth at 40 °C is

so low that a valid comparison cannot be established, a temperature in the region of 39.0-39.5 °C is used, at which temperature the reduction in titre of the reference material must be in the range 3.0-5.0 log<sub>10</sub> of its value at 36 °C; the acceptable minimum reduction is determined for each virus strain at a given temperature. If the titres obtained for 1 or more of the reference viruses are not concordant with the expected values, the test must be repeated.

#### **Neurovirulence**

Each monovalent bulk complies with the test as described under Virus seed lots.

#### **Primary monkey kidney cell cultures**

*The following special requirements apply to monovalent pooled harvests derived from primary monkey kidney cell cultures.*

**Retroviruses** The monovalent pooled harvest is examined using a reverse transcriptase assay. No indication of the presence of retroviruses is found.

**Test in rabbits** A sample of the monovalent pooled harvest is tested for cercopithecoid herpesvirus 1 (B virus) and other viruses by injection of not less than 100 mL into not fewer than 10 healthy rabbits each weighing 1.5-2.5 kg. Each rabbit receives not less than 10 mL and not more than 20 mL, of which 1 mL is given intradermally at multiple sites since the maximum volume to be given intradermally at each site is 0.1 mL, and the remainder subcutaneously. The rabbits are observed for at least 3 weeks for death or signs of illness.

All rabbits that die after the first 24 h of the test and those showing signs of illness are examined by autopsy, and the brain and organs removed for detailed examination to establish the cause of death.

The test is not valid if more than 20 per cent of the inoculated rabbits show signs of intercurrent infection during the observation period. The monovalent pooled harvest passes the test if none of the rabbits shows evidence of infection with B virus or with other extraneous agents or lesions of any kind attributable to the bulk suspension.

If the presence of B virus is demonstrated, the measures concerning vaccine production described above under Cell cultures are taken.

*Test in guinea-pigs. If the primary monkey kidney cell cultures are not derived from monkeys kept in a closed colony, the monovalent pooled harvest shall be shown to comply with the following test* Administer to each of not fewer than 5 guinea-pigs, each weighing 350-450 g, 0.1 mL of the monovalent pooled harvest by intracerebral injection (0.05 mL in each cerebral hemisphere) and 0.5 mL by intraperitoneal injection. Measure the rectal temperature of each animal on each working day for 6 weeks. At the end of the observation period carry out autopsy on each animal.

In addition, administer to not fewer than 5 guinea-pigs 0.5 mL by intraperitoneal injection and observe as described above for 2-3 weeks. At the end of the observation period, carry out a passage from these animals to not fewer than 5 guinea-pigs using blood and a suspension of liver or spleen tissue. Measure the rectal temperature of the latter guinea-pigs for 2-3 weeks. Examine by autopsy all animals that, after the first day of the test, die or are euthanised because they show disease, or show on 3 consecutive days a body temperature higher than 40.1 °C; carry out histological examination to detect infection with filoviruses; in addition, inject a suspension of liver or spleen tissue or of blood intraperitoneally into not fewer than 3 guinea-pigs. If any signs of infection with filoviruses are noted, confirmatory serological tests are carried out on the blood of the affected

animals. The monovalent pooled harvest complies with the test if not fewer than 80 per cent of the guinea-pigs survive to the end of the observation period and remain in good health, and no animal shows signs of infection with filoviruses.

#### FINAL BULK VACCINE

The final bulk vaccine is prepared from one or more satisfactory monovalent bulks and may contain more than one virus type. Suitable flavouring substances and stabilisers may be added.

Only a final bulk vaccine that complies with the following requirement may be used in the preparation of the final lot.

#### Bacterial and fungal contamination

Carry out the test for sterility (2.6.1), using 10 mL for each medium.

#### FINAL LOT

Only a final lot that complies with the following requirement for thermal stability and is satisfactory with respect to each of the requirements given below under Identification, Tests and Assay may be released for use.

#### Thermal stability

Maintain not fewer than 3 containers of the final lot at  $37 \pm 1$  °C for 48 h. Determine the total virus concentration as described under Assay in parallel for the heated vaccine and for vaccine maintained at the temperature recommended for storage. The total virus concentration of the heated vaccine is not more than 0.5 log<sub>10</sub> lower than that of the unheated vaccine.

#### IDENTIFICATION

The vaccine is shown to contain poliovirus of each type stated on the label, using specific antibodies.

#### TESTS

##### Bacterial and fungal contamination

The vaccine complies with the test for sterility (2.6.1).

#### ASSAY

Titrate the vaccine for infectious virus, using not fewer than 3 separate containers of vaccine, following the method described below. Titrate 1 container of an appropriate virus reference preparation in triplicate to validate each assay. The virus concentration of the reference preparation is monitored using a control chart and a titre is established on a historical basis by each laboratory. If the vaccine contains more than one poliovirus type, titrate each type separately, using an appropriate type-specific antiserum (or preferably a monoclonal antibody) to neutralise each of the other types present.

Calculate the individual virus concentration for each container of vaccine and for each replicate of the reference preparation as well as the corresponding combined virus concentrations, using the usual statistical methods (for example, 5.3).

For a trivalent vaccine, the combined estimated virus titres per single human dose must be:

- not less than 6.0 log<sub>10</sub> infectious virus units (CCID<sub>50</sub>) for type 1;
- not less than 5.0 log<sub>10</sub> infectious virus units (CCID<sub>50</sub>) for type 2; and
- not less than 5.5 log<sub>10</sub> infectious virus units (CCID<sub>50</sub>) for type 3.

For a monovalent or divalent vaccine, the minimum virus titres are decided by the competent authority.

**Method** Inoculate a suitable number of wells in a microtitre plate with a suitable volume of each of the selected dilutions

of virus followed by a suitable volume of a cell suspension of the Hep-2 (Cincinnati) line. Examine the cultures between days 7 and 9.

The assay is not valid if:

- the confidence interval ( $P = 0.95$ ) of the estimated virus concentration of the reference preparation for the 3 replicates combined is greater than  $\pm 0.3$  log<sub>10</sub> CCID<sub>50</sub>;
- the virus concentration of the reference preparation differs by more than 0.5 log<sub>10</sub> CCID<sub>50</sub> from the established value.

The assay is repeated if the confidence interval ( $P = 0.95$ ) of the combined virus concentration of the vaccine is greater than  $\pm 0.3$  log<sub>10</sub> CCID<sub>50</sub>; data obtained from valid assays only are combined by the usual statistical methods (for example, 5.3) to calculate the virus concentration of the sample. The confidence interval ( $P = 0.95$ ) of the combined virus concentration is not greater than  $\pm 0.3$  log<sub>10</sub> CCID<sub>50</sub>.

Where justified and authorised, different assay designs may be used; this may imply the application of different validity and acceptance criteria. However, the vaccine must comply if tested as described above.

#### LABELLING

The label states:

- the types of poliovirus contained in the vaccine;
- the minimum amount of virus of each type contained in a single human dose;
- the cell substrate used for the preparation of the vaccine.

Ph Eur

## Rabies Vaccine

(Rabies Vaccine for Human Use Prepared in Cell Cultures, Ph. Eur. monograph 0216)

The label may state 'Rab'.

Ph Eur

#### DEFINITION

Rabies vaccine for human use prepared in cell cultures is a freeze-dried preparation of a suitable strain of fixed rabies virus grown in cell cultures and inactivated by a validated method.

The vaccine is reconstituted immediately before use as stated on the label to give a clear or opalescent liquid that may be coloured owing to the presence of a pH indicator.

#### PRODUCTION

##### GENERAL PROVISIONS

The production of the vaccine is based on a virus seed-lot system and, if a cell line is used for virus propagation, a cell-bank system. The production method shall have been shown to yield consistently vaccines that comply with the requirements for immunogenicity, safety and stability. Unless otherwise justified and authorised, the virus in the final vaccine must not have undergone more passages from the master seed lot than were used to prepare the vaccine shown in clinical studies to be satisfactory with respect to safety and efficacy; even with authorised exceptions, the number of passages beyond the level used for clinical studies must not exceed 5.

##### SUBSTRATE FOR VIRUS PROPAGATION

The virus is propagated in a human diploid cell line, or in a continuous cell line (5.2.3) approved by the competent

authority, or in cultures of chick-embryo cells derived from a flock free from specified pathogens (5.2.2).

#### **SEED LOTS**

The strain of rabies virus used shall be identified by historical records that include information on the origin of the strain and its subsequent manipulation.

Working seed lots are prepared by not more than 5 passages from the master seed lot.

Only a working seed lot that complies with the following tests may be used for virus propagation.

#### **Identification**

Each working seed lot is identified as rabies virus using specific antibodies.

#### **Virus concentration**

The virus concentration of each working seed lot is determined by a cell-culture method using immunofluorescence, to ensure consistency of production.

#### **Extraneous agents (2.6.16)**

The working seed lot complies with the requirements for virus seed lots. If the virus has been passaged in mouse brain, specific tests for murine viruses are carried out.

#### **VIRUS PROPAGATION AND HARVEST**

All processing of the cell bank and subsequent cell cultures is done under aseptic conditions in an area where no other cells are handled. Approved animal (but not human) serum may be used in the media, but the final medium for maintaining cell growth during virus multiplication does not contain animal serum; the media may contain human albumin. Serum and trypsin used in the preparation of cell suspensions and media are shown to be free from extraneous agents. The cell culture media may contain a pH indicator such as phenol red and approved antibiotics at the lowest effective concentration. Not less than 500 mL of the cell cultures employed for vaccine production are set aside as uninfected cell cultures (control cells). The virus suspension is harvested on one or more occasions during incubation. Successive harvests from the same production cell culture may be pooled and considered as a single harvest.

Only a single harvest that complies with the following requirements may be used in the preparation of the inactivated viral harvest.

#### **Identification**

The single harvest contains virus that is identified as rabies virus using specific antibodies.

#### **Virus concentration**

Titrate for infective virus in cell cultures; the titre is used to monitor consistency of production.

#### **Control cells**

The control cells of the production cell culture from which the single harvest is derived comply with a test for identification and with the requirements for extraneous agents (2.6.16).

#### **PURIFICATION AND INACTIVATION**

The virus harvest may be concentrated and/or purified by suitable methods; the virus harvest is inactivated by a validated method at a fixed, well-defined stage of the process, which may be before, during or after any concentration or purification.

In order to ensure that the virus inactivation process is effective, conditions that could lead to virus aggregation should be avoided at process steps preceding virus inactivation. Any aggregates present in the preparation to be inactivated must be removed immediately before the

inactivation process, for example by a suitable filtration method. It shall have been demonstrated in process validation studies that the inactivation process is consistently effective in inactivating rabies virus in such a way that it assures consistent protective immunogenic activity.

The demonstration of consistency must be based on the following:

- the inactivation kinetics are shown to be consistent using at least 5 consecutive batches. Samples of virus, collected at appropriate times, are inoculated into a sensitive substrate to establish the inactivation curve. If necessary, the agent used for inactivation is neutralised prior to inoculation;
- the time needed to achieve complete inactivation is determined in order to define the required inactivation time. The test for residual infectious virus is used for this purpose. The total inactivation time used in routine production must be at least twice the time needed for complete virus inactivation.

If betapropiolactone is used, the concentration shall at no time exceed 1:3500 *W/W*.

Only an inactivated viral suspension that complies with the following requirements may be used in the preparation of the final bulk vaccine.

#### **Residual infectious virus**

Carry out an amplification test for residual infectious rabies virus immediately after inactivation or using a sample frozen immediately after inactivation and stored at  $-70^{\circ}\text{C}$ . Inoculate a quantity of inactivated viral suspension equivalent to not less than 25 mL of bulk vaccine corresponding to at least 25 human doses of vaccine into cell cultures of the same type as those used for production of the vaccine or of another approved cell type. Cells used for the test must be of optimal sensitivity regarding residual infectious rabies virus, for example, Vero, BHK-21 or neuroblastoma cells that are known to be highly sensitive to rabies virus may be used. If other cells are used, they must have been shown to possess at least the same sensitivity as those specified. A passage may be made after 7 days. Maintain the cultures for a total of 21 days and then examine the cell cultures for rabies virus using an immunofluorescence test or another suitable method of comparable sensitivity. The inactivated virus harvest complies with the test if no replicating infectious rabies virus is detected.

#### **Residual host-cell DNA**

If a continuous cell line is used for virus propagation, the content of residual host-cell DNA, determined using a suitable method, is not greater than 10 ng per single human dose.

#### **FINAL BULK VACCINE**

The final bulk vaccine is prepared from one or more inactivated viral suspensions. An approved stabiliser may be added to maintain the activity of the product during and after freeze-drying.

Only a final bulk vaccine that complies with the following requirements may be used in the preparation of the final lot.

#### **Glycoprotein content**

Determine the glycoprotein content by a suitable immunochemical method (2.7.1), for example, single-radial immunodiffusion, enzyme-linked immunosorbent assay or an antibody-binding test. The content is within the limits approved for the particular product.

**Sterility (2.6.1)**

The final bulk vaccine complies with the test for sterility, carried out using 10 mL for each medium.

**FINAL LOT**

The final bulk vaccine is distributed aseptically into sterile containers and freeze-dried to a moisture content shown to be favourable to the stability of the vaccine. The containers are then closed so as to avoid contamination and the introduction of moisture.

Only a final lot that complies with each of the requirements given below under Identification, Tests and Assay may be released for use. Provided that the test for bovine serum albumin has been carried out with satisfactory results on the final bulk vaccine, it may be omitted on the final lot.

**IDENTIFICATION**

The vaccine is shown to contain rabies virus antigen by a suitable immunochemical method (2.7.1) using specific antibodies, preferably monoclonal; alternatively, the assay serves also to identify the vaccine.

**TESTS****Glycoprotein content**

Determine the glycoprotein content by a suitable immunochemical method (2.7.1), for example, single-radial immunodiffusion, enzyme-linked immunosorbent assay or an antibody-binding test. The content is within the limits approved for the particular product.

**Bovine serum albumin**

Maximum 50 ng per single human dose, determined by a suitable immunochemical method (2.7.1).

**Sterility (2.6.1)**

It complies with the test.

**Bacterial endotoxins (2.6.14)**

Less than 25 IU per single human dose.

**Pyrogens (2.6.8)**

The test for pyrogens is performed only in cases of evidence of the presence of non-endotoxin pyrogenic substances. It complies with the test. Unless otherwise justified and authorised, inject into each rabbit 1 mL of a single human dose of the vaccine diluted to 10-100 times its volume.

**Water (2.5.12)**

Maximum 3.0 per cent.

**ASSAY**

The potency of rabies vaccine is determined by comparing the dose necessary to protect mice against the effects of a lethal dose of rabies virus, administered intracerebrally, with the quantity of a reference preparation of rabies vaccine necessary to provide the same protection. For this comparison a reference preparation of rabies vaccine, calibrated in International Units, and a suitable preparation of rabies virus for use as the challenge preparation are necessary. Alternatively, in the interest of animal welfare, a validated serology potency assay or an immunochemical assay (2.7.1) for a native glycoprotein content is recommended. The alternative method is validated against a challenge assay and approved for a given product by the competent authority.

The International Unit is the activity contained in a stated quantity of the International Standard. The equivalence in International Units of the International Standard is stated by the World Health Organization.

The challenge test described below uses a parallel-line model with at least 3 points for the vaccine to be examined and the reference preparation. Once the analyst has experience with

the method for a given vaccine, it is possible to carry out a simplified test using a single dilution of the vaccine to be examined and of the reference preparation. Such a test enables the analyst to determine that the vaccine has a potency significantly higher than the required minimum, but does not give full information on the validity of each individual potency determination. The use of a single dilution allows a considerable reduction in the number of animals required for the test and must be considered by each laboratory in accordance with the provisions of the European Convention for the Protection of Vertebrate Animals Used for Experimental and Other Scientific Purposes.

**Selection and distribution of the test animals** Use healthy female mice, about 4 weeks old, each weighing 11-15 g, and from the same stock. Distribute the mice into 6 groups of a size suitable to meet the requirements for validity of the test and, for titration of the challenge suspension, 4 groups of 5.

**Preparation of the challenge suspension** Inoculate mice intracerebrally with the Challenge Virus Standard (CVS) strain of rabies virus and when the mice show signs of rabies, but before they die, euthanise them, then remove the brains and prepare a homogenate of the brain tissue in a suitable diluent. Separate gross particulate matter by centrifugation and use the supernatant as the challenge suspension. Distribute the suspension in small volumes in ampoules, seal and store at a temperature below  $-60^{\circ}\text{C}$ . Thaw 1 ampoule of the suspension and make serial dilutions in a suitable diluent. Allocate each dilution to a group of 5 mice and inject intracerebrally into each mouse 0.03 mL of the dilution allocated to its group. Observe the mice for 14 days. Calculate the  $\text{LD}_{50}$  of the undiluted suspension using the number in each group that, between the 5<sup>th</sup> and 14<sup>th</sup> days, die or develop signs of rabies.

**Determination of potency of the vaccine** Prepare 3 fivefold serial dilutions of the vaccine to be examined and 3 fivefold serial dilutions of the reference preparation. Prepare the dilutions such that the most concentrated suspensions may be expected to protect more than 50 per cent of the animals to which they are administered and the least concentrated suspensions may be expected to protect less than 50 per cent of the animals to which they are administered. Allocate the 6 dilutions, 1 to each of the 6 groups of mice, and inject by the intraperitoneal route into each mouse 0.5 mL of the dilution allocated to its group. After 7 days, prepare 3 identical dilutions of the vaccine to be examined and of the reference preparation and repeat the injections. Seven days after the second injection, prepare a suspension of the challenge virus such that, on the basis of the preliminary titration, 0.03 mL contains about 50  $\text{LD}_{50}$ . Inject intracerebrally into each vaccinated mouse 0.03 mL of this suspension. Prepare 3 suitable serial dilutions of the challenge suspension. Allocate the challenge suspension and the 3 dilutions, 1 to each of the 4 groups of 5 control mice, and inject intracerebrally into each mouse 0.03 mL of the suspension or dilution allocated to its group. Observe the animals in each group for 14 days and record the number in each group that die or show signs of rabies in the period 5-14 days after challenge.

The test is not valid unless:

- for both the vaccine to be examined and the reference preparation the 50 per cent protective dose lies between the largest and smallest doses given to the mice;
- the titration of the challenge suspension shows that 0.03 mL of the suspension contained not less than 10  $\text{LD}_{50}$ ;

- the statistical analysis shows a significant slope and no significant deviations from linearity or parallelism of the dose-response curves;
- the confidence limits ( $P = 0.95$ ) are not less than 25 per cent and not more than 400 per cent of the estimated potency.

The vaccine complies with the test if the estimated potency is not less than 2.5 IU per human dose.

**Application of alternative end-points** Once a laboratory has established the above assay for routine use, the lethal end-point is replaced by an observation of clinical signs and application of an end-point earlier than death to reduce animal suffering. The following is given as an example.

The progress of rabies infection in mice following intracerebral injection can be represented by 5 stages defined by typical clinical signs:

Stage 1: ruffled fur, hunched back;

Stage 2: slow movements, loss of alertness (circular movements may also occur);

Stage 3: shaky movements, trembling, convulsions;

Stage 4: signs of paresis or paralysis;

Stage 5: moribund state.

Mice are observed at least twice daily from day 4 after challenge. Clinical signs are recorded using a chart such as that shown in Table 0216.-1. Experience has shown that using stage 3 as an end-point yields assay results equivalent to those found when a lethal end-point is used. This must be verified by each laboratory by scoring a suitable number of assays using both the clinical signs and the lethal end-point.

Table 0216.-1. — Example of a chart used to record clinical signs in the rabies vaccine potency test

Clinical signs	Days after challenge							
	4	5	6	7	8	9	10	11
Ruffled fur Hunched back								
Slow movements Loss of alertness Circular movements								
Shaky movements Trembling Convulsions								
Paresis Paralysis								
Moribund state								

### LABELLING

The label states the biological origin of the cells used for the preparation of the vaccine.

Ph Eur

## Rotavirus Vaccine (Live, Oral)

(Ph. Eur. monograph 2417)

The label may state 'Rotavirus (live, oral)'.

Ph Eur

### DEFINITION

Rotavirus vaccine (live, oral) is a preparation of one or more suitable virus serotypes, grown in an approved cell substrate and presented in a form suitable for oral administration.

The vaccine is a clear liquid or it may be a freeze-dried preparation to be reconstituted immediately before use, as stated on the label, to give a slightly turbid liquid.

The vaccine ready for administration may be coloured owing to the presence of a pH indicator.

### PRODUCTION

#### GENERAL PROVISIONS

The vaccine strains and the production method shall have been shown to yield consistently vaccines comparable with the vaccine of proven clinical efficacy and safety in man.

The vaccine is formulated so as to avoid inactivation by gastric fluids. Where the vaccine is freeze-dried, the antacid capacity of the solvent and its stability are established.

The production of vaccine is based on a virus seed-lot system and a cell-bank system. Unless otherwise justified and authorised, the virus in the final vaccine shall have undergone no more passages from the master seed lot than were used to prepare the vaccine shown in clinical studies to be satisfactory with respect to safety and efficacy.

If purification steps are present, the reduction of selected process-related impurities and residuals such as residual host-cell proteins, residual cellular DNA, endotoxins, bovine serum, trypsin, and antibiotics is monitored to establish consistency of the purification process.

#### REFERENCE PREPARATION

A suitable reference preparation that is representative of batches of vaccine shown to be effective in clinical trials is established for use in tests to determine virus concentration. The differences in the composition and characteristics of rotavirus vaccines mean that there will be a specific reference preparation for each one.

#### SUBSTRATE FOR VIRUS PROPAGATION

The virus is propagated in a suitable cell line (5.2.3).

#### VIRUS SEED LOTS

The strain(s) of rotavirus used shall be identified by historical records that include information on the origin of each strain and its subsequent manipulation including the method of attenuation, whether the strains have been biologically cloned prior to generation of the master seed lot, genetic sequence information, the phenotypic and genotypic stability of the master and working seed lots when passaged up to the single harvest level, and the passage level at which attenuation for humans was demonstrated by clinical trials. Virus seed lots are stored at temperatures below  $-20\text{ }^{\circ}\text{C}$  if freeze-dried, or below  $-60\text{ }^{\circ}\text{C}$  if not freeze-dried.

Only a seed lot that complies with the following requirements may be used for virus propagation.

#### Identification

The master and working seed lots are shown to be of the required rotavirus type by an immunological assay using specific antibodies or by a molecular identity test such as polyacrylamide gel electrophoresis of RNA, RNA/RNA hybridisation, or restriction-enzyme mapping of genetic

sequences of polymerase chain reaction (PCR)-amplified VP7 gene segments.

#### **Virus concentration**

The virus concentration of the master and working seed lots is determined to monitor consistency of production. Direct cell-culture based methods and nucleic acid amplification techniques (NAT) (2.6.21) such as PCR quantification of virus replication in cell culture may be used.

#### **Extraneous agents (2.6.16)**

Each working seed lot complies with the requirements for virus seed lots.

#### ***VIRUS PROPAGATION, SINGLE HARVEST, MONOVALENT POOLED HARVEST***

All processing of the cell bank and subsequent cell cultures is done under aseptic conditions in an area where no other cells are being handled. Suitable animal (but not human) serum may be used in the culture media, but the final medium for maintaining cell growth during virus multiplication does not contain animal serum. Serum and trypsin used in the preparation of cell suspensions and culture media are shown to be free from extraneous agents. The cell culture medium may contain a pH indicator such as phenol red and suitable antibiotics at the lowest effective concentration. It is preferable to have a substrate free from antibiotics during production.

#### ***STORED VIRUS INTERMEDIATE CULTURE***

Where a stored virus intermediate culture, prepared from the working seed lot, is used for inoculation, on the day of inoculation not less than 5 per cent or 500 mL of the cell cultures employed, whichever is greater, are set aside as uninfected cell cultures (control cells). Stored virus intermediate cultures are harvested at a time appropriate to the strain of virus and stored at temperatures below -60°C.

Only a stored virus intermediate culture that complies with the following requirements may be used for virus propagation.

#### **Identification**

Each stored virus intermediate culture is identified by rotavirus type by an immunological assay using specific antibodies or by a molecular identity test such as NAT (2.6.21).

#### **Bacterial and fungal contamination**

Each stored virus intermediate culture complies with the test for sterility (2.6.1), carried out using 10 mL for each medium.

#### **Virus concentration**

The virus concentration of each stored virus intermediate culture is determined as prescribed under Assay to monitor consistency of production. Both direct cell-culture based methods and NAT (2.6.21) such as PCR quantification of virus replication in cell culture may be used.

#### **Extraneous agents (2.6.16)**

Each stored virus intermediate culture complies with the tests for extraneous agents.

#### **Control cells**

The control cells of the production cell culture from which each stored virus intermediate culture is derived comply with a test for identity and with the requirements for extraneous agents (2.6.16).

#### ***VIRUS PROPAGATION AND SINGLE HARVEST***

On the day of inoculation with the virus working seed lot or stored virus intermediate culture, cell cultures employed for vaccine production are set aside as uninfected cell cultures

(control cells). If bioreactor technology is used, the size and handling of the cell sample to be examined is approved by the competent authority. The virus suspensions are harvested at a time appropriate to the strain of virus being used.

Only a single virus harvest that complies with the following requirements may be used for further processing.

#### **Bacterial and fungal contamination**

Each single virus harvest complies with the test for sterility (2.6.1), carried out using 10 mL for each medium.

#### **Control cells**

The control cells of the production cell culture from which each single harvest is derived comply with a test for identity and with the requirements for extraneous agents (2.6.16).

#### ***MONOVALENT POOLED HARVEST***

Monovalent pooled harvests are prepared by pooling a number of single harvests of the same virus type. If no monovalent pooled harvest is prepared, the tests below are carried out on each single harvest.

Only a single harvest or a monovalent pooled harvest that complies with the following requirements may be used in the preparation of the purified monovalent harvest.

#### **Identification**

Each single harvest or monovalent pooled harvest is identified by rotavirus type by an immunological assay using specific antibodies or by a molecular identity test such as NAT (2.6.21).

#### **Bacterial and fungal contamination**

Each single harvest or monovalent pooled harvest complies with the test for sterility (2.6.1), carried out using 10 mL for each medium.

#### **Virus concentration**

The virus concentration of each single harvest or monovalent pooled harvest is determined as prescribed under Assay to monitor consistency of production. Both direct cell-culture based methods and NAT (2.6.21) such as PCR quantification of virus replication in cell culture may be used.

#### **Extraneous agents (2.6.16)**

Each single harvest or monovalent pooled harvest complies with the tests for extraneous agents.

#### ***PURIFIED MONOVALENT HARVEST***

The purified monovalent harvest is prepared from a single harvest or a pooled monovalent harvest. The single harvest or pooled monovalent harvest is clarified to remove cell debris and may be further purified.

Only a purified monovalent harvest that complies with the following requirements may be used in the preparation of the final bulk vaccine.

#### **Bacterial and fungal contamination**

The purified monovalent harvest complies with the test for sterility (2.6.1), carried out using 10 mL for each medium.

#### **Virus concentration**

The virus concentration of the purified monovalent harvest is determined as prescribed under Assay to monitor consistency of production. Both direct cell-culture based methods and NAT (2.6.21) such as PCR quantification of virus replication in cell culture may be used.

#### **Residual cellular DNA**

Maximum 100 µg of cellular DNA per human dose for viruses grown in continuous cells lines.

**FINAL BULK VACCINE**

The final bulk vaccine is prepared from one or more satisfactory purified monovalent harvests and may contain more than one virus type. Suitable stabilisers may be added.

Only a final bulk vaccine that complies with the following requirement may be used in the preparation of the final lot.

**Bacterial and fungal contamination**

The final bulk vaccine complies with the test for sterility (2.6.1), carried out using 10 mL for each medium.

**FINAL LOT**

The final bulk vaccine is distributed aseptically into sterile containers and may be freeze-dried to a moisture content shown to be favourable to the stability of the vaccine.

The containers are then closed so as to avoid contamination and the introduction of moisture.

An approved minimum virus concentration for release of the product is established for each virus type to ensure, in light of stability data, that the minimum concentration stated on the label will be present at the end of the period of validity.

For freeze-dried vaccines, tests for identity, pH, volume, sterility and content of key components are carried out on the solvent.

Only a final lot that complies with the following requirement for thermal stability and is satisfactory with respect to each of the requirements given below under Identification, Tests and Assay may be released for use.

**Thermal stability**

Maintain not fewer than 3 containers of the final lot at an elevated temperature for a defined time period, using conditions found suitable for the particular product as approved by the competent authority. Determine the virus concentration as described under Assay in parallel for the heated vaccine and for vaccine maintained at the temperature recommended for storage. The virus concentration of the containers that have been heated does not decrease by more than an approved amount during the period of exposure. For a multivalent vaccine, if there is no significant difference in the virus loss between serotypes, the loss may be determined from total virus concentration.

**IDENTIFICATION**

The vaccine is shown to contain rotavirus of each type stated on the label by an immunological assay using specific antibodies or by a molecular identity test. If PCR is used for the assay, this may serve as the identity test.

**TESTS****Bacterial and fungal contamination**

The vaccine complies with the test for sterility (2.6.1).

**Water (2.5.12)**

Maximum 3.0 per cent for each final lot of freeze-dried vaccine.

**ASSAY**

The assay of rotavirus vaccine is carried out by inoculation of suitable cell cultures with dilutions of the vaccine and evaluation of the rotavirus concentration, either by visualisation of infected areas of a cell monolayer or by comparison of the capacity of the vaccine to produce viral RNA following infection of cells with the corresponding capacity of an approved reference preparation.

*For the assay based on visualisation of infected areas of a cell monolayer* Titrate the vaccine for infective virus using at least 3 separate containers. Titrate the contents of 1 container of an appropriate virus reference preparation in triplicate to validate each assay. If the vaccine contains more

than 1 rotavirus type, titrate each type separately using a method of suitable specificity. The virus concentration of the reference preparation is monitored using a control chart and a titre is established on a historical basis by each laboratory.

Calculate the individual virus concentration for each container of vaccine and for each replicate of the reference preparation as well as the corresponding combined virus concentrations, using the usual statistical methods (for example, 5.3).

The assay is not valid if:

- the confidence interval ( $P = 0.95$ ) of the estimated virus concentration of the reference preparation for the 3 replicates combined is greater than  $\pm 0.3 \log_{10} \text{CCID}_{50}$  (or an equivalent value expressed with a unit suitable for the method used for the assay);
- the virus concentration of the reference preparation differs by more than  $0.5 \log_{10} \text{CCID}_{50}$  (or an equivalent value expressed with a unit suitable for the method used for the assay) from the established value.

The assay is repeated if the confidence interval ( $P = 0.95$ ) of the combined virus concentration of the vaccine is greater than  $\pm 0.3 \log_{10} \text{CCID}_{50}$  (or an equivalent value expressed with a unit suitable for the method used for the assay); data generated from valid assays only are combined by the usual statistical methods (for example, 5.3) to calculate the virus concentration of the sample. The confidence interval ( $P = 0.95$ ) of the combined virus concentration is not greater than  $\pm 0.3 \log_{10} \text{CCID}_{50}$  (or an equivalent value expressed with a unit suitable for the method used for the assay).

Where justified and authorised, different assay designs may be used; this may imply the application of different validity and acceptance criteria. However, the vaccine must comply if tested as described above.

*For the assay based on comparison of the capacity of the vaccine to produce viral RNA* Following infection of cells with the corresponding capacity of an approved reference preparation, a suitable number of cell cultures in a microtitre plate are infected in parallel with serial dilutions of the vaccine and the reference preparation. After incubation to allow virus replication, viral RNA in the individual wells is released from the cells and quantified by NAT (2.6.21), such as real-time quantitative reverse-transcriptase polymerase chain reaction (RT-PCR) technology.

Not fewer than 3 separate containers of the vaccine are assayed against a container of the reference preparation titrated in triplicate.

Calculate the individual virus concentration for each container of vaccine against the reference preparation as well as the corresponding combined virus concentrations, using the usual statistical methods (for example, 5.3).

The combined estimate of the virus concentration for the 3 containers of vaccine is not less than that stated on the label.

The assay is not valid unless:

- the negative external NAT control is unambiguously negative;
- the positive external NAT control is unambiguously positive;
- the negative matrix control (uninfected cells) is unambiguously negative;
- the positive matrix control (cells spiked with viral RNA) is unambiguously positive;
- the statistical analysis shows a significant slope and no significant deviations from linearity or parallelism of the dose-response curves.

The assay is repeated if the confidence interval ( $P = 0.95$ ) of the combined virus concentration of the vaccine is greater than  $\pm 0.3 \log_{10}$  infectious units; data generated from valid assays only are combined by the usual statistical methods (for example, 5.3) to calculate the virus concentration of the sample. The confidence interval ( $P = 0.95$ ) of the combined virus concentration is not greater than  $\pm 0.3 \log_{10}$  infectious units.

#### LABELLING

The label states:

- the type or types of rotavirus contained in the vaccine;
- the minimum amount of each type of virus contained in 1 single human dose;
- the cell substrate used for the preparation of the vaccine.

Ph Eur

## Rubella Vaccine, Live

(Ph. Eur. monograph 0162)

The label may state 'Rubella'.

Ph Eur

#### DEFINITION

Rubella vaccine (live) is a freeze-dried preparation of a suitable attenuated strain of rubella virus. The vaccine is reconstituted immediately before use, as stated on the label, to give a clear liquid that may be coloured owing to the presence of a pH indicator.

#### PRODUCTION

The production of vaccine is based on a virus seed-lot system and a cell-bank system. The production method shall have been shown to yield consistently live rubella vaccines of adequate immunogenicity and safety in man. Unless otherwise justified and authorised, the virus in the final vaccine shall have undergone no more passages from the master seed lot than were used to prepare the vaccine shown in clinical studies to be satisfactory with respect to safety and efficacy.

The potential neurovirulence of the vaccine strain is considered during preclinical development, based on available epidemiological data on neurovirulence and neurotropism, primarily for the wild-type virus. In light of this, a risk analysis is carried out. Where necessary and if available, a test is carried out on the vaccine strain using an animal model that differentiates wild-type and attenuated virus; tests on strains of intermediate attenuation may also be needed.

#### SUBSTRATE FOR VIRUS PROPAGATION

The virus is propagated in human diploid cells (5.2.3).

#### SEED LOT

The strain of rubella virus used shall be identified by historical records that include information on the origin of the strain and its subsequent manipulation. Virus seed lots are prepared in large quantities and stored at temperatures below  $-20\text{ }^{\circ}\text{C}$  if freeze-dried, or below  $-60\text{ }^{\circ}\text{C}$  if not freeze-dried.

Only a seed lot that complies with the following requirements may be used for virus propagation.

#### Identification

The master and working seed lots are identified as rubella virus by serum neutralisation in cell culture, using specific antibodies.

#### Virus concentration

The virus concentration of the master and working seed lots is determined to ensure consistency of production.

#### Extraneous agents (2.6.16)

The working seed lot complies with the requirements for seed lots.

#### PROPAGATION AND HARVEST

All processing of the cell bank and subsequent cell cultures is done under aseptic conditions in an area where no other cells are handled during the production. Suitable animal (but not human) serum may be used in the growth medium, but the final medium for maintaining cell growth during virus multiplication does not contain animal serum. Serum and trypsin used in the preparation of cell suspensions and culture media are shown to be free from extraneous agents. The cell culture medium may contain a pH indicator such as phenol red and suitable antibiotics at the lowest effective concentration. It is preferable to have a substrate free from antibiotics during production. Not less than 500 mL of the production cell cultures is set aside as uninfected cell cultures (control cells). The temperature of incubation is controlled during the growth of the virus. The virus suspension is harvested, on one or more occasions, within 28 days of inoculation. Multiple harvests from the same production cell culture may be pooled and considered as a single harvest.

Only a single harvest that complies with the following requirements may be used in the preparation of the final bulk vaccine.

#### Identification

The single harvest contains virus that is identified as rubella virus by serum neutralisation in cell culture, using specific antibodies.

#### Virus concentration

The virus concentration in the single harvest is determined as prescribed under Assay to monitor consistency of production and to determine the dilution to be used for the final bulk vaccine.

#### Extraneous agents (2.6.16)

The single harvest complies with the tests for extraneous agents.

#### Control cells

The control cells comply with a test for identification and with the tests for extraneous agents (2.6.16).

#### FINAL BULK VACCINE

Single harvests that comply with the above tests are pooled and clarified to remove cells. A suitable stabiliser may be added and the pooled harvests diluted as appropriate.

Only a final bulk vaccine that complies with the following requirement may be used in the preparation of the final lot.

#### Bacterial and fungal contamination

The final bulk vaccine complies with the test for sterility (2.6.1), carried out using 10 mL for each medium.

#### FINAL LOT

A minimum virus concentration for release of the product is established such as to ensure, in light of stability data, that the minimum concentration stated on the label will be present at the end of the period of validity.

Only a final lot that complies with the requirements for minimum virus concentration for release, with the following requirement for thermal stability and with each of the requirements given below under Identification and Tests may be released for use. Provided that the test for bovine serum

albumin has been carried out with satisfactory results on the final bulk vaccine, it may be omitted on the final lot.

#### Thermal stability

Maintain at least 3 vials of the final lot of freeze-dried vaccine in the dry state at  $37 \pm 1$  °C for 7 days. Determine the virus concentration as described under Assay in parallel for the heated vaccine and for vaccine stored at the temperature recommended for storage. The virus concentration of the heated vaccine is not more than  $1.0 \log_{10}$  lower than that of the unheated vaccine.

#### IDENTIFICATION

When the vaccine reconstituted as stated on the label is mixed with specific rubella antibodies, it is no longer able to infect susceptible cell cultures.

#### TESTS

##### Bacterial and fungal contamination

The reconstituted vaccine complies with the test for sterility (2.6.1).

##### Bovine serum albumin

Not more than 50 ng per single human dose, determined by a suitable immunochemical method (2.7.1).

##### Water (2.5.12)

Not more than 3.0 per cent, determined by the semi-micro determination of water.

#### ASSAY

Titrate the vaccine for infective virus, using at least 3 separate vials of vaccine and inoculating a suitable number of wells for each dilution step. Titrate 1 vial of an appropriate virus reference preparation in triplicate to validate each assay. The virus concentration of the reference preparation is monitored using a control chart and a titre is established on a historical basis by each laboratory. The relation with the appropriate European Pharmacopoeia Biological Reference Preparation is established and monitored at regular intervals if a manufacturer's reference preparation is used. Calculate the individual virus concentration for each vial of vaccine and for each replicate of the reference preparation as well as the corresponding combined virus concentrations, using the usual statistical methods (for example, 5.3). The combined estimate of the virus concentration for the 3 vials of vaccine is not less than that stated on the label; the minimum virus concentration stated on the label is not less than  $3.0 \log_{10}$  CCID<sub>50</sub> per single human dose.

The assay is not valid if:

- the confidence interval ( $P = 0.95$ ) of the estimated virus concentration of the reference preparation for the 3 replicates combined is greater than  $\pm 0.3 \log_{10}$  CCID<sub>50</sub>;
- the virus concentration of the reference preparation differs by more than  $0.5 \log_{10}$  CCID<sub>50</sub> from the established value.

The assay is repeated if the confidence interval ( $P = 0.95$ ) of the combined virus concentration of the vaccine is greater than  $\pm 0.3 \log_{10}$  CCID<sub>50</sub>; data obtained from valid assays only are combined by the usual statistical methods (for example, 5.3) to calculate the virus concentration of the sample. The confidence interval ( $P = 0.95$ ) of the combined virus concentration is not greater than  $\pm 0.3 \log_{10}$  CCID<sub>50</sub>.

*Rubella vaccine (live) BRP* is suitable for use as a reference preparation.

Where justified and authorised, different assay designs may be used; this may imply the application of different validity

and acceptance criteria. However, the vaccine must comply if tested as described above.

#### LABELLING

The label states:

- the strain of virus used for the preparation of the vaccine;
- the type and origin of the cells used for the preparation of the vaccine;
- the minimum virus concentration;
- that contact between the vaccine and disinfectants is to be avoided.

Ph Eur

## Shingles (Herpes Zoster) Vaccine (Live)

(Ph. Eur. monograph 2418)

The label may state 'Shingles (live)'.

Ph Eur

#### DEFINITION

Shingles (herpes zoster) vaccine (live) is a freeze-dried preparation of a suitable attenuated strain of human herpesvirus 3. The vaccine is reconstituted immediately before use, as stated on the label, to give a clear or slightly opalescent liquid, almost white suspension or pale yellow liquid that may be coloured owing to the presence of a pH indicator. It is intended for administration to adults.

#### PRODUCTION

The production of vaccine is based on a virus seed-lot system and a cell-bank system. The production method shall have been shown to yield consistently live shingles vaccines of adequate immunogenicity and safety in man. The virus in the final vaccine shall not have been passaged in cell cultures beyond a defined number of passages approved by the competent authority from the original isolated virus.

The potential neurovirulence of the vaccine strain is considered during preclinical development, based on available epidemiological data on neurovirulence and neurotropism, primarily for the wild-type virus. In light of this, a risk analysis is carried out. Where necessary and if available, a test is carried out on the vaccine strain using an animal model that differentiates wild-type and attenuated virus; tests on strains of intermediate attenuation may also be needed.

#### SUBSTRATE FOR VIRUS PROPAGATION

The virus is propagated in human diploid cells (5.2.3).

#### VIRUS SEED LOT

The strain of human herpesvirus 3 shall be identified as being suitable by historical records that include information on the origin of the strain and its subsequent manipulation. The virus shall at no time have been passaged in continuous cell lines. Seed lots are prepared in the same kind of cells as those used for the production of the final vaccine. Virus seed lots are prepared in large quantities and stored at temperatures below  $-20$  °C if freeze-dried, or below  $-60$  °C if not freeze-dried.

Only a virus seed lot that complies with the following requirements may be used for virus propagation.

#### Identification

The master and working seed lots are identified as human herpesvirus 3 by serum neutralisation in cell culture, using specific antibodies.

**Virus concentration**

The virus concentration of the master and working seed lots is determined as prescribed under Assay to monitor consistency of production.

**Extraneous agents (2.6.16)**

The working seed lot complies with the requirements for seed lots for live virus vaccines; a sample of 50 mL is taken for the test in cell cultures.

**VIRUS PROPAGATION AND HARVEST**

All processing of the cell bank and subsequent cell cultures is done under aseptic conditions in an area where no other cells or virus are being handled. Approved animal (but not human) serum may be used in the culture media. Serum and trypsin used in the preparation of cell suspensions and media are shown to be free from extraneous agents. The cell culture medium may contain a pH indicator such as phenol red and approved antibiotics at the lowest effective concentration.

It is preferable to have a substrate free from antibiotics during production. 5 per cent, but not less than 50 mL, of the cell cultures employed for vaccine production is set aside as uninfected cell cultures (control cells). The infected cells constituting a single harvest are washed, released from the support surface and pooled. The cell suspension is disrupted by sonication.

Only a virus harvest that complies with the following requirements may be used in the preparation of the final bulk vaccine.

**Identification**

The virus harvest contains virus that is identified as human herpesvirus 3 by serum neutralisation in cell culture, using specific antibodies.

**Virus concentration**

The concentration of infective virus in virus harvests is determined as prescribed under Assay to monitor consistency of production and to determine the dilution to be used for the final bulk vaccine.

**Extraneous agents (2.6.16)**

Use 50 mL for the test in cell cultures.

**Control cells**

The control cells of the production cell culture from which the single harvest is derived comply with a test for identity and with the requirements for extraneous agents (2.6.16).

**FINAL BULK VACCINE**

Virus harvests that comply with the above tests are pooled and clarified to remove cells. A suitable stabiliser may be added and the pooled harvests diluted as appropriate.

Only a final bulk vaccine that complies with the following requirements may be used in the preparation of the final lot.

**Bacterial and fungal contamination**

Carry out the test for sterility (2.6.1) using 10 mL for each medium.

**FINAL LOT**

The final bulk vaccine is distributed aseptically into sterile, tamper-evident containers and freeze-dried to a moisture content shown to be favourable to the stability of the vaccine. The containers are then closed so as to prevent contamination and the introduction of moisture.

Only a final lot that is satisfactory with respect to the test for water and each of the requirements given below under Identification, Tests and Assay may be released for use. Provided that the test for bovine serum albumin has been carried out with satisfactory results on the final bulk vaccine, it may be omitted on the final lot.

**Water (2.5.12)**

Not more than the amount shown to ensure stability of the vaccine as approved by the competent authority, determined by the semi-micro determination of water.

**IDENTIFICATION**

When the vaccine reconstituted as stated on the label is mixed with specific human herpesvirus 3 antibodies, it is no longer able to infect susceptible cell cultures.

**TESTS****Bacterial and fungal contamination**

The reconstituted vaccine complies with the test for sterility (2.6.1).

**Bovine serum albumin**

Maximum 0.65 µg per human dose, determined by a suitable immunochemical method (2.7.1).

**ASSAY**

Titrate the vaccine for infective virus, using at least 3 separate vials of vaccine. Titrate 1 vial of an appropriate virus reference preparation in triplicate to validate each assay. The virus concentration of the reference preparation is monitored using a control chart and a titre is established on a historical basis by each laboratory. Calculate the individual virus concentration for each vial of vaccine and for each replicate of the reference preparation as well as the corresponding combined virus concentrations, using the usual statistical methods (for example, 5.3). The combined estimate of the virus concentration for the 3 vials of vaccine is not less than that stated on the label.

The assay is not valid if:

- the confidence interval ( $P = 0.95$ ) of the estimated virus concentration of the reference preparation for the 3 replicates combined is greater than  $\pm 0.3 \log_{10}$  PFU;
- the virus concentration of the reference preparation differs by more than  $0.5 \log_{10}$  PFU from the established value.

The assay is repeated if the confidence interval ( $P = 0.95$ ) of the combined virus concentration of the vaccine is greater than  $\pm 0.3 \log_{10}$  PFU; data obtained from valid assays only are combined by the usual statistical methods (for example, 5.3) to calculate the virus concentration of the sample. The confidence interval ( $P = 0.95$ ) of the combined virus concentration is not greater than  $\pm 0.3 \log_{10}$  PFU.

Where justified and authorised, different assay designs may be used; this may imply the application of different validity and acceptance criteria. However, the vaccine must comply if tested as described above.

**LABELLING**

The label states:

- the strain of virus used for the preparation of the vaccine;
- the type and origin of the cells used for the preparation of the vaccine;
- the minimum virus concentration;
- that contact between the vaccine and disinfectants is to be avoided;
- that the vaccine is not to be administered to pregnant women.

Ph Eur

## Smallpox Vaccine (Live)

(Ph. Eur. monograph 0164)

The label may state 'SMV(live)'.

Ph Eur

### DEFINITION

Smallpox vaccine (live) is a liquid or freeze-dried preparation of live vaccinia virus grown *in ovo* in the membranes of the chick embryo, in cell cultures or in the skin of living animals.

This monograph applies to vaccines produced using strains of confirmed efficacy in man, in particular those used during eradication of smallpox, for example the Lister strain (sometimes referred to as the Lister/Elstree strain) and the New York City Board of Health (NYCBOH) strain. It does not apply to non-replicative strains such as Modified Virus Ankara (MVA).

### PRODUCTION

#### GENERAL PROVISIONS

The production method shall have been shown to yield consistently smallpox vaccines of adequate safety and immunogenicity in man. The strain used shall have been shown to produce typical vaccinia skin lesions in man. Production is based on a seed-lot system.

The International Reference Preparation for smallpox vaccine is suitable for use as a reference preparation in virus titration.

#### SUBSTRATE FOR VIRUS PROPAGATION

##### Animals used for production of skin-derived vaccines

If the vaccine is prepared in animals skins, the animals used are of a species approved by the competent authority, are in good health, are kept in closed or intensively monitored colonies, and have not previously been employed for experimental purposes. Only animals susceptible to infection by dermal inoculations with vaccinia virus may be used for vaccine production.

The animals are kept in well-constructed and adequately ventilated animals rooms with cages spaced as far apart as possible. Adequate precautions are taken to prevent cross-infection between cages. Not more than 1 large animal is housed per stall. Not more than 2 small animals are housed per cage and cage-mates must not be interchanged.

The animals must be kept in the country of production of the vaccine in quarantine groups for a period of not less than 6 weeks before use.

If at any time during the quarantine period the overall death rate of the group reaches 5 per cent, no animals from that entire group may be used for vaccine production.

The groups are kept continuously in isolation, as in quarantine, even after completion of the quarantine period, until the animals are used. After the last animal of a group has been taken, the room that housed the group is thoroughly cleaned and decontaminated before receiving a new group.

Animals that are to be inoculated are anaesthetised and thoroughly examined. If an animal shows any pathological lesion, it is not used in the preparation of a seed lot or a vaccine, nor are any of the remaining animals of the quarantine group concerned unless it is evident that their use will not impair the safety of the product.

The prophylactic and diagnostic measures adopted to exclude the presence of infectious disease are approved by the competent authority. According to the species of animals used and the diseases to which that animal is liable in the

country where the vaccine is being produced, these measures may vary. Consideration must also be given to the danger of spreading diseases to other countries to which the vaccine may be shipped. Special attention must always be given to foot-and-mouth disease, brucellosis, Q fever, tuberculosis and dermatomycosis, and it may also be necessary to consider diseases such as contagious pustular dermatitis (orf), anthrax, rinderpest, haemorrhagic septicaemia, Rift valley fever and others.

##### Embryonated eggs

Embryonated eggs used for production are obtained from a flock free from specified pathogens (SPF) (5.2.2).

##### Human diploid cells, continuous cell lines

Human diploid cells and continuous cell lines comply with the requirements for cell substrates (5.2.3).

##### Primary chick embryo cells

Primary chick embryo cells are derived from an SPF flock (5.2.2).

##### Primary rabbit kidney cells

Only healthy rabbits derived from a closed colony approved by the competent authority are used as a source.

The animals, preferably 2-4 weeks old, are tested to ensure freedom from specified pathogens or their antibodies.

Where new animals are introduced into the colony, they are maintained in quarantine for a minimum of 2 months and shown to be free from specified pathogens. Animals to be used to provide kidneys shall not have been previously employed for experimental purposes, especially those involving infectious agents. The colony is monitored for zoonotic viruses and markers of contamination at regular intervals.

At the time the colony is established, all animals are tested to determine freedom from antibodies to possible viral contaminants for which there is evidence of capacity for infecting humans or evidence of capacity to replicate *in vitro* in cells of human origin. A test for retroviruses using a sensitive polymerase chain reaction (PCR)-based reverse transcriptase assay is also included. Nucleic acid amplification tests (2.6.21) for retroviruses may also be used.

After the colony is established, it is monitored by testing a representative group of at least 5 per cent of the animals, which are then bled at suitable (for example monthly) intervals. In addition, the colony is screened for pathogenic micro-organisms, including mycobacteria, fungi and mycoplasmas. The screening programme is designed to ensure that all animals are tested within a given period of time.

Any animal that dies is examined to determine the cause of death. If the presence of a causative infectious agent is demonstrated in the colony, the production of smallpox vaccine is discontinued.

At the time of kidney harvest, the animals are examined for the presence of abnormalities and, if any are noted, the animals are not used for vaccine production.

Each set of control cultures derived from a single group of animals used to produce a single virus harvest must remain identifiable as such until all testing, especially for extraneous agents, is completed.

##### VIRUS SEED LOT

The vaccinia virus isolate used for the master seed lot is identified by historical records that include information on its origin and the tests used in its characterisation.

Virus from the working seed lot must have the same characteristics as the strain that was used to prepare the

master seed lot. The number of passages required to produce single harvests from the original isolate is limited and approved by the competent authority. Vaccine is produced from the working seed with a minimum number of intervening passages.

Since cell culture production and clonal selection (for example, plaque purification) may lead to altered characteristics of the virus, the master seed virus must be characterised as fully as possible, for example by comparing the safety profile and biological characteristics of the strain with that of the parental isolate. The characterisation shall include the following:

- antigenic analyses using specific antisera and/or monoclonal antibodies;
- biological studies such as infectivity titre, chorioallantoic membrane (CAM) assay, *in vitro* yield and *in vivo* growth characteristics in a suitable animal model;
- genetic analyses such as restriction mapping/southern blotting, PCR analyses and limited sequencing studies;
- phenotypic and genetic stability upon passage in the substrate;
- neurovirulence testing and immunogenicity studies.

The characterisation tests are also carried out on each working seed lot and on 3 batches of vaccine from the first working seed lot to verify genetic stability of the vaccine strain.

Only a virus seed that complies with the following requirements may be used for virus propagation.

#### Identification

Each working seed lot is identified as vaccinia virus using specific antibodies and molecular tests. Suitable tests are conducted to exclude the presence of variola virus and other orthopoxviruses.

#### Virus concentration

Determine by the CAM assay or by a suitable validated *in vitro* assay (plaque assay or CCID<sub>50</sub> assay). The virus concentration is the basis for the quantity of virus used in the neurovirulence test.

#### Extraneous agents (2.6.16)

If the working seed lot is produced in embryonated eggs, human diploid cells, or in a continuous cell line, it complies with the requirements for seed lots for virus vaccines. Seed lots produced in embryonated eggs and seed lots produced in primary cell cultures comply with the additional requirements described below.

Where the tests prescribed cannot be carried out because complete neutralisation of the seed virus is not possible, the seed lot may be diluted to a concentration equivalent to that of the dilution used as inoculum for production of vaccine prior to testing for extraneous viruses. Supplementary specific testing for extraneous viruses using validated nucleic acid amplification techniques (2.6.21) or immunochemical methods (2.7.1) may be envisaged. Where the indicator cell culture method for mycoplasma detection (2.6.7) cannot be carried out, nucleic acid amplification testing is performed instead.

Seed lots to be used for embryonated egg or cell culture production are in addition to be tested for carry-over of potential extraneous agents from the original seed. Given that the complete passage history of the original seed is unlikely to be known and that more than one species may have been used, this additional testing must at least cover important extraneous agents of concern.

The bioburden of master and working seed lots prepared in animal skins is limited by meticulous controls of facilities, personnel, and animals used for production, and by specific tests on the seeds. However, it may be difficult to ensure that seed lots produced in animal skins are totally free from extraneous agents, and consideration must be given to production procedures which remove or reduce them. Such lots must comply with the requirements indicated below. The absence of specific human pathogens is confirmed by additional testing procedures, for example, bacterial and fungal cultures, virus culture, nucleic acid amplification testings (2.6.21) for viral agents.

#### Neurovirulence

The neurovirulence of master and working seed lots is assessed using a suitable animal model, for example in monkeys or mice. The parental isolate is used as comparator. Where the original isolate is not available for this purpose, equivalent materials may be used.

#### VIRUS PROPAGATION AND HARVEST

##### VACCINE PRODUCED IN LIVING ANIMALS

Before inoculation the animals are cleaned and thereafter kept in scrupulously clean stalls until the vaccinia material is harvested. For 5 days before inoculation and during incubation the animals remain under veterinary supervision and must remain free from any sign of disease; daily rectal temperatures are recorded. If any abnormal rise in temperature occurs or any clinical sign of disease is observed, the production of vaccine from the group of animals concerned must be suspended until the cause has been resolved.

The inoculation of seed virus is carried out on such parts of the animal that are not liable to be soiled by urine and faeces. The surface used for inoculation is shaved and cleaned so as to achieve conditions that are as close as possible to surgical asepsis. If any antiseptic substance deleterious to the virus is used in the cleaning process it is removed by thorough rinsing with sterile water prior to inoculation. During inoculation the exposed surface of the animal not used for inoculation is covered with a sterile covering. By historical experience the ventral surface of female animals is appropriate for inoculation and inoculation of male animals is more appropriate on the flank.

Before the collection of the vaccinia material, any antibiotic is removed and the inoculated area is cleaned.

The uninoculated surfaces are covered with a sterile covering. Before harvesting the animals are euthanised and exsanguinated to avoid heavy mixtures of the vaccinia material with blood. The vaccinia material from each animal is collected separately with aseptic precautions. All animals used in the production of vaccine are examined by autopsy. If evidence of any generalised or systemic disease other than vaccinia is found, the vaccinia material from that animal is discarded. If the disease is considered to be a communicable one, the harvest from the entire group of animals exposed must be discarded unless otherwise justified and authorised.

##### VACCINE PRODUCED IN EGGS

All processing of embryonated eggs is done under aseptic conditions in an area where no other infectious agents or cells are handled at the same time. After inoculation and incubation at a controlled temperature only living and suitable chick embryos are harvested. The age of the embryos at the time of virus harvest is reckoned from the initial introduction of the egg into the incubator and shall be not more than 12 days. After homogenisation and clarification by centrifugation, the extract of embryonic pulp is tested as

described below and kept at  $-70^{\circ}\text{C}$  or below until further processing. Virus harvests that comply with the prescribed tests may be pooled. No human protein is added to the virus suspension at any stage during production. If stabilisers are added, they shall have been shown to have no antigenic or sensitising properties for man.

Only a single harvest that complies with the following requirements may be used in the preparation of the final bulk vaccine.

#### Control eggs

Control eggs comply with the tests for extraneous agents (2.6.16). A sample of 2 per cent of uninoculated embryonated eggs (not less than 20 and not more than 50) from the batch used for vaccine production shall be incubated under the same conditions as the inoculated eggs. At the time of virus harvest the uninoculated eggs are processed in the same manner as the inoculated eggs.

#### Sterility (2.6.1)

It complies with the test for sterility, carried out using 10 mL for each medium.

#### VACCINE PRODUCED IN CELL CULTURES (PRIMARY CHICK EMBRYO CELLS, PRIMARY RABBIT KIDNEY CELLS, HUMAN DIPLOID CELLS OR CONTINUOUS CELL LINES)

All processing of the cell bank and subsequent cell cultures is done under aseptic conditions in an area where no other cells are handled at the same time during production. Suitable animal (but not human) serum may be used in the culture media, but the final medium for maintaining cell growth during virus multiplication does not contain animal serum. Serum and trypsin used in the preparation of cell suspensions and media are shown to be free from extraneous agents. The cell culture medium may contain a pH indicator such as phenol red and suitable antibiotics at the lowest effective concentration. It is preferable to have a substrate free from antibiotics during production. On the day of inoculation with the virus working seed lot, not less than 5 per cent or 1000 mL, whichever is the least, of the cell cultures employed for vaccine production are set aside as uninfected cell cultures (control cells); special requirements, given below, apply to control cells when the vaccine is produced in primary rabbit kidney cell cultures.

After inoculation of the production cell culture with the working seed lot, inoculated cells are maintained at a suitable fixed temperature, and the virus suspension is harvested after a suitable incubation period.

Only a single harvest that complies with the following requirements may be used in the preparation of the monovalent pooled harvest.

#### Control cells

The control cells of the production cell culture from which the virus harvest is derived comply with a test for identity and with the requirements for extraneous agents (2.6.16) or, where primary rabbit kidney cells cultures are used, with specific tests as mentioned hereafter. The test is invalid if more than 20 per cent of the control cell cultures have been discarded at the end of the observation period.

#### Extraneous agents (2.6.16)

The single harvest complies with the tests for extraneous agents. Complete neutralisation of vaccinia virus may be difficult to achieve at high virus concentration. In this case specific tests such as nucleic acid amplification (2.6.21) and immunochemical tests (2.7.1) can replace non-specific testing in cell culture or eggs. To save biological reagents such as vaccinia neutralising antisera, testing for extraneous agents

may be performed on the final bulk instead of on the single harvests.

*Vaccine prepared in primary chick embryo cells* A sample of fluids pooled from the control cultures is tested for adenoviruses and for avian retroviruses such as avian leukosis virus. In addition, a volume of each neutralised virus pool equivalent to 100 human doses of vaccine or 10 mL, whichever is the greater, is tested in a group of fertilised eggs by the allantoic route of inoculation, and a similar sample is tested in a separate group of eggs by the yolk-sac route of inoculation. In both cases 0.5 mL of inoculum is used per egg. The virus pool passes the test if, after 3-7 days, there is no evidence of the presence of any extraneous agent.

*Vaccine prepared in primary rabbit kidney cell cultures* The following special requirements apply to virus propagation, harvest and testing. On the day of inoculation with virus working seed, a sample of at least 30 mL of the pooled fluid is removed from the cell cultures of the kidneys of each group of animals used to prepare the primary cell suspension. The pooled fluid is inoculated in primary kidney cell cultures in such a way that the dilution of the pooled fluid does not exceed 1 in 4. The cultures are incubated at a temperature of  $34-36^{\circ}\text{C}$  and observed for a period of at least 4 weeks. During this observation period and after not less than 2 weeks of incubation, at least 1 subculture of fluid is made from each of these cultures and observed also for a period of 2 weeks. The test is invalid if more than 20 per cent of the cultures are discarded. If evidence is found of the presence of an extraneous agent, no cell cultures from the entire group may be used for vaccine production.

- *Control cell cultures.* Cultures prepared on the day of inoculation with the working virus seed lot from 25 per cent of the cell suspensions obtained from the kidneys of each group of animals are maintained as controls. These control cell cultures are incubated under the same conditions as the inoculated cultures for at least 2 weeks. The test is invalid if more than 20 per cent of the control cell cultures are discarded for non-specific reasons.
- *Test for haemadsorbing viruses.* At the time of harvest or not more than 4 days after the day of inoculation of the production cultures with the virus working seed, a sample of 4 per cent of the control cell cultures is tested for haemadsorbing viruses by addition of guinea-pig red blood cells.
- *Test for other extraneous agents.* At the time of harvest or not more than 7 days after the day of inoculation of the production cultures with the virus working seed, a sample of at least 20 mL of the pooled fluid from each group of control cultures is tested for other extraneous agents.
- *Tests of neutralised single harvest in primary rabbit kidney cell cultures.* Each neutralised single harvest is additionally tested in primary kidney cell cultures prepared from a different group of animals to that used for production.

#### POOLED HARVEST

Only a pooled harvest that complies with the following requirements and is within the limits approved for the product may be used in the preparation of the final lot.

#### Identity

The vaccinia virus in the pooled harvest is identified by serological methods, which may be supplemented by molecular methods. Molecular tests such as restriction fragment length polymorphism or partial sequencing, especially of terminal DNA sequences which show the greatest variation between vaccinia strains, may be useful.

**Virus concentration**

The vaccinia virus concentration of the pooled harvest is determined by chick egg CAM assay or in cell cultures. A reference preparation is assayed in the same system in parallel for validation of the pooled harvest titration. The virus concentration serves as the basis for the quantity of virus used in the neurovirulence test in mice.

**Consistency of virus characteristics**

Vaccinia virus in the pooled harvest or the final bulk is examined by tests that are able to determine that the phenotypic and genetic characteristics of the vaccinia virus have not undergone changes during the multiplication in the production system. The master seed or an equivalent preparation is used as a comparator in these tests and the comparator and the tests to be used are approved by the competent authority.

**Neurovirulence**

The neurovirulence of the pooled harvest is assessed versus a comparator original seed (or equivalent) by intracerebral inoculation into suckling mice. Other tests may be useful to discriminate between acceptable and unacceptable batches.

**Residual DNA**

For viruses grown in continuous cells the pooled harvest is tested for residual DNA. The production process demonstrates a level of cellular DNA of less than 10 ng per human dose.

**Bacterial and fungal contamination**

For vaccines other than those prepared on animal skins, the final bulk complies with the test for sterility (2.6.1) using 10 mL for each medium.

**Mycoplasma (2.6.7)**

For vaccines other than those prepared on animal skins, the final bulk complies with the test for mycoplasma, carried out using 10 mL.

**FINAL BULK VACCINE**

A minimum virus concentration for release of the product is established such as to ensure, in the light of stability data, that the minimum concentration stated on the label will be present at the end of the period of validity.

**VACCINE PRODUCED IN LIVING ANIMALS**

The pooled harvest is centrifuged. If the vaccine is intended for issue in the liquid form, treatment to reduce the presence of extraneous agents may consist of the addition of glycerol or another suitable diluent, with or without an antimicrobial substance, and temporary storage at a suitable temperature. If the vaccine is intended for issue in the dried form, the treatment may consist of the addition of a suitable antimicrobial substance. The following special requirements apply to the bulk vaccine for vaccines produced in living animals.

Only a final bulk vaccine that complies with the following requirements may be used in the preparation of the final lot.

**Total bacterial count**

For vaccines produced on animal skins only, maximum 50 per millilitre, determined by plate count using a suitable volume of the final bulk vaccine.

***Escherichia coli***

At least 1 mL samples of a 1:100 dilution of the final bulk vaccine is cultured on plates of a medium suitable for differentiating *E. coli* from other bacteria. The plates are incubated at 35-37 °C for 48 h. If *E. coli* is detected the final bulk is discarded or, subject to approval by the competent authority, processed further.

Haemolytic streptococci, coagulase-positive staphylococci or any other pathogenic micro-organisms which are known to be harmful to man by vaccination. At least 1 mL samples of a 1:100 dilution of the final bulk vaccine are cultured on blood agar. The plates are incubated at 35-37 °C for 48 h. If micro-organisms are detected, the final bulk vaccine is discarded.

***Bacillus anthracis***

Any colony seen on any of the plates that morphologically resembles *B. anthracis* is examined. If the organisms contained in the colony are non-motile, further tests for the cultural character of *B. anthracis* are carried out, including pathogenicity tests in suitable animals. If *B. anthracis* is found to be present, the final bulk vaccine and any other associated bulks are discarded. Additional validated molecular testing may be performed.

***Clostridium tetani* and other pathogenic spore-forming anaerobes**

A total volume of not less than 10 mL of the final bulk vaccine is distributed in equal amounts into 10 tubes, each containing not less than 10 mL of suitable medium for the growth of anaerobic micro-organisms. The tubes are kept at 65 °C for 1 h in order to reduce the content of non-spore-forming organisms, after which they are anaerobically incubated at 35-37 °C for at least 1 week. From every tube or plate showing growth, subcultures are made on plates of a suitable medium. Tubes and plates are incubated anaerobically at the same temperature. All anaerobic colonies are examined and identified and if *C. tetani* or other pathogenic spore-forming anaerobes are present, the final bulk is discarded.

**VACCINE PRODUCED IN EGGS**

The pooled harvest is clarified and may be further purified.

**VACCINE PRODUCED IN CELL CULTURES (PRIMARY CHICK EMBRYOS FIBROBLASTS, HUMAN DIPLOID CELLS OR CONTINUOUS CELL LINES)**

The pooled harvest is clarified to remove cells and may be further purified.

**FINAL LOT**

Only a final lot that complies with the requirements for minimum virus concentration for release, with the following requirement for thermal stability and with each of the requirements given below under Identification, Tests and Assay may be released for use. Provided that the tests for antimicrobial preservative, protein content, bovine serum albumin and ovalbumin have been carried out with satisfactory results on the final bulk vaccine, they may be omitted on the final lot.

**Thermal stability**

For liquid products, maintain not fewer than 3 containers of the final lot at an elevated temperature for a defined time period, using conditions found suitable for the particular product as approved by the competent authority. Determine the virus concentration as described under Assay in parallel for the heated vaccine and for vaccine stored at the temperature recommended for storage. The virus concentration of the containers that have been heated does not decrease by more than an approved amount during the period of exposure. The conditions of the test and the requirements are approved by the competent authority.

For freeze-dried products, maintain at least 3 containers of the final lot in the dry state at  $37 \pm 1$  °C for 28 days. Determine the virus concentration as described under Assay in parallel for the heated vaccine and for vaccine stored at

the temperature recommended for storage. The virus concentration of the heated vaccine is not more than  $1.0 \log_{10}$  lower than that of the unheated vaccine.

#### IDENTIFICATION

The vaccinia virus is identified by an appropriate method.

#### TESTS

##### Antimicrobial preservative

Where applicable determine the amount of antimicrobial preservative by a suitable chemical method. The content is not less than the minimum amount shown to be effective and is not greater than 115 per cent of the quantity stated on the label.

##### Phenol (2.5.15)

Maximum 0.5 per cent, if phenol is used.

##### Protein content

The protein content of each filling lot, if not done on the final bulk, is determined and is within the limits approved by the competent authority.

##### Bovine serum albumin

Maximum 50 ng per single human dose, determined by a suitable immunochemical method (2.7.1), where bovine serum albumin is used during cell culture.

##### Ovalbumin

For vaccines produced in embryonated eggs, the ovalbumin content is within the limits approved by the competent authority.

##### Residual moisture

The residual moisture content of each final lot of freeze-dried vaccines is within the limits approved by the competent authority.

##### Bacterial count

For skin-derived vaccines, examine the vaccine by suitable microscopic and culture methods for micro-organisms pathogenic for man and, in particular, haemolytic streptococci, staphylococci, pathogenic spore-bearing organisms, especially *B. anthracis*, and *E. coli*. The vaccine is free from such contaminants. The total number of non-pathogenic bacteria does not exceed 50 per millilitre.

##### Sterility (2.6.1)

Except for skin-derived vaccines, the vaccine complies with the test for sterility.

##### Bacterial endotoxins (2.6.14)

The vaccine complies with the specification approved by the competent authority.

#### ASSAY

Reconstitute the vaccine if necessary and titrate for infectious virus using at least 3 separate containers of vaccine. Titrate 1 container of an appropriate virus reference preparation in triplicate to validate each assay. The virus concentration of the reference preparation is monitored using a control chart and a titre is established on a historical basis by each laboratory. Calculate the individual virus concentration for each container of vaccine and for each replicate of the reference preparation as well as the corresponding combined virus concentrations, using the usual statistical methods (for example, 5.3). The combined virus concentration for the 3 containers of vaccine is not less than  $8.0 \log_{10}$  plaque-forming units per millilitre or the validated equivalent in plaque-forming units or 50 per cent cell culture infective doses, unless a lower titre is justified by clinical studies.

The assay is not valid if:

- the confidence interval ( $P = 0.95$ ) of the estimated virus concentration of the reference preparation for the 3

replicates combined is greater than  $\pm 0.5 \log_{10}$  infectious units;

- the virus concentration of the reference preparation differs by more than  $0.5 \log_{10}$  infectious units from the established value.

The assay is repeated if the confidence interval ( $P = 0.95$ ) of the combined virus concentration of the vaccine is greater than  $\pm 0.5 \log_{10}$  infectious units; data obtained from valid assays only are combined by the usual statistical methods (for example, 5.3) to calculate the virus concentration of the sample. The confidence interval ( $P = 0.95$ ) of the combined virus concentration is not greater than  $\pm 0.5 \log_{10}$  infectious units.

Where justified and authorised, different assay designs may be used; this may imply the application of different validity and acceptance criteria. However, the vaccine must comply if tested as described above.

#### LABELLING

The label states:

- the designation of the vaccinia virus strain;
- the minimum amount of virus per millilitre;
- the substrate used for the preparation of the vaccine;
- the nature and amount of stabiliser, preservative or additive present in the vaccine and/or in the diluent.

Ph Eur

## Adsorbed Tetanus Vaccine

(Tetanus Vaccine (Adsorbed), Ph. Eur. monograph 0452)

The label may state 'Tet'.

When Tetanus Vaccine is prescribed or demanded and the form is not stated, Adsorbed Tetanus Vaccine may be dispensed or supplied.

Ph Eur

#### DEFINITION

Tetanus vaccine (adsorbed) is a preparation of tetanus formol toxoid with a mineral adsorbent. The formol toxoid is prepared from the toxin produced by the growth of *Clostridium tetani*.

#### PRODUCTION

##### BULK PURIFIED TOXOID

For the production of tetanus toxin, from which toxoid is prepared, seed cultures are managed in a defined seed-lot system in which toxinogenicity is conserved and, where necessary, restored by deliberate reselection. A highly toxinogenic strain of *C. tetani* with known origin and history is grown in a suitable liquid medium. At the end of cultivation, the purity of each culture is tested and contaminated cultures are discarded. Toxin-containing culture medium is collected aseptically. The toxin content (Lf per millilitre) is checked (2.7.27) to monitor consistency of production. Single harvests may be pooled to prepare the bulk purified toxoid. The toxin is purified to remove components likely to cause adverse reactions in humans. The purified toxin is detoxified with formaldehyde. The detoxification process is validated to demonstrate its ability to consistently produce a toxoid that is immunogenic and stably detoxified, including at the concentration used in the final lot. Alternatively, purification may be carried out after detoxification.

Only bulk purified toxoid that complies with the following requirements may be used in the preparation of the final bulk vaccine.

#### **Sterility (2.6.1)**

Carry out the test for sterility using 10 mL for each medium.

#### **Absence of tetanus toxin**

Inject subcutaneously 1 mL containing at least 500 Lf of bulk purified toxoid into each of 5 healthy guinea-pigs, each weighing 250-350 g, that have not previously been treated with any material that will interfere with the test. If within 21 days of the injection any of the animals shows signs of or dies from tetanus, the toxoid does not comply with the test. If more than 1 animal dies from non-specific causes, repeat the test once; if more than 1 animal dies in the second test, the toxoid does not comply with the test.

#### **Antigenic purity (2.7.27)**

Not less than 1000 Lf per milligram of protein nitrogen.

#### **FINAL BULK VACCINE**

The final bulk vaccine is prepared by adsorption of a suitable quantity of bulk purified toxoid onto a mineral carrier such as hydrated aluminium phosphate or aluminium hydroxide; the resulting mixture is approximately isotonic with blood. Suitable antimicrobial preservatives may be added. Certain antimicrobial preservatives, particularly those of the phenolic type, adversely affect the antigenic activity and must not be used.

Only final bulk vaccine that complies with the following requirements may be used in the preparation of the final lot.

#### **Antimicrobial preservative**

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The amount is not less than 85 per cent and not greater than 115 per cent of the intended amount.

#### **Sterility (2.6.1)**

Carry out the test for sterility using 10 mL for each medium.

#### **FINAL LOT**

The final bulk vaccine is distributed aseptically into sterile, tamper-evident containers. The containers are closed so as to prevent contamination.

Only a final lot that is satisfactory with respect to each of the requirements given below under Identification, Tests and Assay may be released for use. Provided the test for antimicrobial preservative and the assay have been carried out with satisfactory results on the final bulk vaccine, they may be omitted on the final lot.

Provided the free formaldehyde content has been determined on the bulk purified toxoid or on the final bulk and it has been shown that the content in the final lot will not exceed 0.2 g/L, the test for free formaldehyde may be omitted on the final lot.

#### **IDENTIFICATION**

Tetanus toxoid is identified by a suitable immunochemical method (2.7.1). The following method, applicable to certain vaccines, is given as an example. Dissolve in the vaccine to be examined sufficient sodium citrate R to give a 100 g/L solution. Maintain at 37 °C for about 16 h and centrifuge until a clear supernatant is obtained. The clear supernatant reacts with a suitable tetanus antitoxin, giving a precipitate.

#### **TESTS**

##### **Aluminium (2.5.13)**

Maximum 1.25 mg per single human dose, if aluminium hydroxide or hydrated aluminium phosphate is used as the adsorbent.

##### **Free formaldehyde (2.4.18)**

Maximum 0.2 g/L.

##### **Antimicrobial preservative**

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical method. The content is not less than the minimum amount shown to be effective and is not greater than 115 per cent of the quantity stated on the label.

##### **Sterility (2.6.1)**

The vaccine complies with the test for sterility.

##### **ASSAY**

Carry out one of the prescribed methods for the assay of tetanus vaccine (adsorbed) (2.7.8).

The lower confidence limit ( $P = 0.95$ ) of the estimated potency is not less than 40 IU per single human dose.

##### **LABELLING**

The label states:

- the minimum number of International Units per single human dose,
- the name and the amount of the adsorbent,
- that the vaccine must be shaken before use,
- that the vaccine is not to be frozen.

Ph Eur

## Tick-borne Encephalitis Vaccine, Inactivated

(Tick-borne Encephalitis Vaccine (Inactivated),

Ph. Eur. monograph 1375)

The label may state 'Tic/enceph'.

Ph Eur

#### **DEFINITION**

Tick-borne encephalitis vaccine (inactivated) is a liquid preparation of a suitable strain of tick-borne encephalitis virus grown in cultures of chick-embryo cells or other suitable cell cultures and inactivated by a suitable, validated method.

#### **PRODUCTION**

##### **GENERAL PROVISIONS**

Production of the vaccine is based on a virus seed-lot system. The production method shall have been shown to yield consistently vaccines comparable with the vaccine of proven clinical efficacy and safety in man. Unless otherwise justified and authorised, the virus in the final vaccine shall not have undergone more passages from the master seed lot than the virus in the vaccine used in clinical trials.

##### **SUBSTRATE FOR VIRUS PROPAGATION**

The virus is propagated in chick embryo cells prepared from eggs derived from a chicken flock free from specified pathogens (5.2.2) or in other suitable cell cultures (5.2.3).

##### **SEED LOTS**

The strain of virus used is identified by historical records that include information on the origin of the strain and its subsequent manipulation. Virus seed lots are stored at or below -60 °C.

Only a seed lot that complies with the following requirements may be used for virus propagation.

##### **Identification**

Each seed lot is identified as containing the vaccine strain of tick-borne encephalitis virus by a suitable immunochemical method (2.7.1), preferably using monoclonal antibodies.

**Virus concentration**

The virus concentration of each seed lot is determined by titration in suitable cell cultures to monitor consistency of production.

**Extraneous agents (2.6.16)**

Each seed lot complies with the requirements for extraneous agents in viral vaccines for human use. For neutralisation of the vaccine virus, the use of monoclonal antibodies is preferable.

**VIRUS PROPAGATION AND HARVEST**

If the virus has been passaged in mouse brain during preparation of the master seed lot, not fewer than 2 passages of the master seed virus in cell culture are made before inoculation of the production cell culture.

All processing of the cell cultures is performed under aseptic conditions in an area where no other cells are being handled. Serum and trypsin used in the preparation of cell suspensions and media used must be shown to be free from extraneous agents. The cell culture media may contain a pH indicator such as phenol red and approved antibiotics at the lowest effective concentration. At least 500 mL of the cell cultures employed for vaccine production is set aside as uninfected cell cultures (control cells).

Only a single harvest that complies with the following requirements may be used in the preparation of the inactivated harvest.

**Identification**

The single harvest is shown to contain tick-borne encephalitis virus by a suitable immunochemical method (2.7.1), preferably using monoclonal antibodies, or by virus neutralisation in cell cultures.

**Bacterial and fungal contamination**

The single harvest complies with the test for sterility (2.6.1), carried out using 10 mL for each medium.

**Mycoplasmas (2.6.7)**

The single harvest complies with the test for mycoplasmas carried out using 1 mL for each medium.

**Control cells**

The control cells comply with the tests for extraneous agents (2.6.16). If the vaccine is produced using a cell-bank system, the control cells comply with a test for identification.

**Virus concentration**

Determine the virus concentration by titration in suitable cell cultures to monitor consistency of production.

**INACTIVATION**

To avoid interference, viral aggregates are removed, where necessary, by filtration immediately before the inactivation process. The virus suspension is inactivated by a validated method; the method shall have been shown to be consistently capable of inactivating tick-borne encephalitis virus without destroying the antigenic and immunogenic activity; as part of the validation studies, an inactivation curve is plotted representing residual live virus concentration measured on not fewer than 3 occasions. If formaldehyde is used for inactivation, the presence of an excess of free formaldehyde is verified at the end of the inactivation process.

Only an inactivated harvest that complies with the following requirements may be used in the preparation of the final bulk vaccine.

**Residual infective virus**

Inoculate a quantity of the inactivated harvest equivalent to not less than 10 human doses of vaccine in the final lot into primary chicken fibroblast cell cultures, or other cells shown to be at least as sensitive to tick-borne encephalitis virus, with

not less than 3 cm<sup>2</sup> of cell sheet per millilitre of inoculum. Incubate at 37 ± 1 °C for 14 days. No cytopathic effect is detected at the end of the incubation period. Collect the culture fluid and examine for the presence of infective tick-borne encephalitis virus by the following test in mice or by a validated *in vitro* method: inoculate 0.03 mL intracerebrally into each of not fewer than 10 mice about 4 weeks old. Observe the mice for 14 days. They show no evidence of tick-borne encephalitis virus infection.

**PURIFICATION**

Several inactivated single harvests may be pooled before concentration and purification by suitable methods, preferably by continuous-flow, sucrose density-gradient centrifugation.

Several purified inactivated harvests may be pooled.

Only a purified, inactivated harvest that complies with the following requirements may be used in the preparation of the final bulk vaccine.

**Sterility (2.6.1)**

The purified, inactivated harvest complies with the test for sterility carried out using 10 mL for each medium.

**Specific activity**

Determine the antigen content of the purified, inactivated harvest by a suitable immunochemical method (2.7.1). Determine the total protein content by a suitable method. The specific activity, calculated as the antigen content per unit mass of protein, is within the limits approved for the specific product.

**FINAL BULK VACCINE**

The final bulk vaccine is prepared from one or more purified, inactivated harvests.

Only a final bulk vaccine that complies with the following requirement may be used in the preparation of the final lot.

**Sterility (2.6.1)**

The final bulk vaccine complies with the test for sterility, carried out using 10 mL for each medium.

**FINAL LOT**

Only a final lot that is satisfactory with respect to each of the requirements given below under Identification, Tests and Assay may be released for use. Provided that the tests for free formaldehyde, bovine serum albumin (where applicable) and pyrogens and the assay have been carried out with satisfactory results on the final bulk vaccine, they may be omitted on the final lot.

**IDENTIFICATION**

The vaccine is shown to contain tick-borne encephalitis virus antigen by a suitable immunochemical method (2.7.1) using specific antibodies. The assay also serves to identify the vaccine.

**TESTS****Aluminium (2.5.13)**

Maximum 1.25 mg per single human dose, if aluminium hydroxide or hydrated aluminium phosphate is used as the adsorbent.

**Free formaldehyde (2.4.18)**

Maximum 0.1 g/L.

**Bovine serum albumin**

Maximum 50 ng per single human dose, determined by a suitable immunochemical method (2.7.1), if bovine serum albumin has been used during production.

**Sterility (2.6.1)**

The vaccine complies with the test for sterility.

**Pyrogens (2.6.8)**

The vaccine complies with the test for pyrogens. Inject into each rabbit, per kilogram of body mass, 1 dose of vaccine.

**ASSAY**

The potency is determined by comparing the dose necessary to protect a given proportion of mice against the effects of a lethal dose of tick-borne encephalitis virus, administered intraperitoneally, with the quantity of a reference preparation of tick-borne encephalitis vaccine necessary to provide the same protection. For this comparison an approved reference preparation and a suitable preparation of tick-borne encephalitis virus from an approved strain for use as the challenge preparation are necessary.

*The following is cited as an example of a method that has been found suitable for a given vaccine.*

**Selection and distribution of test animals** Use healthy mice weighing 11-17 g and derived from the same stock. Distribute the mice into not fewer than 6 groups of a suitable size to meet the requirements for validity of the test; for titration of the challenge suspension, use not fewer than 4 groups of 10 mice. Use mice of the same sex or distribute males and females equally between groups.

**Determination of potency of the vaccine** Prepare not fewer than 3 suitable dilutions of the vaccine to be examined and of the reference preparation; in order to comply with validity criteria 4 or 5 dilutions will usually be necessary. Prepare dilutions such that the most concentrated suspension is expected to protect more than 50 per cent of the animals and the least concentrated suspension less than 50 per cent. Allocate each dilution to a different group of mice and inject subcutaneously into each mouse 0.2 mL of the dilution allocated to its group. 7 days later make a second injection using the same dilution scale. 14 days after the second injection prepare a suspension of the challenge virus containing not less than 100 LD<sub>50</sub> in 0.2 mL. Inject 0.2 mL of this virus suspension intraperitoneally into each vaccinated mouse. To verify the challenge dose, prepare a series of not fewer than 3 dilutions of the challenge virus suspension at not greater than one-hundredfold intervals. Allocate the challenge suspension and all of the dilutions, one to each of the groups of 10 mice, and inject intraperitoneally into each mouse 0.2 mL of the challenge suspension or the dilution allocated to its group. Observe the animals for 21 days after the challenge and record the number of mice that die in the period between 7 and 21 days after the challenge. Humane endpoints may be used to avoid unnecessary suffering of animals after the virulent challenge.

**Calculations** Calculate the results for an assay with quantal responses by the usual statistical methods (for example, 5.3).

**Validity criteria** The test is not valid unless:

- the concentration of the challenge virus is not less than 100 LD<sub>50</sub>,
- for both the vaccine to be examined and the reference preparation the 50 per cent protective dose (PD<sub>50</sub>) lies between the largest and smallest doses given to the mice,
- the statistical analysis shows a significant slope and no significant deviation from linearity and parallelism of the dose-response lines,
- the confidence limits ( $P = 0.95$ ) are not less than 33 per cent and not more than 300 per cent of the estimated potency.

**Potency requirement** Include all valid tests to estimate the mean potency and the confidence limits ( $P = 0.95$ ) for the mean potency; compute weighted means with the inverse of the squared standard error as weights. The vaccine complies

with the test if the estimated potency is not less than that approved by the competent authority, based on data from clinical efficacy trials.

**LABELLING**

*The label states:*

- the strain of virus used in preparation,
- the type of cells used for production of the vaccine.

Ph Eur

**Typhoid Polysaccharide Vaccine**

(Ph. Eur. monograph 1160)

The label may state 'Typhoid'.

Ph Eur

**DEFINITION**

Typhoid polysaccharide vaccine is a preparation of purified Vi capsular polysaccharide obtained from *Salmonella typhi* Ty 2 strain or some other suitable strain that has the capacity to produce Vi polysaccharide.

Capsular Vi polysaccharide consists of partly 3-O-acetylated repeated units of 2-acetyl-amino-2-deoxy-D-galactopyranuronic acid with  $\alpha$ -(1→4) linkages.

**PRODUCTION**

The production of Vi polysaccharide is based on a seed-lot system. The method of production shall have been shown to yield consistently typhoid polysaccharide vaccines of adequate immunogenicity and safety in man.

**BACTERIAL SEED LOTS**

The strain of *S. typhi* used for the master seed lot shall be identified by historical records that include information on its origin and by its biochemical and serological characteristics. Cultures from the working seed lot shall have the same characteristics as the strain that was used to prepare the master seed lot.

Only a strain that has the following characteristics may be used in the preparation of the vaccine: (a) stained smears from a culture are typical of enterobacteria; (b) the culture utilises glucose without production of gas; (c) colonies on agar are oxidase-negative; (d) a suspension of the culture agglutinates specifically with a suitable Vi antiserum or colonies form haloes on an agar plate containing a suitable Vi antiserum.

The purity of the bacterial strain used for the seed lot is verified by methods of suitable sensitivity. These may include inoculation into suitable media, examination of colony morphology, microscopic examination of Gram-stained smears and culture agglutination with suitable specific antisera.

**CULTURE AND HARVEST**

The working seed lot is cultured on a solid medium, which may contain blood-group substances, or a liquid medium; the inoculum obtained is transferred to a liquid medium which is used to inoculate the final medium. The liquid medium used and the final medium are semi-synthetic, free from substances that are precipitated by cetrimonium bromide and do not contain blood-group substances or high-molecular-mass polysaccharides, unless it has been demonstrated that they are removed by the purification process.

The bacterial purity of the culture is verified by methods of suitable sensitivity. These may include inoculation into suitable media, examination of colony morphology,

microscopic examination of Gram-stained smears and culture agglutination with suitable specific antisera.

The culture is then inactivated at the beginning of the stationary phase by the addition of formaldehyde. Bacterial cells are eliminated by centrifugation; the polysaccharide is precipitated from the culture medium by addition of hexadecyltrimethylammonium bromide (cetrimonium bromide). The precipitate is harvested and may be stored at  $-20^{\circ}\text{C}$  before purification.

#### **PURIFIED VI POLYSACCHARIDE**

The polysaccharide is purified, after dissociation of the polysaccharide/cetrimonium bromide complex, using suitable procedures to eliminate successively nucleic acids, proteins and lipopolysaccharides. The polysaccharide is precipitated as the calcium salt in the presence of ethanol and dried at  $2-8^{\circ}\text{C}$ ; the powder obtained constitutes the purified Vi polysaccharide. The loss on drying is determined by thermogravimetry (2.2.34) and is used to calculate the results of the chemical tests shown below with reference to the dried substance.

Only a purified Vi polysaccharide that complies with the following requirements may be used in the preparation of the final bulk.

#### **Protein (2.5.16)**

Maximum 10 mg per gram of polysaccharide, calculated with reference to the dried substance.

#### **Nucleic acids (2.5.17)**

Maximum 20 mg per gram of polysaccharide, calculated with reference to the dried substance.

#### **O-Acetyl groups (2.5.19)**

Minimum 2 mmol per gram of polysaccharide, calculated with reference to the dried substance.

#### **Molecular-size or molecular-mass distribution**

Molecular-size or molecular-mass distribution is determined by size-exclusion chromatography (2.2.30) combined with an appropriate detection system. An acceptable value is established for the purified polysaccharide. Each batch must be shown to comply with this limit.

#### **Identification**

Carry out an identification test using a suitable immunochemical method (2.7.1).

#### **Bacterial endotoxins**

The content of bacterial endotoxins determined by a suitable method (2.6.14) is within the limits approved for the specific product.

#### **FINAL BULK VACCINE**

One or more batches of purified Vi polysaccharide are dissolved in a suitable solvent, which may contain an antimicrobial preservative, so that the volume corresponding to 1 dose contains 25  $\mu\text{g}$  of polysaccharide and the solution is isotonic with blood (250 mosmol/kg to 350 mosmol/kg).

Only a final bulk vaccine that complies with the following tests may be used in the preparation of the final lot.

#### **Sterility (2.6.1)**

The final bulk vaccine complies with the test for sterility, carried out using 10 mL for each medium.

#### **Antimicrobial preservative**

Where applicable, determine the amount of antimicrobial preservative by a suitable physico-chemical method. The amount is not less than 85 per cent and not greater than 115 per cent of the intended amount.

#### **FINAL LOT**

The final bulk vaccine is distributed aseptically into sterile tamper-evident containers that are then closed so as to prevent contamination.

Only a final lot that is satisfactory with respect to each of the requirements prescribed below under Identification, Tests and Assay and with the requirement for bacterial endotoxins may be released for use. Provided the tests for free formaldehyde and antimicrobial preservative have been carried out on the final bulk vaccine, they may be omitted on the final lot.

#### **Bacterial endotoxins**

The content of bacterial endotoxins determined by a suitable method (2.6.14) is within the limit approved for the specific product.

#### **CHARACTERS**

Clear colourless liquid, free from visible particles.

#### **IDENTIFICATION**

Carry out an identification test using a suitable immunochemical method (2.7.1).

#### **TESTS**

##### **pH (2.2.3)**

6.5 to 7.5.

##### **O-Acetyl groups**

0.085 ( $\pm 25$  per cent)  $\mu\text{mol}$  per dose (25  $\mu\text{g}$  of polysaccharide).

*Test solution* Place 3 mL of the vaccine in each of 3 tubes (2 reaction solutions and 1 correction solution).

*Reference solutions* Dissolve 0.150 g of *acetylcholine chloride R* in 10 mL of *water R* (stock solution containing 15 g/L of acetylcholine chloride). Immediately before use, dilute 0.5 mL of the stock solution to 50 mL with *water R* (working dilution containing 150  $\mu\text{g}/\text{mL}$  of acetylcholine chloride).

In 10 tubes, place in duplicate (reaction and correction solutions) 0.1 mL, 0.2 mL, 0.5 mL, 1.0 mL and 1.5 mL of the working dilution.

Prepare a blank using 3 mL of *water R*.

Make up the volume in each tube to 3 mL with *water R*. Add 0.5 mL of a mixture of 1 volume of *water R* and 2 volumes of *dilute hydrochloric acid R* to each of the correction tubes and to the blank. Add 1.0 mL of *alkaline hydroxylamine solution R* to each tube. Allow the reaction to proceed for exactly 2 min and add 0.5 mL of a mixture of 1 volume of *water R* and 2 volumes of *dilute hydrochloric acid R* to each of the reaction tubes. Add 0.5 mL of a 200 g/L solution of *ferric chloride R* in 0.2 M *hydrochloric acid* to each tube, stopper the tubes and shake vigorously to remove bubbles.

Measure the absorbance (2.2.25) of each solution at 540 nm using the blank as the compensation liquid. For each reaction solution, subtract the absorbance of the corresponding correction solution. Draw a calibration curve from the corrected absorbances for the 5 reference solutions and the corresponding content of acetylcholine chloride and read from the curve the content of acetylcholine chloride in the test solution for each volume tested. Calculate the mean of the 2 values.

1 mole of acetylcholine chloride (181.7 g) is equivalent to 1 mole of O-acetyl (43.05 g).

##### **Free formaldehyde (2.4.18)**

Maximum 0.2 g/L.

**Antimicrobial preservative**

Where applicable, determine the amount of antimicrobial preservative by a suitable physico-chemical method. The content is not less than the minimum amount shown to be effective and not more than 115 per cent of the content stated on the label. If phenol has been used in the preparation, the content is not more than 2.5 g/L (2.5.15).

**Sterility (2.6.1)**

The vaccine complies with the test for sterility.

**ASSAY**

Determine Vi polysaccharide by a suitable immunochemical method (2.7.1), using a reference purified polysaccharide. The estimated amount of polysaccharide per dose is 80 per cent to 120 per cent of the content stated on the label. The confidence limits ( $P = 0.95$ ) of the estimated amount of polysaccharide are not less than 80 per cent and not more than 120 per cent.

**LABELLING**

The label states:

- the number of micrograms of polysaccharide per single human dose (25 µg);
- the total quantity of polysaccharide in the container.

Ph Eur

**Typhoid Vaccine**

(Ph. Eur. monograph 0156)

The label may state 'Typhoid'.

Ph Eur

**DEFINITION**

Typhoid vaccine is a sterile suspension of inactivated *Salmonella typhi* containing not less than  $5 \times 10^8$  and not more than  $1 \times 10^9$  bacteria (*S. typhi*) per human dose. The human dose does not exceed 1.0 mL.

**PRODUCTION**

The vaccine is prepared using a seed-lot system from a suitable strain, such as Ty 2<sup>1</sup>, of *S. typhi*. The final vaccine represents not more than 3 subcultures from the strain on which were made the laboratory and clinical tests that showed it to be suitable. The bacteria are inactivated by acetone, by formaldehyde, by phenol or by heating or by a combination of the last 2 methods.

**IDENTIFICATION**

It is identified by specific agglutination.

**TESTS****Phenol (2.5.15)**

If phenol has been used in the preparation, the concentration is not more than 5 g/L.

**Antigenic power**

When injected into susceptible laboratory animals, it elicits anti-O, anti-H and, to a lesser extent, anti-Vi agglutinins.

**Sterility (2.6.1)**

It complies with the test for sterility.

**LABELLING**

The label states:

- the method used to inactivate the bacteria;
- the number of bacteria per human dose.

Ph Eur

**Typhoid (Strain Ty 21a) Vaccine, Live (Oral)**

(Typhoid Vaccine (Live, Oral, Strain Ty 21a), Ph. Eur. monograph 1055)

The label may state 'Typhoid (live, oral)'.

Ph Eur

**DEFINITION**

Typhoid vaccine (live, oral, strain Ty 21a) is a freeze-dried preparation of live *Salmonella typhi* strain Ty 21a grown in a suitable medium. When presented in capsules, the vaccine complies with the monograph *Capsules (0016)*.

**PRODUCTION****CHOICE OF VACCINE STRAIN**

The main characteristic of the strain is the defect of the enzyme uridine diphosphate-galactose-4-epimerase. The activities of galactopermease, galactokinase and galactose-1-phosphate uridyl-transferase are reduced by 50 per cent to 90 per cent. Whatever the growth conditions, the strain does not contain Vi antigen. The strain agglutinates to anti-O:9 antiserum only if grown in medium containing galactose. It contains the flagellar H:d antigen and does not produce hydrogen sulfide on Kligler iron agar. The strain is nonvirulent for mice. Cells of strain Ty 21a lyse if grown in the presence of 1 per cent of galactose.

**BACTERIAL SEED LOTS**

The vaccine is prepared using a seed-lot system. The working seed lots represent not more than one subculture from the master seed lot. The final vaccine represents not more than four subcultures from the original vaccine on which were made the laboratory and clinical tests showing the strain to be suitable.

Only a master seed lot that complies with the following requirements may be used in the preparation of working seed lots.

**Galactose metabolism**

In a spectrophotometric assay, no activity of the enzyme uridine diphosphate-galactose-4-epimerase is found in the cytoplasm of strain Ty 21a compared to strain Ty 2.

**Biosynthesis of lipopolysaccharide**

Lipopolysaccharides are extracted by the hot-phenol method and examined by size-exclusion chromatography. Strain Ty 21a grown in medium free of galactose shows only the rough (R) type of lipopolysaccharide.

**Serological characteristics**

Strain Ty 21a grown in a synthetic medium without galactose does not agglutinate to specific anti-O:9 antiserum. Whatever the growth conditions, strain Ty 21a does not agglutinate to Vi antiserum. Strain Ty 21a agglutinates to H:d flagellar antiserum.

**Biochemical markers**

Strain Ty 21a does not produce hydrogen sulfide on Kligler iron agar. This property serves to distinguish Ty 21a from other galactose-epimerase-negative *S. typhi* strains.

<sup>1</sup> This strain is issued by the World Health Organization Collaborating Centre for Reference and Research on Bacterial Vaccines, Human Serum and Vaccine Institute, Szallas Utea 5, H-1107, Budapest, Hungary.

**Cell growth**

Strain Ty 21a cells lyse when grown in the presence of 1 per cent of galactose.

**BACTERIAL PROPAGATION AND HARVEST**

The bacteria from the working seed lot are multiplied in a preculture, subcultured once and are then grown in a suitable medium containing 0.001 per cent of galactose at 30 °C for 13 h to 15 h. The bacteria are harvested. The harvest must be free from contaminating micro-organisms.

Only a single harvest that complies with the following requirements may be used for the preparation of the freeze-dried harvest.

**pH**

The pH of the culture is 6.8 to 7.5.

**Optical density**

The optical density of the culture, measured at 546 nm, is 6.5 to 11.0. Before carrying out the measurement, dilute the culture so that a reading in the range 0.1 to 0.5 is obtained and correct the reading to take account of the dilution.

**Identification**

Culture bacteria on an agar medium containing 1 per cent of galactose and bromothymol blue. Light blue, concave colonies, transparent due to lysis of cells, are formed. No yellow colonies (galactose-fermenting) are found.

**FREEZE-DRIED HARVEST**

The harvest is mixed with a suitable stabiliser and freeze-dried by a process that ensures the survival of at least 10 per cent of the bacteria and to a water content shown to be favourable to the stability of the vaccine. No antimicrobial preservative is added to the vaccine.

Only a freeze-dried harvest that complies with the following tests may be used for the preparation of the final bulk.

**Identification**

Culture bacteria are examined on an agar medium containing 1 per cent of galactose and bromothymol blue. Light blue, concave colonies, transparent due to lysis of cells, are formed. No yellow colonies (galactose-fermenting) are found.

**Number of live bacteria**

Not fewer than  $1 \times 10^{11}$  live *S. typhi* strain Ty 21a per gram.

**Water (2.5.12)**

1.5 per cent to 4.0 per cent, determined by the semi-micro determination of water.

**FINAL BULK VACCINE**

The final bulk vaccine is prepared by mixing under suitable conditions one or more freeze-dried harvests with suitable excipients.

Only a final bulk that complies with the following requirement may be used in the preparation of the final lot.

**Number of live bacteria**

Not fewer than  $40 \times 10^9$  live *S. typhi* strain Ty 21a per gram.

**FINAL LOT**

The final bulk vaccine is distributed under suitable conditions into capsules with a gastro-resistant shell or into suitable containers.

Only a final lot that is satisfactory with respect to each of the requirements given below under Identification, Tests and Number of live bacteria may be released for use, except that in the determination of the number of live bacteria each dosage unit must contain not fewer than  $4 \times 10^9$  live bacteria.

**IDENTIFICATION**

Culture bacteria from the vaccine to be examined on an agar medium containing 1 per cent of galactose and bromothymol blue. Light blue, concave colonies, transparent due to lysis of cells, are formed. No yellow colonies (galactose-fermenting) are found.

**TESTS****Microbial contamination**

Inoculate at least a total of  $2 \times 10^9$  live *S. typhi* Ty 21a on at least 10 plates of casein soya bean digest agar and on at least 10 plates of Sabouraud-dextrose agar. Incubate in aerobic conditions the plates of casein soya bean digest agar at 30-35 °C for 3-5 days and the plates of Sabouraud-dextrose agar at 20-25 °C for 5-7 days. Observe the plates for conspicuous colonies of micro-organisms in a lawn of weakly growing *S. typhi* Ty 21a. The number of contaminating micro-organisms per dosage unit is not greater than  $10^2$  bacteria and 20 fungi.

Carry out the test for specified micro-organisms on selective media and under cultivation conditions as indicated in Table 1055.-1. Test a dose equivalent to at least  $2 \times 10^9$  live *S. typhi* Ty 21a.

Growth-promoting and inhibitory properties of the media used and suitability of the testing conditions are demonstrated.

Composition of culture media listed in Table 1055.-1 that are not described in general chapter 2.6.13. *Microbiological examination of non-sterile products: test for specified micro-organisms.*

**Mannitol salt broth**

Proteose peptone	10.0 g
Beef extract	1.5 g
Sodium chloride	75.0 g
D-Mannitol	10.0 g
Purified water	1000 mL

**Acetamide broth**

Acetamide	2.0 g
Magnesium sulfate	0.2 g
Sodium chloride	0.2 g
Ferric sulfate	0.0005 g
Potassium dihydrogen phosphate	1.0 g
Sodium molybdate	0.005 g
Purified water	1000 mL

**Bromothymol blue galactose broth**

Heart infusion broth	25.0 g
Sodium chloride	5.0 g
Purified water	930 mL

Sterilise the medium and cool to 45 °C, then add 1.0 g of sodium thiosulfate, 40 mL of bromothymol blue solution and 30 mL of galactose solution.

**Bromothymol blue galactose agar**

Heart infusion agar	40.0 g
Sodium chloride	5.0 g
Purified water	930 mL

Sterilise the medium and cool to 45 °C, then add 1.0 g of sodium thiosulfate, 40 mL of bromothymol blue solution and 30 mL of galactose solution.

**Bromothymol blue solution**

Bromothymol blue	2.0 g
0.1 M sodium hydroxide	50 mL
Purified water	950 mL

*Galactose solution*

D-galactose 33.0 g  
Purified water 100 mL

The product complies with the test if no colonies of *Escherichia coli*, *Staphylococcus aureus*, *Pseudomonas aeruginosa* or clostridia, and no salmonella other than strain Ty 21a, are found.

**Water (2.5.12)**

1.5 per cent to 4.0 per cent, determined on the contents of the capsule or of the container by the semi-micro determination of water.

**NUMBER OF LIVE BACTERIA**

Carry out the test using not fewer than 5 dosage units. Homogenise the contents of the dosage units in a 9 g/L solution of *sodium chloride R* at 4 °C using a mixer in a cold room with sufficient glass beads to emerge from the liquid. Immediately after homogenisation prepare a suitable dilution of the suspension using cooled diluent and inoculate brain heart infusion agar; incubate at 36 ± 1 °C for 20 h to 36 h. The vaccine contains not fewer than 2 × 10<sup>9</sup> live *S. typhi* Ty 21a bacteria per dosage unit.

**LABELLING**

The label states:

- the minimum number of live bacteria per dosage unit;
- that the vaccine is for oral use only.

Table 1055.-1. – Test for specified micro-organisms: pre-incubation and subculture conditions

Micro-organism	Pre-incubation 1	Pre-incubation 2	Subculture
<i>Staphylococcus aureus</i>	Mannitol salt broth 30-35 °C 40-48 h		Mannitol salt agar* 30-35 °C 18-72 h
<i>Pseudomonas aeruginosa</i>	Acetamide broth 30-35 °C 40-48 h		Cetrimide agar* 30-35 °C 18-72 h

\*Culture media recommended for identification of specified micro-organisms (see general chapter 2.6.13 for composition)

**Varicella Vaccine (Live)**

(Ph. Eur. monograph 0648)

The label may state 'Var(live)'.

Ph Eur

**DEFINITION**

Varicella vaccine (live) is a freeze-dried preparation of a suitable attenuated strain of human herpesvirus 3. The vaccine is reconstituted immediately before use, as stated on the label, to give a clear liquid that may be coloured owing to the presence of a pH indicator.

**PRODUCTION**

The production of vaccine is based on a virus seed-lot system and a cell-bank system. The production method shall have been shown to yield consistently live varicella vaccines of adequate immunogenicity and safety in man. The virus in the final vaccine shall not have been passaged in cell cultures beyond a defined number of passages approved by the competent authority from the original isolated virus.

The potential neurovirulence of the vaccine strain is considered during preclinical development, based on available epidemiological data on neurovirulence and neurotropism, primarily for the wild-type virus. In light of this, a risk analysis is carried out. Where necessary and if available, a test is carried out on the vaccine strain using an animal model that differentiates wild-type and attenuated virus; tests on strains of intermediate attenuation may also be needed.

**SUBSTRATE FOR VIRUS PROPAGATION**

The virus is propagated in human diploid cells (5.2.3).

**VIRUS SEED LOT**

The strain of human herpesvirus 3 used shall be identified as being suitable by historical records that include information on the origin of the strain and its subsequent manipulation. The virus shall at no time have been passaged in continuous cell lines. Seed lots are prepared in the same kind of cells as those used for the production of the final vaccine. Virus seed lots are prepared in large quantities and stored at temperatures below -20 °C if freeze-dried, or below -60 °C if not freeze-dried.

Only a virus seed lot that complies with the following requirements may be used for virus propagation.

**Identification**

The master and working seed lots are identified as human herpesvirus 3 by serum neutralisation in cell culture, using specific antibodies.

**Virus concentration**

The virus concentration of the master and working seed lots is determined as prescribed under Assay to monitor consistency of production.

**Extraneous agents (2.6.16)**

The working seed lot complies with the requirements for seed lots for live virus vaccines; a sample of 50 mL is taken for the test in cell cultures.

**VIRUS PROPAGATION AND HARVEST**

All processing of the cell bank and subsequent cell cultures is done under aseptic conditions in an area where no other cells or viruses are being handled. Approved animal (but not human) serum may be used in the culture media. Serum and trypsin used in the preparation of cell suspensions and media are shown to be free from extraneous agents. The cell culture medium may contain a pH indicator such as phenol red and approved antibiotics at the lowest effective concentration.

It is preferable to have a substrate free from antibiotics during production. 5 per cent, but not less than 50 mL, of the cell cultures employed for vaccine production is set aside as uninfected cell cultures (control cells). The infected cells constituting a single harvest are washed, released from the support surface and pooled. The cell suspension is disrupted by sonication.

Only a virus harvest that complies with the following requirements may be used in the preparation of the final bulk vaccine.

#### Identification

The virus harvest contains virus that is identified as human herpesvirus 3 by serum neutralisation in cell culture, using specific antibodies.

#### Virus concentration

The concentration of infective virus in virus harvests is determined as prescribed under Assay to monitor consistency of production and to determine the dilution to be used for the final bulk vaccine.

#### Extraneous agents (2.6.16)

Use 50 mL for the test in cell cultures.

#### Control cells

The control cells of the production cell culture from which the single harvest is derived comply with a test for identity and with the requirements for extraneous agents (2.6.16).

#### FINAL BULK VACCINE

Virus harvests that comply with the above tests are pooled and clarified to remove cells. A suitable stabiliser may be added and the pooled harvests diluted as appropriate.

Only a final bulk vaccine that complies with the following requirements may be used in the preparation of the final lot.

#### Bacterial and fungal contamination

Carry out the test for sterility (2.6.1) using 10 mL for each medium.

#### FINAL LOT

The final bulk vaccine is distributed aseptically into sterile, tamper-evident containers and freeze-dried to a moisture content shown to be favourable to the stability of the vaccine. The containers are then closed so as to prevent contamination and the introduction of moisture.

Only a final lot that is satisfactory with respect to the test for water and each of the requirements given below under Identification, Tests and Assay may be released for use. Provided that the test for bovine serum albumin has been carried out with satisfactory results on the final bulk vaccine, it may be omitted on the final lot.

#### Water (2.5.12)

Not more than the amount shown to ensure stability of the vaccines as approved by the competent authority, determined by the semi-micro determination of water.

#### IDENTIFICATION

When the vaccine reconstituted as stated on the label is mixed with specific human herpesvirus 3 antibodies, it is no longer able to infect susceptible cell cultures.

#### TESTS

##### Bacterial and fungal contamination

The reconstituted vaccine complies with the test for sterility (2.6.1).

##### Bovine serum albumin

Maximum 0.5 µg per human dose, determined by a suitable immunochemical method (2.7.1).

#### ASSAY

Titrate the vaccine for infective virus, using at least 3 separate vials of vaccine. Titrate 1 vial of an appropriate virus reference preparation in triplicate to validate each assay. The virus concentration of the reference preparation is monitored using a control chart and a titre is established on a historical basis by each laboratory. The relation with the appropriate European Pharmacopoeia Biological Reference Preparation is established and monitored at regular intervals if a manufacturer's reference preparation is used. Calculate the individual virus concentration for each vial of vaccine and for each replicate of the reference preparation as well as the corresponding combined virus concentrations, using the usual statistical methods (for example, 5.3). The combined estimate of the virus concentration for the 3 vials of vaccine is not less than that stated on the label.

The assay is not valid if:

- the confidence interval ( $P = 0.95$ ) of the estimated virus concentration of the reference preparation for the 3 replicates combined is greater than  $\pm 0.3 \log_{10}$  PFU;
- the virus concentration of the reference preparation differs by more than  $0.5 \log_{10}$  PFU from the established value.

The assay is repeated if the confidence interval ( $P = 0.95$ ) of the combined virus concentration of the vaccine is greater than  $\pm 0.3 \log_{10}$  PFU; data obtained from valid assays only are combined by the usual statistical methods (for example, 5.3) to calculate the virus concentration of the sample. The confidence interval ( $P = 0.95$ ) of the combined virus concentration is not greater than  $\pm 0.3 \log_{10}$  PFU.

*Varicella vaccine (live) BRP* is suitable for use as a reference preparation.

Where justified and authorised, different assay designs may be used; this may imply the application of different validity and acceptance criteria. However, the vaccine must comply if tested as described above.

#### LABELLING

The label states:

- the strain of virus used for the preparation of the vaccine;
- the type and origin of the cells used for the preparation of the vaccine;
- the minimum virus concentration;
- that contact between the vaccine and disinfectants is to be avoided.

Ph Eur

## Yellow Fever Vaccine, Live

(Yellow Fever Vaccine (Live), Ph. Eur. monograph 0537)

Ph Eur

#### DEFINITION

Yellow fever vaccine (live) is a freeze-dried preparation of yellow fever virus derived from the 17D strain and grown in fertilised hen eggs. The vaccine is reconstituted immediately before use, as stated on the label, to give a clear liquid.

#### PRODUCTION

The production of vaccine is based on a virus seed-lot system. The production method shall have been shown to yield consistently yellow fever vaccine (live) of acceptable immunogenicity and safety for man.

**Reference preparation** In the test for neurotropism, a suitable batch of vaccine known to have satisfactory properties in man is used as the reference preparation.

A reference preparation calibrated in International Units per ampoule is used to verify the titre of the virus inoculum in the tests for viraemia (viscerotropism) and immunogenicity, and to titrate the vaccine batch in the potency assay.

The International Unit is the activity contained in a stated quantity of the International Standard. The equivalence in International Units of the International Standard is stated by the World Health Organization.

#### **SUBSTRATE FOR VIRUS PROPAGATION**

Virus for the preparation of master and working seed lots and of all vaccine batches is grown in the tissues of chick embryos from a flock free from specified pathogens (SPF) (5.2.2).

#### **SEED LOTS**

The 17D strain shall be identified by historical records that include information on the origin of the strain and its subsequent manipulation. Virus seed lots are prepared in large quantities and stored at a temperature below  $-60^{\circ}\text{C}$ . Master and working seed lots shall not contain any human protein, added serum or antibiotics.

Unless otherwise justified and authorised, the virus in the final vaccine shall be between passage levels 204 and 239 from the original isolate of strain 17D. A working seed lot shall be only 1 passage from a master seed lot. A working seed lot shall be used without intervening passage as the inoculum for infecting the tissues used in the production of a vaccine lot, so that no vaccine virus is more than 1 passage from a seed lot that has passed all the safety tests.

Only a virus seed lot that complies with the following requirements may be used for virus propagation.

#### **Identification**

The master and working seed lots are identified as containing yellow fever virus by serum neutralisation in cell culture using specific antibodies, or by molecular methods (e.g. nucleic acid amplification techniques (NAT), sequencing).

#### **Extraneous agents (2.6.16)**

Each master seed lot complies with the following tests:

- bacterial and fungal sterility (as described in chapter 2.6.16 under Virus seed lot and virus harvests);
- mycoplasmas (as described in chapter 2.6.16 under Virus seed lot and virus harvests);
- mycobacteria (as described in chapter 2.6.16 under Virus seed lot and virus harvests).

#### **Avian leucosis viruses**

For each master seed lot, the absence of avian leucosis viruses is verified using a suitable method.

#### **Extraneous agents (2.6.16)**

Each working seed lot complies with the following tests:

- bacterial and fungal sterility (as described in chapter 2.6.16 under Virus seed lot and virus harvests);
- mycoplasmas (as described in chapter 2.6.16 under Virus seed lot and virus harvests);
- mycobacteria (as described in chapter 2.6.16 under Virus seed lot and virus harvests);
- test in cell culture for other extraneous agents: a neutralised sample of 5 mL of working seed lot, representing at least 500 000 ( $5.7 \log_{10}$ ) IU, is tested for the presence of extraneous agents by inoculation into continuous simian kidney and human cell cultures as well as into primary chick-embryo-fibroblast cells; the cells are incubated at  $36 \pm 1^{\circ}\text{C}$  and observed for a period of

14 days; the working seed lot passes the test if there is no evidence of the presence of any extraneous agents; the test is not valid unless at least 80 per cent of the cell cultures remain viable;

- avian viruses: a neutralised sample of 1 mL of working seed lot, representing at least 100 000 ( $5.0 \log_{10}$ ) IU, is tested for the presence of avian viruses by inoculation by the allantoic route into a group of at least 20 fertilised, 9- to 11-day-old, SPF eggs (5.2.2), and by inoculation into the yolk sac of a group of at least 20 fertilised, 5- to 7-day-old, SPF eggs (5.2.2); incubate for 7 days; the working seed lot complies if the allantoic and yolk sac fluids show no signs of haemagglutinating agents and if the embryos and chorio-allantoic membranes examined to detect any macroscopic pathology are typical; the test is not valid unless at least 80 per cent of the inoculated eggs survive during the 7-day observation period.

#### **Avian leucosis viruses**

For each working seed lot, the absence of avian leucosis viruses is verified using a suitable method.

#### **Tests in monkeys**

Each master and working seed lot complies with the following tests in monkeys for viraemia (viscerotropism), immunogenicity and neurotropism.

The monkeys shall be *Macaca* sp. susceptible to yellow fever virus and shall have been shown to be non-immune to yellow fever at the time of injecting the seed virus. They shall be healthy and shall not have received previously intracerebral or intraspinal inoculation. Furthermore, they shall not have been inoculated by other routes with neurotropic viruses or with antigens related to yellow fever virus. Not fewer than 10 monkeys are used for each test.

Use a test dose of 0.25 mL containing the equivalent of not less than 5000 ( $3.7 \log_{10}$ ) IU and not more than 50 000 ( $4.7 \log_{10}$ ) IU, determined by an *in vitro* titration for infectious virus in cell culture. Inject the test dose into 1 frontal lobe of each monkey under anaesthesia and observe the monkeys for not less than 30 days.

**Viraemia (Viscerotropism)** Viscerotropism is indicated by the amount of virus present in serum. Take blood from each of the test monkeys on the 2<sup>nd</sup>, 4<sup>th</sup> and 6<sup>th</sup> days after inoculation and prepare serum from each sample. Prepare 1:10, 1:100 and 1:1000 dilutions from each serum and inoculate each dilution into a group of at least 4 cell culture vessels used for the determination of the virus concentration. The seed lot complies with the test if none of the sera contains more than the equivalent of 500 ( $2.7 \log_{10}$ ) IU in 0.03 mL and at most 1 serum contains more than the equivalent of 100 ( $2.0 \log_{10}$ ) IU in 0.03 mL.

**Immunogenicity** Take blood from each monkey 30 days after the injection of the test dose and prepare serum from each sample. The seed lot complies with the test if at least 90 per cent of the test monkeys are shown to be immune, as determined by examining their sera in the test for neutralisation of yellow fever virus described below.

It has been shown that a low dilution of serum (for example, 1:10) may contain non-specific inhibitors that influence this test; such serum shall be treated to remove inhibitors. Mix dilutions of at least 1:10, 1:40 and 1:160 of serum from each monkey with an equal volume of 17D vaccine virus at a dilution that will yield an optimum number of plaques with the titration method used. Incubate the serum-virus mixtures in a water-bath at  $37^{\circ}\text{C}$  for 1 h and then cool in iced water; add 0.2 mL of each serum-virus mixture to each of 4 cell culture plates and proceed as for the

determination of virus concentration. Inoculate similarly 10 plates with the same amount of virus, plus an equal volume of a 1:10 dilution of monkey serum known to contain no neutralising antibodies to yellow fever virus. At the end of the observation period, compare the mean number of plaques in the plates receiving virus plus non-immune serum with the mean number of plaques in the plates receiving virus plus dilutions of each monkey serum. Not more than 10 per cent of the test monkeys have serum that fails to reduce the number of plaques by 50 per cent at the 1:10 dilution.

**Neurotropism** Neurotropism is assessed from clinical evidence of encephalitis, from incidence of clinical manifestations and by evaluation of histological lesions, in comparison with 10 monkeys injected with the reference preparation. The seed lot is not acceptable if either the onset and duration of the febrile reaction or the clinical signs of encephalitis and pathological findings are such as to indicate a change in the properties of the virus.

#### Clinical evaluation

The monkeys are examined daily for 30 days by personnel familiar with clinical signs of encephalitis in primates (if necessary, the monkeys are removed from their cage and examined for signs of motor weakness or spasticity). The seed lot is not acceptable if in the monkeys injected with it the incidence of severe signs of encephalitis, such as paralysis or inability to stand when stimulated, or mortality is greater than for the reference vaccine. These and other signs of encephalitis, such as paresis, incoordination, lethargy, tremors or spasticity are assigned numerical values for the severity of symptoms by a grading method. Each day each monkey in the test is given a score based on the following scale:

- grade 1: rough coat, not eating;
- grade 2: high-pitched voice, inactive, slow moving;
- grade 3: shaky movements, tremors, incoordination, limb weakness;
- grade 4: inability to stand, limb paralysis or death (a dead monkey receives a daily score of 4 from the day of death until day 30).

A clinical score for a particular monkey is the average of its daily scores; the clinical score for the group is the arithmetic mean of the individual monkey scores. The seed lot is not acceptable if the mean of the clinical severity scores for the group of monkeys inoculated with it is significantly greater ( $P = 0.95$ ) than the mean for the group of monkeys injected with the reference preparation. In addition, special consideration is given to any animal showing unusually severe signs when deciding on the acceptability of the seed lot.

#### Histological evaluation

5 levels of the brain are examined including:

- block I: the corpus striatum at the level of the optic chiasma;
- block II: the thalamus at the level of the mamillary bodies;
- block III: the mesencephalon at the level of the superior colliculi;
- block IV: the pons and cerebellum at the level of the superior olives;
- block V: the medulla oblongata and cerebellum at the level of the mid-inferior olivary nuclei.

Cervical and lumbar enlargements of the spinal cord are each divided equally into 6 blocks; 15  $\mu$ m sections are cut from the tissue blocks embedded in paraffin wax and stained with galloyanin. Numerical scores are given to each hemisection

of the cord and to structures in each hemisection of the brain as listed below. Lesions are scored as follows:

- grade 1 - minimal: 1 to 3 small focal inflammatory infiltrates; degeneration or loss of a few neurons;
- grade 2 - moderate: 4 or more focal inflammatory infiltrates; degeneration or loss of neurons affecting not more than one third of cells;
- grade 3 - severe: moderate focal or diffuse inflammatory infiltration; degeneration or loss of 33-90 per cent of the neurons;
- grade 4 - overwhelming: variable but often severe inflammatory reaction; degeneration or loss of more than 90 per cent of neurons.

It has been found that inoculation of yellow fever vaccine into the monkey brain causes histological lesions in different anatomical formations of the central nervous system with varying frequency and severity (I. S. Levenbook *et al.*, *Journal of Biological Standardization*, 1987, 15, 305-313). Based on these 2 indicators, the anatomical structures can be divided into target, spared and discriminator areas. Target areas are those that show more severe specific lesions in a majority of monkeys irrespective of the degree of neurovirulence of the seed lot. Spared areas are those that show only minimal specific lesions and in a minority of monkeys. Discriminator areas are those where there is a significant increase in the frequency of more severe specific lesions with seed lots having a higher degree of neurovirulence. Discriminator and target areas for *Macaca cynomolgus* and *Macaca rhesus* monkeys are shown in the table below.

Type of monkey	Discriminator areas	Target areas
<i>Macaca cynomolgus</i>	Globus pallidus	Substantia nigra
	Putamen	
	Anterior/median thalamic nucleus	
	Lateral thalamic nucleus	
<i>Macaca rhesus</i>	Caudate nucleus	Substantia nigra
	Globus pallidus	Cervical enlargement
	Putamen	Lumbar enlargement
	Anterior/median thalamic nucleus	
	Lateral thalamic nucleus	
	Cervical enlargement Lumbar enlargement	

Scores for discriminator and target areas are used for the final evaluation of the seed lot. The individual monkey score is calculated from the sum of individual target area scores in each hemisection divided by the number of areas examined. A separate score is calculated similarly for the discriminator areas.

Mean scores for the test group are calculated in 2 ways:

- (1) by dividing the sum of the individual monkey discriminator scores by the number of monkeys; and (2) by dividing the sum of the individual monkey target and discriminator scores by the number of monkeys. These 2 mean scores are taken into account when deciding on the acceptability of the seed lot. The seed lot is not acceptable if either of the mean lesion scores is significantly greater ( $P = 0.95$ ) than for the reference preparation.

#### PROPAGATION AND HARVEST

All processing of the fertilised eggs is done under aseptic conditions in an area where no other infectious agents or cells are handled at the same time. At least 2 per cent but not fewer than 20 and not more than 80 eggs are maintained

as uninfected control eggs. After inoculation and incubation at a controlled temperature, only living and typical chick embryos are harvested. At the time of harvest, the control eggs are treated in the same way as the inoculated eggs to obtain a control embryonic pulp. The age of the embryo at the time of virus harvest is reckoned from the initial introduction of the egg into the incubator and shall be not more than 12 days. After homogenisation and clarification by centrifugation, the extract of embryonic pulp is tested as described below and kept at  $-70^{\circ}\text{C}$  or colder until further processing. Virus harvests may be pooled. No human protein is added to the virus suspension at any stage during production. If stabilisers are added, they shall have been shown to have no antigenic or sensitising properties for man.

Only a single harvest or, where applicable, a pool of single harvests that complies with the following requirements may be used in the preparation of the final bulk vaccine.

#### Identification

The single harvest or pool of single harvests contains virus that is identified as yellow fever virus by serum neutralisation in cell culture using specific antibodies, or by molecular methods (e.g. NAT, sequencing).

#### Bacterial and fungal contamination

The single harvest complies with the test for sterility (2.6.1), carried out using 10 mL for each medium.

#### Mycoplasmas (2.6.7)

The single harvest or pool of single harvests complies with the test for mycoplasmas, carried out using 10 mL.

#### Mycobacteria (2.6.2)

A 5 mL sample of the single harvest or pool of single harvests is tested for the presence of *Mycobacterium* spp. by culture methods known to be sensitive for the detection of these organisms.

#### Embryonic pulp of control eggs

The extract of the control eggs shows no evidence of the presence of any extraneous agents in the tests described below.

*Test in cell culture for other extraneous agents* Inoculate a 5 mL sample of embryonic pulp of the control eggs into continuous simian kidney and human cell cultures as well as into primary chick-embryo-fibroblast cells. The cells are incubated at  $36 \pm 1^{\circ}\text{C}$  and observed for a period of 14 days. The embryonic pulp of the control eggs passes the test if there is no evidence of the presence of any extraneous agents. The test is not valid unless at least 80 per cent of the cell cultures remain viable.

*Avian viruses* Using 0.1 mL per egg, inoculate the embryonic pulp of control eggs: by the allantoic route into a group of 10 fertilised, 9- to 11-day-old, SPF eggs (5.2.2); and into the yolk sac of a group of 10 fertilised, 5- to 7-day-old, SPF eggs (5.2.2). Incubate for 7 days. The embryonic pulp lot of the control eggs complies if the allantoic and yolk sac fluids show no signs of haemagglutinating agents and if the embryos and chorio-allantoic membranes examined to detect any macroscopic pathology are typical. The test is not valid unless at least 80 per cent of the inoculated eggs survive during the 7 day observation period.

#### Virus concentration

In order to calculate the dilution for formulation of the final bulk, each single harvest is titrated as described under Assay.

#### FINAL BULK VACCINE

Single harvests or pools of single harvests that comply with the tests prescribed above are pooled and clarified again.

A test for protein nitrogen content is carried out. A suitable

stabiliser may be added and the pooled harvests diluted as appropriate.

Only a final bulk vaccine that complies with the following requirements may be used in the preparation of the final lot.

#### Bacterial and fungal contamination

The final bulk vaccine complies with the test for sterility (2.6.1), carried out using 10 mL for each medium.

#### Protein nitrogen content

Maximum 0.25 mg per human dose before the addition of any stabiliser.

#### FINAL LOT

The final bulk vaccine is distributed aseptically into sterile, tamper-evident containers and freeze-dried to a moisture content shown to be favourable to the stability of the vaccine. The containers are then closed so as to prevent contamination and the introduction of moisture.

Only a final lot that is satisfactory with respect to thermal stability and each of the requirements given below under Identification, Tests and Assay may be released for use. Provided that the test for ovalbumin has been performed with satisfactory results on the final bulk vaccine, it may be omitted on the final lot.

#### Thermal stability

Maintain at least 3 containers of the final lot of freeze-dried vaccine in the dry state at  $37 \pm 1^{\circ}\text{C}$  for 14 days. Determine the virus concentration as described under Assay in parallel for the heated vaccine and for vaccine stored at the temperature recommended for storage. The virus concentration of the heated vaccine is not more than  $1.0 \log_{10}$  lower than that of the unheated vaccine.

#### IDENTIFICATION

When the vaccine reconstituted as stated on the label is mixed with specific yellow fever virus antibodies, there is a significant reduction in its ability to infect susceptible cell cultures. Alternatively, the vaccine reconstituted as stated on the label contains virus that is identified as yellow fever virus by molecular methods (e.g. NAT, sequencing).

#### TESTS

##### Ovalbumin

Maximum 5  $\mu\text{g}$  of ovalbumin per human dose, determined by a suitable immunochemical method (2.7.1).

##### Water (2.5.12)

Maximum 3.0 per cent.

#### Bacterial and fungal contamination

The reconstituted vaccine complies with the test for sterility (2.6.1).

#### Bacterial endotoxins (2.6.14)

Less than 5 IU per single human dose.

#### ASSAY

Titrate for infective virus in cell cultures using at least 3 separate containers of vaccine. Titrate 1 container of an appropriate virus reference preparation in triplicate to validate each assay. The virus concentration of the reference preparation is monitored using a control chart and a titre is established on a historical basis by each laboratory. Calculate the individual virus concentration for each container of vaccine and for each replicate of the reference preparation as well as the corresponding combined virus concentrations using the usual statistical methods (for example, 5.3). The combined virus concentration for the 3 containers of vaccine is compared to the results of the reference preparation titrated in parallel, to obtain results in International Units. The combined virus concentration of the

vaccine is not less than  $3.0 \log_{10}$  IU per human dose and not more than the upper limit approved for the particular product by the competent authority.

The assay is not valid if:

- the confidence interval ( $P = 0.95$ ) of the estimated virus concentration of the reference preparation for the 3 replicates combined is greater than  $\pm 0.3 \log_{10}$  IU;
- the virus concentration of the reference preparation differs by more than  $0.5 \log_{10}$  IU from the established value.

The assay is repeated if the confidence interval ( $P = 0.95$ ) of the combined virus concentration of the vaccine is greater than  $\pm 0.3 \log_{10}$  IU; data obtained from valid assays only are combined by the usual statistical methods (for example, 5.3) to calculate the virus concentration of the sample.

The confidence interval ( $P = 0.95$ ) of the combined virus concentration is not greater than  $\pm 0.3 \log_{10}$  IU.

Where justified and authorised, different assay designs may be used; this may imply the application of different validity and acceptance criteria. However, the vaccine must comply if tested as described above.

#### **LABELLING**

*The label states:*

- the strain of virus used in preparation of the vaccine;
- that the vaccine has been prepared in chick embryos;
- the minimum virus concentration;
- that contact between the vaccine and disinfectants is to be avoided.

*Ph Eur*

## DIAGNOSTIC PREPARATIONS

### Old Tuberculin

(*Tuberculin for Human Use, Old, Ph. Eur. monograph 0152*)

Ph Eur

#### DEFINITION

Old tuberculin for human use consists of a filtrate, concentrated by heating, containing the soluble products of the culture and lysis of one or more strains of *Mycobacterium bovis* and/or *Mycobacterium tuberculosis* that is capable of demonstrating a delayed hypersensitivity in an animal sensitised to micro-organisms of the same species.

Old tuberculin for human use in concentrated form is a transparent, viscous, yellow or brown liquid.

#### PRODUCTION

##### GENERAL PROVISIONS

The production of old tuberculin is based on a seed-lot system. The production method shall have been shown to yield consistently old tuberculin of adequate potency and safety in man. A batch of old tuberculin, calibrated in International Units by the method described under Assay and for which adequate clinical information is available as to its activity in man, is set aside to serve as a reference preparation.

The International Unit is the activity of a stated quantity of the International Standard. The equivalence in International Units of the International Standard is stated by the World Health Organization.

##### SEED LOTS

The strains of mycobacteria used shall be identified by historical records that include information on their origin and subsequent manipulation.

The working seed lots used to inoculate the media for the production of a concentrated harvest shall not have undergone more than 4 subcultures from the master seed lot.

Only seed lots that comply with the following requirements may be used for propagation.

##### Identification

The species of mycobacterium of the master and working seed lots is identified.

##### Bacterial and fungal contamination

Carry out the test for sterility (2.6.1), using 10 mL for each medium. The working seed lot complies with the test for sterility except for the presence of mycobacteria.

##### PROPAGATION AND HARVEST

The bacteria are grown in a liquid medium which may be a glycerolated broth or a synthetic medium. Growth must be typical for the strain. The culture is inactivated by a suitable method, such as treatment in an autoclave (121 °C for not less than 30 min) or in flowing steam at a temperature not less than 100 °C for at least 1 h. The culture liquid, from which the micro-organisms may or may not have been separated by filtration, is concentrated by evaporation, usually to one-tenth of its initial volume. The preparation is free from live mycobacteria. The concentrated harvest is shown to comply with the test for mycobacteria (2.6.2) before addition of any antimicrobial preservative or other substance that might interfere with the test. Phenol (5 g/L) or another suitable antimicrobial preservative that does not give rise to false positive reactions may be added.

Only a concentrated harvest that complies with the following requirements may be used in the preparation of the final bulk tuberculin.

##### pH (2.2.3)

The pH of the concentrated harvest is 6.5 to 8.

##### Glycerol

Where applicable, determine the glycerol content of the concentrated harvest. The amount is within the limits approved for the particular product.

##### Antimicrobial preservative

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical or physico-chemical method. The content is not less than 85 per cent and not more than 115 per cent of the intended amount. If phenol has been used in the preparation, the concentration is not more than 5 g/L (2.5.15).

##### Sensitisation

Carry out the test described under Tests.

##### Sterility (2.6.1)

The concentrated harvest complies with the test for sterility, carried out using 10 mL for each medium.

##### Potency

Determine the potency as described under Assay.

##### FINAL BULK TUBERCULIN

The concentrated harvest is diluted aseptically.

Only a final bulk tuberculin that complies with the following requirement may be used in the preparation of the final lot.

##### Sterility (2.6.1)

The final bulk tuberculin complies with the test for sterility, carried out using 10 mL for each medium.

##### FINAL LOT

The final bulk tuberculin is distributed aseptically into sterile containers which are then closed so as to prevent contamination.

Only a final lot that is satisfactory with respect to each of the requirements given below under Identification, Tests and Assay may be released for use.

The following tests may be omitted on the final lot if they have been carried out at the stages indicated:

- live mycobacteria: concentrated harvest,
- sensitisation: concentrated harvest,
- toxicity: concentrated harvest or final bulk tuberculin,
- antimicrobial preservative: final bulk tuberculin.

##### IDENTIFICATION

Inject increasing doses of the preparation to be examined intradermally into healthy, white or pale-coloured guinea-pigs, specifically sensitised (for example, as described under Assay). A reaction varying from erythema to necrosis is produced at the site of the injection. Similar injections administered to non-sensitised guinea-pigs do not stimulate a reaction. The assay may also serve as identification.

##### TESTS

*Old tuberculin for human use in concentrated form (≥ 100 000 IU/mL) complies with each of the tests prescribed below; the diluted product complies with the tests for antimicrobial preservative and sterility.*

##### Toxicity

Inject a quantity equivalent to 50 000 IU subcutaneously into each of two healthy guinea-pigs weighing 250 g to 350 g and which have not been subjected to any treatment likely to interfere with the test. Observe the animals for 7 days. No adverse effect is produced.

**Sensitisation**

Use 3 guinea-pigs that have not been subjected to any treatment likely to interfere with the test. On 3 occasions at intervals of 5 days, inject intradermally into each guinea-pig about 500 IU of the preparation to be examined in a volume of 0.1 mL. 2 to 3 weeks after the third injection, administer the same dose intradermally to the same animals and to a control group of 3 guinea-pigs of the same mass that have not previously received injections of tuberculin. After 24 h to 72 h, the reactions in the 2 groups of animals are not substantially different.

**Antimicrobial preservative**

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical or physico-chemical method. The content is not less than the minimum amount shown to be effective and not more than 115 per cent of the amount stated on the label. If phenol has been used in the preparation, the concentration is not more than 5 g/L (2.5.15).

**Live mycobacteria (2.6.2)**

It complies with the test for mycobacteria.

**Sterility (2.6.1)**

It complies with the test for sterility.

**ASSAY**

The potency of old tuberculin is determined by comparing the reactions produced by the intradermal injection of increasing doses of the preparation to be examined into sensitised guinea-pigs with the reactions produced by known concentrations of the reference preparation.

Prepare a suspension containing a suitable amount (0.1 mg to 0.4 mg/mL) of heat-inactivated, dried mycobacteria in mineral oil with or without emulsifier; use mycobacteria of a strain of the same species as that used in the preparation to be examined. Sensitise not fewer than 6 pale-coloured guinea-pigs weighing not less than 300 g by injecting intramuscularly or intradermally a total of about 0.5 mL of the suspension, divided between several sites if necessary. Carry out the test after the period of time required for optimal sensitisation which is usually 4 to 8 weeks after sensitisation. Depilate the flanks of the animals so that it is possible to make at least three injections on each side and not more than a total of 12 injection points per animal. Use at least three different doses of the reference preparation and at least 3 different doses of the preparation to be examined. For both preparations, use doses such that the highest dose is about 10 times the lowest dose. Choose the doses such that when they are injected the lesions produced have a diameter of not less than 8 mm and not more than 25 mm. In any given test, the order of the dilutions injected at each point is chosen at random in a Latin square design. Inject each dose intradermally in a constant volume of 0.1 mL or 0.2 mL. Measure the diameters of the lesions 24 h to 48 h later and calculate the results of the test by the usual statistical methods, assuming that the diameters of the lesions are directly proportional to the logarithm of the concentration of the preparation.

The estimated potency is not less than 80 per cent and not more than 125 per cent of the stated potency.

The confidence limits ( $P = 0.95$ ) are not less than 64 per cent and not more than 156 per cent of the stated potency.

**STORAGE**

Store protected from light.

**LABELLING**

The label states:

- the number of International Units per millilitre,
- the species of mycobacterium used to prepare the product,
- the name and quantity of any antimicrobial preservative or any other excipient,
- the expiry date,
- where applicable, that old tuberculin is not to be injected in its concentrated form but diluted so as to administer not more than 100 IU per dose.

Ph Eur

## Tuberculin Purified Protein Derivative

Tuberculin P.P.D.

(*Tuberculine Purified Protein Derivative for Human Use, Ph. Eur. monograph 0151*)

Ph Eur

**DEFINITION**

Tuberculin purified protein derivative (tuberculin PPD) for human use is a preparation obtained by precipitation from the heated products of the culture and lysis of *Mycobacterium bovis* and/or *Mycobacterium tuberculosis* and capable of demonstrating a delayed hypersensitivity in an animal sensitised to micro-organisms of the same species.

Tuberculin PPD is a colourless or pale-yellow liquid; the diluted preparation may be a freeze-dried powder which upon dissolution gives a colourless or pale-yellow liquid.

**PRODUCTION****GENERAL PROVISIONS**

The production of tuberculin PPD is based on a seed-lot system. The production method shall have been shown to yield consistently tuberculin PPD of adequate potency and safety in man. A batch of tuberculin PPD, calibrated in International Units by method A described under Assay and for which adequate clinical information is available as to its activity in man, is set aside to serve as a reference preparation.

The International Unit is the activity of a stated quantity of the International Standard. The equivalence in International Units of the International Standard is stated by the World Health Organization.

**SEED LOTS**

The strains of mycobacteria used shall be identified by historical records that include information on their origin and subsequent manipulation.

The working seed lots used to inoculate the media for production of a concentrated harvest shall not have undergone more than 4 subcultures from the master seed lot. Only seed lots that comply with the following requirements may be used for propagation.

**Identification**

The species of mycobacterium of the master and working seed lots is identified.

**Bacterial and fungal contamination**

Carry out the test for sterility (2.6.1), using 10 mL for each medium. The working seed lot complies with the test for sterility except for the presence of mycobacteria.

**PROPAGATION AND HARVEST**

The bacteria are grown in a liquid synthetic medium. Growth must be typical for the strain. The culture is inactivated by a suitable method such as treatment in an autoclave (121 °C for not less than 30 min) or in flowing steam at a temperature not less than 100 °C for at least 1 h and filtered. The active fraction of the filtrate, consisting mainly of protein, is isolated by precipitation, washed and re-dissolved. The preparation is free from mycobacteria. The concentrated harvest is shown to comply with the test for mycobacteria (2.6.2) before addition of any antimicrobial preservative or other substance that might interfere with the test. Phenol (5 g/L) or another suitable antimicrobial preservative that does not give rise to false positive reactions may be added; a suitable stabiliser intended to prevent adsorption on glass or plastic surfaces may be added. The concentrated harvest may be freeze-dried. Phenol is not added to preparations that are to be freeze-dried.

Only a concentrated harvest that complies with the following requirements may be used in the preparation of the final bulk tuberculin PPD.

**Antimicrobial preservative**

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical or physico-chemical method. The content is not less than 85 per cent and not more than 115 per cent of the intended amount. If phenol has been used in the preparation, the concentration is not more than 5 g/L (2.5.15).

**Sensitisation**

Carry out the test described under Tests.

**Sterility (2.6.1)**

The concentrated harvest, reconstituted if necessary, complies with the test for sterility, carried out using 10 mL for each medium.

**Potency**

Determine the potency as described under Assay.

**FINAL BULK TUBERCULIN PPD**

The concentrated harvest is diluted aseptically, after reconstitution if necessary.

Only a final bulk tuberculin PPD that complies with the following requirement may be used in the preparation of the final lot.

**Sterility (2.6.1)**

The final bulk tuberculin PPD complies with the test for sterility, carried out using 10 mL for each medium.

**FINAL LOT**

The final bulk tuberculin PPD is distributed aseptically into sterile containers which are then closed so as to prevent contamination. It may be freeze-dried.

Only a final lot that is satisfactory with respect to each of the requirements given below under Identification, Tests and Assay may be released for use.

The following tests may be omitted on the final lot if they have been carried out at the stages indicated:

- live mycobacteria: concentrated harvest
- sensitisation: concentrated harvest
- toxicity: concentrated harvest or final bulk tuberculin PPD
- antimicrobial preservative: final bulk tuberculin PPD.

**IDENTIFICATION**

Inject increasing doses of the preparation to be examined intradermally into healthy, white or pale-coloured guinea-pigs, specifically sensitised (for example as described under

Assay). A reaction varying from erythema to necrosis is produced at the site of the injection. Similar injections administered to non-sensitised guinea-pigs do not stimulate a reaction. The assay may also serve as identification.

**TESTS**

*Tuberculin purified protein derivative for human use in concentrated form ( $\geq 100\ 000$  IU/mL) complies with each of the tests prescribed below; the diluted product complies with the tests for pH, antimicrobial preservative and sterility.*

**pH (2.2.3)**

The pH of the preparation, reconstituted if necessary as stated on the label, is 6.5 to 7.5.

**Toxicity**

Inject subcutaneously 50 000 IU of the preparation to be examined into each of two healthy guinea-pigs weighing 250 g to 350 g and which have not been subjected to any treatment likely to interfere with the test. Observe the animals for 7 days. No adverse effect is produced.

**Sensitisation**

Use 3 guinea-pigs that have not been subjected to any treatment likely to interfere with the test. On 3 occasions at intervals of 5 days, inject intradermally into each guinea-pig about 500 IU of the preparation to be examined in a volume of 0.1 mL. 2 to 3 weeks after the third injection, administer the same dose intradermally to the same animals and to a control group of three guinea-pigs of the same mass that have not previously received injections of tuberculin. After 24 h to 72 h, the reactions in the 2 groups of animals are not substantially different.

**Antimicrobial preservative**

Where applicable, determine the amount of antimicrobial preservative by a suitable chemical or physico-chemical method. The content is not less than the minimum amount shown to be effective and not more than 115 per cent of the amount stated on the label. If phenol has been used in the preparation, the concentration is not more than 5 g/L (2.5.15).

**Live mycobacteria (2.6.2)**

It complies with the test for mycobacteria.

**Sterility (2.6.1)**

It complies with the test for sterility.

**ASSAY**

Use method A or, where the preparation contains 1 IU to 2 IU, use method B.

**METHOD A**

The potency of tuberculin PPD is determined by comparing the reactions produced by the intradermal injection of increasing doses of the preparation to be examined into sensitised guinea-pigs with the reactions produced by known concentrations of the reference preparation.

Prepare a suspension containing a suitable amount (0.1 mg/mL to 0.4 mg/mL) of heat-inactivated, dried mycobacteria in mineral oil with or without emulsifier; use mycobacteria of a strain of the same species as that used in the preparation to be examined. Sensitise not fewer than six pale-coloured guinea-pigs weighing not less than 300 g by injecting intramuscularly or intradermally a total of about 0.5 mL of the suspension, divided between several sites if necessary. Carry out the test after the period of time required for optimal sensitisation which is usually 4 to 8 weeks after sensitisation. Depilate the flanks of the animals so that it is possible to make at least 3 injections on each side but not more than a total of 12 injection points per animal. Prepare

dilutions of the preparation to be examined and of the reference preparation using isotonic phosphate-buffered saline (pH 6.5 to 7.5) containing 50 mg/L of polysorbate 80 R. If the preparation to be examined is freeze-dried and does not contain a stabiliser, reconstitute it using the liquid described above. Use at least 3 different doses of the reference preparation and at least 3 different doses of the preparation to be examined. For both preparations, use doses such that the highest dose is about 10 times the lowest dose. Choose the doses such that when they are injected the lesions produced have a diameter of not less than 8 mm and not more than 25 mm. In any given test, the order of the dilutions injected at each point is chosen at random in a Latin square design. Inject each dose intradermally in a constant volume of 0.1 mL or 0.2 mL. Measure the diameters of the lesions 24 h to 48 h later and calculate the results of the test by the usual statistical methods, assuming that the diameters of the lesions are directly proportional to the logarithm of the concentration of the preparation.

The estimated potency is not less than 80 per cent and not more than 125 per cent of the stated potency.

The confidence limits ( $P = 0.95$ ) are not less than 64 per cent and not more than 156 per cent of the stated potency.

#### **METHOD B**

The potency of tuberculin PPD is determined by comparing the reactions produced by the intradermal injection of the preparation to be examined into sensitised guinea-pigs with the reactions produced by known concentrations of the reference preparation.

Prepare a suspension in mineral oil with or without emulsifier and containing a suitable amount (0.1 mg/mL to 0.4 mg/mL) of heat-inactivated, dried mycobacteria; use mycobacteria of a strain of the same species as that used in the preparation to be examined. Sensitise not fewer than 6 pale-coloured guinea-pigs weighing not less than 300 g by injecting intramuscularly or intradermally a total of about 0.5 mL of the suspension, divided between several sites if necessary. Carry out the test after the period of time required for optimal sensitisation which is usually 4 to 8 weeks after sensitisation. Depilate the flanks of the animals so that it is possible to make at least 3 injections on each side but not more than a total of 12 injection points per animal. Prepare dilutions of the reference preparation using isotonic phosphate-buffered saline (pH 6.5 to 7.5) containing 50 mg/L of polysorbate 80 R. Use at least 3 different doses of the reference preparation such that the highest dose is about 10 times the lowest dose and the median dose is the same as that of the preparation to be examined. In any given test, the order of the dilutions injected at each point is chosen at random in a Latin square design. Inject the preparation to be examined and each dilution of the reference preparation intradermally in a constant volume of 0.1 mL or 0.2 mL. Measure the diameters of the lesions 24 h to 48 h later and calculate the results of the test by the usual statistical methods, assuming that the areas of the lesions are directly proportional to the logarithm of the concentration of the preparation to be examined. (This dose relationship applies to this assay and not necessarily to other test systems.)

The estimated potency is not less than 80 per cent and not more than 125 per cent of the stated potency.

The confidence limits ( $P = 0.95$ ) are not less than 64 per cent and not more than 156 per cent of the stated potency.

#### **STORAGE**

Store protected from light.

#### **LABELLING**

The label states:

- the number of International Units per container,
- the species of mycobacteria used to prepare the product,
- the name and quantity of any antimicrobial preservative or any other excipient,
- the expiry date,
- for freeze-dried products, a statement that the product is to be reconstituted using the liquid provided by the manufacturer,
- where applicable, that tuberculin PPD is not to be injected in its concentrated form but diluted so as to administer not more than 100 IU per dose.

If the package does not contain a leaflet warning that the inhalation of concentrated tuberculin PPD may produce toxic effects, this warning must be shown on the label on the container together with a statement that the powder must be handled with care.

Ph Eur

**IMMUNOLOGICAL PRODUCTS**

# Radiopharmaceutical Preparations

## Radiopharmaceutical Preparations

(Ph. Eur. monograph 0125)

Ph Eur

### DEFINITIONS

Radiopharmaceutical preparations or radiopharmaceuticals are medicinal products which, when ready for use, contain 1 or more radionuclides (radioactive isotopes) included for a medicinal purpose.

For the purpose of this general monograph, radiopharmaceutical preparations also cover:

- radionuclide generators: any system incorporating a fixed parent radionuclide from that is produced a daughter radionuclide that is to be obtained by elution or by any other method and used in a radiopharmaceutical preparation;
- kits for radiopharmaceutical preparation: any preparation to be reconstituted or combined with radionuclides in the final radiopharmaceutical preparation, usually prior to its administration;
- radionuclide precursors: any radionuclide produced for radiolabelling of another substance prior to administration.

Radionuclide precursors may be supplied as solutions for radiolabelling.

A nuclide is a species of atom characterised by the number of protons and neutrons in its nucleus (and hence by its atomic number  $Z$  and mass number  $A$ ) and also by its nuclear energy state. Isotopes of an element are nuclides with the same atomic number but different mass numbers. Nuclides containing an unstable arrangement of protons and neutrons will transform spontaneously to either a stable or another unstable combination of protons and neutrons with a constant statistical probability. Such nuclides are said to be radioactive and are called radionuclides. The initial unstable nuclide is referred to as the parent radionuclide and the resulting nuclide as the daughter nuclide.

Decay or transformation of radionuclides may involve the emission of charged particles, electron capture (EC) or isomeric transition (IT). The charged particles emitted from nuclei may be alpha particles (nuclei of  $^4\text{He}$ ) or beta particles (negatively charged, generally called electrons, or positively charged, generally called positrons). Alpha decay usually concerns heavy nuclei ( $Z > 82$ ). Radionuclides with a deficit of protons usually decay by emitting electrons. Radionuclides with a deficit of neutrons usually decay by electron capture or by emitting positrons. In the latter case, radionuclides are called positron emitters. Positrons are annihilated after interaction with electrons in the surrounding matter.

The annihilation results in the emission of 2 gamma photons, each with energy of 0.511 MeV, generally emitted at  $180^\circ$  to each other (annihilation radiation). All decay modes may be accompanied by an emission of gamma rays. The emission of gamma rays may be partly or completely replaced by the ejection of electrons, known as internal conversion electrons. This phenomenon, like the process of electron capture, causes a secondary emission of X-rays (due to a reorganisation of the electrons in the atom). This secondary emission may itself be partly replaced by the ejection of electrons, known as Auger electrons.

### Radioactivity

Generally the term 'radioactivity' is used both to describe the phenomenon of radioactive decay and to express the physical quantity of this phenomenon.

The radioactivity of a preparation is the number of nuclear disintegrations or transformations per unit time.

In the International System (SI), radioactivity is expressed in becquerel (Bq), which is 1 nuclear transformation per second. Absolute radioactivity measurements require a specialised laboratory but identification of radioactivity and quantitative measurement of radioactivity can be carried out relatively by comparing the measured samples with standardised preparations provided by laboratories recognised by the competent authority or by using a calibrated instrument.

### Radioactive decay

Any radionuclide decays at an exponential rate with its characteristic decay constant.

The curve of exponential decay (decay curve) is described by the following expression:

$$A_t = A_0 e^{-\lambda t}$$

$A_t$	=	the radioactivity at time $t$
$A_0$	=	the radioactivity at time $t = 0$ ;
$\lambda$	=	the decay constant, characteristic of each radionuclide;
$e$	=	the base of natural logarithms.

The half-life ( $T_{1/2}$ ) is the time in which a given radioactivity (amount) of a radionuclide decays to half its initial value.

It is related to the decay constant ( $\lambda$ ) by the following equation:

$$T_{1/2} = \frac{\ln 2}{\lambda}$$

The equation of exponential decay can thus be expressed also in the following way, useful for the fast estimation of the radioactivity left after elapsing time  $t$ :

$$A_t = A_0 \left(\frac{1}{2}\right)^{t/T_{1/2}}$$

The penetrating power of each radiation varies considerably according to its nature and its energy. Alpha particles are completely absorbed in a thickness of a few micrometres to some tens of micrometres of matter. Beta particles are completely absorbed in a thickness of several millimetres to several centimetres of matter. Gamma rays are not completely absorbed but only attenuated and a tenfold reduction may require, for example, several centimetres of lead. The denser the absorbent, the shorter the range of alpha and beta particles and the greater the attenuation of gamma rays.

Each radionuclide is characterised by an invariable half-life, expressed in units of time and by the nature and energy of its radiation or radiations. The energy is expressed in electronvolts (eV), kilo-electronvolts (keV) or mega-electronvolts (MeV).

### Radionuclidic purity

The ratio, expressed as a percentage, of the radioactivity of the radionuclide concerned to the total radioactivity of the radiopharmaceutical preparation. The relevant potential radionuclidic impurities are listed with their limits in the individual monographs.

### Radiochemical purity

The ratio, expressed as a percentage, of the radioactivity of the radionuclide concerned which is present in the radiopharmaceutical preparation in the stated chemical form, to the total radioactivity of that radionuclide present in the radiopharmaceutical preparation. The relevant potential

radiochemical impurities are listed with their limits in the individual monographs.

#### Chemical purity

In monographs on radiopharmaceutical preparations, chemical purity is controlled by specifying limits for chemical impurities.

#### Isotopic carrier

A stable isotope of the element concerned either present in or added to the radioactive preparation in the same chemical form as that in which the radionuclide is present.

#### Carrier-free preparation

A preparation free from stable isotopes of the same element as the radionuclide concerned present in the preparation in the stated chemical form or at the position of the radionuclide in the molecule concerned.

#### No-carrier-added preparation

A preparation to which no stable isotopes of the same element as the radionuclide concerned are intentionally added in the stated chemical form or at the position of the radionuclide in the molecule concerned.

#### Specific radioactivity

The radioactivity of a radionuclide per unit mass of the element or of the chemical form concerned, e.g. becquerel per gram or becquerel per mole.

#### Radioactivity concentration

The radioactivity of a radionuclide per unit volume or unit mass of the preparation. For radiopharmaceutical solutions, it is expressed as radioactivity per unit volume of the preparation.

#### Total radioactivity

The radioactivity of the radionuclide, expressed per unit (vial, capsule, ampoule, generator, etc).

#### Period of validity

The time during which specifications described in the monograph must be fulfilled.

### PRODUCTION

A radiopharmaceutical preparation contains its radionuclide:

- as an element in atomic or molecular form, e.g.  $^{135}\text{Xe}$ ,  $^{15}\text{O}_2$ ;
- as an ion, e.g.  $^{131}\text{I}$ iodide,  $^{99\text{m}}\text{Tc}$ pertechnetate;
- included in, adsorbed on or attached to molecules by chelation, e.g.  $^{111}\text{In}$ indium oxine, or by covalent bonding, e.g. 2- $^{18}\text{F}$ fluoro-2-deoxy-D-glucose.

Radionuclides can be produced in the following ways:

- in reactions of neutrons (target irradiation in nuclear reactors);
- in reactions of charged particles (target irradiation using accelerators, in particular cyclotrons);
- by its separation from radionuclide generators.

The probability of nuclear reaction occurrence depends on the nature and energy of the incident particles (protons, neutrons, deuterons etc.) and on the nature of the nucleus that is irradiated by them. The rate of production (yield) of a given radionuclide resulting from the irradiation depends in addition on the isotopic composition of the target material and its chemical purity, and in the case of neutrons on their flux, and in the case of charged particles on beam current.

In addition to the desired nuclear reaction, simultaneous transformations usually occur. Probability of their occurrence is given by the same factors as mentioned in the previous paragraph. Such simultaneous transformations may give rise to radionuclidic impurities.

The nuclear reaction (transformation) can be written in the form: target nucleus (incident particle, emitted particle) produced nucleus.

Examples:

### NEUTRON IRRADIATION

Irradiation of stable radionuclides in nuclear reactors usually results in proton-deficient nuclei, i.e. electron emitters that are formed in  $(n,\gamma)$  reactions (so-called radiative capture). The product is isotopic with the target nucleus and it may thus contain a considerable amount of carrier.

A number of nuclides with high atomic number are fissionable by neutrons. Nuclear fission, denoted as  $(n, f)$  reaction, results in a large number of radionuclides of various masses and half-lives. The most frequently used fission is that of  $^{235}\text{U}$ . Iodine-131, molybdenum-99 and xenon-133 can be produced by irradiation of  $^{235}\text{U}$  in nuclear reactors and by their separation from more than 200 radionuclides formed in that process.

### CHARGED PARTICLE IRRADIATION

Irradiation of stable radionuclides with charged particles usually results in neutron-deficient nuclei that decay either by electron capture or by positron emission. They are formed in particular in  $(p, xn)$  reactions (where  $x$  is the number of emitted neutrons). The product is not isotopic with the target nucleus and its specific radioactivity might be close to that of a carrier-free preparation.

### RADIONUCLIDE GENERATORS

Radionuclide generator systems use a parent radionuclide which decays to a daughter radionuclide with a shorter half-life.

By separating the daughter radionuclide from the parent radionuclide by a chemical or physical process, it is possible to use the daughter radionuclide at a considerable distance from the production site of the generator despite its short half-life.

### TARGET MATERIALS

The isotopic composition and purity of the target material together with other factors such as the nature and energy of incident particles will determine the relative percentages of the principal radionuclide and radionuclidic impurities produced by irradiation. The use of isotopically enriched target material in which the abundance of the required target nuclide has been artificially increased, can improve the production yield and the purity of the desired radionuclide.

The chemical form, the purity and the physical state of the target material and the chemical additives, as well as the irradiation conditions and the direct physical and chemical environment, determine the chemical state and chemical purity of the radionuclides that are produced. In the production of radionuclides, and particularly of radionuclides with a short half-life, it may not be possible to determine any of these quality criteria before further processing and manufacture of radiopharmaceutical preparations. Therefore the quality of each batch of target material is assessed before its use in routine radionuclide production and manufacture of radiopharmaceutical preparations.

The target material is contained in a holder in gaseous, liquid or solid state, in order to be irradiated by a beam of particles. For neutron irradiation, the target material is commonly contained in quartz ampoules or high-purity aluminium or titanium containers. It is necessary to ascertain that no

interaction can occur between the container and its contents under the irradiation conditions.

For charged particle irradiation, the holder for target material is constructed of an appropriate metal, possibly with inlet and outlet ports, a surrounding cooling system and usually a thin metal foil target window.

To evaluate all effects on the efficiency of the production of the radionuclide in terms of quality and quantity, the production procedure must clearly describe and take into consideration: the target material, the construction of the holder for target material, method of irradiation and separation of the desired radionuclide.

#### CHARACTERS

The general chapter 5.7 *Table of physical characteristics of radionuclides mentioned in the European Pharmacopoeia* summarises the most commonly accepted physical characteristics of radionuclides used in preparations that are the subject of monographs in the European Pharmacopoeia. In addition, the Table states the physical characteristics of the main potential radionuclidic impurities of the radionuclides mentioned in the monographs.

The term 'transition probability' means the probability of the transformation of a nucleus in a given energy state, via the transition concerned. Instead of 'probability' the term 'abundance' is also used.

The term 'emission probability' means the probability that an atom of a radionuclide gives rise to the emission of the particles or radiation concerned.

Irrespective of which meaning is intended, probability is usually stated as a percentage.

#### IDENTIFICATION

A radionuclide is generally identified by its half-life or by the nature and energy of its radiation or radiations or by both, as prescribed in the monograph.

##### Approximate half-life

The half-life as determined over a relatively short time period to allow release for use of radiopharmaceutical preparations.

The calculated approximate half-life is within the range of the values stated in the individual monograph.

##### Determination of the nature and energy of the radiation

The nature and energy of the radiation emitted are determined using spectrometry. The nature and energy of the radiation of positron emitters is usually not determined; their identification is performed by determination of their half-life and gamma-ray spectrum.

#### TESTS

*It is sometimes difficult to carry out some of the following tests before releasing the batch for use when the half-life of the radionuclide in the preparation is short. The individual monograph indicates the tests that need not be completed before release for use. These tests then constitute a control of the quality of production.*

##### Non-radioactive substances and related substances

This section prescribes the determination of non-radioactive substances and related substances that can be present.

##### Residual solvents

Residual solvents are limited according to general chapter 5.4. *Residual solvents*, using the methods given in general chapter 2.4.24. *Identification and control of residual solvents* or another suitable method.

#### RADIONUCLIDIC PURITY

Radionuclidic impurities may arise during the production and decay of a radionuclide. Potential radionuclidic impurities may be mentioned in the monographs and their characteristics are described in general chapter 5.7. *Table of physical characteristics of radionuclides mentioned in the European Pharmacopoeia*.

In most cases, to establish the radionuclidic purity of a radiopharmaceutical preparation, the identity of every radionuclide present and its radioactivity must be known. Generally, the most useful method for examination of the radionuclidic purity of gamma- and X-ray emitting radionuclides is gamma-ray spectrometry. The use of sodium iodide detectors may cause a problem: the peaks due to gamma-ray emitting impurities may be concealed in the spectrum of the principal radionuclide or left unresolved from peaks of other radionuclidic impurities in the preparation. Alpha- and beta-particle emitting impurities that do not emit gamma- or X-rays cannot be detected in this way. For alpha- and beta-emitters other methods must be employed.

The individual monographs prescribe the radionuclidic purity required and may set limits for specific radionuclidic impurities (for example, molybdenum-99 in technetium-99<sup>m</sup>). While these requirements are necessary, they are not in themselves sufficient to ensure that the radionuclidic purity of a preparation is sufficient for its clinical use.

The manufacturer must examine the product in detail and especially must examine preparations of radionuclides with a short half-life for impurities with a long half-life after a suitable period of decay. In this way, information on the suitability of the manufacturing processes and the adequacy of the testing procedures is obtained. In cases where 2 or more positron-emitting radionuclides need to be identified and/or differentiated, for example the presence of <sup>18</sup>F-impurities in <sup>13</sup>N-preparations, half-life determinations need to be carried out in addition to gamma-ray spectrometry.

Due to differences in the half-lives of the different radionuclides present in a radiopharmaceutical preparation, the radionuclidic purity changes with time.

#### RADIOCHEMICAL PURITY

Radiochemical impurities may originate from:

- radionuclide production;
- subsequent chemical procedures;
- incomplete preparative separation;
- chemical changes during storage.

The determination of radiochemical purity requires separation of the different chemical substances containing the radionuclide and determination of the percentage of radioactivity of the radionuclide concerned associated with the stated chemical form. The radiochemical purity section of an individual monograph may include limits for specified radiochemical impurities, including isomers.

In principle, any method of analytical separation may be used in the determination of radiochemical purity. For example, the monographs for radiopharmaceutical preparations may include paper chromatography (2.2.26), thin-layer chromatography (2.2.27), electrophoresis (2.2.31), size-exclusion chromatography (2.2.30), gas chromatography (2.2.28) and liquid chromatography (2.2.29). The technical description of these analytical methods is set out in the monographs. Moreover, certain precautions special to radiopharmaceuticals must also be considered, such as radiation protection, measurement geometry, detector linearity, use of carriers, dilution of the preparation.

**Specific radioactivity**

Specific radioactivity is usually calculated taking into account the radioactivity concentration and the concentration of the chemical substance being studied, after verification that the radioactivity is attributable only to the radionuclide (radionuclidic purity) and the chemical species (radiochemical purity) concerned.

Specific radioactivity changes with time. The statement of the specific radioactivity therefore includes reference to a date and, if necessary, time.

**Physiological distribution**

Tests involving animals should be avoided wherever possible. Where the tests for identity and for radiochemical purity are not adequate to completely define and control the radiochemical species in a radiopharmaceutical preparation, a physiological distribution test may be required.

The distribution pattern of radioactivity observed in specified organs, tissues or other body compartments of an appropriate animal species can be a reliable indication of the suitability for the intended purpose.

Alternatively, a physiological distribution test can serve to establish the biological equivalence of the preparation under test with similar preparations known to be clinically effective.

The individual monograph prescribes the details concerning the conduct of the test and the physiological distribution requirements that must be met.

In general, the test is performed as follows.

Each of 3 animals is injected intravenously with the preparation. In some cases, dilution immediately before injection may be necessary.

Immediately after injection each animal is placed in a separate cage for collection of excreta and prevention of contamination of the body surface of the animal. At the specified time after injection, the animals are euthanised by an appropriate method and dissected. Selected organs and tissues are assayed for their radioactivity. The physiological distribution is then calculated and expressed in terms of the percentage of the administered radioactivity that is found in each of the selected organs or tissues, taking into account corrections for radioactive decay. For some radiopharmaceutical preparations it is necessary to determine the ratio of the radioactivity in weighed samples of selected tissues (radioactivity/mass).

A preparation meets the requirements of the test if the distribution of radioactivity in at least 2 of the 3 animals complies with all the specified criteria.

Disregard the results from any animal showing evidence of extravasation of the injection (observed at the time of injection or revealed by subsequent assay of tissue radioactivity). In that case the test may be repeated.

**Sterility**

Radiopharmaceutical preparations for parenteral administration comply with the test for sterility. They must be prepared using precautions designed to exclude microbial contamination and to ensure sterility. The test for sterility is carried out as described in the general method (2.6.1).

Special difficulties arise with radiopharmaceutical preparations because of the short half-life of some radionuclides, the small size of batches and the radiation hazards. In the case that the monograph states that the preparation can be released for use before completion of the test for sterility, the sterility test must be started as soon as practically possible in relation to the radiation. If not started immediately, samples are stored under conditions that are

shown to be appropriate in order to prevent false negative results. Parametric release (5.1.1) of the product manufactured by a fully validated process is the method of choice in such cases. When aseptic manufacturing is used, the test for sterility has to be performed as a control of the quality of production.

When the size of a batch of the radiopharmaceutical preparation is limited to 1 or a few samples, sampling the batch for sterility testing according to the recommendations of the general method (2.6.1) may not be applicable.

When the half-life of the radionuclide is less than 5 min, the administration of the radiopharmaceutical preparation to the patient is generally on-line with a validated production system.

For safety reasons (high level of radioactivity) it is not possible to use the quantity of radiopharmaceutical preparations as required in the test for sterility (2.6.1). The method of membrane filtration is preferred to limit irradiation of personnel.

Notwithstanding the requirements concerning the use of antimicrobial preservatives in the monograph *Parenteral preparations (0520)*, their addition to radiopharmaceutical preparations in multidose containers is not obligatory, unless prescribed in the monograph.

**Bacterial endotoxins - pyrogens**

Radiopharmaceuticals for parenteral administration comply with the test for bacterial endotoxins (2.6.14) or with the test for pyrogens (2.6.8).

Eluates of radionuclide generators, solutions for radiolabelling and kits for radiopharmaceutical preparations also comply with the test for bacterial endotoxins if they are intended for the preparation of radiopharmaceuticals for parenteral administration without further purification.

Radionuclide precursors comply with the test for bacterial endotoxins if intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins.

The test for bacterial endotoxins is carried out as described in the general method (2.6.14), taking the necessary precautions to limit irradiation of the personnel carrying out the test. The limit for bacterial endotoxins is indicated in the individual monograph or calculated according to general chapter 5.1.10. *Guidelines for using the test for bacterial endotoxins.*

When the nature of the radiopharmaceutical preparation results in interference in the test for bacterial endotoxins by inhibition or activation and it is not possible to eliminate the interfering factor(s), the test for pyrogens (2.6.8) may be specifically prescribed.

**STORAGE**

Store preparations containing radioactive substances in an airtight container that is sufficiently shielded to protect personnel from irradiation by primary or secondary emissions and that complies with national and international regulations concerning the storage of radioactive substances. During storage, containers may darken due to irradiation. Such darkening does not necessarily involve deterioration of the preparations.

**LABELLING**

The labelling of radiopharmaceutical preparations complies with the relevant national and European legislation.

For preparations prepared at the site of use, the labelling can be modified.

The radioactivity of a preparation is stated at a given date. If the half-life is less than 70 days the time is also indicated, with reference to a time zone. The radioactivity at other times may be calculated from the decay equation or from tables.

In addition to the above, the label on the container, the package, a leaflet accompanying the package or a certificate of analysis accompanying the radiopharmaceutical preparation states:

- the route of administration;
- if applicable, the maximum recommended dose in millilitres;
- the name and concentration of any added antimicrobial preservative;
- where applicable, any special storage conditions.

#### DETECTION AND MEASUREMENT OF RADIOACTIVITY

Detection and measurement of radioactivity are carried out according to general chapter 2.2.66. *Detection and measurement of radioactivity.*

Ph Eur

## Chemical Precursors for Radiopharmaceutical Preparations

(Ph. Eur. monograph 2902)

Ph Eur

#### DEFINITION AND SCOPE

Chemical precursors for radiopharmaceutical preparations, hereinafter referred to as 'chemical precursors', are non-radioactive substances obtained by chemical synthesis for combination with a radionuclide.

Where a chemical precursor not described in an individual monograph of the European Pharmacopoeia is used in a radiopharmaceutical preparation prepared for the special needs of individual patients, the need for compliance with this general monograph is decided in the light of a risk assessment.

This risk assessment takes account of:

- the quality of the chemical precursor and the information available for quality evaluation;
- any further processing after radiolabelling (which may or may not include purification before administration to the patient);
- the amount used to prepare a patient dose (e.g. diagnostic use versus therapeutic use) and the frequency of administration to the patient.

Where chemical precursors are manufactured using substances of human or animal origin, the requirements of chapter 5.1.7. *Viral safety* apply.

Where chemical precursors are obtained from animals susceptible to transmissible spongiform encephalopathies other than by experimental challenge, where applicable, they also comply with the requirements of the general monograph *Products with risk of transmitting agents of animal spongiform encephalopathies* (1483).

#### PRODUCTION

Chemical precursors are prepared by procedures designed to ensure a consistent quality and provide compounds that comply with the requirements of the individual monograph

or approved specifications. Chemical precursors must be produced within the framework of a suitable quality system.

#### CHARACTERS

The statements under the heading Characters (e.g. statements about the solubility or a melting point) are not to be interpreted in a strict sense and are not requirements. They are given for information.

#### IDENTIFICATION

Appropriate analytical methods, such as nuclear magnetic resonance spectrometry, infrared absorption spectrophotometry, mass spectrometry and chromatographic methods are used to provide confirmation of the identity of the chemical precursor.

#### TESTS

##### Related substances

Unless otherwise prescribed or justified and authorised, organic impurities in chemical precursors and inorganic impurities present in inorganic chemical precursors are to be reported, identified and controlled as follows:

Reporting threshold	0.2 per cent
Identification threshold	2.0 per cent
Total unspecified impurities	maximum 3.0 per cent

Specific thresholds may be applied for impurities known to be unusually potent or to produce toxic or unacceptable pharmacological effects.

If the individual monograph does not provide suitable control for a new impurity, a suitable test for control must be developed and included in the specification for the substance.

##### Residual solvents

Residual solvents are limited according to the principles defined in chapter 5.4 using general method 2.4.24 or another suitable method.

Class 1 solvents must not be employed in the final step of the manufacturing process of chemical precursors. If the use of a Class 1 solvent in an earlier step in the production process is unavoidable, the limits stated in chapter 5.4, Table 1 apply.

Based on the permitted daily exposure (PDE), Class 2 and Class 3 solvents are limited to 0.5 per cent.

For Class 2 and Class 3 solvents, a test for loss on drying or a specific determination of the solvent may be carried out. If for a Class 2 or a Class 3 solvent, a justified and authorised limit greater than 0.5 per cent is prescribed, a specific determination of the solvent is required.

##### Metal catalysts or metal reagent residues

If the production processes of chemical precursors are known or suspected to lead to the presence of metal residues due to the use of a specific metal catalyst or metal containing reagent, the chemical precursors comply with the limit of 0.01 per cent for each of the following metals: Pt, Pd, Ir, Rh, Ru, Os, Mo, Ni, Cr, V, Pb, Hg, Cd and Tl, unless stricter limits are stated in an individual monograph.

The methodology described in general chapter 2.4.20. *Determination of elemental impurities* is to be applied wherever possible.

##### Microbial contamination

TAMC: acceptance criterion  $10^3$  CFU per gram for bulk material or maximum  $10^2$  CFU per container for chemical

precursors packed in single and multidose containers (2.6.12).

TYMC: acceptance criterion  $10^2$  CFU per gram for bulk material or maximum  $10^1$  CFU per container for chemical precursors packed in single-dose and multidose containers (2.6.12).

#### Bacterial endotoxins (2.6.14)

Unless otherwise justified and authorised, bacterial endotoxins are limited to a maximum 100 IU per gram for bulk material or maximum 10 IU per container for chemical precursors packed in single-dose and multidose containers.

#### ASSAY

Unless otherwise justified and authorised, the content of chemical precursors for radiopharmaceutical preparations is determined using a suitable method.

#### STORAGE

Store chemical precursors in an airtight container and in conditions that ensure adequate stability.

#### LABELLING

The labelling of chemical precursors complies with the relevant national and European legislation where relevant information is available. The label indicates the intended use as a chemical precursor for radiopharmaceutical preparations.

The accompanying information may recommend testing the substance in one or more production runs before its use for the manufacture of radiopharmaceutical preparations to ensure that, under specified production conditions, the substance yields a radiopharmaceutical preparation in the desired quantity and of the quality specified.

Ph Eur

## Physical Characteristics of Radionuclides Mentioned in the European Pharmacopoeia

(Ph. Eur. general texts 5.7)

Ph Eur

The following table is given to complete the general monograph *Radiopharmaceutical preparations (0125)*.

The values are obtained from the database of the National Nuclear Data Center (NNDC) at Brookhaven National Laboratory, Upton, N.Y., USA, directly accessible at: [www.nndc.bnl.gov/nndc/nudat/radform.html](http://www.nndc.bnl.gov/nndc/nudat/radform.html)

In case another source of information is preferred (more recent values), this source is explicitly mentioned.

The uncertainty of the half-lives are given in parentheses. In principle the digits in parentheses are the standard uncertainty of the corresponding last digits of the indicated numerical value ('Guide to the Expression of Uncertainty in Measurement', International Organization for Standardization (ISO), 1993, ISBN 92-67-10188-9 or any subsequent revisions of this document).

The following abbreviations are used:

e <sub>A</sub>	=	Auger electrons,
ce	=	conversion electrons,
β <sup>-</sup>	=	electrons,
β <sup>+</sup>	=	positrons,
γ	=	gamma rays,
X	=	X-rays.

Radionuclide	Half-life	Electronic emission			Photon emission		
		Type	Energy (MeV)	Emission probability (per 100 disintegrations)	Type	Energy (MeV)	Emission probability (per 100 disintegrations)

## Extemporaneous Preparation of Radiopharmaceuticals

(Ph. Eur. general text 5.19)

Ph Eur

This general chapter is published for information.

### 1 SCOPE AND DEFINITION

Many radiopharmaceuticals are prepared on-site on a regular basis, typically as doses for a few patients based on specific clinical needs (extemporaneously prepared radiopharmaceuticals, EPRs). Whereas the manufacture of radiopharmaceuticals and investigational medicinal products is well covered by existing regulations, this general chapter only covers EPRs, which are also to be considered in the light of any national competent authority requirements. Radiopharmaceuticals are pharmaceutical preparations, and the provisions and terminology of the general monograph *Pharmaceutical preparations (2619)* apply.

EPRs are either prepared in accordance with a medical prescription for an individual patient, or in accordance with a pharmacopoeial monograph, and intended to be supplied directly to patients. The radiopharmaceuticals concerned are used within their specified expiration time, and include both kit-based preparations (from licensed and unlicensed kits) and unlicensed preparations containing radionuclides for positron emission tomography (PET), single photon emission computed tomography (SPECT) or for therapeutic applications.

For the purpose of this general chapter, the preparation of radiopharmaceuticals is considered as a process involving some or all of the following steps: purchase of materials and products, production of radionuclides for radiolabelling, radiolabelling, chemical modification and/or purification, formulation, dispensing of the pharmaceutical form, sterilisation, analytical control, packaging, labelling and release. Drawing patient doses for immediate application (e.g. from a multidose vial) is considered as part of clinical practice, and not part of the preparation of radiopharmaceuticals.

EPRs require an appropriate framework to ensure the desired quality, hereinafter referred to as the quality system. The extent of the quality system is driven by the risks for the patient concerned, such as microbial contamination, failure of chemical reactions and its consequences, malfunctioning of equipment involved in the preparation process and inappropriate storage conditions. Risk assessment is employed to determine the level of risk and the required level of quality assurance to achieve appropriate product quality and to assure radiation safety. Examples of quality systems can be found in the following guidance documents or any subsequent revisions: *Pharmaceutical Inspection Convention and Pharmaceutical Inspection Co-operation Scheme (PIC/S): Guide to good practices for the preparation of medicinal products in healthcare establishments (PE 010)*; *BudraLex Volume 4, EU Guidelines to Good Manufacturing Practice, Medicinal Products for Human and Veterinary Use*; *European Association of Nuclear Medicine (EANM) guideline: Guidance on current good radiopharmacy practice (eGRPP) for the small-scale preparation of radiopharmaceuticals*; and national guidelines from the

competent authority. Guidance on risk assessment can be found in, for example, *ICH Guideline Q9 Quality Risk Management*.

Particular attention is to be paid to:

- qualified personnel with appropriate training;
- adequate premises;
- qualified and suitable equipment for production and analysis;
- validated procedures for all critical production and testing steps;
- environmental monitoring;
- appropriate documentation;
- procurement of materials and services used in the preparation;
- analytical methods / quality control.

All steps in the preparation of radiopharmaceuticals are designed to meet the radiation safety requirements for the personnel involved and the environment, thereby complying with national or international regulations. This includes appropriate shielding, and measures to avoid and monitor radioactive contamination.

## 2 PREMISES AND EQUIPMENT

The relevant premises and equipment are designed, built, maintained, cleaned and sanitised so that they protect product quality, ensure a low level of particulates and microbial contamination and protect staff and the environment from the effects of radiation.

Radiopharmacies may characteristically prepare a wide variety of radiopharmaceuticals, often in the same session and place. The premises, equipment and workflow are arranged in order to minimise the risk of cross-contamination and mix-up. Facilities and equipment are designed and controlled to reflect the specific risk of all preparations concerned, taking into account the potential for microbial contamination of the preparation. Additional considerations are taken into account when handling biological material.

Detailed knowledge of process parameters, workflow, environmental conditions and microbial aspects of the preparation helps to avoid possible chemical, radiochemical, radionuclidic and microbial contamination. In the particular case of blood cell radiolabelling, movement of operators within the laboratory between the area for blood cell labelling and the area for the preparation of other radiopharmaceuticals is prevented by the appropriate design and layout of the premises. Any biological hazardous material is stored and handled separately from other substances for pharmaceutical use, pharmaceutical preparations or starting materials.

Measurement of radioactivity is carried out as described in general chapter 2.2.66. *Detection and measurement of radioactivity*. Measurement equipment is properly shielded, particularly when high levels of radioactivity are handled in adjacent areas. A system to ensure proper performance of this equipment, including daily checks and periodic calibration, is implemented. All deviations, such as changes to the range of linearity, calibration for energy and efficiency, and unexpected changes in background readings are investigated.

## 3 PREPARATION PROCESS

In the case of a licensed product used as a part of the preparation process, it is the responsibility of the marketing authorisation holder to ensure that the licensed product complies with the requirements of its marketing authorisation. The radiopharmacy preparing licensed radiopharmaceuticals according to the instructions for use

carries the responsibility for the quality of the preparation and the handling of these radiopharmaceuticals at its site.

If the instructions for use of a licensed radiopharmaceutical are not strictly followed or if one or more components used for the preparation do not have a marketing authorisation, risk assessment (including rationales and pharmaceutical equivalence, if applicable) is undertaken and documented. It is the responsibility of the radiopharmacy to demonstrate that the quality of the final preparation is suitable for the intended use.

In general for EPRs, the bioburden of starting materials is an important factor in maintaining a low bacterial endotoxin content and achieving a high sterility assurance level in subsequent operations. Opened or partially used packages of starting materials intended for subsequent use are properly indicated (labelled) and stored under restricted access conditions. Shelf-life periods are defined for opened, unopened and dissolved starting materials, especially in light of the microbiological background in the specific working conditions. The use of single-use packages is recommended. A shelf-life for starting material sets is defined with consideration given to the degradation of ingredients, microbial contamination and the stability of packaging materials, taking into account the permeability of plastic and elastomeric packaging. Shelf-life is indicated and justified by stability studies reflecting the mode of use.

Monitoring of the environment and personnel during the extemporaneous preparation of radiopharmaceuticals is essential in defining the quality of the final preparation, irrespective of the origin of material used in the preparation. Recommendations for the frequency of monitoring can be found in guidance documents such as PIC/S Guide PE 010 or any subsequent revisions. Deviations from the recommended frequency are made based on risk assessment and justified. When a sterile preparation is to be obtained and terminal sterilising filtration is not possible, all starting materials are sterile. Components of the equipment that come into direct contact with the preparation during the preparation process are sterile and disposable or re-used only after a validated cleaning and sterilisation procedure has been carried out.

### 3-1 PRODUCTION OF RADIONUCLIDES

The procedure for production of the radionuclide describes major parameters, such as:

- target material;
- nuclear reaction;
- construction of the holder for the target material;
- maintenance of the holder for the target material and the transfer lines;
- irradiation data, such as beam energy and intensity;
- typical radionuclidic contaminants for the adopted conditions (excitation function);
- separation/purification process of the desired radionuclide;

and evaluates all effects on the efficiency of the production in terms of quality and quantity of the radionuclide produced.

Radionuclide precursors and radiolabelled molecules comply with the requirements of the general monograph *Radiopharmaceutical preparations (0125)* and any individual monographs where available.

### 3-2 CHEMICAL PRECURSORS

Chemical precursors are usually obtained by chemical synthesis. They can be combined or pre-loaded with other substances in the form of pre-prepared sets for radiolabelling procedures and/or used as starting materials in cassettes or kits.

Chemical precursors, either in isolated form or in the form of starting material sets, have an acceptable, low degree of microbial contamination, irrespective of whether the final product is terminally sterilised or sterilised by filtration. Sterilisation is to be considered if there is a risk that the chemical precursors support microbial growth.

Quality requirements for chemical precursors are stated in the respective individual monographs. Where no monograph is available, the general monograph *Substances for pharmaceutical use (2034)* applies and a programme to test the quality is implemented. However, it is to be noted that certain provisions of the general monograph *Substances for pharmaceutical use (2034)* are not applicable to radiopharmaceutical preparations or chemical precursors. These provisions are covered by the general monograph *Radiopharmaceutical preparations (0125)*.

### 3-3 RADIOLABELLING

The radiolabelling step is the reaction of the radionuclide with a chemical precursor. Biological materials such as proteins or cells can also be substrates for direct radiolabelling.

The radiolabelling includes the mixing of starting materials in controlled conditions (i.e. temperature or pressure). After radiolabelling, subsequent steps may be involved to remove protecting groups or to couple the radiolabelled compound to another molecule, which may be an organic moiety or a more complex structure such as a peptide or an antibody.

Risks to radiolabelling efficiency, quality, safety and efficacy of the radiopharmaceutical, associated with the chemical and physical composition of the kit, the components or the starting materials, are evaluated and documented. Chemical and physical stability and risks of microbial contamination are examined closely.

The source and quality of starting materials (e.g. metal contaminants), the quantitative and qualitative composition (e.g. concentration, pH, sterility, osmolarity, viscosity, solubility, stability) and the operating conditions (e.g. use of inert gas, temperature, pressure) are considered when developing the synthesis. Special attention is also paid to possible side products of the synthesis. Automation and/or use of cassettes are possible ways of improving the reliability of synthesis processes, reducing the risk of microbial contamination and increasing radiation safety.

Before introducing a new synthesis in clinical application, the synthesis process is validated by suitable controls during the preparation (in-process control) and extensive quality control of the final preparation using at least 3 batches. Once the process is validated, the routine controls that need to be performed before patient administration are considered based on a risk assessment, taking into account different factors such as chemical complexity, factors affecting the efficacy of the product, and radiation dose concerns for the patient, for example through the control of radiochemical and radionuclidic impurities.

#### 3-3-1 Radiopharmaceuticals not requiring a purification step

This type of synthesis is characterised by combining a radionuclide with a mixture of starting materials. This addition is followed by a near-quantitative reaction of the radionuclide with the chemical precursor, so that the extemporaneous preparation process does not require a purification step. Open methods for radiosynthesis are to be avoided due to the elevated risk of microbial contamination.

All components are co-injected with the resulting radiopharmaceutical active ingredient. The required risk assessment focuses on the chemical, radiochemical and microbiological quality of all starting materials, including the radionuclide. In case of multiple additions, the risk assessment also focuses on the conditions of addition and reaction of the different starting materials, and especially the reaction container.

#### 3-3-2 Radiopharmaceuticals requiring purification

This type of synthesis is characterised by a single addition of a radionuclide solution to a mixture of starting materials or by multiple additions of different starting materials, which then requires subsequent purification (see also section 3-5). An efficient purification of the desired radioactive compound from the reaction mixture is necessary in order to ensure low levels of radionuclidic, chemical and/or radiochemical impurities. Physico-chemical and chemical separation of intermediates or the final product is essential to yield a radiopharmaceutical that meets the desired quality specifications. If possible, the preparation process, including the critical separation steps, is monitored with suitable detectors, and controls are performed with regard to radiation safety. The required risk assessment focuses on the same points as in section 3-3-1, as well as on the conditions of purification, especially the efficiency of separation and the effect of chromatographic media on the subsequent microbiological quality of the product (endotoxin content).

#### 3-3-3 Cell radiolabelling

Cross-contamination, cross-infection, mix-up of blood and blood components, and integrity and/or viability of the cells after radiolabelling are all specific points of attention for the risk assessment of cell radiolabelling. This type of radiolabelling is considered more extensively in section 3-14.

### 3-4 AUTOMATED SYSTEMS

Some of the steps described above can be subject to automation. An automated module (synthesiser) usually consists of a combination of power supplies, actuators, pumps, heaters and sensors that are used in combination with an interconnected network of containers, reactors, tubing, syringes, solid phase cartridges and/or preparative liquid chromatography systems. The automated module can be a commercial piece of equipment or can be custom made. It is common for different radiopharmaceuticals to be made on the same automated module.

Within the synthesis process, the automated module controls process parameters in such a way that a solution of a radiopharmaceutical is produced. The containers and the purification system used with the automated module can be single-use ('radiopharmaceutical cassette') or used in multiple production runs.

When using consecutive production runs, the risk of cross-contamination is considered. Appropriate measures are taken to prevent cross-contamination by using dedicated components or equipment or by assessing the effectiveness of the cleaning procedure.

The containers and purification systems (e.g. the column of a preparative liquid chromatography system) are considered part of the synthesiser.

The electronic components of the synthesiser are resistant to high radiation levels.

Components of the automated module that come into contact with the starting materials, solvents and/or the radiopharmaceutical are chemically inert. Special care is

taken with components that may degrade under the influence of radiation and that come into contact with the starting materials, solvents and/or the radiopharmaceutical, as they may release impurities over time.

Automated modules may also control formulation and dispensing of the radiopharmaceutical, usually by using volume- or weight-measuring devices and radioactivity detectors in order to measure and dispense the correct quantities. For dispensing, single-use tubing systems are used. The measuring system is calibrated.

For an automated synthesis and/or dispensing module, 2 levels of qualification/validation are required.

The automated module itself is qualified by the supplier and/or the user. After this qualification, the extemporaneous preparation/dispensing process is validated.

The synthesis process on the synthesiser is usually controlled by software and is validated. The user of the automated system has the list of the sequence steps used in the synthesis and a history of changes made to them. The software is under access control, and any changes to it are controlled and documented. Guidance on the use of computerised systems can be found, for example, in EudraLex Volume 4, Annex 11.

Manual interventions or adjustments of parameters (e.g. manual operation of valves) are documented and investigated as a process deviation if outside the validated ranges. The version of the software used for a production is recorded as a batch parameter. When changes are made to the software, the old version of the software is archived for the same period as the documentation of the batches made with that version.

Automated systems may involve the use of radiopharmaceutical cassettes and other disposable devices. Cassettes are used with a set of starting materials (such as precursors, solvents, catalysts, etc.), which may be contained in the cassette (prefilled cassette) or provided separately (empty cassette).

Cassettes can be made by commercial manufacturers or assembled in-house. The requirements apply to both, and the related information is directed towards the users of the cassette to help them establish their user requirements.

All materials in the system that come into contact with reagents or product exhibit suitable stability during storage and use. The compatibility of the materials (e.g. plastics) with the chemical process is assessed and documented. Glass components are at least type I (see general chapter 3.2.1. *Glass containers for pharmaceutical use*).

Before administration of a preparation produced with the aid of cassettes, it is validated that the combination of the cassette and the automated system consistently produces the radiopharmaceutical of the desired quality.

The quality of the chemicals used complies with the requirements mentioned in section 3-2.

The cassette is able to synthesise the radiopharmaceutical to the agreed specification during the entire shelf-life of the cassette.

In order to maintain a low bacterial endotoxin content and achieve a high sterility assurance level for the radiopharmaceutical prepared with the use of a cassette, the cassette has a low initial bioburden.

The suitability of the manufacturing process is assured and the user confirms the final product quality by appropriate analytical tests.

The user of the automated system has the necessary information on the chemicals and reaction processes applied within the system in order to evaluate potential deviations that may occur during the production of the radiopharmaceuticals. In the case of suboptimal reaction or system malfunction, yields might be lower and/or additional impurities may occur. Sufficient information about potential system malfunctions is made available to the user in order to set up appropriate release specifications.

### 3-5 PURIFICATION

Separation of the product is often required, particularly when organic chemical reactions are carried out. Since the purification step ensures the final quality of the radiopharmaceutical, separation efficiency has to be carefully evaluated in terms of final radiochemical, radionuclidic and chemical purity. Special attention is paid to residual solvents (see general chapter 5.4. *Residual solvents*). All purification procedures are validated.

A microbial contamination risk exists when using chromatographic media, especially in the case of multiple-use liquid chromatography columns. Risk assessment focuses on cleaning/conditioning procedures and conditions of storage of chromatographic media. Bioburden and bacterial endotoxin content are maintained below suitable limits to allow sterilisation in case of parenteral dosage forms.

The radiolabelling process for biological materials such as blood cells are developed in such a way that the purification step, typically centrifugation, guarantees a reproducible quality of product.

### 3-6 FORMULATION

After purification of the labelled compound, the radiolabelled molecule is formulated into a suitable form for administration to patients.

The source and quality of excipients and additives are documented.

When an in-house starting material set is used, the use of components with no microbial contamination (or an acceptably low level) is recommended, irrespective of whether the final product is terminally sterilised or sterile-filtered.

In case different types of radiopharmaceuticals from kits are to be prepared in the same period, separate vials of diluent are used to prevent cross-contamination.

Most radiopharmaceuticals are intended for parenteral administration. In this respect, pH, osmolarity, viscosity, ionic strength and solubility are appropriately addressed when radiopharmaceuticals and in-house starting material sets are developed.

### 3-7 DISPENSING

Dispensing is the process of aliquoting formulation solution into final product dosage forms, subject to release before medical administration (see section 3-12). It includes preparation of a batch consisting of one or more final product vials or syringes. In order to keep the bioburden as low as possible, components used in the dispensing process are sterile. If unavailable, components are sterilised by a validated process. If components are reused, it is ensured by a validated cleaning procedure that no cross-contamination from one product to another can take place.

### 3-8 STERILISATION

Radiopharmaceuticals for parenteral administration are sterile. Terminal sterilisation provides the highest level of assurance that a product will be sterile. In most cases, only sterilising filtration steps can be performed, but in others, no

sterilisation is possible (e.g. when autologous cells are radiolabelled). These are to be considered as aseptic preparations. The methods of sterilisation that can be used are described in general chapter 5.1.1. *Methods of preparation of sterile products*.

Aseptic manipulations take place in a grade A environment (class A zone). The grade of the surrounding environment will depend on the containment system used, the risk of contamination for the preparation, the shelf-life of the preparation and the number of units prepared during a preparation run. With respect to air cleanliness, a grade C surrounding area for open workstations, or a grade D surrounding area for isolators is typically acceptable.

The complexity of operation and the shelf-life determine the measures that need to be taken to ensure a sterile product, for example:

- for simple operations in a closed system requiring little handling (e.g. preparing radiopharmaceuticals from licensed kits and generators), suitable control of the immediate surrounding area of a workstation may provide the appropriate level of air cleanliness when additional measures (e.g. gowning flow) are in place; a risk assessment is crucial in this respect;
- for complex operations (e.g. open-vial preparation or vial filling after sterile filtration, aseptic preparation, labelling of autologous cells), additional measures may be required in the immediate surrounding area of an open workstation to ensure a sterile product.

Closed procedures for dispensing are used whenever possible as an alternative to open-vial filling, especially for very small batches or individual patient preparations. The dispensing set (sterilising filter, needles, tubes and vials) that is used in closed aseptic dispensing operations is sterile. This can be achieved by sterilisation of the dispensing set, or by using sterile components. These sterile components are assembled and connected in a grade A air-supply area located in a grade C area with respect to air cleanliness. The process of closed aseptic dispensing can be performed in an area that is at least grade C with respect to air cleanliness.

Monitoring of critical grade A air-supply areas and the background environment for particulates and microbial contamination is carried out on a regular basis. When sterilising filtration is used to sterilise the preparation, the filter is tested for integrity before administration of the preparation to the patient. Filter-integrity testing for each type of preparation, for example by bubble-point determination, is validated.

Preparations that contain a radionuclide with a half-life shorter than 10 min are exempt from filter integrity testing before release of the product.

Where the administration is performed directly from the equipment to the patient, the filter used is suitable for direct human use.

Compatibility of the filter membrane and housing with the product solution is verified experimentally using the supplier specifications. In some cases it is not possible to find acceptable certified filters for certain applications (e.g. for hydrophobic radiopharmaceuticals). In these cases, filters need to be tested for bacterial endotoxin content, efficiency and product recovery.

### 3-9 ANALYTICAL CONTROL

All analytical systems are qualified and all methods validated according to the recognised standards (e.g. *ICH Guideline Q2 Validation of Analytical Procedures: Text and Methodology*).

Wherever possible, quality control testing is carried out by a person other than the person who prepared the radiopharmaceutical.

#### 3-9-1 Starting materials

Starting materials used for extemporaneous preparation comply with the general monograph *Substances for pharmaceutical use (2034)* and with their individual monographs where available.

For starting materials that are not present in the radiopharmaceutical (e.g. reagents removed by purification, catalysts, solvents, cartridges), specifications are verified by evaluation of the certificate of analysis provided by the manufacturer, completed if necessary by specific tests. If testing is not possible from a technical point of view, for example when using commercially available prefilled cassettes, testing can be omitted provided that the omission is backed up by a risk assessment. Specifications are adapted to the level of chemical and microbiological purity needed to ensure a suitable quality for the intended purpose in the radiosynthesis.

The identity of excipients included in the final formulation is verified by a suitable analytical method, unless they are licensed. Specifications are adapted to the level of purity required to ensure a quality suitable for a component of a pharmaceutical for injection, especially bioburden and bacterial endotoxin content.

Some radionuclides cannot be systematically evaluated by analysis before use in the radiosynthesis process.

The suitability for the intended purpose is established each time a new batch of the target material is used or a modification of the radionuclide preparation process takes place.

For chemical precursors, (i) identity is verified by a suitable analytical method, (ii) suitability for radiosynthesis is verified by performing a complete radiosynthesis with a final radiopharmaceutical product complying with all its specifications (test synthesis), and (iii) specifications are verified by evaluation of the certificate of analysis provided by the manufacturer, completed if necessary by specific tests.

#### 3-9-2 Radiopharmaceuticals

Extemporaneously prepared radiopharmaceuticals comply with the general monograph *Radiopharmaceutical preparations (0125)* and with individual monographs where available.

Moreover, other applicable general monographs and general texts also apply, especially *Pharmaceutical preparations (2619)*, 5.1.1. *Methods of preparation of sterile products* and 5.4. *Residual solvents*.

Where no individual monograph or authorised summary of product characteristics exists, specifications and corresponding test methods need to be established for each radiopharmaceutical. Table 5.19.-1 provides examples for determining the suitable analytical parameters and methods. Details on the measurement of radioactivity in test methods can be found in general chapter 2.2.66. *Detection and measurement of radioactivity*. For each scheduled test, it is stated whether the result has to be available before release for use of the radiopharmaceutical. When a test is delayed until after release for use, this must be justified and a maximum period of delay for performing the test is established.

Table 5.19.-1. – Examples of analytical parameters and methods for release of an extemporaneously prepared radiopharmaceutical

Test or parameter	Equipment and/or method
Characters, appearance	Visual inspection
Identity of radionuclide	Half-life determination; alpha spectrometry; beta spectrometry; gamma-ray spectrometry
Radiochemical identity	Liquid chromatography, thin-layer chromatography
Radiochemical purity	Liquid chromatography, thin-layer chromatography
Chemical purity	Liquid chromatography, thin-layer chromatography
Radionuclidic purity	Half-life determination; gamma-ray spectrometry, alpha spectrometry, beta spectrometry
Residual solvents	Gas chromatography
Pharmaceutical or physiological parameters	pH, osmolality
Microbiological contamination	Bacterial endotoxins, sterility
Radioactivity content, concentration	Ionisation chamber
Specific radioactivity	Liquid chromatography, ionisation chamber
Enantiomeric purity	Chiral chromatography

### 3-10 PACKAGING

The primary packaging material is compatible with the preparation.

### 3-11 LABELLING

Where a radiopharmaceutical is prepared and used on the same site, the labelling of the primary packaging of the radiopharmaceutical indicates the identity and ensures traceability. It complies with the relevant national and European legislation.

The label typically states:

- the name of the preparation/active substance and/or its reference;
- an unequivocal reference to the preparation (batch number or date of the EPR);
- where applicable, a serial number for the dispensed unit (where several units are dispensed);
- the international symbol for radiation (trefoil).

Where applicable, the shielding labelling contains a reference to the patient (identification number or name).

For liquid and gaseous preparations, the total radioactivity in the container or the radioactive concentration per millilitre at a stated date and measurement time, and the volume of liquid in the container are stated on the shielding labelling.

For solid preparations (such as capsules), the total radioactivity at a stated date and, if necessary, measurement time are stated.

The labelling can be adapted in certain cases where, due to the extremely short half-life (i.e. less than 10 min) of the product, the preparation is used before all of the information is available.

In addition, the label on the shielding or on the outer package states:

- where applicable, the name of any excipients;
- the name of the manufacturer (site where the preparation was made);

- the route of administration;
- the period of validity or the expiry date;
- where applicable, any special storage conditions.

### 3-12 RELEASE

The decision to release a radiopharmaceutical as suitable for administration is dependent on the conformance of the analytical results to the specifications, and to the process data related to its preparation, especially in-process controls and monitoring (e.g. particle, microbial, environmental). However, due to the short-lived nature of radiopharmaceuticals, not all quality parameters of the preparation can be known at the time of release for administration. The list of analytical tests to be performed before release for administration is established according to section 3-9-2. Release for administration follows a written procedure indicating all relevant data (preparation, quality control, assessment of deviations, etc.) required. This procedure is based on a risk assessment. Retrospective examination of analytical results is acceptable in cases where the test results can technically not be obtained before administration of the radiopharmaceutical and is based on a risk assessment. The review and the release of the preparation before administration by the responsible person is confirmed in writing in the batch documentation.

A written procedure also describes the actions to be taken by the responsible person in case unsatisfactory test results are obtained after the preparation has been released (recall or provision of information to users of the preparation, depending on the time of discovery).

The final review and final release of the preparation by the responsible person is confirmed in writing in the batch documentation.

### 3-13 RETENTION SAMPLES

In the case of preparations without a marketing authorisation, retention samples are kept for a period of 1 month from the time all testing is completed or 1 month after expiry of the preparation, whichever is the longer. In the case of single vial dispensing, retention samples may not be available; this is carefully considered in any risk assessment. Where technically possible, the same approach is applied to chemical precursors and starting materials. No retention samples are needed for preparations of radiolabelled blood cells.

### 3-14 PREPARATION OF RADIOLABELLED BLOOD CELLS

During cell manipulation and radiolabelling, it is necessary to maintain both cell viability and sterility. Operator protection is of paramount importance, and operator exposure to biological and radiation hazards is avoided.

#### 3-14-1 Collection of blood cells and cellular components for radiolabelling and reinjection into the original donor/patient

Blood cells and cellular components are collected in such a way as to preserve their function (use of a wide-bore needle, use of a syringe pre-coated with an appropriate anticoagulant, avoiding excessive centrifugation). The containers are suitably labelled with the patient's information in order to prevent mix-up. Quality requirements for all substances used in the separation of the cells are stated in the respective individual monographs, if available. The general monograph *Substances for pharmaceutical use (2034)* applies, whether or not an individual monograph is available. Further precautions may be necessary where the use of heterologous cells is required, as provided in respective regulations.

A centrifuge, constructed to ensure containment in case of spills and/or breakage (with closed buckets), is required for

blood-cell component separations. The equipment used in the labelling of cells is only used for one procedure (one patient) at a time, and single-use utensils are the preferred choice. The processing of samples from different patients is separated by a suitable period of time, and includes a cleaning/disinfection process for utensils and equipment that ensures the destruction of blood-borne pathogens and viruses.

### 3-14-2 Radiolabelling of the cells

Precautions are taken to prevent cross-contamination, cross-infection or mix-up of blood, and the introduction of microbial contamination. Radiolabelling conditions do not impair the integrity and/or viability of the cells. As terminal sterilisation is not possible, radiolabelling of cells is considered as an aseptic preparation (see section 3-8).

### 3-14-3 Quality control

Identification, calculation of the labelling yield and absence of aggregation or clumping of cells is assessed to verify the suitability of radiolabelled cells before release and reinjection/administration. At regular time intervals, testing for cell viability/integrity is performed.

Validation of the preparation of radiolabelled blood cells includes testing of cell viability, morphology or function depending on the cell type. Any changes to the procedure for preparation of radiolabelled cells is validated.

## GLOSSARY

### Automated module for synthesis and/or dispensing

Electromechanical device controlled by software to automatically perform a sequence of operations needed for radiolabelling, purification, formulation, dispensing and/or sterilisation of a radiopharmaceutical.

### Cassette

Single use production hardware consisting of a pre-assembled network of containers, valves and syringes, including or not the starting material set, intended to be mounted on a synthesis module in order to prepare an EPR.

### Closed method for radiosynthesis

Method where a solution is never directly exposed to the environment during the radiosynthesis process, but is contained within the synthesis system (e.g. a cassette).

### Closed vial dispensing

Method of dispensing, in which the solution to be filled after sterile filtration is not in direct contact with the environment and no aseptic connections are made in the system after the sterilising filter during the dispensing process.

### Open method for radiosynthesis or dispensing (open vial filling)

Method where at some point during the process, a solution is directly exposed to the environment (*NOTE*: for dispensing, contact with the environment through a sterilising air filter is not considered a direct exposure).

### Responsible person

Person designated as responsible for the release of a radiopharmaceutical, who meets the requirements provided by the national legislation.

### Starting material

Substance used for the preparation of a medicinal product. Generators, chemicals for synthesis, ion-exchange resins, packing components and consumables are considered as starting materials.

### Starting material set

Set of reagents, solvents and precursors in their usable forms for the EPR. Usable forms are mostly either a weighed

amount of a solid or a volumetric sample of a suitable solution. Solids and liquids are often dispensed in closed vials for storage before use. Starting material sets may be available commercially or be prepared on-site from commercial or locally synthesised chemicals and packaging materials.

Ph Eur

## Betiatide for Radiopharmaceutical Preparations

(Ph. Eur. monograph 2551)

C<sub>15</sub>H<sub>17</sub>N<sub>3</sub>O<sub>6</sub>S

367.4

103725-47-9

Ph Eur

### DEFINITION

*N*-[2-(Benzoylsulfanyl)acetyl]glycylglycylglycine.

### Content

98.0 per cent to 102.0 per cent (anhydrous substance).

### CHARACTERS

#### Appearance

White or almost white powder.

#### Solubility

Practically insoluble in water, soluble in dimethylsulfoxide, very slightly soluble in anhydrous ethanol.

### IDENTIFICATION

Infrared absorption spectrophotometry (2.2.24).

*Comparison betiatide CRS.*

### TESTS

#### Related substances

Liquid chromatography (2.2.29). Prepare the solutions immediately before use.

*Solvent mixture* acetonitrile R, water R (50:50 V/V).

*Test solution* Dissolve 10.0 mg of the substance to be examined in 8 mL of the solvent mixture, sonicate if necessary for 10-20 s and dilute to 10.0 mL with the solvent mixture.

*Reference solution (a)* Dilute 1.0 mL of the test solution to 100.0 mL with the solvent mixture. Dilute 1.0 mL of this solution to 10.0 mL with the solvent mixture.

*Reference solution (b)* Dissolve 2 mg of *betiatide impurity D CRS* in 20 mL of the solvent mixture, using sonication if necessary, and dilute to 50 mL with the solvent mixture. Dilute 2.5 mL of the solution to 50 mL with the solvent mixture.

*Reference solution (c)* Dilute 1 mL of the test solution to 10 mL with reference solution (b).

#### Column:

— *size*:  $l = 0.25$  m,  $\varnothing = 4.6$  mm;

— *stationary phase*: end-capped octadecylsilyl silica gel for chromatography R (5  $\mu$ m).

#### Mobile phase:

— *mobile phase A*: water for chromatography R, acetonitrile R (30:70 V/V);

— *mobile phase B*: 0.1 per cent V/V solution of trifluoroacetic acid R;

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 35	10 → 85	90 → 15

**Flow rate** 1.0 mL/min.

**Detection** Spectrophotometer at 254 nm.

**Injection** 10 µL of the test solution and reference solutions (a) and (c).

**Relative retention** with reference to betiatide (retention time = about 17 min): impurity D = about 1.1.

**System suitability** Reference solution (c):

— **resolution**: minimum 2.5 between the peaks due to betiatide and impurity D.

**Calculation of percentage contents:**

— for each impurity, use the concentration of betiatide in reference solution (a).

**Limits:**

- **impurity D**: maximum 0.2 per cent;
- **unspecified impurities**: for each impurity, maximum 0.20 per cent, and not more than 1 such impurity exceeds 0.10 per cent;
- **total unspecified impurities**: maximum 3.0 per cent;
- **reporting threshold**: 0.05 per cent.

**Water (2.5.12)**

Maximum 1.0 per cent, determined on 0.100 g using a mixture of equal volumes of *methanol R* and *formamide R* as solvent.

**ASSAY**

Dissolve 0.100 g in 50 mL of equal volumes of *anhydrous ethanol R* and *water R* by heating at 50–60 °C with constant stirring and sonicating to ensure complete dissolution. Allow to cool to room temperature. Titrate with 0.1 M *sodium hydroxide*, determining the end-point potentiometrically (2.2.20).

1 mL of 0.1 M *sodium hydroxide* is equivalent to 36.74 mg of  $C_{15}H_{17}N_3O_6S$ .

**STORAGE**

In an airtight container, protected from light, at a temperature of 2 °C to 8 °C.

**IMPURITIES**

**Specified impurities** D.

**Other detectable impurities** (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities. It is therefore not necessary to identify these impurities for demonstration of compliance): A, B, C, E, F.

A. benzoic acid,

B. (benzoylsulfanyl)acetic acid,

C. 2,5-dioxopyrrolidin-1-yl 2-(benzoylsulfanyl)acetate,

D. *N*-[2-(benzoylsulfanyl)acetyl]glycylglycine,

E. (benzylsulfanyl)acetic acid,

F. *N*-[2-(benzoylsulfanyl)acetyl]hexaglycine.

## Iobenguane Sulfate for Radiopharmaceutical Preparations

Iobenguane Sulphate for Radiopharmaceutical Preparations

(Ph. Eur. monograph 2351)

$C_{16}H_{22}I_2N_6O_4S$

648

87862-25-7

Ph Eur

**DEFINITION**

Bis[[(3-iodophenyl)methyl]guanidine] sulfate.

**Content**

98.0 per cent to 102.0 per cent (dried substance).

**CHARACTERS**

**Appearance**

White or almost white crystals.

**IDENTIFICATION**

A. Infrared absorption spectrophotometry (2.2.24).

**Comparison** iobenguane sulfate CRS.

B. Dissolve about 10 mg in 1 mL of *water R* with gentle heating. The solution gives reaction (a) of sulfates (2.3.1).

**TESTS**

**Impurity A**

Liquid chromatography (2.2.29). Prepare the solutions and the mobile phase immediately before use.

**Test solution** Dissolve 10.0 mg of the substance to be examined in 1 mL of the mobile phase and dilute to 5.0 mL with the mobile phase.

**Reference solution (a)** Dissolve 10.0 mg of *iobenguane sulfate CRS* in 1 mL of the mobile phase and dilute to 5.0 mL with the mobile phase.

**Reference solution (b)** Dissolve 23.1 mg of *3-iodobenzylammonium chloride R* (salt of impurity A) in 1 mL of the mobile phase and dilute to 10.0 mL with the mobile phase.

**Reference solution (c)** Mix 1 mL of reference solution (a) and 1 mL of reference solution (b).

**Reference solution (d)** Dilute 0.1 mL of reference solution (b) to 10.0 mL with the mobile phase.

**Column:**

- size:  $l = 0.25$  m,  $\varnothing = 4.0$  mm;
- stationary phase: silica gel for chromatography R (5  $\mu$ m);
- temperature: maintain at a constant temperature between 20 °C and 30 °C.

**Mobile phase** Mix 40 mL of an 80 g/L solution of ammonium nitrate R, 80 mL of dilute ammonia R2 and 1080 mL of methanol R.

**Flow rate** 1 mL/min.

**Detection** Spectrophotometer at 254 nm.

**Injection** 20  $\mu$ L of the test solution and reference solutions (c) and (d).

**Run time** 15 min.

**Relative retention** With reference to iobenguane (retention time = about 7 min): impurity A = about 0.2.

**System suitability** Reference solution (c):

- resolution: minimum 4.0 between the peaks due to impurity A and iobenguane.

**Limit:**

- impurity A: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (d) (1.0 per cent).

**Loss on drying (2.2.32)**

Maximum 3.0 per cent, determined on 0.100 g by drying in an oven at 105 °C.

**ASSAY**

Liquid chromatography (2.2.29) as described in the test for related substances with the following modification.

**Injection** Test solution and reference solution (a).

Calculate the percentage content of  $C_{16}H_{22}I_2N_6O_4S$  from the declared content of iobenguane sulfate CRS.

**STORAGE**

Protected from light, at a temperature below 25 °C.

**IMPURITIES**

**Specified impurities** A.

A. 1-(3-iodophenyl)methanamine.

Ph Eur

## Medronic Acid for Radiopharmaceutical Preparations

(Ph. Eur. monograph 2350)

$CH_6O_8P_2$

176.0

1984-15-2

**Action and use**

Bisphosphonate; used for bone scanning.

Ph Eur

**DEFINITION**

Methylenediphosphonic acid.

**Content**

99.0 per cent to 101.0 per cent (dried substance).

**CHARACTERS****Appearance**

White or almost white, amorphous or crystalline, hygroscopic powder.

**Solubility**

Very soluble in water, very slightly soluble in anhydrous ethanol, practically insoluble in methylene chloride.

**IDENTIFICATION**

**First identification:** A.

**Second identification:** B.

**A. Nuclear magnetic resonance spectrometry (2.2.33).**

**Preparation** 100 g/L solution in deuterium oxide R.

**Comparison** 100 g/L solution of medronic acid CRS in deuterium oxide R.

**Results** The  $^1H$  NMR spectrum obtained is qualitatively similar to the  $^1H$  NMR spectrum obtained with medronic acid CRS.

**B. Infrared absorption spectrophotometry (2.2.24).**

**Comparison** medronic acid CRS.

**TESTS****Impurities A and B**

Nuclear magnetic resonance spectrometry (2.2.33).

**Test solution** To 1.0 g of the substance to be examined add 10 mL of deuterated chloroform R. Stir for 1 hour. Pass the resulting solution through a sintered-glass filter to remove the precipitate containing medronic acid. Evaporate the filtrate to about 0.5 mL.

**Reference solution (a)** Mix 10  $\mu$ L of medronic acid impurity A CRS with 1.0 mL of deuterated chloroform R.

**Reference solution (b)** Mix 10  $\mu$ L of medronic acid impurity B CRS with 1.0 mL of deuterated chloroform R.

**Reference solution (c)** After recording the NMR spectrum of the test solution, add 10  $\mu$ L of medronic acid impurity A CRS and 10  $\mu$ L of medronic acid impurity B CRS to the test solution.

**Apparatus** NMR spectrometer operating at minimum 250 MHz.

Record the  $^1H$  NMR spectra of the test solution and the reference solutions, if necessary using tetramethylsilane R as a chemical shift internal reference compound.

**Position of the signals** Deuterated chloroform = about 7.3 ppm; impurity A = about 4.4 ppm and 1.3 ppm; impurity B = about 4.7 ppm, 2.4 ppm and 1.3 ppm.

**System suitability:**

- the positions of the signals due to impurities A and B in the spectrum obtained with reference solution (c) do not differ significantly from those in the spectra obtained with reference solutions (a) and (b).

**Limits:**

- integration: integrate the multiplet at 4.4 ppm due to impurity A and the multiplet at 2.4 ppm due to impurity B in the spectra obtained with the test solution and reference solution (c) to obtain the areas of the peaks used in the comparison of impurity contents;
- impurities A, B: for each impurity, not more than 0.5 times the area of the corresponding peak in the spectrum obtained with reference solution (c) (1 per cent).

**Phosphates (2.4.11)**

Maximum 1.0 per cent.

Dissolve 0.100 g in 10 mL of water R and dilute to 100.0 mL with the same solvent. Dilute 1.0 mL of this solution to 100.0 mL with water R.

**Loss on drying (2.2.32)**

Maximum 0.5 per cent, determined on 0.500 g by drying in an oven at 105 °C.

**ASSAY**

Dissolve 75 mg in *water R* and dilute to 50 mL with the same solvent. Titrate with 0.1 M sodium hydroxide, using 0.1 mL of bromocresol green solution *R* as indicator.

1 mL of 0.1 M sodium hydroxide is equivalent to 8.80 mg of  $\text{CH}_6\text{O}_6\text{P}_2$ .

**STORAGE**

In an airtight container, protected from light.

**IMPURITIES**

Specified impurities A, B.

## A. tris[(propan-2-yl)oxy]phosphane,

## B. tetrakis[(propan-2-yl)oxy]methylenediphosphonate.

Ph Eur

## Pentetate Sodium Calcium for Radiopharmaceutical Preparations

(Ph. Eur. monograph 2353)

$\text{C}_{14}\text{H}_{18}\text{CaN}_3\text{Na}_3\text{O}_{10} \cdot x\text{H}_2\text{O}$  497.4  
(anhydrous substance)

Ph Eur

**DEFINITION**

Trisodium [1,1',1'',1'''-[[[(carboxylatomethyl)imino]bis(ethylenenitrilo)]tetraacetato]calcate(3-).

It is a starting material for the preparation of technetium ( $^{99\text{m}}\text{Tc}$ ) pentetate injection.

**Content**

98.0 per cent to 102.0 per cent (anhydrous substance).

It contains a variable quantity of water.

**CHARACTERS****Appearance**

White or almost white, hygroscopic powder or crystals.

**Solubility**

Freely soluble in water, practically insoluble in ethanol (96 per cent).

**IDENTIFICATION**

A. Infrared absorption spectrophotometry (2.2.24).

Comparison pentetate sodium calcium CRS.

B. Ignite. The residue gives reaction (b) of calcium (2.3.1).

C. The substance to be examined gives reaction (a) of sodium (2.3.1).

**TESTS****Solution S**

Dissolve 5.0 g in carbon dioxide-free water *R* and dilute to 25.0 mL with the same solvent.

**Appearance of solution**

Solution S is clear (2.2.1) and colourless (2.2.2, Method II).

**pH (2.2.3)**

8.0 to 9.5 for solution S.

**Impurity A**

Liquid chromatography (2.2.29). Carry out the test protected from light.

**Solvent mixture** Dissolve 10 g of ferric sulfate pentahydrate *R* in 20 mL of 0.5 M sulfuric acid and add 780 mL of water *R*. Adjust to pH 2.0 with 1 M sodium hydroxide and dilute to 1000 mL with water *R*.

**Test solution** Dissolve 0.100 g of the substance to be examined in the solvent mixture and dilute to 25.0 mL with the solvent mixture.

**Reference solution (a)** Dissolve 0.100 g of sodium calcium edetate *R* in the solvent mixture and dilute to 25.0 mL with the solvent mixture.

**Reference solution (b)** Dissolve 40.0 mg of nitrilotriacetic acid *R* (impurity A) in the solvent mixture and dilute to 100.0 mL with the solvent mixture. To 10.0 mL of the solution add 1 mL of reference solution (a) and dilute to 100.0 mL with the solvent mixture. Dilute 1.0 mL of this solution to 10.0 mL with the solvent mixture.

**Column:**

— size:  $l = 0.10$  m,  $\varnothing = 4.6$  mm;

— stationary phase: spherical graphitised carbon for chromatography R1 (5  $\mu\text{m}$ ) with a specific surface area of 120  $\text{m}^2/\text{g}$  and a pore size of 25 nm.

**Mobile phase** Dissolve 50 mg of ferric sulfate pentahydrate *R* in 50 mL of 0.5 M sulfuric acid and add 750 mL of water *R*; adjust to pH 1.5 with 0.5 M sulfuric acid or 1 M sodium hydroxide, add 20 mL of ethylene glycol *R* and dilute to 1000 mL with water *R*.

**Flow rate** 1 mL/min.

**Detection** Spectrophotometer at 273 nm.

**Injection** 20  $\mu\text{L}$  of the test solution and reference solution (b); filter the solutions and inject immediately.

**Run time** 4 times the retention time of the iron complex of impurity A.

**Retention time** Iron complex of impurity A = about 5 min; iron complex of edetic acid = about 10 min; the iron complex of pentetic acid elutes with the void volume.

**System suitability** Reference solution (b):

— resolution: minimum 7 between the peaks due to the iron complex of impurity A and the iron complex of edetic acid;

— signal-to-noise ratio: minimum 50 for the peak due to the iron complex of impurity A.

**Limit:**

- **impurity A:** not more than the area of the corresponding peak in the chromatogram obtained with reference solution (b) (0.1 per cent).

**Impurity B**

Maximum 1.0 per cent.

Dissolve 5.0 g of the substance to be examined in 250 mL of *water R*. Add 10 mL of *ammonium chloride buffer solution pH 10.0 R* and 50 mg of *mordant black 11 triturate R*. Not more than 1.3 mL of 0.1 M magnesium chloride is required to change the colour of the indicator to violet.

**Chlorides**

Maximum 0.1 per cent.

Dissolve 0.7 g in *water R* and dilute to 20 mL with the same solvent. Add 30 mL of *dilute nitric acid R*, allow to stand for 30 min and filter. Dilute 10 mL of the filtrate to 50 mL with *water R*. Use this solution as the test solution. Prepare the reference solution using 0.40 mL of 0.01 M *hydrochloric acid*, add 6 mL of *dilute nitric acid R* and dilute to 50 mL with *water R*. Filter both solutions if necessary. Add 1 mL of *silver nitrate solution R2* to the test solution and the reference solution. Mix and allow to stand for 5 min protected from light. Any opalescence in the test solution is not more intense than that in the reference solution.

**Iron (2.4.9)**

Maximum 20 ppm.

Dilute 2.5 mL of solution S to 10 mL with *water R*. Add 0.25 g of *calcium chloride R* to the test solution and the standard before the addition of the *thioglycollic acid R*.

**Water (2.5.12)**

Maximum 15.0 per cent, determined on 0.100 g.

**ASSAY**

Dissolve 0.100 g in *water R* and dilute to 50.0 mL with the same solvent. To 25.0 mL of this solution add 80 mL of *water R* and adjust to pH 2.3 with *dilute nitric acid R*. Titrate with 0.01 M *bismuth nitrate* using 0.1 mL of a 1 g/L solution of *xylene orange R* as indicator. The colour of the solution changes from yellow to red.

1 mL of 0.01 M *bismuth nitrate* is equivalent to 4.974 mg of  $C_{14}H_{18}CaN_3Na_3O_{10}$ .

**STORAGE**

In an airtight container, protected from light.

**IMPURITIES**

*Specified impurities* A, B.

A. nitilotriacetic acid,

B. [[[carboxymethyl]imino]bis(ethyleneditrilo)]tetraacetic acid (pentetic acid).

Ph Eur

## Sodium Iodohippurate Dihydrate for Radiopharmaceutical Preparations

(Ph. Eur. monograph 2352)

$C_9H_7INNaO_3 \cdot 2H_2O$

363.1

5990-94-3

Ph Eur

**DEFINITION**

Sodium (2-iodobenzamido)acetate dihydrate.

**Content**

99.0 per cent to 101.0 per cent (anhydrous substance).

**CHARACTERS****Appearance**

White or almost white, crystalline powder.

**Solubility**

Soluble in water and in ethanol (96 per cent), practically insoluble in methylene chloride.

**IDENTIFICATION**

A. Infrared absorption spectrophotometry (2.2.24).

*Comparison* sodium iodohippurate CRS.

B. It gives reaction (b) of sodium (2.3.1).

**TESTS****Related substances**

Liquid chromatography (2.2.29).

*Test solution* Dissolve 0.100 g of the substance to be examined in the mobile phase and dilute to 10.0 mL with the mobile phase.

*Reference solution (a)* Dilute 1.0 mL of the test solution to 100.0 mL with the mobile phase. Dilute 1.0 mL of this solution to 10.0 mL with the mobile phase.

*Reference solution (b)* Dissolve 10 mg of 2-iodobenzoic acid R (impurity A) in *methanol R* and dilute to 100.0 mL with the same solvent.

*Reference solution (c)* Dissolve 10 mg of *benzoic acid R* in the mobile phase, add 1 mL of the test solution and dilute to 100 mL with the mobile phase.

**Column:**

— *size:*  $l = 0.25$  m,  $\varnothing = 4.6$  mm;

— *stationary phase:* end-capped polar-embedded octadecylsilyl amorphous organosilica polymer R (5  $\mu$ m).

*Mobile phase* acetic acid R, *methanol R*, *water R* (1:50:50 V/V/V).

*Flow rate* 1 mL/min.

*Detection* Spectrophotometer at 230 nm.

*Injection* 20  $\mu$ L.

*Run time* 7 times the retention time of 2-iodohippuric acid.

*Identification of impurities* Use the chromatogram obtained with reference solution (b) to identify the peak due to impurity A.

*Relative retention* With reference to 2-iodohippuric acid (retention time = about 4.5 min): benzoic acid = about 1.6; impurity A = about 2.1.

**System suitability** Reference solution (c):

- **resolution:** minimum 5.0 between the peaks due to 2-iodohippuric acid and benzoic acid.

**Limits:**

- **impurity A:** not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent);
- **unspecified impurities:** for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.10 per cent);
- **total:** not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent);
- **disregard limit:** 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

**Water (2.5.12)**

8.0 per cent to 12.0 per cent, determined on 0.100 g.

#### ASSAY

Dissolve 0.250 g in 20 mL of *glacial acetic acid R*. Titrate with 0.1 M perchloric acid, determining the end-point potentiometrically (2.2.20).

1 mL of 0.1 M perchloric acid is equivalent to 32.71 mg of  $C_9H_7INNaO_3$ .

#### STORAGE

Protected from light.

#### IMPURITIES

**Specified impurities A.**

A. 2-iodobenzoic acid.

Ph Eur

## Tetra-O-Acetyl-Mannose Triflate for Radiopharmaceutical Preparations

(Ph. Eur. monograph 2294)

$C_{15}H_{19}F_3O_{12}S$

480.4

92051-23-5

Ph Eur

#### DEFINITION

1,3,4,6-Tetra-O-acetyl-2-O-trifluoromethanesulfonyl-β-D-mannopyranose.

#### Content

97.0 per cent to 102.0 per cent (dried substance).

#### CHARACTERS

##### Appearance

White or almost white, crystalline, hygroscopic powder.

##### Solubility

Practically insoluble in water, very soluble in acetonitrile, freely soluble in methylene chloride, slightly soluble in ethanol (96 per cent).

#### IDENTIFICATION

Infrared absorption spectrophotometry (2.2.24).

**Comparison** *tetra-O-acetyl-mannose triflate CRS*.

#### TESTS

**Specific optical rotation (2.2.7)**

−12.0 to −16.0 (dried substance), measured at 20 °C.

Dissolve 0.250 g in *acetonitrile R* and dilute to 10.0 mL with the same solvent.

##### Impurity B

$^{19}F$  Nuclear magnetic resonance spectrometry (2.2.33).

Prepare the solutions immediately before use.

**Test solution** Dissolve 20.0 mg of the substance to be examined in *deuterated acetonitrile R* and dilute to 1.0 mL with the same solvent.

**Reference solution (a)** Dissolve 20.0 mg of *tetra-O-acetyl-mannose triflate CRS* in *deuterated acetonitrile R* and dilute to 1.0 mL with the same solvent.

**Reference solution (b)** Dissolve 4.0 mg of *lithium trifluoromethanesulfonate R* (lithium salt of impurity B) in *deuterated acetonitrile R* and dilute to 1.0 mL with the same solvent.

**Reference solution (c)** Mix 1.0 mL of reference solution (a) and 10 μL of reference solution (b).

**Limit** The peak area identified in the spectrum obtained with the test solution at about −78 ppm is smaller than the peak area identified in the spectrum obtained with reference solution (c) at the same chemical shift (0.2 per cent).

##### Related substances

Liquid chromatography (2.2.29). Prepare the solutions immediately before use.

**Test solution (a)** Dissolve 0.200 g of the substance to be examined in *acetonitrile R* and dilute to 2.0 mL with the same solvent.

**Test solution (b)** Dissolve 10.0 mg of the substance to be examined in *acetonitrile R* and dilute to 5.0 mL with the same solvent.

**Reference solution (a)** Dissolve 10.0 mg of *tetra-O-acetyl-mannose triflate CRS* in *acetonitrile R* and dilute to 5.0 mL with the same solvent.

**Reference solution (b)** Dilute 1.0 mL of test solution (a) to 10.0 mL with *acetonitrile R*. Dilute 1.0 mL of this solution to 100.0 mL with *acetonitrile R*.

**Reference solution (c)** Dissolve 10 mg of *1,3,4,6-tetra-O-acetyl-β-D-mannopyranose R* (impurity A) in 5 mL of *acetonitrile R*. Mix 1 mL of this solution and 1 mL of reference solution (a).

##### Column:

— **size:**  $l = 0.25$  m,  $\varnothing = 4.0$  mm;

— **stationary phase:** end-capped octadecylsilyl silica gel for chromatography R (5 μm);

— **temperature:** 25 °C.

##### Mobile phase:

— **mobile phase A:** water R;

— **mobile phase B:** *acetonitrile R1*;

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 1	80	20
1 - 20	80 → 55	20 → 45
20 - 35	55	45
35 - 45	55 → 0	45 → 100
45 - 50	0	100

**Flow rate** 1 mL/min.

**Detection** Spectrophotometer at 220 nm.

**Injection** 20 µL of test solution (a) and reference solutions (b) and (c).

**Relative retention** With reference to tetra-*O*-acetyl-mannose triflate (retention time = about 29 min): impurity A = about 0.2.

**System suitability** Reference solution (c):

— **resolution:** minimum 5.0 between the peaks due to impurity A and tetra-*O*-acetyl-mannose triflate.

**Limits:**

- **impurity A:** not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent);
- **any other impurity:** for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.10 per cent);
- **total:** not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent);
- **disregard limit:** 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

**Loss on drying**

Maximum 0.6 per cent, determined on 25 mg by thermogravimetry (2.2.34). Heat to 80 °C at a rate of 2.5 °C/min.

**ASSAY**

Liquid chromatography (2.2.29) as described in the test for related substances with the following modification.

**Injection** Test solution (b) and reference solution (a).

Calculate the percentage content of C<sub>15</sub>H<sub>19</sub>F<sub>3</sub>O<sub>12</sub>S from the declared content of tetra-*O*-acetyl-mannose triflate CRS.

**STORAGE**

In an airtight container, protected from light, at a temperature of 2 °C to 8 °C.

**IMPURITIES**

**Specified impurities** A, B.

A. 1,3,4,6-tetra-*O*-acetyl-β-D-mannopyranose,

B. trifluoromethanesulfonic acid.

Ph Eur

## Iodinated (<sup>125</sup>I) Albumin Injection

(Human Albumin Injection Iodinated (<sup>125</sup>I), Ph. Eur. monograph 1922)

Ph Eur

### DEFINITION

Sterile, endotoxin-free solution of human albumin labelled with iodine-125. It may contain a suitable buffer and an antimicrobial preservative. The human albumin used complies with the requirements of the monograph on *Human albumin solution* (0255).

### Content

90 per cent to 110 per cent of the declared iodine-125 radioactivity at the date stated on the label.

### Purity:

- minimum of 99.0 per cent of the total radioactivity corresponds to iodine-125,
- minimum of 80 per cent of the total radioactivity is associated with the albumin fractions II to V,
- maximum of 5 per cent of the total radioactivity corresponds to unbound iodide.

**Content of albumin:** 95 per cent to 105 per cent of the declared albumin content stated on the label.

### CHARACTERS

#### Appearance

Clear, colourless to yellowish solution.

#### Half-life and nature of radiation of iodine-125

See general chapter 5.7. *Table of physical characteristics of radionuclides.*

### IDENTIFICATION

A. Gamma-ray and X-ray spectrometry.

**Comparison** Standardised iodine-125 solution, or by using a calibrated instrument. Standardised iodine-125 solutions and/or standardisation services are available from the competent authority.

**Results** The spectrum obtained with the preparation to be examined does not differ significantly from that obtained with a standardised iodine-125 solution, apart from any differences attributable to the presence of iodine-126. The most prominent photon has an energy of 0.027 MeV, corresponding to the characteristic X-ray of tellurium, gamma photons of an energy of 0.035 MeV are also present. Iodine-126 has a half-life of 13.11 days and its most prominent gamma photons have energies of 0.388 MeV and 0.666 MeV.

B. Examine by a suitable immunoelectrophoresis technique (2.7.1). Using antiserum to normal human serum, compare normal human serum and the preparation to be examined, both diluted if necessary. The main component of the preparation to be examined corresponds to the main component of the normal human serum. The diluted solution may show the presence of small quantities of other plasma proteins.

### TESTS

**pH** (2.2.3)

5.0 to 9.0.

#### Albumin

**Reference solution** Dilute *human albumin solution R* with a 9 g/L solution of *sodium chloride R* to a concentration of 5 mg of albumin per millilitre.

To 1.0 mL of the preparation to be examined and to 1.0 mL of the reference solution add 4.0 mL of *biuret reagent R* and

mix. After exactly 30 min, measure the absorbance (2.2.25) of each solution at 540 nm, using as the compensation liquid a 9 g/L solution of *sodium chloride R* treated in the same manner. From the absorbances measured, calculate the content of albumin in the injection to be examined in milligrams per millilitre.

#### Sterility

It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations (0125)*.

#### Bacterial endotoxins (2.6.14)

Less than 175/V IU/mL, V being the maximum recommended dose in millilitres.

#### RADIONUCLIDIC PURITY

##### Iodine-125

Minimum 99.0 per cent of the total radioactivity.

Gamma-ray and X-ray spectroscopy.

*Comparison* Standardised solution of iodine-125.

Determine the relative amounts of iodine-125 and iodine-126 present.

#### RADIOCHEMICAL PURITY

**Iodine-125 in albumin fractions II to V, iodine-125 corresponding to unbound iodide**

Size-exclusion chromatography (2.2.30).

*Test solution* Mix 0.25 mL of the preparation to be examined with 0.25 mL of the mobile phase. Use immediately after mixing.

*Reference solution* Human albumin solution R or another appropriate human albumin standard diluted with the mobile phase to a suitable albumin concentration.

#### Column:

- size:  $l = 0.6$  m,  $\varnothing = 7.5$  mm,
- stationary phase: silica gel for size-exclusion chromatography R,
- temperature: 25 °C.

*Mobile phase* Dissolve 11.24 g of potassium dihydrogen phosphate R, 42.0 g of disodium hydrogen phosphate dodecahydrate R, 11.70 g of sodium chloride R in 2000 mL of water R.

*Flow rate* 0.6 mL/min.

*Detection* Spectrophotometer at 280 nm and radioactivity detector set for iodine-125 connected in series.

*Injection* Loop injector.

*Run time* 85 min.

*Retention times:*

Peak No.	Fraction	Description of the compound	Retention time (min)
1	I	High molecular mass compound	18 - 20
2	II	Poly III albumin	23 - 24
3	III	Poly II albumin	25 - 26
4	IV	Poly I albumin	28
5	V	Human serum albumin	29 - 31
6	VI	Iodide	43 - 45

The main peak in the chromatogram obtained with the reference solution corresponds to fraction V.

#### Limits:

- radioactivity in fractions II to V: minimum 80 per cent of the total radioactivity applied to the column,
- iodine-125 in fraction VI: maximum 5 per cent of the total radioactivity.

#### RADIOACTIVITY

Measure the radioactivity using suitable equipment by comparison with a standardised iodine-125 solution or by measurement with a calibrated instrument.

#### LABELLING

The label states:

- the amount of albumin,
- the maximum volume to be injected.

Ph Eur

## Alovudine (<sup>18</sup>F) Injection

(Ph. Eur. monograph 2460)

$C_{10}H_{13}^{18}FN_2O_4$

243.2

Ph Eur

#### DEFINITION

Sterile solution containing 1-[(2R,4S,5R)-4-[<sup>18</sup>F]fluoro-5-(hydroxymethyl)tetrahydrofuran-2-yl]-5-methylpyrimidine-2,4-(1H,3H)-dione (3'-deoxy-3'-[<sup>18</sup>F]fluorothymidine, [<sup>18</sup>F]fluorodeoxythymidine, [<sup>18</sup>F]FLT). It may contain a suitable buffer.

#### Content

- fluorine-18: 90 per cent to 110 per cent of the declared fluorine-18 radioactivity at the date and time stated on the label;
- alovudine: maximum 0.1 mg per maximum recommended dose in millilitres.

#### CHARACTERS

##### Appearance

Clear, colourless or slightly yellow solution.

##### Half-life and nature of radiation of fluorine-18

See general chapter 5.7. *Table of physical characteristics of radionuclides*.

#### IDENTIFICATION

##### A. Gamma-ray spectrometry.

*Result* The principal gamma photons have an energy of 0.511 MeV and, depending on the measurement geometry, a sum peak of 1.022 MeV may be observed.

**B. Determine the approximate half-life by no fewer than 3 measurements of the activity of a sample in the same geometrical conditions within a suitable period of time (for example, 30 min).**

*Result* 105 min to 115 min.

**C. Examine the chromatograms obtained in the test for [<sup>18</sup>F]alovudine under radiochemical purity (see Tests).**

*Result* The principal peak in the radiochromatogram obtained with the test solution is similar in retention time to the principal peak in the chromatogram obtained with reference solution (a).

**TESTS****pH**

4.5 to 8.5, using a *pH indicator strip R*.

**Impurity A**

Spot test.

**Test solution** To 100 µL of the preparation to be examined add 400 µL of *water R* and mix.

**Reference solution (a)** *water R*.

**Reference solution (b)** Dissolve 11.0 mg of *aminopolyether R* (impurity A) in *water R* and dilute to 25.0 mL with the same solvent. Dilute 1.0 mL of the solution to *V* with *water R*, *V* being the maximum recommended dose in millilitres.

**Plate** TLC silica gel plate for *aminopolyether test R*.

**Application** 2.5 µL; as an additional spot, apply 2.5 µL of the test solution and then 2.5 µL of reference solution (b) at the same place.

**Detection** Visually compare the spots 1 min after application.

**System suitability:**

- the spot due to the application of both the test solution and reference solution (b) is similar in appearance to the spot due to reference solution (b), which is characterised by a number of concentric circles; the darker innermost circle (of intensity proportional to the concentration of impurity A) may be surrounded by a bluish-black ring, outside of which is a lighter circle surrounded by a peripheral dark edge;
- the spot due to reference solution (a) has a more diffuse inner circle, which is brownish-pink and without a distinct margin between it and the surrounding lighter zone;
- the spot due to reference solution (b) is clearly different from the spot due to reference solution (a).

**Limit:**

- the central portion of the spot due to the test solution is not more intense than that of the spot due to reference solution (b) (2.2 mg/*V*).

**Impurity B**

Liquid chromatography (2.2.29).

**Test solution** The preparation to be examined.

**Reference solution (a)** Dissolve 0.170 g of *tetrabutylammonium hydroxide R* in *water R* and dilute to 20.0 mL with the same solvent. Dilute 1.0 mL of the solution to *V* with *water R*, *V* being the maximum recommended dose in millilitres.

**Reference solution (b)** Dissolve 80.0 mg of *tetrabutylammonium hydroxide R* in *water R* and dilute to 10.0 mL with the same solvent. Dilute 1.0 mL of the solution to 25.0 mL with *water R*.

**Column:**

- size:  $l = 0.1$  m,  $\varnothing = 4.6$  mm;
- stationary phase: *octadecylsilyl silica gel for chromatography R* (3 µm).

**Mobile phase** 0.95 g/L solution of *toluenesulfonic acid R*, *acetonitrile R* (25:75 *V/V*).

**Flow rate** 0.6 mL/min.

**Detection** Spectrophotometer at 254 nm.

**Injection** 20 µL.

**Run time** Twice the retention time of impurity B.

**Retention time** Impurity B = about 3.3 min.

**System suitability** Reference solution (b):

- *signal-to-noise ratio*: minimum 10 for the principal peak;
- *symmetry factor*: maximum 1.8 for the principal peak.

**Limit:**

- *impurity B*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (2.6 mg/*V*).

**Alovudine and related substances**

Liquid chromatography (2.2.29).

**Test solution** The preparation to be examined.

**Reference solution (a)** Dissolve 5.0 mg of *alovudine R* in *water R* and dilute to 50.0 mL with the same solvent. Dilute 1.0 mL of the solution to *V* with *water R*, *V* being the maximum recommended dose in millilitres.

**Reference solution (b)** Dissolve 5.0 mg of *stavudine R* (impurity C) in *water R* and dilute to 50.0 mL with the same solvent. Dilute 1.0 mL of the solution to *V* with *water R*, *V* being the maximum recommended dose in millilitres.

**Reference solution (c)** Mix 1 mL of reference solution (a) and 1 mL of reference solution (b).

**Blank solution** Prepare a solution containing each excipient at the concentration used in the preparation.

**Column:**

- size:  $l = 0.25$  m,  $\varnothing = 4.6$  mm;
- stationary phase: *end-capped polar-embedded octadecylsilyl amorphous organosilica polymer R* (5 µm).

**Mobile phase:**

- *mobile phase A*: *carbon dioxide-free water R*, protected from the atmosphere during chromatography;
- *mobile phase B*: *acetonitrile R*;

Time (min)	Mobile phase A (per cent <i>V/V</i> )	Mobile phase B (per cent <i>V/V</i> )
0 - 10	90	10
10 - 20	90 → 5	10 → 95
20 - 30	5	95

**Flow rate** 1 mL/min.

**Detection** Spectrophotometer at 270 nm and radioactivity detector connected in series.

**Injection** 20 µL.

**Relative retention** With reference to alovudine (retention time = about 8 min): impurity C = about 0.6.

**System suitability** Reference solution (c) using the spectrophotometer:

- *resolution*: minimum 5.0 between the peaks due to impurity C and alovudine.

**Limits** In the chromatogram obtained with the spectrophotometer:

- *alovudine*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (0.1 mg/*V*);
- *impurity C*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (b) (0.1 mg/*V*);
- *any other impurity*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 mg/*V*);
- *total*: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 mg/*V*);
- *disregard limit*: 0.3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.03 mg/*V*).

**Ethanol** (2.4.24 or another suitable, validated method)  
Maximum 10 per cent *V/V* and maximum 2.5 g per administration, taking the density (2.2.5) to be 0.790 g/mL.

#### Residual solvents

Limited according to the principles defined in general chapter 5.4. The preparation may be released for use before completion of the test.

#### Sterility

It complies with the test for sterility prescribed in the monograph *Radiopharmaceutical preparations (0125)*. The preparation may be released for use before completion of the test.

#### Bacterial endotoxins (2.6.14)

Less than 175/*V* IU/mL, *V* being the maximum recommended dose in millilitres. The preparation may be released for use before completion of the test.

#### RADIONUCLIDIC PURITY

The preparation may be released for use before completion of test B.

#### Fluorine-18

Minimum 99.9 per cent of the total radioactivity.

##### A. Gamma-ray spectrometry.

**Limit** Peaks in the gamma spectrum corresponding to photons with an energy different from 0.511 MeV or 1.022 MeV represent not more than 0.1 per cent of the total radioactivity.

##### B. Gamma-ray spectrometry.

Determine the amount of fluorine-18 and radionuclidic impurities with a half-life longer than 2 h. For the detection and quantification of impurities, retain the preparation to be examined for at least 24 h to allow the fluorine-18 to decay to a level that permits the detection of impurities.

**Result** The total radioactivity due to radionuclidic impurities is not more than 0.1 per cent.

#### RADIOCHEMICAL PURITY

##### [<sup>18</sup>F]Alovudine

Liquid chromatography (2.2.29) as described in the test for alovudine and related substances. If necessary, dilute the test solution with water *R* to obtain a radioactivity concentration suitable for the radioactivity detector.

Examine the chromatogram recorded using the radioactivity detector and locate the peak due to [<sup>18</sup>F]alovudine by comparison with the chromatogram obtained with reference solution (a) using the spectrophotometer.

##### Limit:

— [<sup>18</sup>F]alovudine: minimum 95 per cent of the total radioactivity due to fluorine-18.

#### Impurity D

Thin-layer chromatography (2.2.27).

**Test solution** The preparation to be examined.

**Plate** TLC silica gel plate *R*.

**Mobile phase** water *R*, acetonitrile *R* (5:95 *V/V*).

**Application** About 5 μL.

**Development** Over 2/3 of the plate.

**Drying** In a current of warm air.

**Detection** Suitable detector to determine the distribution of radioactivity.

**Retardation factors** Impurity D = about 0; [<sup>18</sup>F]alovudine = about 0.7.

##### Limit:

— impurity D: maximum 5 per cent of the total radioactivity due to fluorine-18.

#### RADIOACTIVITY

Determine the radioactivity using a calibrated instrument.

#### LABELLING

The label states the percentage content of ethanol in the preparation.

#### IMPURITIES

**Specified impurities** A, B, C, D.

**Other detectable impurities** (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities. It is therefore not necessary to identify these impurities for demonstration of compliance): E, F.

- A. 4,7,13,16,21,24-hexaoxa-1,10-diazabicyclo[8.8.8]hexacosane (aminopolyether),

- B. *N,N,N*-tributylbutan-1-ammonium (tetrabutylammonium),

- C. 1-[(2*R*,5*S*)-5-(hydroxymethyl)-2,5-dihydrofuran-2-yl]-5-methylpyrimidine-2,4(1*H*,3*H*)-dione (stavudine),  
D. [<sup>18</sup>F]fluoride,

- E. *tert*-butyl 3-[(2*R*,4*R*,5*R*)-5-[[bis(4-methoxyphenyl)phenylmethoxy]methyl]-4-[[[(4-nitrophenyl)sulfonyl]oxy]tetrahydrofuran-2-yl]-5-methyl-2,6-dioxo-3,6-dihydropyrimidine-1(2*H*)-carboxylate,

F. (2*R*,3*R*,5*R*)-3-[[bis(4-methoxyphenyl)phenylmethoxy]methyl]-8-methyl-2,3-dihydro-9*H*-2,5-methanopyrimido[2,1-*b*][1,5,3]dioxazepin-9-one.

Ph Eur

## Ammonia (<sup>13</sup>N) Injection

(Ph. Eur. monograph 1492)

Ph Eur

### DEFINITION

Sterile solution of [<sup>13</sup>N]ammonia for diagnostic use.

**Nitrogen-13** 90 per cent to 110 per cent of the declared nitrogen-13 radioactivity at the date and time stated on the label.

### CHARACTERS

#### Appearance

Clear, colourless solution.

#### Half-life and nature of radiation of nitrogen-13

See general chapter 5.7. *Table of physical characteristics of radionuclides.*

### IDENTIFICATION

#### A. Gamma-ray spectrometry.

**Results** The only gamma photons have an energy of 0.511 MeV and, depending on the measurement geometry, a sum peak of 1.022 MeV may be observed.

B. Test A for radionuclidic purity (see Tests).

C. Examine the chromatograms obtained in the test for radiochemical purity (see Tests).

**Result** The principal peak in the radiochromatogram obtained with the test solution has approximately the same retention time as the principal peak in the radiochromatogram obtained with the reference solution.

### TESTS

**pH** (2.2.3)

5.5 to 8.5.

#### Sterility

It complies with the test for sterility prescribed in the monograph *Radiopharmaceutical preparations* (0125). The preparation may be released for use before completion of the test.

#### Bacterial endotoxins (2.6.14)

Less than 175/*V* IU/mL, *V* being the maximum recommended dose in millilitres. The preparation may be released for use before completion of the test.

#### Aluminium

Maximum 2 ppm. The preparation may be released for use before completion of the test.

**Test solution** In a test-tube about 12 mm in internal diameter, mix 1 mL of acetate buffer solution pH 4.6 *R* and 2 mL of a 1 in 20 dilution of the preparation to be examined

in water *R*. Add 0.05 mL of a 10 g/L solution of chromazurol *S R*.

**Reference solution** Prepare at the same time and in the same manner as the test solution using 2 mL of a 1 in 20 dilution of aluminium standard solution (2 ppm *Al*) *R*.

After 3 min, the colour of the test solution is not more intense than that of the reference solution.

### RADIONUCLIDIC PURITY

The preparation may be released for use before completion of tests A and B.

A. **Half-life.** The half-life is between 9 min and 11 min.

B. **Gamma emitting impurities:** maximum 1.0 per cent of the total radioactivity.

**Gamma-ray spectrometry** Retain a sample of the preparation to be examined for 2 h. Examine the gamma-ray spectrum of the decayed material for the presence of radionuclidic impurities, which should, where possible, be identified and quantified.

### RADIOCHEMICAL PURITY

#### [<sup>13</sup>N]Ammonia

Liquid chromatography (2.2.29).

The preparation may be released for use before completion of the test.

**Test solution** The preparation to be examined.

**Reference solution** Dilute 1.0 mL of dilute ammonia *R2* to 10.0 mL with water *R*.

#### Column:

— size: *l* = 0.04 m, Ø = 4.0 mm;

— stationary phase: cation-exchange resin *R* (10 µm);

— temperature: constant at 20–30 °C.

**Mobile phase** 0.002 M nitric acid.

**Flow rate** 2 mL/min.

**Detection** Suitable radioactivity detector and conductivity detector.

**System suitability** The chromatogram obtained with the test solution and the radioactivity detector shows a principal peak with approximately the same retention time as the peak in the chromatogram obtained with the reference solution and the conductivity detector.

#### Limit:

— [<sup>13</sup>N]ammonia: minimum 99 per cent of the total radioactivity due to nitrogen-13.

### RADIOACTIVITY

Determine the radioactivity using a calibrated instrument.

### IMPURITIES

A. [<sup>13</sup>N]O<sub>2</sub><sup>-</sup>,

B. [<sup>13</sup>N]O<sub>3</sub><sup>-</sup>,

C. [<sup>18</sup>F],

D. H<sub>2</sub>[<sup>15</sup>O].

Ph Eur

## Carbon Monoxide ( $^{15}\text{O}$ )

(Ph. Eur. monograph 1607)

Ph Eur

### DEFINITION

Mixture of carbon [ $^{15}\text{O}$ ]monoxide in the gaseous phase and a suitable vehicle such as *Medicinal air (1238)*, for diagnostic use.

### Purity.

- minimum 99 per cent of the total radioactivity corresponds to oxygen-15,
- minimum 97 per cent of the total radioactivity corresponds to oxygen-15 in the form of carbon monoxide ( $\text{CO}$ ).

### PRODUCTION

#### RADIONUCLIDE PRODUCTION

Oxygen-15 is a radioactive isotope of oxygen which may be produced by various nuclear reactions such as proton irradiation of nitrogen-15 or deuteron irradiation of nitrogen-14.

#### RADIOCHEMICAL SYNTHESIS

In order to recover oxygen-15 as molecular oxygen from the nitrogen target gas, carrier oxygen is added at concentrations generally ranging from 0.2 per cent *V/V* to 1.0 per cent *V/V*. After irradiation, the target gas is usually reacted with activated charcoal at a temperature of about 950 °C. The activated charcoal is preconditioned before use by flushing an inert gas at the production flow rate at a temperature of about 950 °C for not less than 1 h. The carbon [ $^{15}\text{O}$ ]monoxide obtained is purified by passage through a carbon dioxide scavenger, such as soda lime, before mixing with the vehicle.

### CHARACTERS

#### Appearance

Colourless gas.

#### Half-life and nature of radiation of oxygen-15

See general chapter 5.7. *Table of physical characteristics of radionuclides*.

### IDENTIFICATION

#### A. Gamma spectrometry.

**Results** The only gamma photons have an energy of 0.511 MeV and, depending on the measurement geometry, a sum peak of 1.022 MeV may be observed.

#### B. Radionuclidic purity (see Tests).

#### C. Examine the chromatograms obtained in the test for radiochemical purity.

**Results** The principal peaks in the chromatogram obtained with the test gas using the radioactivity detector are similar in retention times to the principal peaks corresponding to carbon monoxide in the chromatogram obtained with reference gas (a) using the thermal conductivity detector.

### TESTS

The following tests are performed on carbon [ $^{15}\text{O}$ ]monoxide as described under radiochemical synthesis before mixing with the vehicle.

#### Carbon monoxide

Gas chromatography (2.2.28) as described in the test for radiochemical purity.

The concentration of carbon monoxide in the test sample is determined before administration and is used to calculate the

amount of carbon monoxide to be administered to the patient.

#### Injection Test sample, reference gas (b).

Examine the chromatogram obtained with the thermal conductivity detector and calculate the content of carbon monoxide.

### RADIONUCLIDIC PURITY

#### Oxygen-15

Minimum 99 per cent of the total radioactivity.

#### A. Gamma spectrometry.

**Comparison** Standardised fluorine-18 solution, or by using an instrument calibrated with the aid of such a solution. Standardised fluorine-18 solutions and/or standardisation services are available from the competent authority.

**Results** The spectrum obtained with the solution to be examined does not differ significantly from that obtained with a standardised fluorine-18 solution.

#### B. Half-life: 1.9 min to 2.2 min.

The preparation may be released for use before completion of the test.

### RADIOCHEMICAL PURITY

#### Carbon [ $^{15}\text{O}$ ]monoxide

Gas chromatography (2.2.28): use the normalisation procedure.

**Test sample** Carbon [ $^{15}\text{O}$ ]monoxide as described under radiochemical synthesis.

#### Reference gas (a) Nitrogen gas mixture R.

**Reference gas (b) Nitrogen R**, containing 2.0 per cent *V/V* of carbon monoxide R1.

#### Column:

- size:  $l = 1.8 \text{ m}$ ,  $\text{Ø}1 = 6.3 \text{ mm}$  and  $\text{Ø}2 = 3.2 \text{ mm}$ ,
- stationary phase: GC concentric column R,

**Carrier gas** helium for chromatography R.

**Flow rate** 65 mL/min.

#### Temperature:

- column: 40 °C,
- injection port: 40 °C,
- thermal conductivity detector: 70 °C.

**Detection** Thermal conductivity detector and radioactivity detector connected in series.

#### Injection

Loop injector.

**Run time** 10 min.

**Retention times** Oxygen, nitrogen and carbon monoxide eluting from the inner column = about 0.4 min; carbon dioxide eluting from the inner column = about 0.8 min; oxygen eluting from the outer column = about 2.1 min; nitrogen eluting from the outer column = about 3.1 min; carbon monoxide eluting from the outer column = about 6.2 min.

#### System suitability

- 5 clearly separated principal peaks are observed in the chromatogram obtained using the thermal conductivity detector,
- resolution: minimum of 1.5 between the peaks due to carbon dioxide eluting from the inner column and oxygen eluting from the outer column, in the chromatogram obtained using the thermal conductivity detector.

**Limits** Examine the chromatogram obtained with the radioactivity detector and calculate the percentage content of oxygen-15 substances from the peak areas.

— carbon [ $^{15}\text{O}$ ]monoxide: minimum 97 per cent of the total radioactivity.

— disregard the first peak corresponding to components co-eluting from the inner column.

#### RADIOACTIVITY

The radioactive concentration is determined before administration.

Measure the radioactivity using suitable equipment by comparison with a standardised fluorine-18 solution or by measurement in an instrument calibrated with the aid of such a solution.

Ph Eur

## Choline ( $^{11}\text{C}$ Methyl) Injection

(Ph. Eur. monograph 2462)

$^{11}\text{C}_1\text{C}_4\text{H}_{14}\text{NO}^+$

103.2

94793-58-5

Ph Eur

#### DEFINITION

Sterile solution containing 2-hydroxy-*N*-[ $^{11}\text{C}$ ]methyl-*N,N*-dimethylethan-1-aminium ((methyl- $^{11}\text{C}$ )choline) ions. It may contain a suitable buffer.

#### Content

— carbon-11: 90 per cent to 110 per cent of the declared carbon-11 radioactivity at the date and time stated on the label.

#### CHARACTERS

##### Appearance

Clear, colourless solution.

##### Half-life and nature of radiation of carbon-11

See general chapter 5.7. Table of physical characteristics of radionuclides.

#### IDENTIFICATION

##### A. Gamma-ray spectrometry.

**Result** The principal gamma photons have an energy of 0.511 MeV and, depending on the measurement geometry, a sum peak of 1.022 MeV may be observed.

##### B. Approximate half-life: 19.0 min to 21.8 min.

C. Examine the chromatograms obtained with reference solution (d) in the test for [methyl- $^{11}\text{C}$ ]choline under Radiochemical purity (see Tests).

**Result** The principal peak in the radiochromatogram is similar in retention time to the principal positive peak in the chromatogram obtained with the spectrophotometer.

#### TESTS

##### pH (2.2.4)

4.5 to 8.5.

##### Impurity A

Gas chromatography (2.2.28).

**Test solution** The preparation to be examined.

**Reference solution (a)** Dissolve 10.0 mg of dimethylaminoethanol R (impurity A) in water R and dilute to

10.0 mL with the same solvent. Dilute 1.0 mL of the solution to  $V$  with water R,  $V$  being the maximum recommended dose in millilitres.

**Reference solution (b)** To 0.1 mL of ethanol R add 0.1 mL of acetonitrile R and dilute to 10 mL with water R.

#### Column:

— material: fused silica;

— size:  $l = 30\text{ m}$ ,  $\varnothing = 0.32\text{ mm}$ ;

— stationary phase: cyanopropyl(3)phenyl(3)methyl(94) polysiloxane R (film thickness 1.8  $\mu\text{m}$ ).

**Carrier gas** nitrogen for chromatography R.

**Flow rate** 1.5 mL/min.

**Split ratio** 1:10.

**Temperature:**

	Time (min)	Temperature (°C)
Column	0 - 1	60
	1 - 5	60 → 160
	5 - 13	160
Injection port		250
Detector		275

**Detection** Flame ionisation.

**Injection** 1.0  $\mu\text{L}$ .

**System suitability** Reference solution (b):

— resolution: minimum 2.0 between the peaks due to ethanol and acetonitrile.

**Calculation of content:**

— for impurity A, use the concentration of impurity A in reference solution (a).

**Limit:**

— impurity A: maximum 1.0 mg/ $V$ .

#### Residual solvents

Limited according to the principles defined in general chapter 5.4. The preparation may be released for use before completion of the test.

#### Sterility

It complies with the test for sterility prescribed in the monograph *Radiopharmaceutical preparations (0125)*.

The preparation may be released for use before completion of the test.

#### Bacterial endotoxins (2.6.14)

Less than 175/ $V$  IU/ mL,  $V$  being the maximum recommended dose in millilitres. The preparation may be released for use before completion of the test.

#### RADIONUCLIDIC PURITY

The preparation may be released for use before completion of test B.

#### Carbon-11

Minimum 99.9 per cent of the total radioactivity.

##### A. Gamma-ray spectrometry.

**Limits** Peaks in the gamma spectrum corresponding to photons with an energy different from 0.511 MeV or 1.022 MeV represent not more than 0.1 per cent of the total radioactivity.

##### B. Gamma-ray spectrometry.

Determine the amount of carbon-11 and radionuclidic impurities with a half-life longer than 20 min. For the detection and quantification of impurities, retain the preparation to be examined for at least 3 h to allow the

carbon-11 to decay to a level that permits the detection of impurities.

**Result** The total radioactivity due to radionuclidic impurities is not more than 0.1 per cent.

#### RADIOCHEMICAL PURITY

##### [Methyl-<sup>11</sup>C]choline

Liquid chromatography (2.2.29).

**Test solution** The preparation to be examined.

**Reference solution (a)** Dissolve 5 mg of *choline chloride R* in water *R* and dilute to 20 mL with the same solvent.

**Reference solution (b)** Dissolve 5 mg of *fluorocholeline chloride R* in water *R* and dilute to 20 mL with the same solvent.

**Reference solution (c)** Mix 1 mL of reference solution (a) and 1 mL of reference solution (b).

**Reference solution (d)** Mix 1 mL of the test solution and 1 mL of reference solution (a).

##### Column:

— size:  $l = 0.25$  m,  $\varnothing = 4.6$  mm;

— stationary phase: strong cation-exchange silica gel for chromatography *R* (5  $\mu$ m).

**Mobile phase** Dissolve 20.7 g of *sodium dihydrogen phosphate monohydrate R* in water for chromatography *R* and add 80  $\mu$ L of *anhydrous pyridine R*. Adjust to pH 2.5 with *phosphoric acid R* and dilute to 1 L with water for chromatography *R*.

**Flow rate** 1.5 mL/min.

**Detection** Spectrophotometer at 270 nm and radioactivity detector connected in series.

**Injection** 20  $\mu$ L of the test solution and reference solutions (c) and (d).

**Run time** 14 min.

**Relative retention** With reference to choline: fluorocholeline = about 0.9.

**System suitability** Reference solution (c) using the spectrophotometer:

— resolution: baseline separation between the peaks due to fluorocholeline and choline.

Examine the radiochromatogram obtained with the test solution.

##### Limit:

— [methyl-<sup>11</sup>C]choline: minimum 95 per cent of the total radioactivity due to carbon-11.

#### RADIOACTIVITY

Determine the radioactivity using a calibrated instrument.

#### IMPURITIES

A. 2-(dimethylamino)ethan-1-ol,

[<sup>11</sup>C]H<sub>3</sub>I

B. iodo[<sup>11</sup>C]methane.

Ph Eur

## Chromium (<sup>51</sup>Cr) Edetate Injection

(Ph. Eur. monograph 0266)

Ph Eur

#### DEFINITION

Sterile solution containing chromium-51 in the form of a complex of chromium(III) with (ethylenedinitrilo)tetraacetic acid, the latter being present in excess. It may be made isotonic by the addition of sodium chloride and may contain a suitable antimicrobial preservative such as benzyl alcohol.

**Chromium-51** 90 per cent to 110 per cent of the declared chromium-51 radioactivity at the date and time stated on the label.

**Chromium** Maximum 1 mg/mL.

#### CHARACTERS

##### Appearance

Clear, violet solution.

##### Half-life and nature of radiation of chromium-51

See general chapter 5.7. *Table of physical characteristics of radionuclides.*

#### IDENTIFICATION

A. Radionuclidic purity (see Tests).

B. Examine the chromatograms obtained in the test for radiochemical purity (see Tests).

**Result** The principal peak in the radiochromatogram obtained with the test solution is similar in retardation factor to the principal peak in the chromatogram obtained with the reference solution.

#### TESTS

##### pH (2.2.3)

3.5 to 6.5.

##### Chromium

Maximum 1 mg/mL.

Ultraviolet and visible absorption spectrophotometry (2.2.25).

**Test solution** The preparation to be examined.

**Reference solution** Dissolve 0.96 g of *chromic potassium sulfate R* and 2.87 g of *sodium edetate R* in 50 mL of water *R*, boil for 10 min, cool, adjust to pH 3.5–6.5 with *dilute sodium hydroxide solution R* and dilute to 100.0 mL with water *R*.

Measure the absorbance of the test solution and the reference solution at the absorption maximum at 560 nm.

**Result** The absorbance of the test solution is not greater than that of the reference solution.

##### Sterility

It complies with the test for sterility prescribed in the monograph *Radiopharmaceutical preparations (0125)*.

The preparation may be released for use before completion of the test.

#### RADIONUCLIDIC PURITY

##### Chromium-51

Minimum 99.9 per cent of the total radioactivity.

##### A. Gamma-ray spectrometry.

**Results** The only gamma photons have an energy of 0.320 MeV.

**B. Gamma-ray spectrometry.**

Determine the relative amount of radionuclidic impurities.

**Results** The total radioactivity due to radionuclidic impurities is not more than 0.1 per cent.

**RADIOCHEMICAL PURITY****[<sup>51</sup>Cr]Chromium edetate**

Descending paper chromatography (2.2.26).

**Test solution** The preparation to be examined.

**Reference solution** Use the reference solution from the test for chromium.

**Chromate carrier solution** Dissolve 0.1 g of *potassium chromate R* in 1 mL of *concentrated ammonia R1* and dilute to 100 mL with *water R*.

**Paper** paper for chromatography R.

**Mobile phase** *concentrated ammonia R1*, *ethanol (96 per cent) R*, *water R* (1:2:5 V/V/V).

**Application** Apply a band of a 50 g/L solution of *lead acetate R* to the paper at about 4 cm from the origin and dry in hot air. Apply 10 µL of the chromate carrier solution at the origin, followed by 10 µL of the test solution on the same spot. On a separate sheet, repeat the above procedure, applying 10 µL of the reference solution instead of the test solution.

**Development** Immediately, over a path of 14 cm.

**Drying** In air.

**Detection** Suitable detector to determine the distribution of radioactivity.

**Retardation factors** Impurity A = 0; impurity B = 0.2 to 0.4; [<sup>51</sup>Cr]chromium edetate = 0.8 to 0.9.

**System suitability** The band of lead acetate turns yellow due to reaction with the chromate carrier solution.

The retardation factor of the radioactive spot due to [<sup>51</sup>Cr]chromium edetate in the radiochromatogram obtained with the test solution is similar to that of the violet spot in the chromatogram obtained with the reference solution.

**Limit:**

— [<sup>51</sup>Cr]chromium edetate: minimum 97.0 per cent of the total radioactivity due to chromium-51.

**RADIOACTIVITY**

Determine the radioactivity using a calibrated instrument.

**IMPURITIES**

A. [<sup>51</sup>Cr]chromium(III) ion,

B. [<sup>51</sup>Cr]chromate ion.

Ph Eur

## Copper Tetramibi Tetrafluoroborate for Radiopharmaceutical Preparations

(Ph. Eur. monograph 2547)

C<sub>24</sub>H<sub>44</sub>BCuF<sub>4</sub>N<sub>4</sub>O<sub>4</sub>

603

103694-84-4

Ph Eur

**DEFINITION**

(*T-4*)-Tetrakis[1-(isocyano-κC)-2-methoxy-2-methylpropane]copper(I) tetrafluoroborate.

**Content**

10.04 per cent to 11.04 per cent of Cu (*A*<sub>r</sub> 63.5) (anhydrous substance).

**CHARACTERS****Appearance**

White or almost white, crystalline powder.

**Solubility**

Slightly soluble in water, freely soluble in anhydrous ethanol.

**IDENTIFICATION**

Infrared absorption spectrophotometry (2.2.24).

**Comparison** *copper tetramibi tetrafluoroborate GRS*.

**TESTS****Solution S**

Dissolve 25 mg in *carbon dioxide-free water R* and dilute to 10.0 mL with the same solvent.

**Appearance of solution**

Solution S is clear (2.2.1) and colourless (2.2.2, *Method I*).

**pH (2.2.3)**

4.5 to 5.5 for solution S.

**Related substances**

Liquid chromatography (2.2.29). *Prepare the solutions immediately before use.*

**Test solution** Dissolve 50.0 mg of the substance to be examined in the mobile phase and dilute to 10.0 mL with the mobile phase.

**Reference solution** Dilute 1.0 mL of the test solution to 100.0 mL with the mobile phase. Dilute 1.0 mL of this solution to 10.0 mL with the mobile phase.

**Column:**

- *size*: *l* = 0.25 m,  $\varnothing$  = 4.6 mm;
- *stationary phase*: strong cation-exchange silica gel for chromatography R (5 µm);
- *temperature*: 20 °C.

**Mobile phase** Mix 40 volumes of *acetonitrile R1* and 60 volumes of a 20.4 g/L solution of *potassium dihydrogen phosphate R*, previously adjusted to pH 6.0 with a 56.1 g/L solution of *potassium hydroxide R*.

*Flow rate* 1.0 mL/min.

*Detection* Spectrophotometer at 230 nm.

*Injection* 20 µL.

*Run time* Twice the retention time of copper tetramibi.

*Retention time* Copper tetramibi = about 5 min.

*System suitability* Reference solution:

— *symmetry factor*: maximum 1.35 for the principal peak.

*Calculation of percentage contents*:

— for each impurity, use the concentration of copper tetramibi tetrafluoroborate in the reference solution.

*Limits*:

— *unspecified impurities*: for each impurity, maximum 0.10 per cent;

— *total*: maximum 0.2 per cent;

— *reporting threshold*: 0.05 per cent.

**Water (2.5.32)**

Maximum 0.5 per cent, determined on 0.100 g. Use direct sample introduction.

### ASSAY

Inductively coupled plasma-mass spectrometry (2.2.58).

*Test solution* Place 20.0 mg of the substance to be examined in a polytetrafluoroethylene tube for microwave digestion and add 4.5 mL of *heavy metal-free nitric acid R* and 1.5 mL of *strong hydrogen peroxide solution R*. Treat by digestion in a microwave oven and dilute to 25.0 mL with *water R*.

*Copper stock solution (1 mg/L)* To 50 mL of *water R* in a 100 mL plastic volumetric flask add 1.0 mL of *heavy metal-free nitric acid R* and 100 µL of *copper standard solution (0.1 per cent Cu) for ICP R* and dilute to 100.0 mL with *water R*.

*Scandium internal standard (10 mg/L)* To 50 mL of *water R* in a 100 mL plastic volumetric flask add 1.0 mL of *heavy metal-free nitric acid R* and 1000 µL of *scandium standard solution (0.1 per cent Sc) for ICP R* and dilute to 100.0 mL with *water R*.

*Reference solutions* Dilute the copper stock solution (1 mg/L) with *water R* to prepare a range of reference solutions spanning 80-120 per cent of the expected concentration of copper in the substance to be examined.

*Procedure* To 50 µL of the digested sample solution and each of the reference solutions, add 1.0 mL of the scandium internal standard (10 mg/L) and 1.0 mL of *heavy metal-free nitric acid R* and dilute to 100.0 mL with *water R*.

*Detection*:

— copper *m/z* = 63;

— scandium *m/z* = 45.

### STORAGE

In an airtight container, protected from light, at a temperature of 2 °C to 8 °C.

Ph Eur

## Cyanocobalamin (<sup>57</sup>Co) Capsules

(Ph. Eur. monograph 0710)

Ph Eur

### DEFINITION

Capsules containing [<sup>57</sup>Co]-α-(5,6-dimethylbenzimidazol-1-yl)cobamide cyanide; they may contain suitable excipients.

The capsules comply with the requirements for hard capsules prescribed in the monograph *Capsules (0016)*, unless otherwise justified and authorised.

*Cobalt-57* 90 per cent to 110 per cent of the declared cobalt-57 radioactivity at the date stated on the label.

### CHARACTERS

#### Appearance

Hard, gelatin capsules.

#### Half-life and nature of radiation of cobalt-57

See general chapter 5.7. *Table of physical characteristics of radionuclides*.

### IDENTIFICATION

#### A. Gamma-ray spectrometry.

*Result* The most prominent gamma photon of cobalt-57 has an energy of 0.122 MeV.

#### B. Examine the chromatograms obtained in the test for radiochemical purity (see Tests).

*Result* The principal peak in the radiochromatogram obtained with the test solution is similar in retention time to the principal peak in the chromatogram obtained with the reference solution.

### TESTS

#### Disintegration

The capsules comply with the test for disintegration of tablets and capsules (2.9.1), except that 1 capsule is used in the test instead of 6.

#### Uniformity of content

Determine, by measurement in a suitable counting assembly and under identical geometrical conditions, the radioactivity of each of not fewer than 10 capsules. Calculate the average radioactivity per capsule. The radioactivity of no capsule differs by more than 10 per cent from the average. The relative standard deviation is less than 3.5 per cent.

### RADIONUCLIDIC PURITY

#### Cobalt-57

Minimum 99.9 per cent of the total radioactivity.

Gamma-ray spectrometry.

Determine the relative amounts of cobalt-57, cobalt-56 and cobalt-58 present.

### RADIOCHEMICAL PURITY

#### [<sup>57</sup>Co]Cyanocobalamin

Liquid chromatography (2.2.29).

*Test solution* Dissolve the contents of a capsule in 1.0 mL of *water R* and allow to stand for 10 min. Centrifuge at 2000 r/min for 10 min. Use the supernatant.

*Reference solution* Dissolve 10 mg of *cyanocobalamin CRS* in the mobile phase and dilute to 100 mL with the mobile phase. Dilute 2 mL of this solution to 100 mL with the mobile phase. Use within 1 h of preparation.

*Column*:

— *size*: *l* = 0.25 m,  $\varnothing$  = 4.0 mm;

— *stationary phase*: octylsilyl silica gel for chromatography R (5 µm).

*Mobile phase* 26.5 volumes of *methanol R* and 73.5 volumes of a 10 g/L solution of *disodium hydrogen phosphate dodecahydrate R* adjusted to pH 3.5 using *phosphoric acid R*. Use within 2 days of preparation.

*Flow rate* 1.0 mL/min.

*Detection* Radioactivity detector adjusted for cobalt-57 and spectrophotometer at 361 nm.

*Injection* 100 µL.

*Run time* 3 times the retention time of cyanocobalamin for the test solution; 30 min for the reference solution.

**Limit:**

— [<sup>57</sup>Co]cyanocobalamin: minimum 90 per cent of the total radioactivity due to cobalt-57.

**RADIOACTIVITY**

Determine the radioactivity using a calibrated instrument.

**STORAGE**

In an airtight container, protected from light, at a temperature of 2 °C to 8 °C.

**IMPURITIES**

- A. cobalt-56,  
B. cobalt-58.

Ph Eur

**Cyanocobalamin (<sup>57</sup>Co) Solution**

(Ph. Eur. monograph 0269)

Ph Eur

**DEFINITION**

Solution of [<sup>57</sup>Co]-α-(5,6-dimethylbenzimidazol-1-yl)cobamide cyanide and may contain a stabiliser and an antimicrobial preservative.

**Cobalt-57** 90 per cent to 110 per cent of the declared cobalt-57 radioactivity at the date stated on the label.

**CHARACTERS****Appearance**

Clear, colourless or slightly pink solution.

**Half-life and nature of radiation of cobalt-57**

See general chapter 5.7. *Table of physical characteristics of radionuclides.*

**IDENTIFICATION**

A. Gamma-ray spectrometry.

**Result** The most prominent gamma photon of cobalt-57 has an energy of 0.122 MeV.

B. Examine the chromatograms obtained in the test for radiochemical purity (see Tests).

**Result** The principal peak in the radiochromatogram obtained with the test solution is similar in retention time to the principal peak in the chromatogram obtained with the reference solution.

**TESTS**

**pH (2.2.3)**

4.0 to 6.0.

**RADIONUCLIDIC PURITY**

**Cobalt-57**

Minimum 99.9 per cent of the total radioactivity.

Gamma-ray spectrometry.

Determine the relative amounts of cobalt-57, cobalt-56 and cobalt-58 present.

**RADIOCHEMICAL PURITY**

**[<sup>57</sup>Co]Cyanocobalamin**

Liquid chromatography (2.2.29).

**Test solution** The preparation to be examined.

**Reference solution** Dissolve 10 mg of cyanocobalamin CRS in the mobile phase and dilute to 100 mL with the mobile phase. Dilute 2 mL of this solution to 100 mL with the mobile phase. Use within 1 h after preparation.

**Column:**

— size:  $l = 0.25$  m,  $\varnothing = 4.0$  mm;

— stationary phase: octylsilyl silica gel for chromatography R (5 μm).

**Mobile phase** 26.5 volumes of methanol R and 73.5 volumes of a 10 g/L solution of disodium hydrogen phosphate dodecahydrate R adjusted to pH 3.5 using phosphoric acid R (use within 2 days after preparation).

**Flow rate** 1.0 mL/min.

**Detection** Radioactivity detector adjusted for cobalt-57 and spectrophotometer at 361 nm.

**Injection** 100 μL.

**Run time** 3 times the retention time of cyanocobalamin for the test solution; 30 min for the reference solution.

**Limit:**

— [<sup>57</sup>Co]cyanocobalamin: minimum 90 per cent of the radioactivity due to cobalt-57.

**RADIOACTIVITY**

Determine the radioactivity using a calibrated instrument.

**STORAGE**

Protected from light, at a temperature of 2 °C to 8 °C.

**IMPURITIES**

- A. cobalt-56,  
B. cobalt-58.

Ph Eur

**Cyanocobalamin (<sup>58</sup>Co) Capsules**

(Ph. Eur. monograph 1505)

Ph Eur

**DEFINITION**

Capsules containing [<sup>58</sup>Co]-α-(5,6-dimethylbenzimidazol-1-yl)cobamide cyanide; they may contain suitable excipients.

The capsules comply with the requirements for hard capsules in the monograph *Capsules (0016)*, unless otherwise justified and authorised.

**Cobalt-58** Average between 90 per cent and 110 per cent of the declared cobalt-58 radioactivity at the date stated on the label.

**CHARACTERS****Appearance**

Hard gelatin capsules.

**Half-life and nature of radiation of cobalt-58**

See general chapter 5.7. *Table of physical characteristics of radionuclides.*

**IDENTIFICATION**

A. Gamma-ray spectrometry.

**Results** The most prominent gamma photons of cobalt-58 have energies of 0.511 MeV (annihilation radiation) and 0.811 MeV.

B. Examine the chromatograms obtained in the test for radiochemical purity (see Tests).

**Result** The principal peak in the radiochromatogram obtained with the test solution is similar in retention time to the principal peak in the chromatogram obtained with the reference solution.

**TESTS****Disintegration**

The capsules comply with the test for disintegration of tablets and capsules (2.9.1) except that 1 capsule is used in the test instead of 6.

**Uniformity of content**

Determine by measurement in a suitable counting assembly and under identical geometrical conditions the radioactivity of each of not less than 10 capsules. Calculate the average radioactivity per capsule. The radioactivity of no capsule differs by more than 10 per cent from the average. The relative standard deviation is less than 3.5 per cent.

**RADIONUCLIDIC PURITY****Cobalt-58**

Minimum 98 per cent of the total radioactivity.

Gamma-ray spectrometry.

Determine the relative amounts of cobalt-58, cobalt-57 and cobalt-60 present.

*Result:*

— *cobalt-60*: maximum 1 per cent of the total radioactivity.

**RADIOCHEMICAL PURITY****[<sup>58</sup>Co]Cyanocobalamin**

Liquid chromatography (2.2.29).

*Test solution* Dissolve the contents of a capsule in 1.0 mL of water R and allow to stand for 10 min. Centrifuge at 2000 r/min for 10 min. Use the supernatant.

*Reference solution* Dissolve 10 mg of cyanocobalamin CRS in the mobile phase and dilute to 100 mL with the mobile phase. Dilute 2 mL of this solution to 100 mL with the mobile phase. Use within 1 h after preparation.

*Column:*

— *size*:  $l = 0.25$  m,  $\varnothing = 4.0$  mm;

— *stationary phase*: octylsilyl silica gel for chromatography R (5  $\mu$ m).

*Mobile phase* 26.5 volumes of methanol R and 73.5 volumes of a 10 g/L solution of disodium hydrogen phosphate dodecahydrate R, adjusted to pH 3.5 with phosphoric acid R (use within 2 days).

*Flow rate* 1.0 mL/min.

*Detection* Radioactivity detector adjusted for cobalt-58 and spectrophotometer at 361 nm.

*Injection* 100  $\mu$ L.

*Run time* 3 times the retention time of cyanocobalamin for the test solution; 30 min for the reference solution.

*Limit:*

— [<sup>58</sup>Co]cyanocobalamin: minimum 84 per cent of the total radioactivity due to cobalt-58.

**RADIOACTIVITY**

Determine the radioactivity using a calibrated instrument.

**STORAGE**

In an airtight container, protected from light, at a temperature of 2 °C to 8 °C.

**IMPURITIES**

A. cobalt-57,

B. cobalt-60.

#### RADIOACTIVITY

Determine the radioactivity using a calibrated instrument.

#### STORAGE

Protected from light, at a temperature of 2 °C to 8 °C.

#### IMPURITIES

- A. cobalt-57,  
B. cobalt-60.

Ph Eur

## Fludeoxyglucose ( $^{18}\text{F}$ ) Injection

(Ph. Eur. monograph 1325)

$\text{C}_6\text{H}_{11}^{18}\text{FO}_5$

181.1

Ph Eur

#### DEFINITION

Sterile solution containing 2- [ $^{18}\text{F}$ ]fluoro-2-deoxy-D-glucopyranose (2- [ $^{18}\text{F}$ ]fluoro-2-deoxy-D-glucose) prepared by nucleophilic substitution. It may also contain 2- [ $^{18}\text{F}$ ]fluoro-2-deoxy-D-mannose.

#### Content

- *fluorine-18*: 90 per cent to 110 per cent of the declared fluorine-18 radioactivity at the date and time stated on the label.
- *2-fluoro-2-deoxy-D-glucose*: maximum 0.5 mg per maximum recommended dose in millilitres.

#### CHARACTERS

##### Appearance

Clear, colourless or slightly yellow solution.

##### Half-life and nature of radiation of fluorine-18

See general chapter 5.7. *Table of physical characteristics of radionuclides.*

#### IDENTIFICATION

A. Gamma-ray spectrometry.

**Result** The principal gamma photons have an energy of 0.511 MeV and, depending on the measurement geometry, a sum peak of 1.022 MeV may be observed.

B. Determine the approximate half-life by no fewer than 3 measurements of the activity of a sample in the same geometrical conditions within a suitable period of time (for example, 30 min).

**Result** 105 min to 115 min.

C. Examine the chromatograms obtained in test A for radiochemical purity (see Tests).

**Result** The principal peak in the radiochromatogram obtained with the test solution is similar in retention time to the principal peak in the chromatogram obtained with reference solution (a).

#### TESTS

*Particular tests for chemical impurities may be omitted if the substances mentioned are not used or cannot be formed in the production process.*

**pH** (2.2.3)

4.5 to 8.5.

#### 2-Fluoro-2-deoxy-D-glucose and impurity A

Liquid chromatography (2.2.29).

**Test solution** The preparation to be examined.

**Reference solution (a)** Dissolve 1.0 mg of 2-fluoro-2-deoxy-D-glucose R in water R and dilute to 2.0 mL with the same solvent. Dilute 1.0 mL of the solution to V with water R, V being the maximum recommended dose in millilitres.

**Reference solution (b)** Dissolve 1.0 mg of 2-chloro-2-deoxy-D-glucose R (impurity A) in water R and dilute to 2.0 mL with the same solvent. Dilute 1.0 mL of the solution to V with water R, V being the maximum recommended dose in millilitres.

**Reference solution (c)** Dissolve 1.0 mg of 2-fluoro-2-deoxy-D-mannose R in water R and dilute to 20.0 mL with the same solvent. Mix 0.5 mL of this solution with 0.5 mL of reference solution (a).

#### Column:

- *size*:  $l = 0.25 \text{ m}$ ,  $\text{Ø} = 4.0 \text{ mm}$ ;
- *stationary phase*: strongly basic anion-exchange resin for chromatography R (10  $\mu\text{m}$ );
- *temperature*: 25 °C.

**Mobile phase** 4 g/L solution of sodium hydroxide R in carbon dioxide-free water R, protected from the atmosphere during chromatography.

**Flow rate** 1 mL/min.

**Detection** Detector suitable for carbohydrates in the required concentration range, such as a pulsed amperometric detector and radioactivity detector connected in series.

**Injection** 20  $\mu\text{L}$ .

**Run time** Twice the retention time of 2-fluoro-2-deoxy-D-glucose.

**Relative retention** With reference to 2-fluoro-2-deoxy-D-glucose (retention time = about 12 min): 2-fluoro-2-deoxy-D-mannose = about 0.9; impurity A = about 1.1.

**System suitability** Reference solution (c) using the carbohydrate detector:

- *resolution*: minimum 1.5 between the peaks due to 2-fluoro-2-deoxy-D-mannose and 2-fluoro-2-deoxy-D-glucose;
- *signal-to-noise ratio*: minimum 10 for the peak due to 2-fluoro-2-deoxy-D-glucose.

**Limits** In the chromatogram obtained with the carbohydrate detector:

- *2-fluoro-2-deoxy-D-glucose*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (0.5 mg/V);
- *impurity A*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (b) (0.5 mg/V).

#### Impurity B

Spot test.

**Test solution** To 100  $\mu\text{L}$  of the preparation to be examined add 400  $\mu\text{L}$  of water R and mix.

**Reference solution (a)** water R.

**Reference solution (b)** Dissolve 11.0 mg of aminopolyether R (impurity B) in water R and dilute to 25.0 mL with the same

solvent. Dilute 1.0 mL of the solution to  $V$  with *water R*,  $V$  being the maximum recommended dose in millilitres.

**Plate** TLC silica gel plate for aminopolyether test R.

**Application** 2.5  $\mu\text{L}$ ; in addition, apply 2.5  $\mu\text{L}$  of the test solution and then 2.5  $\mu\text{L}$  of reference solution (b) at the same place.

**Detection** Visually compare the spots 1 min after application.

**System suitability:**

- the spot due to the successive application of the test solution and reference solution (b) is similar in appearance to the spot due to reference solution (b), which is characterised by a number of concentric circles; the darker innermost circle (of intensity proportional to the concentration of impurity B) may be surrounded by a bluish-black ring, outside of which is a lighter circle surrounded by a peripheral dark edge;
- the spot due to reference solution (a) has a more diffuse inner circle, which is brownish-pink and without a distinct margin between it and the surrounding lighter zone;
- the spot due to reference solution (b) is clearly different from the spot due to reference solution (a).

**Limit:**

- the central portion of the spot due to the test solution is not more intense than that of the spot due to reference solution (b) (2.2 mg/ $V$ ).

#### Impurity C

Liquid chromatography (2.2.29).

**Test solution** The preparation to be examined.

**Reference solution (a)** Dissolve 0.170 g of *tetrabutylammonium hydroxide R* in *water R* and dilute to 20.0 mL with the same solvent. Dilute 1.0 mL of the solution to  $V$  with *water R*,  $V$  being the maximum recommended dose in millilitres.

**Reference solution (b)** Dissolve 80.0 mg of *tetrabutylammonium hydroxide R* in *water R* and dilute to 10.0 mL with the same solvent. Dilute 1.0 mL of the solution to 25.0 mL with *water R*.

**Column:**

- size:  $l = 0.10$  m,  $\varnothing = 4.6$  mm;
- stationary phase: octadecylsilyl silica gel for chromatography R (3  $\mu\text{m}$ ).

**Mobile phase** 25 volumes of a 0.95 g/L solution of *toluenesulfonic acid R* and 75 volumes of *acetonitrile R*.

**Flow rate** 0.6 mL/min.

**Detection** Spectrophotometer at 254 nm.

**Injection** 20  $\mu\text{L}$ .

**Run time** Twice the retention time of impurity C.

**Retention time** Impurity C = about 3.3 min.

**System suitability** Reference solution (b):

- signal-to-noise ratio: minimum 10 for the principal peak;
- symmetry factor: maximum 1.8 for the principal peak.

**Limit:**

- impurity C: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (2.6 mg/ $V$ ).

#### Impurity D

Maximum 0.02 mg/ $V$ .

Ultraviolet and visible absorption spectrophotometry (2.2.25).

**Test solution** The preparation to be examined.

**Reference solution** Dissolve 20.0 mg of 4-(4-methylpiperidin-1-yl)pyridine R (impurity D) in *water R* and dilute to 100.0 mL

with the same solvent. Dilute 0.1 mL of the solution to  $V$  with *water R*,  $V$  being the maximum recommended dose in millilitres.

Measure the absorbance of the test solution and the reference solution at the absorption maximum of 263 nm.

**Result** The absorbance of the test solution is not greater than that of the reference solution.

#### Residual solvents

Limited according to the principles defined in general chapter 5.4. The preparation may be released for use before completion of the test.

#### Sterility

It complies with the test for sterility prescribed in the monograph *Radiopharmaceutical preparations (0125)*. The preparation may be released for use before completion of the test.

#### Bacterial endotoxins (2.6.14)

Less than 175/ $V$  IU/mL,  $V$  being the maximum recommended dose in millilitres. The preparation may be released for use before completion of the test.

#### RADIONUCLIDIC PURITY

The preparation may be released for use before completion of test B.

#### Fluorine-18

Minimum 99.9 per cent of the total radioactivity.

A. Gamma-ray spectrometry.

**Limit** Peaks in the gamma spectrum corresponding to photons with an energy different from 0.511 MeV or 1.022 MeV represent not more than 0.1 per cent of the total radioactivity.

B. Gamma-ray spectrometry.

Determine the amount of fluorine-18 and radionuclidic impurities with a half-life longer than 2 h. For the detection and quantification of impurities, retain the preparation to be examined for at least 24 h to allow the fluorine-18 to decay to a level that permits the detection of impurities.

**Results** The total radioactivity due to radionuclidic impurities is not more than 0.1 per cent.

#### RADIOCHEMICAL PURITY

A. Liquid chromatography (2.2.29) as described in the test for 2-fluoro-2-deoxy-D-glucose and impurity A. If necessary, dilute the test solution with *water R* to obtain a radioactivity concentration suitable for the radioactivity detector.

**Injection** Test solution and reference solutions (a) and (c).

**Relative retention** With reference to 2-[ $^{18}\text{F}$ ]fluoro-2-deoxy-D-glucose (retention time = about 12 min): 2-[ $^{18}\text{F}$ ]fluoro-2-deoxy-D-mannose = about 0.9. Partially or fully acetylated derivatives of both compounds hydrolyse under the chromatographic conditions and therefore elute as 2-[ $^{18}\text{F}$ ]fluoro-2-deoxy-D-glucose and 2-[ $^{18}\text{F}$ ]fluoro-2-deoxy-D-mannose.

Locate the peaks due to 2-[ $^{18}\text{F}$ ]fluoro-2-deoxy-D-glucose and 2-[ $^{18}\text{F}$ ]fluoro-2-deoxy-D-mannose using the chromatograms obtained with the carbohydrate detector and reference solutions (a) and (c).

**Limits:**

- [ $^{18}\text{F}$ ]fluorine in the form of 2-[ $^{18}\text{F}$ ]fluoro-2-deoxy-D-glucose and 2-[ $^{18}\text{F}$ ]fluoro-2-deoxy-D-mannose: minimum 95 per cent of the total radioactivity due to fluorine-18;

- 2-[<sup>18</sup>F]fluoro-2-deoxy-D-mannose: maximum 10 per cent of the total radioactivity due to 2-[<sup>18</sup>F]fluoro-2-deoxy-D-glucose and 2-[<sup>18</sup>F]fluoro-2-deoxy-D-mannose.

**B. Thin-layer chromatography (2.2.27).**

**Test solution** The preparation to be examined.

**Reference solution** Dissolve, with gentle heating, 30 mg of 1,2,3,4-tetra-O-acetyl-β-D-glucopyranose R and 20 mg of glucose R in 1 mL of water R.

**Plate** TLC silica gel plate R.

**Mobile phase** water R, acetonitrile R (5:95 V/V).

**Application** About 5 μL.

**Development** Over a path of 8 cm.

**Drying** In air for 15 min.

**Detection** Suitable detector to determine the distribution of radioactivity; immerse the plate in a 75 g/L solution of sulfuric acid R in methanol R and dry with a heat gun or at 150 °C until the appearance of dark spots in the chromatogram obtained with the reference solution.

**Retardation factors** [<sup>18</sup>F]fluoride = about 0; 2-[<sup>18</sup>F]fluoro-2-deoxy-D-glucose and 2-[<sup>18</sup>F]fluoro-2-deoxy-D-mannose = about 0.45; partially or fully acetylated derivatives of 2-[<sup>18</sup>F]fluoro-2-deoxy-D-glucose and 2-[<sup>18</sup>F]fluoro-2-deoxy-D-mannose = about 0.8 to 0.95.

**System suitability** Reference solution:

- the chromatogram shows 2 clearly separated spots.

**Limits:**

- [<sup>18</sup>F]fluorine in the form of 2-[<sup>18</sup>F]fluoro-2-deoxy-D-glucose and 2-[<sup>18</sup>F]fluoro-2-deoxy-D-mannose: minimum 95 per cent of the total radioactivity due to fluorine-18;
- [<sup>18</sup>F]fluorine in the form of fluoride and partially or fully acetylated derivatives of 2-[<sup>18</sup>F]fluoro-2-deoxy-D-glucose and 2-[<sup>18</sup>F]fluoro-2-deoxy-D-mannose: maximum 5 per cent of the total radioactivity due to fluorine-18.

**RADIOACTIVITY**

Determine the radioactivity using a calibrated instrument.

**IMPURITIES**

**Specified impurities** A, B, C, D, E.

- A. 2-chloro-2-deoxy-D-glucopyranose (2-chloro-2-deoxy-D-glucose),

- B. 4,7,13,16,21,24-hexaoxa-1,10-diazabicyclo[8.8.8]hexacosane (aminopolyether),

- C. N,N,N-tributylbutan-1-aminium (tetrabutylammonium),

- D. 4-(4-methylpiperidin-1-yl)pyridine,  
E. [<sup>18</sup>F]fluoride.

Ph Eur

**Flumazenil (N-[<sup>11</sup>C]methyl) Injection**

(Ph. Eur. monograph 1917)

Ph Eur

**DEFINITION**

Sterile solution of ethyl 8-fluoro-5-[<sup>11</sup>C]methyl-6-oxo-5,6-dihydro-4H-imidazo[1,5-a][1,4]benzodiazepine-3-carboxylate which may contain a stabiliser such as ascorbic acid.

**Content**

90 per cent to 110 per cent of the declared carbon-11 radioactivity at the date and time stated on the label.

**Content of flumazenil:** maximum 50 μg in the maximum recommended dose in millilitres.

**PRODUCTION**

**RADIONUCLIDE PRODUCTION**

Carbon-11 is a radioactive isotope of carbon which is most commonly produced by proton irradiation of nitrogen. Depending on the addition of either trace amounts of oxygen or small amounts of hydrogen, the radioactivity is obtained as [<sup>11</sup>C]carbon dioxide or [<sup>11</sup>C]methane, respectively.

**RADIOCHEMICAL SYNTHESIS**

[5-Methyl-<sup>11</sup>C]flumazenil may be prepared by N-alkylation of ethyl 8-fluoro-6-oxo-5,6-dihydro-4H-imidazo[1,5-a][1,4]benzodiazepine-3-carboxylate (demethylflumazenil) with iodo [<sup>11</sup>C]methane or [<sup>11</sup>C]methyl trifluoromethanesulfonate.

**Synthesis of iodo[<sup>11</sup>C]methane**

Iodo[<sup>11</sup>C]methane may be produced from [<sup>11</sup>C]carbon dioxide or from [<sup>11</sup>C]methane. The most frequently used method is reduction of [<sup>11</sup>C]carbon dioxide with lithium aluminium hydride. The [<sup>11</sup>C]methanolate formed is reacted with hydriodic acid. Alternatively [<sup>11</sup>C]methane, either obtained directly in the target or by on-line processes from [<sup>11</sup>C]carbon dioxide, is reacted with iodine.

**Synthesis of [<sup>11</sup>C]methyl trifluoromethanesulfonate**

[<sup>11</sup>C]methyl trifluoromethanesulfonate may be prepared from iodo[<sup>11</sup>C]methane using a solid support such as graphitised carbon, impregnated with silver trifluoromethanesulfonate.

**Synthesis of [5-methyl-<sup>11</sup>C]flumazenil**

The most widely used method to obtain [5-methyl-<sup>11</sup>C]flumazenil is the N-alkylation of demethylflumazenil with iodo[<sup>11</sup>C]methane in alkaline conditions in a solvent such as dimethylformamide or acetone. The resulting [5-methyl-<sup>11</sup>C]flumazenil can be

purified by semi-preparative liquid chromatography. For example, a column packed with octadecylsilyl silica gel for chromatography eluted with a mixture of ethanol and water is suitable.

#### PRECURSOR FOR SYNTHESIS

##### Demethylflumazenil

Melting point (2.2.14): 286 °C to 289 °C.

Infrared absorption spectrophotometry (2.2.24).

Comparison Ph. Eur. reference spectrum of demethylflumazenil.

#### CHARACTERS

##### Appearance

Clear, colourless solution.

##### Half-life and nature of radiation of carbon-11

See general chapter 5.7. Table of physical characteristics of radionuclides.

#### IDENTIFICATION

##### A. Gamma-ray spectrometry.

**Results** The only gamma photons have an energy of 0.511 MeV and, depending on the measurement geometry, a sum peak of 1.022 MeV may be observed.

B. It complies with test B for radionuclidic purity (see Tests).

C. Examine the chromatograms obtained in the test for radiochemical purity.

**Results** The principal peak in the radiochromatogram obtained with the test solution is similar in retention time to the principal peak in the chromatogram obtained with reference solution (a).

#### TESTS

##### pH (2.2.3)

6.0 to 8.0.

##### Sterility

It complies with the test for sterility prescribed in the monograph on Radiopharmaceutical preparations (0125). The injection may be released for use before completion of the test.

##### Bacterial endotoxins (2.6.14)

Less than 175/V IU/mL, V being the maximum recommended dose in millilitres. The injection may be released for use before completion of the test.

##### Flumazenil and impurity A

Liquid chromatography (2.2.29).

**Test solution** The preparation to be examined.

**Reference solution (a)** Dissolve 2.5 mg of flumazenil R in 5 mL of methanol R.

**Reference solution (b)** Dissolve 2.5 mg of demethylflumazenil R in 50 mL of methanol R.

**Reference solution (c)** To 0.1 mL of reference solution (a) add 0.1 mL of reference solution (b) and dilute to V with a 0.9 g/L solution of sodium chloride R, V being the maximum recommended dose in millilitres.

**Reference solution (d)** Dilute 0.1 mL of reference solution (a) to 50 mL with methanol R. Dilute 1.0 mL of this solution to V with a 0.9 g/L solution of sodium chloride R, V being the maximum recommended dose in millilitres.

##### Column:

— size:  $l = 0.15$  m,  $\varnothing = 3.9$  mm,

— stationary phase: spherical octadecylsilyl silica gel for chromatography R (5  $\mu$ m) with a specific surface area of 440 m<sup>2</sup>/g, a pore size of 100 nm and a carbon loading of 19 per cent,

— temperature: maintain at a constant temperature between 20–30 °C.

**Mobile phase** methanol R, water R (45:55 V/V).

**Flow rate** 1 mL/min.

**Detection** Spectrophotometer at 260 nm and radioactivity detector connected in series.

**Injection** 100  $\mu$ L.

**Run time** 10 min.

**Relative retention** With reference to flumazenil: impurity A = about 0.74.

**System suitability** Reference solution (c):

— resolution: minimum 2.5 between the peaks due to flumazenil and impurity A.

**Limits** Examine the chromatogram obtained with the spectrophotometer:

— flumazenil: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (c) (50  $\mu$ g/V),

— impurity A: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (c) (5  $\mu$ g/V),

— any other impurity: not more than the area of the principal peak in the chromatogram obtained with reference solution (d) (1  $\mu$ g/V).

**Residual solvents** are limited according to the principles defined in the general chapter (5.4), using the general method (2.4.24)

The preparation may be released for use before completion of the test.

#### RADIONUCLIDIC PURITY

##### Carbon-11

Minimum 99 per cent of the total radioactivity.

The preparation may be released for use before completion of the test.

##### A. Gamma-ray spectrometry.

**Results** The spectrum obtained with the solution to be examined does not differ significantly from that obtained with a standardised fluorine-18 solution.

B. Half-life: 19.9 min to 20.9 min.

#### RADIOCHEMICAL PURITY

Liquid chromatography (2.2.29) as described in the test for flumazenil and impurity A, with the following modifications.

**Injection** Test solution and reference solution (a); if necessary, dilute the test solution to a radioactivity concentration suitable for the detector.

**Limit** Examine the chromatogram obtained with the radioactivity detector:

— [5-methyl-<sup>11</sup>C]flumazenil: minimum 95 per cent of the total radioactivity.

#### RADIOACTIVITY

Determine the radioactivity using a calibrated instrument.

#### LABELLING

The label states the maximum recommended dose in millilitres.

## IMPURITIES

- A. ethyl 8-fluoro-6-oxo-5,6-dihydro-4H-imidazo[1,5-a][1,4]benzodiazepine-3-carboxylate (demethylflumazenil),

- B. ethyl 8-fluoro-6-oxo-9-(2-oxopropyl)-5,6-dihydro-4H-imidazo[1,5-a][1,4]benzodiazepine-3-carboxylate (acetone addition compound of demethylflumazenil).

Ph Eur

## Fluoride ( $^{18}\text{F}$ ) Solution for Radiolabelling

(Ph. Eur. monograph 2390)

Ph Eur

## DEFINITION

Alkaline solution containing fluorine-18 in the form of [ $^{18}\text{F}$ ]fluoride.

## Content

90 per cent to 110 per cent of the declared fluorine-18 radioactivity at the date and time stated on the label.

## CHARACTERS

## Appearance

Clear, colourless solution.

## Half-life and nature of radiation of fluorine-18

See general chapter 5.7. *Table of physical characteristics of radionuclides.*

## IDENTIFICATION

## A. Gamma-ray spectrometry.

*Result* The principal photons have an energy of 0.511 MeV and, depending on the measurement geometry, a sum peak of 1.022 MeV may be observed.

B. Determine the approximate half-life by no fewer than 3 measurements of the activity of a sample in the same geometrical conditions within a suitable period of time (for example, 30 min).

*Result* 105 min to 115 min.

C. Examine the chromatograms obtained in the test for radiochemical purity (see Tests).

*Results* The principal peak in the radiochromatogram obtained with the test solution is similar in retention time to the principal peak in the chromatogram obtained with the reference solution; in the chromatogram obtained with the reference solution, the signal due to fluoride is negative.

## TESTS

## pH

8.0 to 14.0, using a *pH indicator strip R*.

## Bacterial endotoxins (2.6.14)

Less than 20 IU/mL, if intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins.

The preparation may be released for use before completion of the test.

## RADIONUCLIDIC PURITY

The preparation may be released for use before completion of test B.

## Fluorine-18

Minimum 99.9 per cent of the total radioactivity.

A. Gamma-ray spectrometry. Preliminary test.

*Limit* Peaks in the gamma spectrum corresponding to photons with an energy different from 0.511 MeV or 1.022 MeV represent not more than 0.1 per cent of the total radioactivity.

B. Gamma-ray spectrometry.

Determine the amount of fluorine-18 and radionuclidic impurities with a half-life longer than 2 h. For the detection and quantification of impurities, retain the preparation to be examined for at least 24 h to allow the fluorine-18 to decay to a level that permits the detection of impurities.

*Result* The total radioactivity due to radionuclidic impurities is not more than 0.1 per cent.

## RADIOCHEMICAL PURITY

[ $^{18}\text{F}$ ]fluoride

Liquid chromatography (2.2.29).

*Test solution* Dilute the preparation to be examined with *water R* to obtain a radioactivity concentration suitable for the radioactivity detector.

*Reference solution* Dissolve 10 mg of *potassium fluoride R* in *water R* and dilute to 10 mL with the same solvent.

## Column:

— *size*:  $l = 0.25\text{ m}$ ,  $\varnothing = 4.0\text{ mm}$ ;

— *stationary phase*: strongly basic anion-exchange resin for chromatography *R* (10  $\mu\text{m}$ ).

*Mobile phase* 4 g/L solution of *sodium hydroxide R* in *carbon dioxide-free water R*, protected from atmospheric carbon dioxide.

*Flow rate* 1 mL/min.

*Detection* Spectrophotometer at 220 nm and a radioactivity detector connected in series.

*Injection* 20  $\mu\text{L}$ .

*Run time* 12 min.

*System suitability* Reference solution:

— *signal-to-noise ratio*: minimum 10 for the principal peak;  
— *retention time of fluoride*: minimum 3 times the hold-up time.

Examine the chromatogram obtained with the test solution using the radioactivity detector and locate the peak due to fluoride by comparison with the chromatogram obtained with the reference solution using the spectrophotometer.

## Limit:

— [ $^{18}\text{F}$ ]fluoride: minimum 98.5 per cent of the total radioactivity due to fluorine-18.

## RADIOACTIVITY

Determine the radioactivity using a calibrated instrument.

## LABELLING

*The label states:*

— that the solution is not for direct administration to humans;

— where applicable, that the substance is suitable for use in the manufacture of parenteral preparations.

Ph Eur

## Fluorocholine (<sup>18</sup>F) Injection

(Ph. Eur. monograph 2793)

C<sub>5</sub>H<sub>13</sub><sup>18</sup>FNO<sup>+</sup>

121.2

Ph Eur

### DEFINITION

Sterile solution containing *N*-([<sup>18</sup>F]fluoromethyl)-2-hydroxy-*N,N*-dimethylethan-1-aminium ([<sup>18</sup>F]fluorocholine) ions. It may contain a suitable buffer.

### Content

— *fluorine-18*: 90 per cent to 110 per cent of the declared fluorine-18 radioactivity at the date and time stated on the label.

### CHARACTERS

#### Appearance

Clear, colourless solution.

#### Half-life and nature of radiation of fluorine-18

See general chapter 5.7. *Table of physical characteristics of radionuclides*.

### IDENTIFICATION

#### A. Gamma-ray spectrometry.

*Result* The principal gamma photons have an energy of 0.511 MeV and, depending on the measurement geometry, a sum peak of 1.022 MeV may be observed.

B. Determine the approximate half-life by no fewer than 3 measurements of the activity of a sample in the same geometrical conditions within a suitable period of time (for example, 30 min).

*Result* 105 min to 115 min.

C. Examine the chromatograms obtained with reference solution (d) in the test for [<sup>18</sup>F]fluorocholine under Radiochemical purity (see Tests).

*Result* The principal peak in the radiochromatogram is similar in retention time to the principal positive peak in the chromatogram obtained with the spectrophotometer.

### TESTS

#### pH

4.5 to 8.5, using a *pH indicator strip R*.

#### Impurity A

Gas chromatography (2.2.28).

*Test solution* The preparation to be examined.

*Reference solution (a)* Dissolve 10.0 mg of *dimethylaminoethanol R* (impurity A) in *water R* and dilute to 10.0 mL with the same solvent. Dilute 1.0 mL of the solution to *V* with *water R*, *V* being the maximum recommended dose in millilitres.

*Reference solution (b)* To 0.1 mL of *anhydrous ethanol R*, add 0.1 mL of *acetonitrile R* and dilute to 10 mL with *water R*.

#### Column:

— *material*: fused silica;

— *size*: *l* = 30 m,  $\varnothing$  = 0.32 mm;

— *stationary phase*: cyanopropyl(3)phenyl(3)methyl(94) polysiloxane *R* (film thickness 1.8  $\mu$ m).

*Carrier gas* nitrogen for chromatography *R*.

*Flow rate* 1.5 mL/min.

*Split ratio* 1:10.

*Temperature*:

	Time (min)	Temperature (°C)
Column	0 - 1	60
	1 - 5	60 → 160
	5 - 13	160
Injection port		250
Detector		275

*Detection* Flame ionisation.

*Injection* 1.0  $\mu$ L.

*System suitability* Reference solution (b):

— *resolution*: minimum 2.0 between the peaks due to ethanol and acetonitrile.

*Calculation of content*:

— for impurity A, use the concentration of impurity A in reference solution (a).

*Limit*:

— *impurity A*: maximum 1.0 mg/V.

**Impurity B** (2.4.24 or another suitable, validated method)

The following solutions or dilutions therefrom may be used:

*Test solution* The preparation to be examined.

*Reference solution* Dissolve 10.0 mg of *dibromomethane R* (impurity B) in *water R* and dilute to 100.0 mL with the same solvent. Dilute 1.0 mL of the solution to *V* with *water R*, *V* being the maximum recommended dose in millilitres.

*Limit*:

— *impurity B*: maximum 0.1 mg/V.

**Impurity C**

Spot test.

*Test solution* To 100  $\mu$ L of the preparation to be examined add 400  $\mu$ L of *water R* and mix.

*Reference solution (a)* *water R*.

*Reference solution (b)* Dissolve 11.0 mg of *aminopolyether R* (impurity C) in *water R* and dilute to 25.0 mL with the same solvent. Dilute 1.0 mL of the solution to *V* with *water R*, *V* being the maximum recommended dose in millilitres.

*Plate* TLC silica gel plate for aminopolyether test *R*.

*Application* 2.5  $\mu$ L; also apply 2.5  $\mu$ L of the test solution and then 2.5  $\mu$ L of reference solution (b) at the same place.

*Detection* Visually compare the spots 1 min after application.

*System suitability*:

— the spot due to the successive application of the test solution and reference solution (b) is similar in appearance to the spot due to reference solution (b), which is characterised by a number of concentric circles; the darker innermost circle (of intensity proportional to the concentration of impurity C) may be surrounded by a bluish-black ring, outside of which is a lighter circle surrounded by a peripheral dark edge;

— the spot due to reference solution (a) has a more diffuse inner circle, which is brownish-pink and without a distinct margin between it and the surrounding lighter zone;

- the spot due to reference solution (b) is clearly different from the spot due to reference solution (a).

**Limit:**

- the central portion of the spot due to the test solution is not more intense than that of the spot due to reference solution (b) (2.2mg/V).

**Impurity D**

Liquid chromatography (2.2.29).

**Test solution** The preparation to be examined.

**Reference solution (a)** Dissolve 0.170 g of *tetrabutylammonium hydroxide R* (impurity D) in *water R* and dilute to 20.0 mL with the same solvent. Dilute 1.0 mL of the solution to *V* with *water R*, *V* being the maximum recommended dose in millilitres.

**Reference solution (b)** Dissolve 80 mg of *tetrabutylammonium hydroxide R* in *water R* and dilute to 10 mL with the same solvent. Dilute 1 mL of the solution to 25 mL with *water R*.

**Column:**

- size:  $l = 0.1$  m,  $\varnothing = 4.6$  mm;
- stationary phase: *end-capped octadecylsilyl silica gel for chromatography R* (3  $\mu$ m).

**Mobile phase** 0.95 g/L solution of *toluenesulfonic acid R*, *acetonitrile R* (25:75 *V/V*).

**Flow rate** 0.6 mL/min.

**Detection** Spectrophotometer at 254 nm.

**Injection** 20  $\mu$ L.

**Run time** Twice the retention time of impurity D.

**Retention time** Impurity D = about 3.3 min.

**System suitability** Reference solution (b):

- *signal-to-noise ratio*: minimum 10 for the principal peak;
- *symmetry factor*: maximum 1.8 for the principal peak.

**Limit:**

- *impurity D*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (2.6mg/V).

**Residual solvents**

Limited according to the principles defined in general chapter 5.4. The preparation may be released for use before completion of the test.

**Sterility**

It complies with the test for sterility prescribed in the monograph *Radiopharmaceutical preparations (0125)*. The preparation may be released for use before completion of the test.

**Bacterial endotoxins (2.6.14)**

Less than 175/*V* IU/mL, *V* being the maximum recommended dose in millilitres. The preparation may be released for use before completion of the test.

**RADIONUCLIDIC PURITY**

The preparation may be released for use before completion of test B.

**Fluorine-18**

Minimum 99.9 per cent of the total radioactivity.

**A. Gamma-ray spectrometry.**

**Limits** Peaks in the gamma spectrum corresponding to photons with an energy different from 0.511 MeV or 1.022 MeV represent not more than 0.1 per cent of the total radioactivity.

**B. Gamma-ray spectrometry.**

Determine the amount of fluorine-18 and radionuclidic impurities with a half-life longer than 2 h. For the detection

and quantification of impurities, retain the preparation to be examined for at least 24 h to allow the fluorine-18 to decay to a level that permits the detection of impurities.

**Result** The total radioactivity due to radionuclidic impurities is not more than 0.1 per cent.

**RADIOCHEMICAL PURITY****[<sup>18</sup>F]Fluorocholine**

Liquid chromatography (2.2.29).

**Test solution** The preparation to be examined.

**Reference solution (a)** Dissolve 5 mg of *fluorocholine chloride R* in *water R* and dilute to 20 mL with the same solvent.

**Reference solution (b)** Dissolve 5 mg of *fluoroethyl(2-hydroxyethyl)dimethylammonium chloride R* in *water R* and dilute to 20 mL with the same solvent.

**Reference solution (c)** Mix 1 mL of reference solution (a) and 1 mL of reference solution (b).

**Reference solution (d)** Mix 1 mL of the test solution and 1 mL of reference solution (a).

**Column:**

- size:  $l = 0.25$  m,  $\varnothing = 4.6$  mm;
- stationary phase: *strong cation-exchange silica gel for chromatography R* (5  $\mu$ m).

**Mobile phase** Dissolve 20.7 g of *sodium dihydrogen phosphate monohydrate R* in *water for chromatography R*, add 80  $\mu$ L of *anhydrous pyridine R*, adjust to pH 2.5 with *phosphoric acid R* and dilute to 1000 mL with *water for chromatography R*.

**Flow rate** 1.0 mL/min.

**Detection** Spectrophotometer at 270 nm and radioactivity detector connected in series.

**Injection** 20  $\mu$ L of the test solution and reference solutions (c) and (d).

**Run time** 20 min.

**Relative retention** With reference to fluorocholine (retention time = about 8 min): *fluoroethyl(2-hydroxyethyl)dimethylammonium* = about 1.1.

**System suitability** Reference solution (c) using the spectrophotometer:

- *resolution*: baseline separation between the peaks due to fluorocholine and *fluoroethyl(2-hydroxyethyl)dimethylammonium*.

Examine the radiochromatogram obtained with the test solution.

**Limit:**

- [<sup>18</sup>F]fluorocholine: minimum 95 per cent of the total radioactivity due to fluorine-18.

**Impurity E**

Thin-layer chromatography (2.2.27).

**Test solution** The preparation to be examined.

**Plate** *TLC silica gel plate R*.

**Mobile phase** *acetonitrile R*, 9 g/L solution of *sodium chloride R* (50:50 *V/V*).

**Application** About 5  $\mu$ L.

**Development** Over 2/3 of the plate.

**Drying** In a current of warm air.

**Detection** Suitable detector to determine the distribution of radioactivity.

**Retardation factors** Impurity E = about 0.0; [<sup>18</sup>F]fluorocholine = about 0.5.

**Limit:**

— *impurity E*: maximum 5 per cent of the total radioactivity due to fluorine-18.

**RADIOACTIVITY**

Determine the radioactivity using a calibrated instrument.

**IMPURITIES**

A. 2-(dimethylamino)ethan-1-ol,

B. dibromomethane,

C. 4,7,13,16,21,24-hexaoxa-1,10-diazabicyclo[8.8.8]hexacosane (aminopolyether),

E. [<sup>18</sup>F]fluoride.

Ph Eur

## Fluorodopa (<sup>18</sup>F) Injection

(Fluorodopa (<sup>18</sup>F) (Prepared By Electrophilic Substitution) Injection, Ph. Eur. monograph 1918)

Ph Eur

**DEFINITION**

Sterile solution of (2*S*)-2-amino-3-(2-([<sup>18</sup>F]fluoro)-4,5-dihydroxyphenyl)propanoic acid (6-[<sup>18</sup>F]fluorolevodopa). It may contain stabilisers such as ascorbic acid and edetic acid.

This monograph applies to an injection containing 6-[<sup>18</sup>F]fluorolevodopa produced by electrophilic substitution.

**Content**

- *fluorine-18*: 90 per cent to 110 per cent of the declared fluorine-18 radioactivity at the date and time stated on the label;
- *dopa*: maximum 1 mg per maximum recommended dose in millilitres;
- *6-fluorolevodopa*: maximum 15 mg per maximum recommended dose in millilitres.

**PRODUCTION****RADIONUCLIDE PRODUCTION**

Fluorine-18 is a radioactive isotope of fluorine that may be produced by various nuclear reactions induced by proton irradiation of oxygen-18, deuteron irradiation of neon-20, or helium-3 or helium-4 irradiation of oxygen-16.

In order to obtain fluorine-18 in a chemical form suitable for electrophilic substitution reactions, such as fluorine gas or gaseous acetylhypofluorite, a small amount of non-radioactive fluorine gas (0.3-0.8 per cent of the target gas volume) must be added as a carrier at some step in the production process.

**RADIOCHEMICAL SYNTHESIS**

6-[<sup>18</sup>F]Fluorolevodopa may be prepared by various radiochemical synthetic pathways, which lead to different products in terms of yield, specific radioactivity, by-products and possible impurities. Electrophilic pathways for production of 6-[<sup>18</sup>F]fluorolevodopa may proceed by fluorodemetalation of a stannylated derivative of levodopa, with molecular [<sup>18</sup>F]fluorine or [<sup>18</sup>F]acetylhypofluorite, followed by hydrolysis of protecting groups and final purification by semipreparative liquid chromatography. Pathways using demercuration or dethallation must not be used.

**CHARACTERS****Appearance**

Clear, colourless solution.

**Half-life and nature of radiation of fluorine-18**

See general chapter 5.7. Table of physical characteristics of radionuclides.

**IDENTIFICATION**

A. Test A for radionuclidic purity (see Tests).

B. Determine the approximate half-life by at least 3 measurements of the activity of a sample in the same geometrical conditions over a suitable period of time, for example 30 min.

*Results* 105 min to 115 min.

C. Examine the chromatograms obtained in the test for radiochemical purity (see Tests).

*Results* The principal peak in the radiochromatogram obtained with the test solution is similar in retention time to the peak due to 6-fluorolevodopa in the chromatogram obtained with reference solution (a).

D. Examine the chromatograms obtained in the test for impurities C and D (see Tests).

*Results* The principal peak in the radiochromatogram obtained with the test solution is similar in retardation factor to the peak due to 6-fluorolevodopa in the chromatogram obtained with reference solution (b).

**TESTS**

**pH** (2.2.3)

4.0 to 5.5.

**Sterility**

It complies with the test for sterility prescribed in the monograph *Radiopharmaceutical preparations* (0125). The injection may be released for use before completion of the test.

**Bacterial endotoxins** (2.6.14)

Less than 175/*V* IU/mL, *V* being the maximum recommended dose in millilitres. The injection may be released for use before completion of the test.

**6-Fluorolevodopa, dopa, impurity A and impurity B**

Liquid chromatography (2.2.29). Prepare the reference solutions immediately before use.

**Test solution** The preparation to be examined.

**Reference solution (a)** Dissolve 18.0 mg of 6-fluorolevodopa hydrochloride R in 5.0 mL of the mobile phase and dilute to *V* with the mobile phase, *V* being the maximum recommended dose in millilitres.

**Reference solution (b)** Dissolve 1.0 mg of levodopa R in 5 mL of the mobile phase and dilute to *V* with the mobile phase, *V* being the maximum recommended dose in millilitres.

**Reference solution (c)** Dissolve 1.0 mg of trimethyltin chloride R (impurity A) in 2.0 mL of the mobile phase. Dilute 1.0 mL of this solution to *V* with the mobile phase, *V* being the maximum recommended dose in millilitres.

**Reference solution (d)** Mix equal volumes of reference solutions (b) and (c).

**Reference solution (e)** Dissolve 2.0 mg of 6-hydroxydopa R (impurity B) in 20.0 mL of the mobile phase. Dilute 0.25 mL of this solution to *V* with the mobile phase, *V* being the maximum recommended dose in millilitres.

**Column:**

- size:  $l = 0.25$  m,  $\varnothing = 4.0$  mm;
- stationary phase: spherical end-capped octadecylsilyl silica gel for chromatography R;
- temperature: maintain at a constant temperature between 20 °C and 30 °C.

**Mobile phase** 6.9 g/L solution of sodium dihydrogen phosphate R adjusted to pH 2.4 with a 4.8 g/L solution of phosphoric acid R.

**Flow rate** 1 mL/min.

**Detection** Spectrophotometer at 200 nm and radioactivity detector connected in series.

**Injection** 20  $\mu$ L.

**Run time** 15 min.

**Relative retention** With reference to 6-fluorolevodopa (retention time = about 6 min): impurity A and impurity B = about 0.7; dopa = about 0.8.

**System suitability** Reference solution (d):

- resolution: minimum 1.5 between the peaks due to dopa and impurity A.

**Limits** Examine the chromatograms obtained with the spectrophotometer:

- 6-fluorolevodopa: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (15 mg/*V*);
- dopa: not more than the area of the peak due to levodopa in the chromatogram obtained with reference solution (b) (1.0 mg/*V*);
- sum of impurities A and B: not more than the area of the principal peak in the chromatogram obtained with reference solution (e) (corresponding to a limit of 0.5 mg/*V* of impurity A or a limit of 0.025 mg/*V* of impurity B, or to lower limits of each if both impurities are present).

**Residual solvents**

Limited according to the principles defined in general chapter 5.4. The preparation may be released for use before completion of the test.

**RADIONUCLIDIC PURITY****Fluorine-18**

Minimum 99.9 per cent of the total radioactivity.

The preparation may be released for use before completion of test B.

**A. Gamma-ray spectrometry**

**Results** The only gamma photons have an energy of 0.511 MeV and, depending on the measurement geometry, a sum peak of 1.022 MeV may be observed.

**B. Gamma-ray spectrometry**

Determine the amount of fluorine-18 and radionuclidic impurities with a half-life longer than 2 h. For the detection and quantification of impurities, retain the preparation to be examined for a sufficient time to allow the fluorine-18 to decay to a level that permits the detection of impurities.

**Results** The spectrum obtained with the preparation to be examined does not differ significantly from a background spectrum.

**RADIOCHEMICAL PURITY**

Liquid chromatography (2.2.29) as described in the test for 6-fluorolevodopa, dopa, impurity A and impurity B.

Examine the chromatogram recorded using the radioactivity detector and locate the peak due to 6-[<sup>18</sup>F]fluorolevodopa by comparison with the chromatogram obtained with reference solution (a) and the spectrophotometer.

**Limit:**

- 6-[<sup>18</sup>F]fluorolevodopa: minimum 95 per cent of the total radioactivity due to fluorine-18.

**Impurities C and D**

Thin-layer chromatography (2.2.27).

**Test solution** The preparation to be examined.

**Reference solution (a)** Dissolve 2 mg of DL-6-fluorodopa hydrochloride R in water R and dilute to 10 mL with the same solvent.

**Reference solution (b)** Dissolve 2 mg of 6-fluorolevodopa hydrochloride R in water R and dilute to 10 mL with the same solvent.

**Plate** TLC octadecylsilyl silica gel plate for chiral separations R.

**Mobile phase** methanol R, water R (50:50 V/V).

**Application** 2  $\mu$ L.

**Development** Over a path of 10 cm.

**Drying** In air for 5 min.

**Detection** Spray with a 2 g/L solution of ninhydrin R in anhydrous ethanol R and heat at 60 °C for 10 min; determine the distribution of radioactivity using a suitable detector.

**Retardation factors** Impurity D = about 0; 6-[<sup>18</sup>F]fluorolevodopa = about 0.3; impurity C = about 0.5.

**System suitability** Reference solution (a):

- the chromatogram shows 2 clearly separated spots.

**Limits:**

- impurity C: maximum 2 per cent of the total radioactivity due to fluorine-18;
- impurity D: maximum 4 per cent of the total radioactivity due to fluorine-18.

**RADIOACTIVITY**

Measure the radioactivity using a calibrated instrument.

**LABELLING**

The label states the maximum recommended dose in millilitres.

## IMPURITIES

A.  $\text{Cl-Sn(CH}_3)_3$ : chlorotrimethylstannane (trimethyltin chloride),

B. (2*R*)-2-amino-3-(2,4,5-trihydroxyphenyl)propanoic acid (6-hydroxydopa),

C. (2*R*)-2-amino-3-(2-[ $^{18}\text{F}$ ]fluoro-4,5-dihydroxyphenyl)propanoic acid (6-[ $^{18}\text{F}$ ]fluorodextrodopa),

D. [ $^{18}\text{F}$ ]fluoride.

Ph Eur

## DEFINITION

Sterile solution of (2*S*)-2-amino-3-(2-[ $^{18}\text{F}$ ]fluoro-4,5-dihydroxyphenyl)propanoic acid (6-[ $^{18}\text{F}$ ]fluorolevodopa). It may contain stabilisers such as ascorbic acid or edetic acid.

This monograph applies to an injection containing 6-[ $^{18}\text{F}$ ]fluorolevodopa produced by nucleophilic substitution.

## Content

- *fluorine-18*: 90 per cent to 110 per cent of the declared fluorine-18 radioactivity at the date and time stated on the label;
- *6-fluorolevodopa*: maximum 0.1 mg per maximum recommended dose in millilitres.

## CHARACTERS

## Appearance

Clear, colourless solution.

## Half-life and nature of radiation of fluorine-18

See general chapter 5.7. *Table of physical characteristics of radionuclides*.

## IDENTIFICATION

A. Gamma-ray spectrometry.

*Result* The principal gamma photons have an energy of 0.511 MeV and, depending on the measurement geometry, a sum peak of 1.022 MeV may be observed.

B. Approximate half-life: 105 min to 115 min.

C. Examine the chromatograms obtained in the test for 6-[ $^{18}\text{F}$ ]fluorolevodopa under Radiochemical purity (see Tests).

*Result* The principal peak in the radiochromatogram obtained with the test solution is similar in retention time to the principal peak in the chromatogram obtained with reference solution (a).

D. Examine the chromatograms obtained in the test for enantiomeric purity (see Tests).

*Result* The principal peak in the radiochromatogram obtained with the test solution is similar in retention time to the principal peak in the chromatogram obtained with reference solution (a).

## TESTS

pH (2.2.4)

4.0 to 5.5.

## Impurity A

Spot test.

*Test solution* To 100  $\mu\text{L}$  of the preparation to be examined add 400  $\mu\text{L}$  of *water R* and mix.

*Reference solution (a)* *water R*.

*Reference solution (b)* Dissolve 11.0 mg of *aminopolyether R* (impurity A) in *water R* and dilute to 25.0 mL with the same solvent. Dilute 1.0 mL of the solution to *V* with *water R*, *V* being the maximum recommended dose in millilitres.

*Plate* TLC silica gel plate for *aminopolyether test R*.

*Application* 2.5  $\mu\text{L}$ ; also apply 2.5  $\mu\text{L}$  of the test solution and then 2.5  $\mu\text{L}$  of reference solution (b) at the same place.

*Detection* Visually compare the spots 1 min after application.

## System suitability:

- the spot due to the application of both the test solution and reference solution (b) is similar in appearance to the spot due to reference solution (b), which is characterised by a number of concentric circles; the darker innermost circle (of intensity proportional to the concentration of impurity A) may be surrounded by a bluish-black ring, outside of which is a lighter circle surrounded by a peripheral dark edge;
- the spot due to reference solution (a) has a more diffuse inner circle, which is brownish-pink and without a distinct margin between it and the surrounding lighter zone;
- the spot due to reference solution (b) is clearly different from the spot due to reference solution (a).

## Limit:

- the central portion of the spot due to the test solution is not more intense than that of the spot due to reference solution (b) (2.2 mg/*V*).

## Impurity B

Liquid chromatography (2.2.29).

*Test solution* The preparation to be examined.

*Reference solution (a)* Dissolve 170.0 mg of *tetrabutylammonium hydroxide R* (impurity B) in *water R* and dilute to 20.0 mL with the same solvent. Dilute 1.0 mL of the solution to *V* with *water R*, *V* being the maximum recommended dose in millilitres.

*Reference solution (b)* Dissolve 80.0 mg of *tetrabutylammonium hydroxide R* in *water R* and dilute to

10.0 mL with the same solvent. Dilute 1.0 mL of the solution to 25.0 mL with water R.

**Column:**

- size:  $l = 0.1$  m,  $\varnothing = 4.6$  mm;
- stationary phase: end-capped octadecylsilyl silica gel for chromatography R (3  $\mu$ m).

**Mobile phase** 0.95 g/L solution of toluenesulfonic acid R, acetonitrile R (25:75 V/V).

**Flow rate** 0.6 mL/min.

**Detection** Spectrophotometer at 254 nm.

**Injection** 20  $\mu$ L.

**Run time** Twice the retention time of impurity B.

**Retention time** Impurity B = about 3.3 min.

**System suitability** Reference solution (b):

- signal-to-noise ratio: minimum 10 for the principal peak;
- symmetry factor: maximum 1.8 for the principal peak.

**Limit:**

- impurity B: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (2.6 mg/V).

**6-Fluorolevodopa and related substances**

Liquid chromatography (2.2.29).

**Test solution** The preparation to be examined.

**Reference solution (a)** Dissolve 2.3 mg of 6-fluorolevodopa hydrochloride R in mobile phase A and dilute to 20.0 mL with mobile phase A. Dilute 1.0 mL of the solution to V with mobile phase A, V being the maximum recommended dose in millilitres.

**Reference solution (b)** Dissolve 2 mg of levodopa R (L-form of impurity D) in mobile phase A and dilute to 20 mL with mobile phase A. Dilute 1 mL of the solution to V with mobile phase A, V being the maximum recommended dose in millilitres.

**Reference solution (c)** Dissolve 2 mg of 6-hydroxydopa R (impurity E) in mobile phase A and dilute to 20 mL with mobile phase A. Dilute 1 mL of the solution to V with mobile phase A, V being the maximum recommended dose in millilitres.

**Reference solution (d)** Mix equal volumes of reference solutions (a), (b) and (c).

**Blank solution** Prepare a solution in mobile phase A containing each excipient at the concentration used in the preparation.

**Column:**

- size:  $l = 0.25$  m,  $\varnothing = 4.6$  mm;
- stationary phase: end-capped polar-embedded octadecylsilyl amorphous organosilica polymer R (5  $\mu$ m).

**Mobile phase:**

- mobile phase A: 1.22 g/L solution of trifluoroacetic acid R;
- mobile phase B: acetonitrile R;

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 10	98	2
10 - 13	98 → 95	2 → 5
13 - 20	95	5
20 - 35	95 → 5	5 → 95
35 - 37	5	95

**Flow rate** 1 mL/min.

**Detection** Spectrophotometer at 283 nm and radioactivity detector connected in series.

**Injection** 20  $\mu$ L.

**Relative retention** With reference to 6-fluorolevodopa (retention time = about 10 min): impurity E = about 0.7; impurity D = about 0.8.

**System suitability** Reference solution (d):

- resolution: minimum 2.5 between the peaks due to impurities E and D; minimum 5 between the peaks due to impurity D and 6-fluorolevodopa.

**Limits:**

- 6-fluorolevodopa: not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 mg/V);
- impurity E: not more than half the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 mg/V);
- any other impurity: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 mg/V);
- total: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 mg/V);
- disregard limit: 0.3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.03 mg/V); disregard any peak due to the blank.

**Ethanol** (2.4.24 or another suitable, validated method) Maximum 10 per cent V/V and maximum 2.5 g per administration, taking the density (2.2.5) to be 0.790 g/mL.

**Residual solvents**

Limited according to the principles defined in the general chapter 5.4. The preparation may be released for use before completion of the test.

**Sterility**

It complies with the test for sterility prescribed in the monograph *Radiopharmaceutical preparations* (0125). The preparation may be released for use before completion of the test.

**Bacterial endotoxins** (2.6.14)

Less than 175/V IU/mL, V being the maximum recommended dose in millilitres. The preparation may be released for use before completion of the test.

**RADIONUCLIDIC PURITY**

The preparation may be released for use before completion of test B.

**Fluorine-18**

Minimum 99.9 per cent of the total radioactivity.

**A. Gamma-ray spectrometry.**

**Limit** Peaks in the gamma spectrum corresponding to photons with an energy different from 0.511 MeV or 1.022 MeV represent not more than 0.1 per cent of the total radioactivity.

**B. Gamma-ray spectrometry.**

Determine the amount of fluorine-18 and radionuclidic impurities with a half-life longer than 2 h. For the detection and quantification of impurities, retain the preparation to be examined for at least 24 h to allow the fluorine-18 to decay to a level that permits the detection of impurities.

**Result** The total radioactivity due to radionuclidic impurities is not more than 0.1 per cent.

**RADIOCHEMICAL PURITY**

**6-[<sup>18</sup>F]Fluorolevodopa**

Minimum 95 per cent of the total radioactivity due to fluorine-18.

Liquid chromatography (2.2.29) as described in the test for 6-fluorolevodopa and related substances. If necessary, dilute the test solution with mobile phase A to obtain a radioactivity concentration suitable for the radioactivity detector.

Examine the chromatogram recorded using the radioactivity detector and locate the peak due to 6- $^{18}\text{F}$ fluorolevodopa by comparison with the chromatogram obtained with reference solution (a) and the spectrophotometer.

#### Impurity I

Thin-layer chromatography (2.2.27).

**Test solution** The preparation to be examined.

**Plate** TLC silica gel plate R.

**Mobile phase** acetic acid R, methanol R (10:90 V/V).

**Application** About 5  $\mu\text{L}$ .

**Development** Over 2/3 of the plate.

**Drying** In a current of warm air.

**Detection** Suitable detector to determine the distribution of radioactivity.

**Retardation factors** Impurity I = about 0; 6- $^{18}\text{F}$ fluorolevodopa = about 0.4.

#### Limit:

— **impurity I:** maximum 5 per cent of the total radioactivity due to fluorine-18.

#### ENANTIOMERIC PURITY

Liquid chromatography (2.2.29).

**Test solution** The preparation to be examined.

**Reference solution (a)** Dissolve 2 mg of 6-fluorolevodopa hydrochloride R in the mobile phase and dilute to 10 mL with the mobile phase.

**Reference solution (b)** Dissolve 2 mg of DL-6-fluorodopa hydrochloride R in the mobile phase and dilute to 10 mL with the mobile phase.

#### Column:

— **size:**  $l = 0.15\text{ m}$ ,  $\varnothing = 4.0\text{ mm}$ ;

— **stationary phase:** crown-ether silica gel for chiral separation R (5  $\mu\text{m}$ ).

**Mobile phase** 2.9 g/L solution of perchloric acid R.

**Flow rate** 1 mL/min.

**Detection** Spectrophotometer at 283 nm and radioactivity detector connected in series.

**Injection** 20  $\mu\text{L}$ .

**Run time** Twice the retention time of 6- $^{18}\text{F}$ fluorolevodopa.

**Relative retention** With reference to 6- $^{18}\text{F}$ fluorolevodopa (retention time = about 7 min): impurity F = about 0.7.

Examine the chromatogram recorded using the radioactivity detector and locate the peak due to 6- $^{18}\text{F}$ fluorolevodopa by comparison with the chromatogram obtained with reference solution (a) and the spectrophotometer.

**System suitability** Reference solution (b):

— **resolution:** minimum 1.5 between the peaks due to 6-fluorodextrodopa (non-radioactive analogue of impurity F) and 6-fluorolevodopa.

#### Limits:

— 6- $^{18}\text{F}$ fluorolevodopa: minimum 96 per cent of the total radioactivity;

— **impurity F:** maximum 4 per cent of the total radioactivity.

#### RADIOACTIVITY

Determine the radioactivity using a calibrated instrument.

#### IMPURITIES

**Specified impurities** A, B, E, F, I.

**Other detectable impurities** (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities. It is therefore not necessary to identify these impurities for demonstration of compliance): D, G, H, J, K, L, M, N, O, P, Q.

A. 4,7,13,16,21,24-hexaoxa-1,10-diazabicyclo[8.8.8]hexacosane (aminopolyether),

B. *N,N,N*-tributylbutan-1-aminium (tetrabutylammonium),

D. (2*R*)-2-amino-3-(3,4-dihydroxyphenyl)propanoic acid (DL-dopa),

E. (2*R*)-2-amino-3-(2,4,5-trihydroxyphenyl)propanoic acid (6-hydroxy-DL-dopa),

F. (2*R*)-2-amino-3-(2- $^{18}\text{F}$ fluoro-4,5-dihydroxyphenyl)propanoic acid (6- $^{18}\text{F}$ fluorodextrodopa),

G. (2*R*)-2-amino-3-(4,5-dihydroxy-2-nitrophenyl)propanoic acid (6-nitro-DL-dopa),

- H. (2*RS*)-2-amino-3-(5-formyl-4-hydroxy-2-nitrophenyl)propanoic acid (3-formyl-6-nitro-DL-dopa),  
I. [<sup>18</sup>F]fluoride,

- J. (2*RS*)-2-amino-3-(2-fluoro-5-formyl-4-hydroxyphenyl)propanoic acid (6-fluoro-3-formyl-DL-dopa),

- K. 4,5-dimethoxy-2-nitrobenzaldehyde,

- L. 2-fluoro-4,5-dimethoxybenzaldehyde,

- M. (2-fluoro-4,5-dimethoxyphenyl)methanol,

- N. 1-fluoro-2-(iodomethyl)-4,5-dimethoxybenzene,

- O. *tert*-butyl (2*E*)-2-[(diphenylmethylidene)amino]-3-(2-fluoro-4,5-dimethoxyphenyl)propanoate,

- P. 3-chlorobenzene-1-carboperoxoic acid,

- Q. *tert*-butyl (2*S*)-3-[5-formyl-4-(methoxymethoxy)-2-nitrophenyl]-2-[(triphenylmethyl)amino]propanoate.

Ph Eur

## Fluoroethyl-L-Tyrosine (<sup>18</sup>F) Injection

(Ph. Eur. monograph 2466)

C<sub>11</sub>H<sub>14</sub><sup>18</sup>FNO<sub>3</sub>

226.2

Ph Eur

### DEFINITION

Sterile solution containing (2*S*)-2-amino-3-[4-(2-[<sup>18</sup>F]fluoroethoxy)phenyl]propanoic acid (*O*-(2-[<sup>18</sup>F]fluoroethyl)-L-tyrosine, [<sup>18</sup>F]FET). It may contain a suitable buffer.

### Content

- *fluorine-18*: 90 per cent to 110 per cent of the declared fluorine-18 radioactivity at the date and time stated on the label;
- *fluoroethyl-L-tyrosine*: maximum 0.1 mg per maximum recommended dose in millilitres.

### CHARACTERS

#### Appearance

Clear, colourless or slightly yellow solution.

#### Half-life and nature of radiation of fluorine-18

See general chapter 5.7. *Table of physical characteristics of radionuclides*.

### IDENTIFICATION

#### A. Gamma-ray spectrometry.

*Result* The principal gamma photons have an energy of 0.511 MeV and, depending on the measurement geometry, a sum peak of 1.022 MeV may be observed.

**B.** Determine the approximate half-life by no fewer than 3 measurements of the activity of a sample in the same geometrical conditions within a suitable period of time (for example, 30 min).

*Result* 105 min to 115 min.

**C.** Examine the chromatograms obtained in the test for [<sup>18</sup>F]fluoroethyl-L-tyrosine under radiochemical purity (see Tests).

*Result* The principal peak in the radiochromatogram obtained with the test solution is similar in retention time to

the principal peak in the chromatogram obtained with reference solution (a).

### TESTS

#### pH

4.5 to 8.5, using a pH indicator strip R.

#### Impurity A

##### Spot test.

**Test solution** To 100 µL of the preparation to be examined add 400 µL of water R and mix.

**Reference solution (a)** water R.

**Reference solution (b)** Dissolve 11.0 mg of aminopolyether R (impurity A) in water R and dilute to 25.0 mL with the same solvent. Dilute 1.0 mL of the solution to V with water R, V being the maximum recommended dose in millilitres.

**Plate** TLC silica gel plate for aminopolyether test R.

**Application** 2.5 µL; as an additional spot, apply 2.5 µL of the test solution and then 2.5 µL of reference solution (b) at the same place.

**Detection** Visually compare the spots 1 min after application.

##### System suitability:

- the spot due to the application of both the test solution and reference solution (b) is similar in appearance to the spot due to reference solution (b), which is characterised by a number of concentric circles; the darker innermost circle (of intensity proportional to the concentration of impurity A) may be surrounded by a bluish-black ring, outside of which is a lighter circle surrounded by a peripheral dark edge;
- the spot due to reference solution (a) has a more diffuse inner circle, which is brownish-pink and without a distinct margin between it and the surrounding lighter zone;
- the spot due to reference solution (b) is clearly different from the spot due to reference solution (a).

##### Limit:

- the central portion of the spot due to the test solution is not more intense than that of the spot due to reference solution (b) (2.2 mg/V).

#### Impurity B

Liquid chromatography (2.2.29).

**Test solution** The preparation to be examined.

**Reference solution (a)** Dissolve 0.170 g of tetrabutylammonium hydroxide R in water R and dilute to 20.0 mL with the same solvent. Dilute 1.0 mL of the solution to V with water R, V being the maximum recommended dose in millilitres.

**Reference solution (b)** Dissolve 80.0 mg of tetrabutylammonium hydroxide R in water R and dilute to 10.0 mL with the same solvent. Dilute 1.0 mL of the solution to 25.0 mL with water R.

##### Column:

- size:  $l = 0.1$  m,  $\emptyset = 4.6$  mm;
- stationary phase: end-capped octadecylsilyl silica gel for chromatography R (3 µm).

**Mobile phase** 0.95 g/L solution of toluenesulfonic acid R, acetonitrile R (25:75 V/V).

**Flow rate** 0.6 mL/min.

**Detection** Spectrophotometer at 254 nm.

**Injection** 20 µL.

**Run time** Twice the retention time of impurity B.

**Retention time** Impurity B = about 3.3 min.

**System suitability** Reference solution (b):

- signal-to-noise ratio: minimum 10 for the principal peak;
- symmetry factor: maximum 1.8 for the principal peak.

##### Limit:

- impurity B: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (2.6 mg/V).

#### Fluoroethyl-L-tyrosine and related substances

Liquid chromatography (2.2.29).

**Test solution** The preparation to be examined.

**Reference solution (a)** Dissolve 11.6 mg of fluoroethyl-L-tyrosine hydrochloride R in water R and dilute to 100.0 mL with the same solvent.

**Reference solution (b)** Dilute 1.0 mL of reference solution (a) to V with water R, V being the maximum recommended dose in millilitres.

**Reference solution (c)** Dissolve 10 mg of 3,4-dimethoxy-L-phenylalanine R in water R and dilute to 20 mL with the same solvent. To 1 mL of the solution add 1 mL of reference solution (a).

**Blank solution** Prepare a solution containing 2 mg/mL of each excipient stated on the label.

##### Column:

- size:  $l = 0.25$  m,  $\emptyset = 4.6$  mm;
- stationary phase: end-capped polar-embedded octadecylsilyl amorphous organosilica polymer R (5 µm).

##### Mobile phase:

- mobile phase A: carbon dioxide-free water R, protected from the atmosphere during chromatography;
- mobile phase B: acetonitrile R;

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 10	90	10
10 - 20	90 → 5	10 → 95
20 - 30	5	95

**Flow rate** 1 mL/min.

**Detection** Spectrophotometer at 225 nm and radioactivity detector connected in series.

**Injection** 20 µL.

**Relative retention** With reference to fluoroethyl-L-tyrosine (retention time = about 6 min): 3,4-dimethoxy-L-phenylalanine = about 0.8.

**System suitability** Reference solution (c) using the spectrophotometer:

- resolution: minimum 2.0 between the peaks due to fluoroethyl-L-tyrosine and 3,4-dimethoxy-L-phenylalanine.

**Limits** In the chromatogram obtained with the spectrophotometer:

- fluoroethyl-L-tyrosine: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (b) (0.1 mg/V);
- any impurity: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 mg/V);
- total of fluoroethyl-L-tyrosine and impurities: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 mg/V);
- disregard limit: 0.3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.03 mg/V).

**Ethanol** (2.4.24 or another suitable, validated method)  
Maximum 10 per cent *V/V* and maximum 2.5 g per administration, taking the density (2.2.5) to be 0.790 g/mL.

#### Residual solvents

Limited according to the principles defined in general chapter 5.4. The preparation may be released for use before completion of the test.

#### Sterility

It complies with the test for sterility prescribed in the monograph *Radiopharmaceutical preparations (0125)*. The preparation may be released for use before completion of the test.

#### Bacterial endotoxins (2.6.14)

Less than 175/*V* IU/mL, *V* being the maximum recommended dose in millilitres. The preparation may be released for use before completion of the test.

#### RADIONUCLIDIC PURITY

The preparation may be released for use before completion of test B.

#### Fluorine-18

Minimum 99.9 per cent of the total radioactivity.

##### A. Gamma-ray spectrometry.

**Limit** Peaks in the gamma spectrum corresponding to photons with an energy different from 0.511 MeV or 1.022 MeV represent not more than 0.1 per cent of the total radioactivity.

##### B. Gamma-ray spectrometry.

Determine the amount of fluorine-18 and radionuclidic impurities with a half-life longer than 2 h. For the detection and quantification of impurities, retain the preparation to be examined for at least 24 hours to allow the fluorine-18 to decay to a level that permits the detection of impurities.

**Result** The total radioactivity due to radionuclidic impurities is not more than 0.1 per cent.

#### RADIOCHEMICAL PURITY

##### [<sup>18</sup>F]Fluoroethyl-L-tyrosine

Liquid chromatography (2.2.29) as described in the test for fluoroethyl-L-tyrosine and related substances. If necessary, dilute the test solution with *water R* to obtain a radioactivity concentration suitable for the radioactivity detector.

Examine the chromatogram recorded using the radioactivity detector and locate the peak due to [<sup>18</sup>F]fluoroethyl-L-tyrosine by comparison with the chromatogram obtained with reference solution (b) and the spectrophotometer.

##### Limit:

— [<sup>18</sup>F]fluoroethyl-L-tyrosine: minimum 95 per cent of the total radioactivity due to fluorine-18.

##### Impurity D

Thin-layer chromatography (2.2.27).

**Test solution** The preparation to be examined.

**Plate** TLC silica gel plate *R*.

**Mobile phase** acetic acid *R*, methanol *R* (10:90 *V/V*).

**Application** About 5 µL.

**Development** Over 2/3 of the plate.

**Drying** In a current of warm air.

**Detection** Suitable detector to determine the distribution of radioactivity.

**Retardation factors** Impurity D = about 0; [<sup>18</sup>F]fluoroethyl-L-tyrosine = about 0.7.

##### Limit:

— impurity *D*: maximum 5 per cent of the total radioactivity due to fluorine-18.

#### ENANTIOMERIC PURITY

Liquid chromatography (2.2.29).

**Test solution** The preparation to be examined.

**Reference solution (a)** Reference solution (b) of the test for fluoroethyl-L-tyrosine and related substances. Add 0.01 mL of a 2.9 g/L solution of perchloric acid *R*.

**Reference solution (b)** Dissolve 1 mg of fluoroethyl-D-tyrosine hydrochloride *R* (non-radioactive analog of impurity C) in *water R* and dilute to 10 mL with the same solvent. Dilute 1 mL of the solution to *V* with *water R*, *V* being the maximum recommended dose in millilitres. Add 0.01 mL of a 2.9 g/L solution of perchloric acid *R*.

**Reference solution (c)** Mix 1.5 mL of reference solution (a) and 1.5 mL of reference solution (b).

##### Column:

— size: *l* = 0.15 m, Ø = 4.0 mm;

— stationary phase: crown-ether silica gel for chiral separation *R* (5 µm).

**Mobile phase** methanol *R*, 2.9 g/L solution of perchloric acid *R* (10:90 *V/V*).

**Flow rate** 1 mL/min.

**Detection** Spectrophotometer at 225 nm and radioactivity detector connected in series.

**Injection** 20 µL of the test solution and reference solutions (a) and (c).

**Run time** 2.5 times the retention time of [<sup>18</sup>F]fluoroethyl-L-tyrosine.

**Relative retention** With reference to [<sup>18</sup>F]fluoroethyl-L-tyrosine (retention time = about 14 min):

impurity *D* = about 0.1 [unretained];

impurity *C* = about 0.7.

Examine the chromatogram recorded using the radioactivity detector and locate the peak due to [<sup>18</sup>F]fluoroethyl-L-tyrosine by comparison with the chromatogram obtained with reference solution (a) and the spectrophotometer.

**System suitability** Reference solution (c):

— resolution: minimum 1.5 between the peaks due to impurity *C* and fluoroethyl-L-tyrosine.

##### Limits:

— [<sup>18</sup>F]fluoroethyl-L-tyrosine: minimum 95 per cent of the total radioactivity;

— sum of impurities *C* and *D*: maximum 5 per cent of the total radioactivity.

#### RADIOACTIVITY

Determine the radioactivity using a calibrated instrument.

#### LABELLING

The label states the name of each excipient and the percentage content of ethanol in the preparation.

#### IMPURITIES

**Specified impurities** *A*, *B*, *C*, *D*.

**Other detectable impurities** (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities. It is therefore not necessary to identify these impurities for demonstration of compliance): *E*.

- A. 4,7,13,16,21,24-hexaoxa-1,10-diazabicyclo[8.8.8] hexacosane (aminopolyether),

- B. *N,N,N*-tributylbutan-1-aminium (tetrabutylammonium),

- C. (2*R*)-2-amino-3-[4-(2-[<sup>18</sup>F]fluoroethoxy)phenyl]propanoic acid ([<sup>18</sup>F]fluoroethyl-D-tyrosine),

- D. [<sup>18</sup>F]fluoride,

- E. 1,1-dimethylethyl (2*S*)-3-[4-[2-[(4-methylphenyl)sulfonyl]oxy]ethoxy]phenyl]-2-[(triphenylmethyl)amino] propanoate.

Ph Eur

## Fluoromisonidazole (<sup>18</sup>F) Injection

(Ph. Eur. monograph 2459)

$C_6H_8^{18}FN_3O_3$

188.1

Ph Eur

### DEFINITION

Sterile solution containing (2*RS*)-1-[<sup>18</sup>F]fluoro-3-(2-nitro-1*H*-imidazol-1-yl)propan-2-ol ([<sup>18</sup>F]FMISO). It may contain a suitable buffer.

### Content

- *fluorine-18*: 90 per cent to 110 per cent of the declared fluorine-18 radioactivity at the date and time stated on the label;
- *fluoromisonidazole*: maximum 0.1 mg per maximum recommended dose in millilitres.

### CHARACTERS

#### Appearance

Clear, colourless or slightly yellow solution.

#### Half-life and nature of radiation of fluorine-18

See general chapter 5.7. Table of physical characteristics of radionuclides.

### IDENTIFICATION

A. Gamma-ray spectrometry.

*Result* The principal gamma photons have an energy of 0.511 MeV and, depending on the measurement geometry, a sum peak of 1.022 MeV may be observed.

B. Determine the approximate half-life by no fewer than 3 measurements of the activity of a sample in the same geometrical conditions within a suitable period of time (for example, 30 min).

*Result* 105 min to 115 min.

C. Examine the chromatograms obtained in the test for [<sup>18</sup>F] fluoromisonidazole under radiochemical purity (see Tests).

*Result* The principal peak in the radiochromatogram obtained with the test solution is similar in retention time to the principal peak in the chromatogram obtained with reference solution (a).

### TESTS

#### pH

4.5 to 8.5, using a pH indicator strip R.

#### Impurity A

Spot test.

*Test solution* To 100 µL of the preparation to be examined add 400 µL of water R and mix.

*Reference solution (a)* water R.

*Reference solution (b)* Dissolve 11.0 mg of aminopolyether R (impurity A) in water R and dilute to 25.0 mL with the same solvent. Dilute 1.0 mL of the solution to *V* with water R, *V* being the maximum recommended dose in millilitres.

*Plate* TLC silica gel plate for aminopolyether test R.

*Application* 2.5 µL; as an additional spot, apply 2.5 µL of the test solution and then 2.5 µL of reference solution (b) at the same place.

*Detection* Visually compare the spots 1 min after application.

#### System suitability:

- the spot due to the application of both the test solution and reference solution (b) is similar in appearance to the spot due to reference solution (b), which is characterised by a number of concentric circles; the darker innermost circle (of intensity proportional to the concentration of impurity A) may be surrounded by a bluish-black ring, outside of which is a lighter circle surrounded by a peripheral dark edge;
- the spot due to reference solution (a) has a more diffuse inner circle, which is brownish-pink and without a distinct margin between it and the surrounding lighter zone;
- the spot due to reference solution (b) is clearly different from the spot due to reference solution (a).

#### Limit:

- the central portion of the spot due to the test solution is not more intense than that of the spot due to reference solution (b) (2.2 mg/*V*).

#### Impurity B

Liquid chromatography (2.2.29).

*Test solution* The preparation to be examined.

*Reference solution (a)* Dissolve 0.170 g of tetrabutylammonium hydroxide R in water R and dilute to 20.0 mL with the same solvent. Dilute 1.0 mL of the solution to *V* with water R, *V* being the maximum recommended dose in millilitres.

*Reference solution (b)* Dissolve 80.0 mg of tetrabutylammonium hydroxide R in water R and dilute to

10.0 mL with the same solvent. Dilute 1.0 mL of the solution to 25.0 mL with *water R*.

**Column:**

- size:  $l = 0.1$  m,  $\varnothing = 4.6$  mm;
- stationary phase: octadecylsilyl silica gel for chromatography R (3  $\mu$ m).

**Mobile phase** 0.95 g/L solution of *toluenesulfonic acid R*, *acetonitrile R* (25:75 *V/V*).

**Flow rate** 0.6 mL/min.

**Detection** Spectrophotometer at 254 nm.

**Injection** 20  $\mu$ L.

**Run time** Twice the retention time of impurity B.

**Retention time** Impurity B = about 3.3 min.

**System suitability** Reference solution (b):

- signal-to-noise ratio: minimum 10 for the principal peak;
- symmetry factor: maximum 1.8 for the principal peak.

**Limit:**

- impurity B: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (2.6 mg/*V*).

**Fluoromisonidazole and related substances**

Liquid chromatography (2.2.29).

**Test solution** The preparation to be examined.

**Reference solution (a)** Dissolve 5.0 mg of *fluoromisonidazole R* in *water R* and dilute to 50.0 mL with the same solvent.

Dilute 1.0 mL of the solution to *V* with *water R*, *V* being the maximum recommended dose in millilitres.

**Reference solution (b)** Dissolve 5.0 mg of *desmethylmisonidazole R* (impurity C) in *water R* and dilute to 50.0 mL with the same solvent. Dilute 1.0 mL of the solution to *V* with *water R*, *V* being the maximum recommended dose in millilitres.

**Reference solution (c)** Mix 1 mL of reference solution (a) and 1 mL of reference solution (b).

**Blank solution** Prepare a solution containing each excipient at the concentration used in the preparation.

**Column:**

- size:  $l = 0.25$  m,  $\varnothing = 4.6$  mm;
- stationary phase: end-capped polar-embedded octadecylsilyl amorphous organosilica polymer R (5  $\mu$ m).

**Mobile phase:**

- mobile phase A: carbon dioxide-free *water R*, protected from the atmosphere during chromatography;
- mobile phase B: *acetonitrile R*;

Time (min)	Mobile phase A (per cent <i>V/V</i> )	Mobile phase B (per cent <i>V/V</i> )
0 - 10	90	10
10 - 20	90 → 5	10 → 95
20 - 30	5	95

**Flow rate** 1 mL/min.

**Detection** Spectrophotometer at 320 nm and radioactivity detector connected in series.

**Injection** 20  $\mu$ L.

**Relative retention** With reference to *fluoromisonidazole* (retention time = about 6 min): impurity C = about 0.6.

**System suitability** Reference solution (c) using the spectrophotometer:

- resolution: minimum 5.0 between the peaks due to impurity C and *fluoromisonidazole*.

**Limits** In the chromatogram obtained with the spectrophotometer:

- *fluoromisonidazole*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (0.1 mg/*V*);
- impurity C: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (b) (0.1 mg/*V*);
- any other impurity: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 mg/*V*);
- total: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 mg/*V*);
- disregard limit: 0.3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.03 mg/*V*).

**Ethanol** (2.4.24 or another suitable, validated method)

Maximum 10 per cent *V/V* and maximum 2.5 g per administration, taking the density (2.2.5) to be 0.790 g/mL.

**Residual solvents**

Limited according to the principles defined in general chapter 5.4. The preparation may be released for use before completion of the test.

**Sterility**

It complies with the test for sterility prescribed in the monograph *Radiopharmaceutical preparations* (0125).

The preparation may be released for use before completion of the test.

**Bacterial endotoxins** (2.6.14)

Less than 175/*V* IU/mL, *V* being the maximum recommended dose in millilitres. The preparation may be released for use before completion of the test.

**RADIONUCLIDIC PURITY**

The preparation may be released for use before completion of test B.

**Fluorine-18**

Minimum 99.9 per cent of the total radioactivity.

A. Gamma-ray spectrometry.

**Limit** Peaks in the gamma spectrum corresponding to photons with an energy different from 0.511 MeV or 1.022 MeV represent not more than 0.1 per cent of the total radioactivity.

B. Gamma-ray spectrometry.

Determine the amount of fluorine-18 and radionuclidic impurities with a half-life longer than 2 h. For the detection and quantification of impurities, retain the preparation to be examined for at least 24 h to allow the fluorine-18 to decay to a level that permits the detection of impurities.

**Result** The total radioactivity due to radionuclidic impurities is not more than 0.1 per cent.

**RADIOCHEMICAL PURITY**

**[<sup>18</sup>F]Fluoromisonidazole**

Liquid chromatography (2.2.29) as described in the test for *fluoromisonidazole* and related substances. If necessary, dilute the test solution with *water R* to obtain a radioactivity concentration suitable for the radioactivity detector.

Examine the chromatogram recorded using the radioactivity detector and locate the peak due to [<sup>18</sup>F]*fluoromisonidazole* by comparison with the chromatogram obtained with reference solution (a) using the spectrophotometer.

**Limit:**

— [ $^{18}\text{F}$ ]fluoromisonidazole: minimum 95 per cent of the total radioactivity due to fluorine-18.

**Impurity D**

Thin-layer chromatography (2.2.27).

**Test solution** The preparation to be examined.

**Plate** TLC silica gel plate R.

**Mobile phase** water R, acetonitrile R (5:95 V/V).

**Application** About 5  $\mu\text{L}$ .

**Development** Over 2/3 of the plate.

**Drying** In a current of warm air.

**Detection** Suitable detector to determine the distribution of radioactivity.

**Retardation factors** Impurity D = about 0; [ $^{18}\text{F}$ ]fluoromisonidazole = about 0.8.

**Limit:**

— impurity D: maximum 5 per cent of the total radioactivity due to fluorine-18.

**RADIOACTIVITY**

Determine the radioactivity using a calibrated instrument.

**LABELLING**

The label states the percentage content of ethanol in the preparation.

**IMPURITIES**

**Specified impurities** A, B, C, D.

**Other detectable impurities** (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities. It is therefore not necessary to identify these impurities for demonstration of compliance): E.

- A. 4,7,13,16,21,24-hexaoxa-1,10-diazabicyclo[8.8.8]hexacosane (aminopolyether),

- B. *N,N,N*-tributylbutan-1-aminium (tetrabutylammonium),

- C. (2*RS*)-3-(2-nitro-1*H*-imidazol-1-yl)propane-1,2-diol (desmethylmisonidazole),  
D. [ $^{18}\text{F}$ ]fluoride,

- E. mixture of the 4 stereoisomers of 3-(2-nitro-1*H*-imidazol-1-yl)-2-(tetrahydro-2*H*-pyran-2-yloxy)propyl 4-methylbenzenesulfonate.

Ph Eur

**Gallium ( $^{67}\text{Ga}$ ) Citrate Injection**

(Ph. Eur. monograph 0555)

Ph Eur

**DEFINITION**

Sterile solution of gallium-67 in the form of gallium citrate. It may be made isotonic by the addition of sodium chloride and sodium citrate and may contain a suitable antimicrobial preservative such as benzyl alcohol.

**Gallium-67** 90 per cent to 110 per cent of the declared gallium-67 radioactivity at the date and time stated on the label.

**CHARACTERS****Appearance**

Clear, colourless solution.

**Half-life and nature of radiation of gallium-67**

See general chapter 5.7. *Table of physical characteristics of radionuclides.*

**IDENTIFICATION****A. Gamma-ray spectrometry.**

**Results** The most prominent gamma photons have energies of 0.093 MeV, 0.185 MeV and 0.300 MeV.

**B.** To 0.2 mL of the preparation to be examined add 0.2 mL of a solution containing 1 g/L of ferric chloride R and 0.1 per cent V/V of hydrochloric acid R and mix.

Compare the colour with that of a solution containing 7 g/L of sodium chloride R and 9 g/L of benzyl alcohol R treated in the same manner. A yellow colour develops in the test solution only.

**TESTS****pH (2.2.3)**

5.0 to 8.0.

**Zinc**

Maximum 5 ppm.

**Test solution** To 0.1 mL of the preparation to be examined add 0.9 mL of water R, 1 mL of a 250 g/L solution of sodium thiosulfate R, 5 mL of acetate buffer solution pH 4.7 R and 5.0 mL of a dithizone solution prepared as follows: dissolve 10 mg of dithizone R in 100 mL of methyl ethyl ketone R allow to stand for 5 min, filter and immediately before use dilute the solution to 10 times its volume with methyl ethyl ketone R. Shake vigorously for 2 min and allow the organic layer to separate.

**Reference solution** 0.1 mL of zinc standard solution (5 ppm Zn) R treated in the same manner as the test solution.

Measure the absorbance (2.2.25) of the organic layers at 530 nm, using the organic layer of a blank solution as the compensation liquid.

**Results** The absorbance of the organic layer obtained with the test solution is not greater than that of the organic layer obtained with the reference solution.

#### Sterility

It complies with the test for sterility prescribed in the monograph *Radiopharmaceutical preparations (0125)*. The preparation may be released for use before completion of the test.

#### RADIONUCLIDIC PURITY

##### Gallium-67

Minimum 99.8 per cent of the total radioactivity.

Gamma-ray spectrometry.

Determine the relative amounts of gallium-66 and other radionuclidic impurities present.

#### RADIOACTIVITY

Determine the radioactivity using a calibrated instrument.

#### IMPURITIES

A. gallium-66.

the top of a column containing *strong cation-exchange resin R*<sub>1</sub>, push 5 mL of air through the column and collect the eluate. Determine the radioactivity of the eluate (A1). Elute the column with 1 mL of a 1.03 g/L solution of *hydrochloric acid R*. Determine the radioactivity of the eluate (A2). Elute the column with 1 mL of a mixture of 2 volumes of *hydrochloric acid R* and 98 volumes of *acetone R* and push 5 mL of air through the column. Determine the radioactivity of the eluate (A3) and the residual radioactivity on the column (A4).

Calculate the percentage of radioactivity in the A3 eluate using the following expression:

$$A3 \times 100 / (A1 + A2 + A3 + A4)$$

**Result** The percentage of radioactivity in the A3 eluate is not less than 90 per cent of the total radioactivity applied to the column.

E. To 100 µL of *silver nitrate solution R2* add 5 µL of the preparation to be examined. A white precipitate is formed.

#### TESTS

##### pH (2.2.4)

Maximum 2.

##### Iron

Maximum 10 µg/GBq.

Atomic absorption spectrometry (2.2.23, *Method I*).

*Modifier solution* 14 g/L solution of *magnesium nitrate R*.

*Test solution* Dilute the preparation to be examined with a 1 per cent *V/V* solution of *nitric acid R* to obtain a radioactivity concentration of 2.5 MBq/mL.

*Reference solutions* Prepare the reference solutions using *iron standard solution (20 ppm Fe) R*, diluting with a 1 per cent *V/V* solution of *nitric acid R*.

*Source* Iron hollow-cathode lamp.

*Wavelength* 248.3 nm.

*Atomisation device* Graphite furnace.

An example of the injection and instrument parameters for the graphic furnace atomic absorption analysis is shown below.

*Internal and external protective gas* argon R.

*Injection* 20 µL of the test solution and the reference solutions, and 1 µL of the modifier solution.

*Injection temperature* 20 °C.

*Furnace programme:*

Step	Final temperature (°C)	Ramp time (s)	Hold time (s)	Internal protective gas flow rate (mL/min)
Drying	110	1	30	250
Drying	130	15	30	250
Pyrolysis	1400	10	20	250
Atomisation	2100	0	5	0
Cleaning	2450	1	3	250

The solution may be released for use before completion of the test.

##### Zinc

Maximum 10 µg/GBq.

Atomic absorption spectrometry (2.2.23, *Method I*).

*Test solution* Dilute the preparation to be examined with a 1 per cent *V/V* solution of *nitric acid R* to obtain a radioactivity concentration of 50 MBq/mL.

## Gallium (<sup>68</sup>Ga) Chloride (accelerator-produced) Solution for Radiolabelling

(Ph. Eur. monograph 3109)

<sup>68</sup>GaCl<sub>3</sub> · 174.3

Ph Eur

#### DEFINITION

Solution containing gallium-68, prepared by proton irradiation of enriched zinc-68, in the form of gallium chloride in dilute hydrochloric acid.

#### Content

— *gallium-68*: 90 per cent to 110 per cent of the declared gallium-68 radioactivity at the date and time stated on the label.

#### PRODUCTION

[<sup>68</sup>Ga]Gallium chloride is produced by proton irradiation of enriched zinc-68.

#### CHARACTERS

##### Appearance

Clear, colourless solution.

##### Half-life and nature of radiation of gallium-68

See general chapter 5.7. *Table of physical characteristics of radionuclides*.

#### IDENTIFICATION

A. Gamma-ray spectrometry.

**Result** The principal gamma photons have energies of 0.511 MeV and 1.077 MeV and, depending on the measurement geometry, a sum peak of 1.022 MeV may be observed; peaks due to gamma photons with an energy of 1.883 MeV may be observed.

B. Approximate half-life: 62 min to 74 min.

C. pH (see Tests).

D. To a volume of the preparation to be examined of between 20 µL and 100 µL, chosen to allow measurement of the radioactivity with sufficient accuracy, add 1 mL of a 1.03 g/L solution of *hydrochloric acid R*. Apply this solution to

**Reference solutions** Prepare the reference solutions using zinc standard solution (10 ppm Zn) R, diluting with a 1 per cent V/V solution of nitric acid R.

**Source** Zinc hollow-cathode lamp.

**Wavelength** 213.9 nm.

**Atomisation device** Air-acetylene flame.

The solution may be released for use before completion of the test.

#### Bacterial endotoxins (2.6.14)

Less than 175 IU/V, V being the maximum volume to be used for the preparation of a single patient dose, if intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins. The solution may be released for use before completion of the test.

#### RADIONUCLIDIC PURITY

The solution may be released for use before completion of tests B and C.

#### Gallium-68

Minimum 98 per cent of the total radioactivity.

##### A. Gamma-ray spectrometry.

**Limit** Peaks in the gamma-ray spectrum corresponding to photons with an energy different from 0.511 MeV, 1.077 MeV and 1.883 MeV represent not more than 2 per cent of the total radioactivity; disregard the peak corresponding to 1.022 MeV.

##### B. Gallium-66, gallium-67. Gamma-ray spectrometry.

Determine the amount of gallium-68, gallium-66 and gallium-67. For the detection and quantification of gallium-66 and gallium-67, retain the preparation to be examined for at least 12 h to allow the gallium-68 to decay to a level that permits the detection of gallium-66 and gallium-67.

**Result** The total radioactivity due to gallium-66 and gallium-67 is not more than 2 per cent of the total radioactivity.

##### C. Other gamma-ray-emitting impurities. Gamma-ray spectrometry.

Determine the amount of gallium-68. For the detection and quantification of the other gamma-ray-emitting impurities, retain the preparation to be examined for at least 24 h to allow the gallium-68 to decay to a level that permits the detection of other gamma-ray-emitting impurities. Disregard the peaks due to the decay of gallium-66 and gallium-67.

**Result** The total radioactivity due to other gamma-ray-emitting impurities is not more than 0.1 per cent of the total radioactivity.

#### RADIOCHEMICAL PURITY

##### [<sup>68</sup>Ga]Gallium(III) ion

Thin-layer chromatography (2.2.27).

**Test solution** Adjust the preparation to be examined to obtain a concentration of hydrochloric acid R of 10.3 g/L.

**Reference solution (a)** To 0.2 mL of the test solution add 0.3 mL of a 4 g/L solution of sodium hydroxide R. Use within 30 min of preparation.

**Reference solution (b)** To 1 mL of the test solution add 1 mL of a 10 g/L solution of pentetic acid R in a 4 g/L solution of sodium hydroxide R. Use within 30 min of preparation.

**Plate** TLC silica gel plate R; use a glass-fibre plate.

**Mobile phase** 77 g/L solution of ammonium acetate R, methanol R (50:50 V/V).

**Application** About 5 µL.

**Development** Immediately, over a path of at least 7 cm.

**Drying** In air.

**Detection** Suitable detector to determine the distribution of radioactivity.

**Retardation factor** [<sup>68</sup>Ga]gallium(III) ion = 0-0.2.

**System suitability** The retardation factor of the principal peak in the chromatogram obtained with reference solution (a) is not more than 0.1; the retardation factor of the principal peak in the chromatogram obtained with reference solution (b) is not less than 0.7.

**Limit:**

— [<sup>68</sup>Ga]gallium(III) ion: minimum 95 per cent of the total radioactivity due to gallium-68.

#### RADIOACTIVITY

Determine the radioactivity using a calibrated instrument.

#### LABELLING

The label states:

- that the solution is not for direct administration to humans;
- where applicable, that the solution is sterile;
- the maximum volume that can be used for the preparation of a single patient dose;
- the concentration of hydrochloric acid;
- that the limits regarding radionuclidic impurities apply until the end of the shelf-life of the gallium-68-labelled radiopharmaceuticals prepared using the solution.

#### IMPURITIES

A. gallium-67,

B. gallium-66.

Ph Eur

## Gallium (<sup>68</sup>Ga) Chloride Solution for Radiolabelling

(Ph. Eur. monograph 2464)

<sup>68</sup>GaCl<sub>3</sub>

174.3

Ph Eur

#### DEFINITION

Solution containing gallium-68 in the form of gallium chloride in dilute hydrochloric acid. The preparation may contain acetone.

#### Content

— gallium-68: 90 per cent to 110 per cent of the declared gallium-68 radioactivity at the date and time stated on the label.

#### CHARACTERS

##### Appearance

Clear, colourless solution.

##### Half-life and nature of radiation of gallium-68

See general chapter 5.7. Table of physical characteristics of radionuclides.

#### IDENTIFICATION

A. Gamma-ray spectrometry.

**Result** The principal gamma photons have energies of 0.511 MeV and 1.077 MeV and, depending on the measurement geometry, a sum peak of 1.022 MeV may be observed.

B. Determine the approximate half-life by no fewer than 3 measurements of the activity of a sample in the same geometrical conditions within a suitable period of time (for example, 15 min).

*Result* 62 min to 74 min.

C. pH (see Tests).

D. To a volume of 20-100  $\mu\text{L}$  of the solution to be examined add 1 mL of a 1.03 g/L solution of *hydrochloric acid R*. Apply this solution to the top of a column containing *strong cation-exchange resin R*, push 5 mL of air through the column and collect the eluate. Determine the radioactivity of the eluate (A1). Elute the column with 1 mL of a 1.03 g/L solution of *hydrochloric acid R*. Determine the radioactivity of the eluate (A2). Elute the column with 1 mL of a mixture of 2 volumes of *hydrochloric acid R* and 98 volumes of *acetone R* and push 5 mL of air through the column. Determine the radioactivity of the eluate (A3) and the residual activity on the column (A4).

Calculate the percentage of radioactivity in the A3 eluate using the following expression:

$$A3 \times 100 / (A1 + A2 + A3 + A4)$$

*Result* The percentage of radioactivity in the A3 eluate is not less than 90 per cent.

E. To 100  $\mu\text{L}$  of *silver nitrate solution R2* add 50  $\mu\text{L}$  of the solution to be examined. A white precipitate is formed.

#### TESTS

##### pH

Maximum 2, using a *pH-indicator strip R*.

##### Iron

Maximum 10  $\mu\text{g}/\text{GBq}$ .

Atomic absorption spectrometry (2.2.23, *Method I*).

*Modifier solution* 14 g/L solution of *magnesium nitrate R*.

*Test solution* Dilute the solution to be examined with a 1 per cent *V/V* solution of *nitric acid R* to obtain a radioactivity concentration of 2.5 MBq/mL.

*Reference solutions* Prepare the reference solutions using *iron standard solution (20 ppm Fe) R*, diluting with a 1 per cent *V/V* solution of *nitric acid R*.

*Source* Iron hollow-cathode lamp.

*Wavelength* 248.3 nm.

*Atomisation device* Graphite furnace.

An example of the injection and instrument parameters for the graphic furnace atomic absorption analysis is shown below.

*Internal and external protective gas* argon *R*.

*Injection* 20  $\mu\text{L}$  of the test solution and the reference solutions, and 1  $\mu\text{L}$  of the modifier solution.

*Injection temperature* 20 °C.

*Furnace programme:*

Step	Final temperature (°C)	Ramp time (s)	Hold time (s)	Internal protective gas flow rate (mL/min)
Drying	110	1	30	250
Drying	130	15	30	250
Pyrolysis	1400	10	20	250
Atomisation	2100	0	5	0
Cleaning	2450	1	3	250

The solution may be released for use before completion of the test.

##### Zinc

Maximum 10  $\mu\text{g}/\text{GBq}$ .

Atomic absorption spectrometry (2.2.23, *Method I*).

*Test solution* Dilute the solution to be examined with a 1 per cent *V/V* solution of *nitric acid R* to obtain a radioactivity concentration of 50 MBq/mL.

*Reference solutions* Prepare the reference solutions using *zinc standard solution (10 ppm Zn) R*, diluting with a 1 per cent *V/V* solution of *nitric acid R*.

*Source* Zinc hollow-cathode lamp.

*Wavelength* 213.9 nm.

*Atomisation device* Air-acetylene flame.

The solution may be released for use before completion of the test.

##### Bacterial endotoxins (2.6.14)

Less than 175 IU/*V*, *V* being the maximum volume to be used for the preparation of a single patient dose, if intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins. The solution may be released for use before completion of the test.

##### RADIONUCLIDIC PURITY

The solution may be released for use before completion of test B.

##### Gallium-68

Minimum 99.9 per cent of the total radioactivity.

A. Gamma-ray spectrometry.

*Limit* Peaks in the gamma-ray spectrum corresponding to photons with an energy different from 0.511 MeV, 1.077 MeV, 1.022 MeV and 1.883 MeV represent not more than 0.1 per cent of the total radioactivity.

B. Germanium-68 and gamma-ray-emitting impurities. Gamma-ray spectrometry.

Determine the amount of gallium-68, germanium-68 and radionuclidic impurities with a half-life longer than 5 h. For the detection and quantification of germanium-68 and gamma-ray-emitting impurities, retain the solution to be examined for at least 48 h to allow the gallium-68 to decay to a level that permits the detection of impurities.

*Result* The total radioactivity due to germanium-68 and gamma-ray-emitting impurities is not more than 0.001 per cent.

##### RADIOCHEMICAL PURITY

[<sup>68</sup>Ga]Gallium(III) ion

Thin-layer chromatography (2.2.27).

*Test solution* Adjust the solution to be examined to obtain a concentration of *hydrochloric acid R* of 10.3 g/L.

*Reference solution (a)* To 0.2 mL of the test solution add 0.3 mL of a 4 g/L solution of *sodium hydroxide R*. Use within 30 min of preparation.

*Reference solution (b)* To 1 mL of the test solution add 1 mL of a 10 g/L solution of *pentetic acid R* in a 4 g/L solution of *sodium hydroxide R*. Use within 30 min of preparation.

*Plate* TLC silica gel plate *R*; use a glass-fibre plate.

*Mobile phase* 77 g/L solution of *ammonium acetate R*, *methanol R* (50:50 *V/V*).

*Application* About 5  $\mu\text{L}$ .

*Development* Immediately, over a path of at least 10 cm.

**Drying** In air.

**Detection** Suitable detector to determine the distribution of radioactivity.

**Retardation factor** [ $^{68}\text{Ga}$ ]Gallium(III) ion = 0-0.2.

**System suitability** The retardation factor of the principal peak in the chromatogram obtained with reference solution (a) is not more than 0.1; the retardation factor of the principal peak in the chromatogram obtained with reference solution (b) is not less than 0.7.

**Limit:**

— [ $^{68}\text{Ga}$ ]gallium(III) ion: minimum 95 per cent of the total radioactivity due to gallium-68.

### RADIOACTIVITY

Determine the radioactivity using a calibrated instrument.

### LABELLING

The label states:

- that the solution is not intended for direct administration to humans;
- the maximum volume that can be used for the preparation of a single patient dose;
- the concentration of hydrochloric acid;
- the concentration of acetone, if present;
- that the solution is intended for use in the preparation of gallium-68-labelled radiopharmaceuticals;
- a procedure to reduce the level of germanium-68 below 0.001 per cent of the total radioactivity.

### IMPURITIES

A. germanium-68.

Ph Eur

## Gallium ( $^{68}\text{Ga}$ ) Edotreotide Injection

(Ph. Eur. monograph 2482)

$\text{C}_{65}\text{H}_{89}^{68}\text{GaN}_{14}\text{O}_{18}\text{S}_2$  1487

Ph Eur

### DEFINITION

Sterile solution of a complex of gallium-68 with edotreotide (*N*-[[4,7,10-tris(carboxymethyl)-1,4,7,10-tetraazacyclododecan-1-yl]acetyl]-*D*-phenylalanyl-L-cysteinyl-L-tyrosyl-D-tryptophyl-L-lysyl-L-threonyl-*N*-[(1*R*,2*R*)-2-hydroxy-1-(hydroxymethyl)propyl]-L-cysteinamide cyclic (2→7)-disulfide) (gallium-68 DOTATOC).

### Content

- **gallium-68:** 90 per cent to 110 per cent of the declared gallium-68 radioactivity at the date and time stated on the label;
- **edotreotide:** maximum 50 µg per maximum recommended dose in millilitres.

### CHARACTERS

#### Appearance

Clear, colourless solution.

#### Half-life and nature of radiation of gallium-68

See general chapter 5.7. *Table of physical characteristics of radionuclides.*

### IDENTIFICATION

#### A. Gamma-ray spectrometry.

**Result** The principal gamma photons have energies of 0.511 MeV and 1.077 MeV and, depending on the measurement geometry, a sum peak of 1.022 MeV may be observed.

**B.** Determine the approximate half-life by no fewer than 3 measurements of the activity of a sample in the same geometrical conditions within a suitable period of time (for example, 15 min).

**Result** 62 min to 74 min.

**C.** Examine the chromatograms obtained in the test for other radiochemical impurities (see Tests).

**Result** The principal peak in the radiochromatogram obtained with the test solution has a relative retention of 1.3 with reference to the principal peak in the chromatogram obtained with reference solution (a) using the spectrophotometer.

### TESTS

#### pH

4.0 to 8.0, using a *pH indicator strip R*.

#### Edotreotide, gallium edotreotide and other related substances

Liquid chromatography (2.2.29).

**Test solution** The preparation to be examined.

**Reference solution (a)** Prepare a 50 µg/*V* solution of edotreotide *R* in a 10.3 g/L solution of hydrochloric acid *R*, *V* being the maximum recommended dose in millilitres.

**Reference solution (b)** Prepare a 50 µg/*V* solution of octreotide acetate *R* in a 10.3 g/L solution of hydrochloric acid *R*, *V* being the maximum recommended dose in millilitres.

**Reference solution (c)** Mix 0.1 mL of reference solution (a) and 0.1 mL of reference solution (b).

#### Column:

- **size:** *l* = 0.15 m,  $\varnothing$  = 3.0 mm;
- **stationary phase:** base-deactivated end-capped octadecylsilyl silica gel for chromatography *R* (3 µm).

#### Mobile phase:

- **mobile phase A:** trifluoroacetic acid *R*, water for chromatography *R* (0.1:99.9 *V/V*);
- **mobile phase B:** trifluoroacetic acid *R*, acetonitrile for chromatography *R* (0.1:99.9 *V/V*);

Time (min)	Mobile phase A (per cent <i>V/V</i> )	Mobile phase B (per cent <i>V/V</i> )
0 - 8	76	24
8 - 9	76 → 40	24 → 60
9 - 14	40	60

**Flow rate** 0.6 mL/min.

**Detection** Spectrophotometer at 220 nm and radioactivity detector connected in series.

**Injection** 20 µL.

**Relative retention** With reference to edotreotide (retention time = about 3.3 min): gallium edotreotide = about 1.3; octreotide = about 2.6.

**System suitability** Reference solution (c) using the spectrophotometer:

- **resolution:** minimum 5.0 between the peaks due to edotreotide and octreotide.

**Limits** In the chromatogram obtained with the spectrophotometer:

- **edotreotide and metal complexes of edotreotide** (sum of the areas of the peaks with a relative retention with reference to edotreotide between 0.8 and 1.4): not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (50 µg/V);
- **unspecified impurities:** for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (50 µg/V); disregard any peak with a relative retention with reference to edotreotide of 0.5 or less.

#### Impurity D

Thin-layer chromatography (2.2.27).

**Test solution** The preparation to be examined.

**Reference solution** Dissolve 10 mg of HBPES R (impurity D) in water R and dilute to V with the same solvent, V being the maximum recommended dose in millilitres. Dilute 1.0 mL of the solution to 50.0 mL with water R.

**Plate** TLC silica gel F<sub>254</sub> plate R; use an aluminium plate.

**Mobile phase** water R, acetonitrile R (25:75 V/V).

**Application** (V/1000) mL, V being the maximum recommended dose in millilitres; apply portions of 1 µL and dry with a current of warm air after each application.

**Development** Over 2/3 of the plate.

**Detection** Expose to iodine vapour for 4 min.

**Retardation factor** Impurity D = about 0.3.

**System suitability** Reference solution:

- the chromatogram shows a clearly visible spot.

**Limit:**

- **impurity D:** any spot due to impurity D is not more intense than the corresponding spot in the chromatogram obtained with the reference solution (200 µg/V).

#### Ethanol

Gas chromatography (2.2.28).

**Internal standard solution** Dilute 1 mL of propanol R to 1000 mL with water R.

**Test solution** Dilute 0.10 mL of the preparation to be examined to 10.0 mL with the internal standard solution.

**Reference solution** Dilute 1.0 mL of anhydrous ethanol R to 100.0 mL with the internal standard solution. Dilute 1.0 mL of this solution to 10.0 mL with the internal standard solution.

**Column:**

- **material:** fused silica;
- **size:** l = 30 m, Ø = 0.53 mm;
- **stationary phase:** macrogol 20 000 R (film thickness 1.0 µm).

**Carrier gas** helium for chromatography R.

**Flow rate** 10 mL/min.

**Split ratio** 1:10.

**Temperature:**

- **column:** 35 °C;
- **injection port:** 140 °C;
- **detector:** 220 °C.

**Detection** Flame ionisation.

**Injection** 1.0 µL.

**System suitability** Reference solution:

- **retention time:** ethanol = 2 min to 4 min;
- **resolution:** minimum 5.0 between the peaks due to ethanol and propanol.

**Limit:**

- **ethanol:** maximum 10 per cent V/V and maximum 2.5 g per administration, taking the density (2.2.5) to be 0.790 g/mL.

#### Sterility

It complies with the test for sterility prescribed in the monograph *Radiopharmaceutical preparations (0125)*. The preparation may be released for use before completion of the test.

#### Bacterial endotoxins (2.6.14)

Less than 175/V IU/mL, V being the maximum recommended dose in millilitres. The preparation may be released for use before completion of the test.

#### RADIONUCLIDIC PURITY

The preparation may be released for use before completion of test B.

##### Gallium-68

Minimum 99.9 per cent of the total radioactivity.

A. Gamma-ray spectrometry.

**Limit** Peaks in the gamma-ray spectrum corresponding to photons with an energy different from 0.511 MeV, 1.077 MeV, 1.022 MeV and 1.883 MeV represent not more than 0.1 per cent of the total radioactivity.

B. Germanium-68 and gamma-ray-emitting impurities. Gamma-ray spectrometry.

Determine the amount of gallium-68, germanium-68 and radionuclidic impurities with a half-life longer than 5 h. For the detection and quantification of germanium-68 and gamma-ray-emitting impurities, retain the preparation to be examined for at least 48 h to allow the gallium-68 to decay to a level that permits the detection of impurities.

**Result** The total radioactivity due to germanium-68 and gamma-ray-emitting impurities is not more than 0.001 per cent.

#### RADIOCHEMICAL PURITY

- [<sup>68</sup>Ga]gallium edotreotide: minimum 91 per cent of the total radioactivity due to gallium-68.

##### Impurity A

Thin-layer chromatography (2.2.27).

**Test solution** The preparation to be examined.

**Reference solution (a)** Dilute gallium (<sup>68</sup>Ga) chloride solution R with water R to obtain a final concentration of 10 g/L of hydrochloric acid R. To 1 mL of this solution add 1.5 mL of a 4 g/L solution of sodium hydroxide R. Use within 30 min of preparation.

**Reference solution (b)** Dilute gallium (<sup>68</sup>Ga) chloride solution R with water R to obtain a final concentration of 10 g/L of hydrochloric acid R. To 1 mL of this solution add 1 mL of a solution containing 10 g/L of penetic acid R and 4 g/L of sodium hydroxide R. Use within 30 min after preparation.

**Plate** TLC silica gel plate R; use a glass-fibre plate.

**Mobile phase** 77 g/L solution of ammonium acetate R in water R, methanol R (50:50 V/V).

**Application** 5 µL.

**Development** Immediately, over 2/3 of the plate.

**Drying** In air.

**Detection** Suitable detector to determine the distribution of radioactivity.

**Retardation factors** Impurity A = 0.0-0.1; [ $^{68}\text{Ga}$ ]gallium edotreotide = 0.8-1.0.

**System suitability** The retardation factor of the principal signal in the chromatogram obtained with reference solution (a) is not more than 0.1; the retardation factor of the principal signal in the chromatogram obtained with reference solution (b) is more than 0.7.

**Limit:**

— **impurity A:** not more than 3 per cent of the total radioactivity due to gallium-68.

**Other radiochemical impurities**

Liquid chromatography (2.2.29) as described in the test for edotreotide, gallium edotreotide and other related substances. If necessary, dilute the test solution with *water R* to a radioactivity concentration suitable for the radioactivity detector.

Examine the chromatogram recorded using the radioactivity detector and locate the peak due to [ $^{68}\text{Ga}$ ]gallium edotreotide by comparison with the chromatogram obtained with reference solution (a) and the spectrophotometer.

**Relative retention** With reference to [ $^{68}\text{Ga}$ ]gallium edotreotide (retention time = about 4.2 min): impurity B = about 0.3.

**Limit:**

— **impurity B:** not more than 2 per cent of the total radioactivity due to gallium-68.

Calculate the percentage of radioactivity due to [ $^{68}\text{Ga}$ ]gallium edotreotide using the following expression:

$$(100 - A) \times T$$

- A* = percentage of radioactivity due to impurity A determined in the test for impurity A under radiochemical purity;  
*T* = proportion of the area of the peak due to [ $^{68}\text{Ga}$ ]gallium edotreotide relative to the total areas of the peaks in the chromatogram obtained with the test solution.

**RADIOACTIVITY**

Determine the radioactivity using a calibrated instrument.

**LABELLING**

The label states the percentage content of ethanol in the preparation.

**IMPURITIES**

**Specified impurities** A, B, C, D.

- A. [ $^{68}\text{Ga}$ ]gallium in colloidal form,  
 B. [ $^{68}\text{Ga}$ ]gallium(III) ion,  
 C. germanium-68,

- D. 2-[4-(2-hydroxyethyl)piperazin-1-yl]ethanesulfonic acid (HEPES).

*Ph Eur*

## Gallium ( $^{68}\text{Ga}$ ) PSMA-11 Injection

(*Ph. Eur. monograph 3044*)

$\text{C}_{44}\text{H}_{59}^{68}\text{Ga}\text{N}_6\text{O}_{17}$

1012

*Ph Eur*

**DEFINITION**

Sterile solution of a complex of gallium-68 with the human prostate-specific membrane antigen (PSMA)-targeting ligand (3*S*,7*S*)-22-[3-[[[2-[[[5-(2-carboxyethyl)-2-hydroxyphenyl]methyl](carboxymethyl)amino]ethyl](carboxymethyl)amino]methyl]-4-hydroxyphenyl]-5,13,20-trioxo-4,6,12,19-tetraazadocosane-1,3,7-tricarboxylic acid (PSMA-11). It is prepared using *Gallium ( $^{68}\text{Ga}$ ) chloride solution for radiolabelling (2464)* or *Gallium ( $^{68}\text{Ga}$ ) chloride (accelerator-produced) solution for radiolabelling (3109)* and PSMA-11. It may contain a suitable buffer.

**Content**

- **gallium-68:** 90 per cent to 110 per cent of the declared gallium-68 radioactivity at the date and time stated on the label;  
 — **PSMA-11:** maximum 30  $\mu\text{g}$  per maximum recommended dose in millilitres.

A reversible stereoisomerisation of [ $^{68}\text{Ga}$ ]gallium PSMA-11 takes place in solution depending on temperature, pH and time.

**CHARACTERS**

**Appearance**

Clear, colourless solution.

**Half-life and nature of radiation of gallium-68**

See general chapter 5.7. *Table of physical characteristics of radionuclides.*

**IDENTIFICATION**

A. Gamma-ray spectrometry.

**Result** The principal gamma photons have energies of 0.511 MeV and 1.077 MeV and, depending on the measurement geometry, a sum peak of 1.022 MeV may be observed; a peak corresponding to gamma photons with an energy of 1.883 MeV may be observed.

B. Approximate half-life: 61 min to 75 min.

C. Examine the chromatograms obtained in test B for radiochemical purity (see Tests).

**Result** The 2 principal peaks in the radiochromatogram obtained with the test solution are similar in retention time to the 2 principal peaks in the chromatogram obtained with reference solution (a).

**TESTS**

**pH (2.2.4)**

4 to 8.

**PSMA-11, gallium PSMA-11 and other related substances**

Liquid chromatography (2.2.29).

*Test solution* The preparation to be examined.

*Reference solution (a)* Dissolve a quantity of *gallium PSMA-11 R* corresponding to 50 µg of anhydrous and trifluoroacetic acid-free gallium PSMA-11 in 1.0 mL of *water R*.

*Reference solution (b)* Dissolve a quantity of *PSMA-11 R* corresponding to 30 µg of anhydrous and trifluoroacetic acid-free PSMA-11 in mobile phase A and dilute to *V* with mobile phase A, *V* being the maximum recommended dose in millilitres.

*Reference solution (c)* Dilute 1.0 mL of reference solution (b) to 10.0 mL with mobile phase A.

*Column:*

- *size:*  $l = 0.15$  m,  $\varnothing = 3.0$  mm;
- *stationary phase:* base-deactivated end-capped octadecylsilyl silica gel for chromatography R (3 µm).

*Mobile phase:*

- *mobile phase A:* trifluoroacetic acid R, *water* for chromatography R (1:999 *V/V*);
- *mobile phase B:* trifluoroacetic acid R, *acetonitrile R* (1:999 *V/V*);

Time (min)	Mobile phase A (per cent <i>V/V</i> )	Mobile phase B (per cent <i>V/V</i> )
0 - 0.5	95	5
0.5 - 10	95 → 60	5 → 40
10 - 12	60	40

*Flow rate* 0.6 mL/min.

*Detection* Spectrophotometer at 280 nm and radioactivity detector connected in series.

*Injection* 20 µL.

*Relative retention* With reference to PSMA-11 (retention time = about 8 min): gallium PSMA-11 stereoisomer 1 = about 0.9; gallium PSMA-11 stereoisomer 2 = about 1.0.

*System suitability* Reference solution (a) using the spectrophotometer:

- *resolution:* minimum 1.5 between the peaks due to gallium PSMA-11 stereoisomers 1 and 2.

*Limits* In the chromatogram obtained with the spectrophotometer:

- *PSMA-11, gallium PSMA-11 and other related substances* (sum of the areas of the peaks due to compounds with a relative retention with reference to PSMA-11 of 0.8 to 1.3): not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (30 µg/*V*);
- *disregard limit:* the area of the principal peak in the chromatogram obtained with reference solution (c) (3 µg/*V*).

**Impurity C**

Thin-layer chromatography (2.2.27).

*Solution A* A solution of the same composition as that of the test solution, but without HEPES and without [<sup>68</sup>Ga] gallium PSMA-11.

*Test solution* The preparation to be examined.

*Reference solution* Dissolve 25 mg of HEPES R (impurity C) in solution A, and dilute to *V* with the same solution, *V* being the maximum recommended dose in millilitres. Dilute 1.0 mL of the solution to 50.0 mL with solution A.

*Plate* TLC silica gel F<sub>254</sub> plate R.

*Mobile phase* methanol R, *water R*, *acetonitrile R* (10:15:75 *V/V/V*).

*Application* (*V*/1000 mL), *V* being the maximum recommended dose in millilitres; apply portions of 2 µL and dry with a current of warm air after each application.

*Development* Over 2/3 of the plate.

*Detection* Expose to iodine vapour heated to 30-40 °C for 4 min.

*Retardation factor* Impurity C = about 0.3.

*System suitability* Reference solution:

- the chromatogram shows a clearly visible spot.

*Limit:*

- *impurity C:* any spot due to impurity C is not more intense than the corresponding spot in the chromatogram obtained with the reference solution (500 µg/*V*).

*Ethanol* (2.4.24 or another suitable, validated method) Maximum 10 per cent *V/V* and maximum 2.5 g per administration, taking the density (2.2.5) to be 0.790 g/mL.

**Sterility**

It complies with the test for sterility prescribed in the monograph *Radiopharmaceutical preparations* (0125).

The preparation may be released for use before completion of the test.

**Bacterial endotoxins (2.6.14)**

Less than 175/*V* IU/mL, *V* being the maximum recommended dose in millilitres. The preparation may be released for use before completion of the test.

**RADIOCHEMICAL PURITY**

A. Thin-layer chromatography (2.2.27).

*Test solution* The preparation to be examined.

*Reference solution (a)* Adjust Gallium (<sup>68</sup>Ga) chloride solution for radiolabelling (2464) or Gallium (<sup>68</sup>Ga) chloride (accelerator-produced) solution for radiolabelling (3109) to pH 1.0 ± 0.2 using dilute hydrochloric acid R or by diluting with *water R*.

*Reference solution (b)* To 1 mL of reference solution (a) add 1 mL of a solution containing 4 g/L of sodium hydroxide R and 10 g/L of pentetic acid R. Use within 30 min.

*Plate* TLC silica gel plate R; use a glass-fibre plate.

*Mobile phase* 77 g/L solution of ammonium acetate R in *water R*, *methanol R* (50:50 *V/V*).

*Application* 5 µL.

*Development* Immediately, over 2/3 of the plate.

*Drying* In air.

*Detection* Suitable detector to determine the distribution of radioactivity.

*Retardation factor* [<sup>68</sup>Ga]gallium PSMA-11 = 0.8-1.0.

*System suitability* The retardation factor of the principal peak in the chromatogram obtained with reference solution (a) is not more than 0.1; the retardation factor of the principal peak in the chromatogram obtained with reference solution (b) is more than 0.7.

*Limit:*

- not more than 3 per cent of the total radioactivity is due to gallium-68 species migrating with a retardation factor lower than 0.2.

B. Liquid chromatography (2.2.29) as described in the test for PSMA-11, gallium PSMA-11 and other related substances. If necessary, dilute the test solution with *water R* to obtain a radioactivity concentration suitable for the radioactivity detector.

Examine the chromatogram recorded using the radioactivity detector and locate the peaks due to [<sup>68</sup>Ga]gallium PSMA-11 by comparison with the chromatogram obtained with reference solution (a) using the spectrophotometer.

**Limit:**

- sum of [<sup>68</sup>Ga]gallium PSMA-11 stereoisomer 1 and [<sup>68</sup>Ga]gallium PSMA-11 stereoisomer 2: minimum 95 per cent of the total radioactivity due to gallium-68.

**RADIOACTIVITY**

Determine the radioactivity using a calibrated instrument.

**LABELLING**

The label states the percentage content of ethanol in the preparation.

**IMPURITIES**

Specified impurities C.

C. 2-[4-(2-hydroxyethyl)piperazin-1-yl]ethane-1-sulfonic acid (HEPES).

Ph Eur

## Indium (<sup>111</sup>In) Chloride Solution

(Ph. Eur. monograph 1227)

Ph Eur

**DEFINITION**

Sterile solution of indium-111 as the chloride in aqueous hydrochloric acid containing no additives.

**Indium-111** 90 per cent to 110 per cent of the declared indium-111 radioactivity at the date and time stated on the label.

**Specific radioactivity** Minimum 1.85 GBq of indium-111 per microgram of indium.

**PRODUCTION**

No carrier indium is added.

**CHARACTERS****Appearance**

Clear, colourless solution.

**Half-life and nature of radiation of indium-111**

See general chapter 5.7. *Table of physical characteristics of radionuclides.*

**IDENTIFICATION**

A. Gamma-ray and X-ray spectrometry. *Carry out the test after allowing sufficient time for short-lived impurities such as indium-110m to decay.*

**Results** The most prominent gamma photons of indium-111 have energies of 0.171 MeV and 0.245 MeV.

B. To 100 µL of silver nitrate solution R2 add 50 µL of the preparation to be examined. A white precipitate is formed.

C. pH (see Tests).

D. Examine the chromatogram obtained in the test for radiochemical purity (see Tests).

**Result** The retardation factor of the principal peak in the radiochromatogram obtained with the test solution is 0.5 to 0.8.

**TESTS**

pH (2.2.3)

1.0 to 2.0.

**Cadmium**

Maximum 0.40 µg/mL.

Atomic absorption spectrometry (2.2.23, *Method I*).

**Test solution** Dilute 0.05 mL of the preparation to be examined to a suitable volume with a suitable concentration of hydrochloric acid R.

**Reference solutions** Prepare the reference solutions using cadmium standard solution (0.1 per cent Cd) R, diluting with the same concentration of hydrochloric acid R as in the test solution.

**Source** Cadmium hollow-cathode lamp.

**Wavelength** 228.8 nm.

**Atomisation device** Electrothermal.

**Copper**

Maximum 0.15 µg/mL.

Atomic absorption spectrometry (2.2.23, *Method I*).

**Test solution** Dilute 0.1 mL of the preparation to be examined to a suitable volume with a suitable concentration of hydrochloric acid R.

**Reference solutions** Prepare the reference solutions using copper standard solution (0.1 per cent Cu) R diluting with the same concentration of hydrochloric acid R as in the test solution.

**Source** Copper hollow-cathode lamp.

**Wavelength** 324.8 nm.

**Atomisation device** Electrothermal.

**Iron**

Maximum 0.60 µg/mL.

Atomic absorption spectrometry (2.2.23, *Method I*).

**Test solution** Dilute 0.1 mL of the preparation to be examined to a suitable volume with a suitable concentration of hydrochloric acid R.

**Reference solutions** Prepare the reference solutions using iron standard solution (0.1 per cent Fe) R diluting with the same concentration of hydrochloric acid R as in the test solution.

**Source** Iron hollow-cathode lamp

**Wavelength** 248.3 nm.

**Atomisation device** Electrothermal.

**Sterility**

It complies with the test for sterility prescribed in the monograph *Radiopharmaceutical preparations (0125)*.

The preparation may be released for use before completion of the test.

**RADIONUCLIDIC PURITY****Indium-111**

Gamma-ray and X-ray spectrometry.

**Comparison** Standardised indium-111 solution.

**Result** The spectrum obtained with the preparation to be examined does not differ significantly from that obtained with a standardised indium-111 solution apart from any differences due to the presence of indium-114m.

**Impurity A**

Maximum 0.25 per cent of the total radioactivity.

Gamma-ray spectrometry. *Carry out the test after allowing sufficient time for short-lived impurities such as indium-110m to decay.*

Take a volume equivalent to 30 MBq and record the gamma-ray spectrum using a suitable detector with a shield of lead, 6 mm thick, placed between the sample and the detector.

**Results** The response in the region corresponding to the 0.558 MeV photon and the 0.725 MeV photon of indium-114m does not exceed that obtained using 75 kBq of a standardised indium-114m solution measured under the same conditions, when all measurements are calculated with reference to the date and time of administration.

#### RADIOCHEMICAL PURITY

##### [<sup>111</sup>In]Indium(III) ion

Thin-layer chromatography (2.2.27)

**Test solution** The preparation to be examined.

**Plate** TLC silica gel plate R. Use silica gel as the coating substance on a glass-fibre sheet.

**Mobile phase** 9.0 g/L solution of sodium chloride R adjusted to pH 2.3 ± 0.05 with dilute hydrochloric acid R.

**Application** 5 µL.

**Development** Immediately over a path of 15 cm.

**Drying** In a current of cold air.

**Detection** Suitable detector to determine the distribution of radioactivity.

**Retardation factor** [<sup>111</sup>In]indium(III) ion = 0.5 to 0.8.

**Limit:**

— [<sup>111</sup>In]indium(III) ion : minimum 95 per cent of the radioactivity due to indium-111.

#### RADIOACTIVITY

Determine the radioactivity using a calibrated instrument.

#### IMPURITIES

A. indium-114m.

Ph Eur

## Indium (<sup>111</sup>In) Oxine Solution

(Ph. Eur. monograph 1109)

C<sub>27</sub>H<sub>18</sub>[<sup>111</sup>In]N<sub>3</sub>O<sub>3</sub> 543.5

Ph Eur

#### DEFINITION

Sterile solution of indium-111 in the form of a complex with 8-hydroxyquinoline. It may contain suitable surface active agents and may be made isotonic by the addition of sodium chloride and a suitable buffer.

**Indium-111** 90 per cent to 110 per cent of the declared indium-111 radioactivity at the date and time stated on the label.

**Specific radioactivity** Minimum 1.85 GBq of indium-111 per microgram of indium.

#### PRODUCTION

No carrier indium is added.

#### CHARACTERS

##### Appearance

Clear, colourless solution.

##### Half-life and nature of radiation of indium-111

See general chapter 5.7. Table of physical characteristics of radionuclides.

#### IDENTIFICATION

**A. Gamma-ray and X-ray spectrometry.** Carry out the test after allowing sufficient time for short-lived impurities such as indium-110m to decay.

**Results** The most prominent gamma photons of indium-111 have energies of 0.171 MeV and 0.245 MeV.

**B. Place 5-10 mg of magnesium oxide R** in a glass container about 20 mm in internal diameter. Add 20 µL of the preparation to be examined. Examine in ultraviolet light at 365 nm. Bright yellow fluorescence is produced.

**C. The distribution of radioactivity between the organic and aqueous phases in the test for radiochemical purity (see Tests) contributes to the identification of the preparation.**

#### TESTS

##### pH (2.2.3)

6.0 to 7.5.

##### Sterility

It complies with the test for sterility prescribed in the monograph *Radiopharmaceutical preparations (0125)*.

The preparation may be released for use before completion of the test.

#### RADIONUCLIDIC PURITY

##### Indium-111

Gamma-ray and X-ray spectrometry.

**Comparison** Standardised indium-111 solution.

**Result** The spectrum obtained with the preparation to be examined does not differ significantly from that obtained with a standardised indium-111 solution, apart from any differences due to the presence of indium-114m.

##### Impurity A

Maximum 0.25 per cent of the total radioactivity.

Gamma-ray spectrometry. Carry out the test after allowing sufficient time for short-lived impurities such as indium-110m to decay.

Take a volume equivalent to 30 MBq and record the gamma-ray spectrum using a suitable detector with a shield of lead, 6 mm thick, placed between the sample and the detector.

**Results** The response in the region corresponding to the 0.558 MeV photon and the 0.725 MeV photon of indium-114m does not exceed that obtained using 75 kBq of a standardised indium-114m solution measured under the same conditions, when all measurements are calculated with reference to the date and time of administration.

#### RADIOCHEMICAL PURITY

##### [<sup>111</sup>In]Indium oxine

To a silanised separating funnel containing 3 mL of a 9 g/L solution of sodium chloride R add 100 µL of the preparation to be examined and mix. Add 6 mL of octanol R and shake vigorously. Allow the phases to separate and then run the lower layer into a suitable vial for counting. Allow the upper layer to drain completely into a similar vial. Add 1 mL of octanol R to the separating funnel, shake vigorously and drain

into the vial containing the organic fraction. Add 5 mL of dilute hydrochloric acid R to the separating funnel, shake vigorously and drain these rinsings into a 3<sup>rd</sup> vial. Seal each vial and, using a suitable instrument, measure the radioactivity in each. Calculate the radiochemical purity by expressing the radioactivity of the [<sup>111</sup>In]indium oxine, found in the organic phase, as a percentage of the total radioactivity due to indium-111 measured in the 3 solutions.

**Result** Minimum 90 per cent of the radioactivity due to indium-111.

#### RADIOACTIVITY

Determine the radioactivity using a calibrated instrument.

#### LABELLING

The label states that the solution is not for direct administration to humans.

#### IMPURITIES

A. indium-114m.

Ph Eur

## Indium (<sup>111</sup>In) Pentetate Injection

(Ph. Eur. monograph 0670)

Ph Eur

#### DEFINITION

Sterile solution containing indium-111 in the form of indium diethylenetriaminepenta-acetate. It may contain calcium and may be made isotonic by the addition of sodium chloride and a suitable buffer.

**Indium-111** 90 per cent to 110 per cent of the declared indium-111 radioactivity at the date and time stated on the label.

#### CHARACTERS

##### Appearance

Clear, colourless solution.

##### Half-life and nature of radiation of Indium-111

See general chapter 5.7. Table of physical characteristics of radionuclides.

#### IDENTIFICATION

A. Gamma-ray and X-ray spectrometry.

**Results** The most prominent gamma photons of indium-111 have energies of 0.171 MeV and 0.245 MeV.

B. Examine the chromatogram obtained in the test for radiochemical purity (see Tests). The distribution of radioactivity contributes to the identification of the preparation.

#### TESTS

##### pH (2.2.3)

7.0 to 8.0.

##### Cadmium

Maximum 5 µg/mL.

Atomic absorption spectrometry (2.2.23, Method II).

**Test solution** Mix 0.1 mL of the preparation to be examined with 0.9 mL of a mixture of 1 volume of hydrochloric acid R and 99 volumes of water R.

**Reference solutions** Prepare the reference solutions using cadmium standard solution (0.1 per cent Cd) R and diluting with a mixture of 1 volume of hydrochloric acid R and 99 volumes of water R.

**Source** Cadmium hollow-cathode lamp.

**Wavelength** 228.8 nm.

**Atomisation device** Air-acetylene flame.

**Uncomplexed diethylenetriaminepenta-acetic acid**  
Maximum 0.4 mg/mL.

In a micro test-tube, mix 100 µL of the preparation to be examined with 100 µL of a freshly prepared 1 g/L solution of hydroxynaphthol blue, sodium salt R in a 42 g/L solution of sodium hydroxide R. Add 50 µL of a 0.15 g/L solution of calcium chloride R. The solution remains pinkish-violet or changes from blue to pinkish-violet.

#### Sterility

It complies with the test for sterility prescribed in the monograph Radiopharmaceutical preparations (0125).

The preparation may be released for use before completion of the test.

#### Bacterial endotoxins (2.6.14)

Less than 14/V IU/mL, V being the maximum recommended dose in millilitres.

#### RADIONUCLIDIC PURITY

##### Indium-111

Gamma-ray and X-ray spectrometry.

**Comparison** Standardised indium-111 solution.

**Result** The spectrum obtained with the preparation to be examined does not differ significantly from that obtained with a standardised indium-111 solution apart from any differences due to the presence of indium-114m.

##### Impurity A

Maximum 0.2 per cent of the total radioactivity at the date and time of administration.

Gamma-ray spectrometry.

Retain a sample of the preparation to be examined for a sufficient time to allow the indium-111 radioactivity to decay to a sufficiently low level to permit the detection of radionuclidic impurities. Record the gamma-ray spectrum of the decayed material in a suitable instrument calibrated with the aid of a standardised indium-114m solution.

**Result** Indium-114m has a half-life of 49.5 days and its most prominent gamma photon has an energy of 0.190 MeV.

#### RADIOCHEMICAL PURITY

##### [<sup>111</sup>In]Indium pentetate

Thin-layer chromatography (2.2.27).

**Test solution** The preparation to be examined.

**Plate** TLC silica gel plate R; use silica gel as the coating substance on a glass-fibre sheet heated at 110 °C for 10 min.

**Mobile phase** 9 g/L solution of sodium chloride R.

**Application** 5-10 µL.

**Development** Over a path of 10-15 cm in about 10 min.

**Drying** In air.

**Detection** Suitable detector to determine the distribution of radioactivity.

**Identification of spots** [<sup>111</sup>In]indium pentetate migrates near to the solvent front.

##### Limit:

— [<sup>111</sup>In]indium pentetate : minimum 95 per cent of the radioactivity due to indium-111.

#### RADIOACTIVITY

Determine the radioactivity using a calibrated instrument.

#### IMPURITIES

A. indium-114m.

Ph Eur

Iobenguane ( $^{123}\text{I}$ ) Injection

(Ph. Eur. monograph 1113)

Ph Eur

**DEFINITION**

Sterile, bacterial endotoxin-free solution of 1-(3- $^{123}\text{I}$ iodobenzyl)guanidine or its salts. It may contain a suitable buffer, a suitable labelling catalyst such as ionic copper, a suitable labelling stabiliser such as ascorbic acid and antimicrobial preservatives.

**Iodine-123** 90 per cent to 110 per cent of the declared iodine-123 radioactivity at the date and time stated on the label.

**Specific radioactivity** Minimum 10 GBq of iodine-123 per gram of iobenguane base.

**CHARACTERS****Appearance**

Clear, colourless or slightly yellow solution.

**Half-life and nature of radiation of iodine-123**

See general chapter 5.7. *Table of physical characteristics of radionuclides.*

**IDENTIFICATION****A. Gamma-ray and X-ray spectrometry.**

**Result** The energy of the most prominent gamma photon of iodine-123 is 0.159 MeV.

**B.** Examine the chromatogram obtained in the test for radiochemical purity (see Tests). The distribution of the radioactivity contributes to the identification of the preparation.

**TESTS****pH (2.2.3)**

3.5 to 8.0.

**Specific radioactivity**

The specific radioactivity is calculated from the results obtained in the test for radiochemical purity. Determine the content of iobenguane sulfate from the areas of the peaks due to iobenguane in the chromatograms obtained with the test solution and reference solution (b). Calculate the concentration as iobenguane base by multiplying the result obtained in the test by 0.85.

**Sterility**

It complies with the test for sterility prescribed in the monograph *Radiopharmaceutical preparations (0125)*. The preparation may be released for use before completion of the test.

**Bacterial endotoxins (2.6.14)**

Less than 175/V IU/mL, V being the maximum recommended dose in millilitres.

**RADIONUCLIDIC PURITY**

The preparation may be released for use before completion of the test.

**Radionuclides other than iodine-123**

Maximum 0.35 per cent of the total radioactivity.

Gamma-ray and X-ray spectrometry.

Record the gamma-ray spectrum and the X-ray spectrum using a suitable instrument.

Determine the relative amounts of iodine-125, tellurium-121 and other radionuclidic impurities present. For their determination, retain the preparation to be examined for a sufficient time to allow iodine-123 to decay to a level which permits the detection of radionuclidic impurities. No radionuclides with a half-life longer than that of iodine-125 are detected.

**RADIOCHEMICAL PURITY****[ $^{123}\text{I}$ ]Iobenguane**

Liquid chromatography (2.2.29).

**Test solution** The preparation to be examined.

**Reference solution (a)** Dissolve 0.100 g of sodium iodide R in the mobile phase and dilute to 100 mL with the mobile phase.

**Reference solution (b)** Dissolve 10.0 mg of iobenguane sulfate CRS in 25 mL of the mobile phase and dilute to 50.0 mL with the mobile phase.

**Column:**

— size:  $l = 0.25$  m,  $\varnothing = 4.0$  mm;

— stationary phase: silica gel for chromatography R (5  $\mu\text{m}$ ).

**Mobile phase** 80 g/L solution of ammonium nitrate R, dilute ammonia R2, methanol R (1:2:27 V/V/V).

**Flow rate** 1.0 mL/min.

**Detection** Suitable detector to determine the distribution of radioactivity and spectrophotometer at 254 nm, provided with a flow-cell.

**Injection** 10  $\mu\text{L}$ .

**Limits:**

- [ $^{123}\text{I}$ ]iobenguane: minimum 95 per cent of the radioactivity due to iodine-123;
- impurity A: maximum 4 per cent of the radioactivity due to iodine-123;
- other impurities: maximum 1 per cent of the radioactivity due to iodine-123.

**RADIOACTIVITY**

Determine the radioactivity using a calibrated instrument.

**STORAGE**

Protected from light.

**LABELLING**

The label states the specific radioactivity expressed in GBq of iodine-123 per gram of iobenguane base.

**IMPURITIES**

- A. [ $^{123}\text{I}$ ]iodide,
- B. iodine-125,
- C. tellurium-121.

$6\beta$ -[<sup>131</sup>I]iodomethyl-19-norcholest-5(10)-en-3 $\beta$ -ol

Thin-layer chromatography (2.2.27).

**Test solution** The preparation to be examined.

**Carrier solution** Dissolve 10 mg of *potassium iodide R*, 20 mg of *potassium iodate R* and 0.1 g of *sodium hydrogen carbonate R* in *distilled water R* and dilute to 10 mL with the same solvent.

**Plate** TLC silica gel GF<sub>254</sub> plate R.

**Mobile phase** chloroform R.

**Application** Up to 5  $\mu$ L of the test solution and 10  $\mu$ L of the carrier solution on the same spot.

**Development** Over a path of 15 cm in about 60 min.

**Drying** In air.

**Detection** Ultraviolet light at 254 nm and suitable detector to determine the distribution of radioactivity.

**Retardation factor**  $6\beta$ -[<sup>131</sup>I]iodomethyl-19-norcholest-5(10)-en-3 $\beta$ -ol = about 0.5.

**Identification of spots** Impurity C remains near the point of application.

**Limit:**

—  $6\beta$ -[<sup>131</sup>I]iodomethyl-19-norcholest-5(10)-en-3 $\beta$ -ol: minimum 85 per cent of the total radioactivity due to iodine-131.

#### Impurity C

Thin-layer chromatography (2.2.27).

**Test solution** The preparation to be examined.

**Carrier solution** Dissolve 10 mg of *potassium iodide R*, 20 mg of *potassium iodate R* and 0.1 g of *sodium hydrogen carbonate R* in *distilled water R* and dilute to 10 mL with the same solvent.

**Plate** TLC silica gel GF<sub>254</sub> plate R.

**Mobile phase** chloroform R, anhydrous ethanol R (50:50 V/V).

**Application** 10  $\mu$ L of the carrier solution and then up to 5  $\mu$ L of the test solution on the same spot.

**Development** Over a path of 15 cm in about 90 min.

**Drying** In air.

**Detection** Ultraviolet light at 254 nm for 5 min and suitable detector to determine the distribution of radioactivity.

**Retardation factor** Impurity C (yellow spot) = about 0.5.

**Identifications of spots** The principal peak of radioactivity is near to the solvent front; other iodocholesterols migrate near the solvent front.

**Limit:**

— *impurity C*: maximum 5 per cent of the total radioactivity.

#### RADIOACTIVITY

Determine the radioactivity using a calibrated instrument.

#### STORAGE

Protected from light, at -18 °C or below.

#### IMPURITIES

A. iodine-133,

B. iodine-135,

C. [<sup>131</sup>I]iodide.

Ph Eur

## Krypton (<sup>81m</sup>Kr) Inhalation Gas

(Ph. Eur. monograph 1533)

Ph Eur

#### DEFINITION

Gaseous mixture of krypton-81m and a suitable vehicle such as air.

#### PRODUCTION

Krypton-81m is formed by decay of its parent radionuclide rubidium-81. Rubidium-81 has a half-life of 4.58 h.

The krypton-81m formed is separated from the rubidium-81 with a flow of a suitable gas in a rubidium/krypton generator. Rubidium-81 is produced by proton irradiation of krypton isotopes or by helium-3 or helium-4 irradiation of bromine. After separation of rubidium-81 from the target, it is retained by a suitable support.

Krypton-81m is eluted at a suitable flow rate with a vehicle such as air. The level of moisture required in the eluent depends on the type of generator used. The transport tube for administration has a defined length and inner diameter. The radioactivity concentration is determined before administration.

#### CHARACTERS

##### Appearance

Clear, colourless gas.

##### Half-life and nature of radiation of krypton-81m

See general chapter 5.7. *Table of physical characteristics of radionuclides*.

#### IDENTIFICATION

A. Gamma-ray and X-ray spectrometry.

**Result** The gamma photon of krypton-81m has an energy of 0.190 MeV.

B. The half-life of krypton-81m is 11.8 s to 14.4 s.

#### TESTS

#### RADIONUCLIDIC PURITY

##### Radionuclides other than krypton-81m

Maximum 0.1 per cent of the radioactivity passed through the absorber, calculated with reference to the date and time of administration.

**Gamma-ray and X-ray spectrometry.**

Elute the generator as prescribed. Pass a sufficient amount (2 L to 10 L) of eluate at a suitable flow rate through a suitable absorber such as water. Determine the amount of radioactivity eluted. Allow the krypton-81m to decay for 5 min and record the gamma and X-ray spectrum of the residual radioactivity on the absorber using a suitable instrument. Examine the gamma-ray and X-ray spectrum of the absorber for the presence of radioactive impurities, which must be identified and quantified.

**RADIOACTIVITY**

Determine the radioactive concentration of the preparation using suitable equipment such as an ionisation chamber or a gamma ray spectrometer. The radioactivity is measured under defined operating conditions, such as gas flow rate and measurement geometry, that are identical to those used for the calibration of the instrument.

**STORAGE**

The storage conditions apply to the generator.

**LABELLING**

The labelling conditions apply to the generator.

## L-Methionine ([<sup>11</sup>C]Methyl) Injection

(Ph. Eur. monograph 1617)

Ph Eur

**DEFINITION**

Sterile solution of (2S)-2-amino-4-([<sup>11</sup>C]methylsulfanyl)butanoic acid for diagnostic use.

**Content**

90 per cent to 110 per cent of the declared carbon-11 radioactivity at the date and time stated on the label.

**Purity:**

- minimum of 99 per cent of the total radioactivity corresponds to carbon-11,
- minimum of 95 per cent of the total radioactivity corresponds to carbon-11 in the form of L-[methyl-<sup>11</sup>C]methionine and D-[methyl-<sup>11</sup>C]methionine,
- maximum of 10 per cent of the total radioactivity corresponds to carbon-11 in the form of D-[methyl-<sup>11</sup>C]methionine.

*Content of methionine:* maximum of 2 mg per maximum recommended dose in millilitres.

**PRODUCTION****RADIONUCLIDE PRODUCTION**

Carbon-11 is a radioactive isotope of carbon which is most commonly produced by proton irradiation of nitrogen. Depending on the addition of either trace amounts of oxygen or small amounts of hydrogen, the radioactivity is obtained as [<sup>11</sup>C]carbon dioxide or [<sup>11</sup>C]methane.

**RADIOCHEMICAL SYNTHESIS**

L-[Methyl-<sup>11</sup>C]methionine can be prepared by various chemical synthetic pathways. All methods rely on the alkylation of the sulfide anion of L-homocysteine with [<sup>11</sup>C]

methyl iodide or [<sup>11</sup>C]methyl triflate. Variations in the procedures used to generate the sulfide anion of L-homocysteine and methods to obtain [<sup>11</sup>C]methyl iodide lead to negligible differences with respect to quality in terms of specific radioactivity, enantiomeric purity and possible chemical and radiochemical impurities.

**Synthesis of [<sup>11</sup>C]methyl iodide**

[<sup>11</sup>C]Methyl iodide can be obtained either starting from [<sup>11</sup>C]carbon dioxide or from [<sup>11</sup>C]methane. The most frequently used method is the reduction of [<sup>11</sup>C]carbon dioxide with lithium aluminium hydride. The formed [<sup>11</sup>C]methanol is reacted with hydroiodic acid. Alternatively [<sup>11</sup>C]methane, either obtained directly in the target or by on-line processes from [<sup>11</sup>C]carbon dioxide, is reacted with iodine.

**Synthesis of [<sup>11</sup>C]methyl triflate**

[<sup>11</sup>C]methyl triflate can be prepared from [<sup>11</sup>C]methyl iodide using a silver triflate-impregnated solid support such as graphitised carbon.

**Synthesis of L-[methyl-<sup>11</sup>C]methionine**

The most widely used method to obtain L-[methyl-<sup>11</sup>C]methionine is the alkylation of the sulfide anion, generated from L-homocysteine thiolactone, with [<sup>11</sup>C]methyl iodide or [<sup>11</sup>C]methyl triflate in alkaline conditions in a solvent such as acetone. The L-[methyl-<sup>11</sup>C]methionine obtained can be purified by semi-preparative liquid chromatography. For example, a column packed with octadecylsilyl silica gel for chromatography eluted with a 9 g/L solution of sodium chloride is suitable.

**L-Homocysteine thiolactone hydrochloride**

Specific optical rotation (2.2.7): + 20.5 to + 21.5, determined on a 10 g/L solution at 25 °C.

Infrared absorption spectrophotometry (2.2.24).

*Comparison Ph. Eur. reference spectrum of L-homocysteine thiolactone hydrochloride.*

**CHARACTERS****Appearance**

Clear, colourless solution.

**Half-life and nature of radiation of carbon-11**

See general chapter 5.7. *Table of physical characteristics of radionuclides.*

**IDENTIFICATION****A. Gamma-ray spectrometry.**

*Results* The only gamma photons have an energy of 0.511 MeV and, depending on the measurement geometry, a sum peak of 1.022 MeV may be observed.

**B. Radionuclidic purity (see Tests).**

**C. Examine the chromatograms obtained in the test for radiochemical purity.**

*Results* The principal peak in the radiochromatogram obtained with the test solution is similar in retention time to the principal peak in the chromatogram obtained with reference solution (b).

**TESTS****pH (2.2.3)**

4.5 to 8.5.

**Sterility**

It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations (0125)*. The injection may be released for use before completion of the test.

**Bacterial endotoxins (2.6.14)**

Less than 175/V IU/mL, V being the maximum recommended dose in millilitres. The injection may be released for use before completion of the test.

**CHEMICAL PURITY****Impurity A, impurity B and methionine**

Liquid chromatography (2.2.29).

**Test solution** The preparation to be examined.

**Reference solution (a)** Dissolve 0.6 mg of *L-homocysteine thiolactone hydrochloride R*, 2 mg of *DL-homocysteine R* and 2 mg of *DL-methionine R* in water R and dilute to V, V being the maximum recommended dose in millilitres.

**Reference solution (b)** Dissolve 2 mg of *L-methionine R* in the same solvent as used in the test solution and dilute to 10 mL with the same solvent.

**Column:**

- size:  $l = 0.25$  m,  $\varnothing = 4.6$  mm,
- stationary phase: spherical octadecylsilyl silica gel for chromatography R (5  $\mu$ m) with a specific surface of 220 m<sup>2</sup>/g, a pore size of 8 nm and a carbon loading of 6.2 per cent,
- temperature: 25 °C.

**Mobile phase** 1.4 g/L solution of potassium dihydrogen phosphate R.

**Flow rate** 1 mL/min.

**Detection** Spectrophotometer at 225 nm and radioactivity detector connected in series.

**Injection** Loop injector.

**Run time** 10 min.

**Relative retention** With reference to methionine (retention time = about 2.6 min): impurity B = about 0.8, impurity A = about 2.7.

**System suitability** Reference solution (a):

- resolution: minimum of 2.5 between the peaks due to methionine and impurity B.

**Limits** Examine the chromatogram obtained with the spectrophotometer:

- impurity A: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (0.6 mg/V),
- impurity B: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (2 mg/V),
- methionine: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (2 mg/V).

**Residual solvents (2.4.24)**

Maximum 50 mg/V for the concentration of acetone, V being the maximum recommended dose in millilitres.

The preparation may be released for use before completion of the test.

**RADIONUCLIDIC PURITY****Carbon-11**

Minimum 99 per cent of the total radioactivity.

**A. Gamma-ray spectroscopy.**

**Comparison** Standardised fluorine-18 solution, or by using an instrument calibrated with the aid of such a solution. Standardised fluorine-18 solutions and/or standardisation services are available from the competent authority.

**Results** The spectrum obtained with the solution to be examined does not differ significantly from that obtained with a standardised fluorine-18 solution.

B. Half-life: 19.9 min to 20.9 min.

The preparation may be released for use before completion of the test.

**RADIOCHEMICAL PURITY****L-[Methyl-<sup>11</sup>C]methionine and impurity E**

Liquid chromatography (2.2.29) as described in the test for impurity A, impurity B and methionine.

**Injection** Test solution and reference solution (b).

**Limits** Examine the chromatogram obtained with the radioactivity detector:

- total of L-[methyl-<sup>11</sup>C]methionine and impurity E: minimum of 95 per cent of the total radioactivity,
- other peaks in the chromatogram may be due to impurity C, impurity D and impurity F.

**ENANTIOMERIC PURITY****Impurity E**

Thin-layer chromatography (2.2.27).

**Test solution** The preparation to be examined.

**Reference solution (a)** Dissolve 2 mg of *L-methionine R* in water R and dilute to 10 mL with the same solvent.

**Reference solution (b)** Dissolve 4 mg of *DL-methionine R* in water R and dilute to 10 mL with the same solvent.

**Plate** TLC octadecylsilyl silica gel plate for chiral separations R.

**Mobile phase** methanol R, water R (50:50 V/V).

**Application** 2-10  $\mu$ L.

**Development** Over a path of 8 cm.

**Drying** In air for 5 min.

**Detection** Spray with a 2 g/L solution of ninhydrin R in ethanol R and heat at 60 °C for 10 min. Determine the distribution of radioactivity using a suitable detector.

**Retardation factors** L-[methyl-<sup>11</sup>C]methionine = about 0.58; impurity E = about 0.51.

**System suitability** The chromatogram obtained with reference solution (b) shows 2 clearly separated spots.

**Limits:**

- total of L-[methyl-<sup>11</sup>C]methionine and impurity E: minimum 95 per cent of the total radioactivity,
- impurity E: maximum 10 per cent of the total radioactivity.

The preparation may be released for use before completion of the test.

**RADIOACTIVITY**

Measure the radioactivity using suitable equipment by comparison with a standardised fluorine-18 solution or by measurement in an instrument calibrated with the aid of such a solution.

**LABELLING**

The accompanying information specifies the maximum recommended dose in millilitres.

**IMPURITIES**

A. (3S)-3-aminodihydrothiophen-2(3H)-one (L-homocysteine thiolactone),

B. (2*S*)-2-amino-4-sulfanylbutanoic acid (L-homocysteine),

C. (2*RS*)-2-amino-4-([<sup>11</sup>C]methylsulfonyl)butanoic acid (DL-[methyl-<sup>11</sup>C]methionine *S,S*-dioxide),

D. (2*RS*)-2-amino-4-([<sup>11</sup>C]methylsulfinyl)butanoic acid (DL-[methyl-<sup>11</sup>C]methionine *S*-oxide),

E. (2*R*)-2-amino-4-([<sup>11</sup>C]methylsulfanyl)butanoic acid (D-[methyl-<sup>11</sup>C]methionine),

F. [<sup>11</sup>C]methanol

Ph Eur

## Lutetium (<sup>177</sup>Lu) Solution for Radiolabelling

(Ph. Eur. monograph 2798)

<sup>177</sup>Lu<sup>3+</sup>

176.9

Ph Eur

### DEFINITION

Solution containing lutetium-177 in the form of lutetium(III) ion in dilute hydrochloric acid.

### Content

— *lutetium-177*: 90 per cent to 110 per cent of the declared *lutetium-177* radioactivity at the date and time stated on the label.

### CHARACTERS

#### Appearance

Clear, colourless solution.

#### Half-life and nature of radiation of lutetium-177

See general chapter 5.7. *Table of physical characteristics of radionuclides*.

### IDENTIFICATION

A. Gamma-ray spectrometry.

*Result* The most prominent gamma photon of lutetium-177 has an energy of 0.208 MeV. Gamma photons with an energy of 0.113 MeV are also present.

B. pH (see Tests).

C. Examine the chromatograms obtained in the test for radiochemical purity (see Tests).

*Result* The retardation factor of the principal peak in the radiochromatogram obtained with the test solution is 0.4 to 0.7.

### TESTS

#### pH

1.0 to 2.0, using a *pH indicator strip R*.

#### Lutetium

Inductively coupled plasma-atomic emission spectrometry (2.2.57), for determination of specific radioactivity.

*Test solution* Dilute the preparation to be examined with a 48.3 g/L solution of *heavy metal-free nitric acid R* to obtain a radioactivity concentration of 50 MBq/mL.

*Reference solutions* Prepare the reference solutions using *lutetium standard solution (20 ppm Lu) R*, diluting with a 48.3 g/L solution of *heavy metal-free nitric acid R*.

*Wavelength* 261.542 nm.

#### Copper

Maximum 1.0 µg/GBq.

Inductively coupled plasma-atomic emission spectrometry (2.2.57).

*Test solution* Dilute the preparation to be examined with a 48.3 g/L solution of *heavy metal-free nitric acid R* to obtain a radioactivity concentration of 50 MBq/mL.

*Reference solutions* Prepare the reference solutions using *copper standard solution (10 ppm Cu) R*, diluting with a 48.3 g/L solution of *heavy metal-free nitric acid R*.

*Wavelength* 327.393 nm.

#### Iron

Maximum 0.5 µg/GBq.

Inductively coupled plasma-atomic emission spectrometry (2.2.57).

*Test solution* Dilute the preparation to be examined with a 48.3 g/L solution of *heavy metal-free nitric acid R* to obtain a radioactivity concentration of 50 MBq/mL.

*Reference solutions* Prepare the reference solutions using *iron standard solution (20 ppm Fe) R*, diluting with a 48.3 g/L solution of *heavy metal-free nitric acid R*.

*Wavelength* 238.204 nm.

#### Lead

Maximum 0.5 µg/GBq.

Inductively coupled plasma-atomic emission spectrometry (2.2.57).

*Test solution* Dilute the preparation to be examined with a 48.3 g/L solution of *heavy metal-free nitric acid R* to obtain a radioactivity concentration of 50 MBq/mL.

*Reference solutions* Prepare the reference solutions using *lead standard solution (10 ppm Pb) R*, diluting with a 48.3 g/L solution of *heavy metal-free nitric acid R*.

*Wavelength* 220.353 nm.

#### Zinc

Maximum 1.0 µg/GBq.

Inductively coupled plasma-atomic emission spectrometry (2.2.57).

*Test solution* Dilute the preparation to be examined with a 48.3 g/L solution of *heavy metal-free nitric acid R* to obtain a radioactivity concentration of 50 MBq/mL.

*Reference solutions* Prepare the reference solutions using *zinc standard solution (10 ppm Zn) R*, diluting with a 48.3 g/L solution of *heavy metal-free nitric acid R*.

*Wavelength* 213.855 nm.

#### Sterility

If intended for use in the manufacture of parenteral preparations without a further appropriate sterilisation procedure, it complies with the test for sterility prescribed in

the monograph *Radiopharmaceutical preparations (0125)*.  
The preparation may be released for use before completion of the test.

#### Bacterial endotoxins (2.6.14)

Less than 175 IU/V, V being the maximum volume to be used for the preparation of a single patient dose, if intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins.

#### RADIONUCLIDIC PURITY

##### Lutetium-177

Minimum 99.9 per cent of the total radioactivity.

Gamma-ray spectrometry.

Determine the relative amounts of lutetium-177m, ytterbium-175 and other radionuclidic impurities present.

#### Results:

- the total radioactivity due to ytterbium-175 (impurity B) is not more than 0.1 per cent;
- the total radioactivity due to lutetium-177m (impurity A) is not more than 0.07 per cent;
- the total radioactivity due to radionuclidic impurities other than A and B is not more than 0.01 per cent.

#### RADIOCHEMICAL PURITY

##### [<sup>177</sup>Lu]lutetium(III) ion

Thin-layer chromatography (2.2.27).

**Test solution** The preparation to be examined.

**Reference solution** To 1 mL of the test solution add 0.4 mL of a 10 g/L solution of *pentetic acid R* in a 4 g/L solution of *sodium hydroxide R*.

**Plate** TLC silica gel plate R; use a glass-fibre plate.

**Mobile phase** 9.0 g/L solution of *sodium chloride R* adjusted to pH 2.30 ± 0.05 with *dilute hydrochloric acid R*.

**Application** 5 µL.

**Development** Immediately, over 2/3 of the plate.

**Drying** In a current of cold air.

**Detection** Suitable detector to determine the distribution of radioactivity.

**Retardation factors** [<sup>177</sup>Lu]lutetium(III) ion = about 0.4-0.7; [<sup>177</sup>Lu]lutetium pentetate = minimum 0.9.

**System suitability** Reference solution:

- the chromatogram shows 2 clearly separated spots.

#### Limit:

- [<sup>177</sup>Lu]lutetium(III) ion: minimum 99 per cent of the total radioactivity due to lutetium-177.

#### RADIOACTIVITY

Determine the radioactivity using a calibrated instrument.

#### LABELLING

The label states:

- that the solution is not for direct administration to humans;
- the maximum volume that can be used for the preparation of a single patient dose;
- the concentration of hydrochloric acid;
- that the solution is intended for use in the preparation of lutetium-177-labelled radiopharmaceuticals;
- the specific radioactivity.

#### IMPURITIES

A. lutetium-177m,

B. ytterbium-175.

## Oxygen (<sup>15</sup>O)

(Ph. Eur. monograph 1620)

Ph Eur

#### DEFINITION

Mixture of [<sup>15</sup>O]oxygen in the gaseous phase and a suitable vehicle such as *Medicinal air (1238)*, for diagnostic use.

#### Purity:

- minimum 99 per cent of the total radioactivity corresponds to oxygen-15,
- minimum 97 per cent of the total radioactivity corresponds to oxygen-15 in the form of oxygen (O<sub>2</sub>).

#### PRODUCTION

##### RADIONUCLIDIC PRODUCTION

Oxygen-15 is a radioactive isotope of oxygen which may be produced by various nuclear reactions such as proton irradiation of nitrogen-15 or deuteron irradiation of nitrogen-14.

##### RADIOCHEMICAL SYNTHESIS

In order to recover oxygen-15 as molecular oxygen from the nitrogen target gas, carrier oxygen is added at concentrations generally ranging from 0.2 per cent V/V to 1.0 per cent V/V. After irradiation, the target gas is usually passed through activated charcoal and a carbon dioxide scavenger, such as soda lime, before mixing with the vehicle.

#### CHARACTERS

##### Appearance

Colourless gas.

##### Half-life and nature of radiation of oxygen-15

See general chapter 5.7. *Table of physical characteristics of radionuclides*.

#### IDENTIFICATION

##### A. Gamma spectrometry.

**Results** The only gamma photons have an energy of 0.511 MeV and, depending on the measurement geometry, a sum peak of 1.022 MeV may be observed.

##### B. Radionuclidic purity (see Tests).

##### C. Examine the chromatograms obtained in the test for radiochemical purity.

**Results** The retention times of the principal peaks in the chromatogram obtained with the test gas using the radioactivity detector are similar to those of the principal peaks corresponding to oxygen in the chromatogram obtained with the reference gas using the thermal conductivity detector.

#### TESTS

*The following tests are performed on [<sup>15</sup>O]oxygen as described under radiochemical synthesis before mixing with the vehicle.*

##### RADIONUCLIDIC PURITY

##### Oxygen-15

Minimum 99 per cent of the total radioactivity.

##### A. Gamma spectrometry.

**Comparison** Standardised fluorine-18 solution, or by using an instrument calibrated with the aid of such a solution. Standardised fluorine-18 solutions and/or standardisation services are available from the competent authority.

**Results** The spectrum obtained with the solution to be examined does not differ significantly from that obtained with a standardised fluorine-18 solution.

##### B. Half-life: 1.9 min to 2.2 min.

Ph Eur

The preparation may be released for use before completion of the test.

#### RADIOCHEMICAL PURITY

##### Oxygen-15 in the form of O<sub>2</sub>

Gas chromatography (2.2.28): use the normalisation procedure.

**Test sample** [<sup>15</sup>O]oxygen as described under radiochemical synthesis.

**Reference gas** Nitrogen gas mixture R.

##### Column:

- size: l = 1.8 m, Ø1 = 6.3 mm and Ø2 = 3.2 mm,
- stationary phase: GC concentrical column R.

**Carrier gas** helium for chromatography R.

**Flow rate** 65 mL/min.

##### Temperature:

- column: 40 °C,
- injection port: 40 °C,
- thermal conductivity detector: 70 °C.

**Detection** Thermal conductivity detector and radioactivity detector connected in series.

**Injection** Loop injector.

**Run time** 10 min.

**Retention times** Oxygen, nitrogen and carbon monoxide eluting from the inner column = about 0.4 min; carbon dioxide eluting from the inner column = about 0.8 min; oxygen eluting from the outer column = about 2.1 min; nitrogen eluting from the outer column = about 3.1 min; carbon monoxide eluting from the outer column = about 6.2 min.

**System suitability** Reference gas:

- 5 clearly separated principal peaks are observed in the chromatogram obtained using the thermal conductivity detector,
- resolution: minimum of 1.5 between the peaks due to carbon dioxide eluting from the inner column and oxygen eluting from the outer column, in the chromatogram obtained using the thermal conductivity detector.

**Limits** Examine the chromatogram obtained with the radioactivity detector and calculate the percentage content of oxygen-15 substances from the peak areas.

- oxygen-15 gas in the form of O<sub>2</sub>: minimum 97 per cent of the total radioactivity,
- disregard the first peak corresponding to components co-eluting from the inner column.

#### RADIOACTIVITY

The radioactive concentration is determined before administration.

Measure the radioactivity using suitable equipment by comparison with a standardised fluorine-18 solution or by measurement in an instrument calibrated with the aid of such a solution.

Ph Eur

## PSMA-1007 (<sup>18</sup>F) Injection

(Ph. Eur. monograph 3116)

C<sub>49</sub>H<sub>55</sub><sup>18</sup>FN<sub>8</sub>O<sub>16</sub>

1030

2093321-19-6

Ph Eur

#### DEFINITION

Sterile solution of (3*S*,10*S*,14*S*)-1-[4-[[[(2*S*)-4-carboxy-2-[(2*S*)-4-carboxy-2-(6-[<sup>18</sup>F]fluoropyridin-3-amido)butanamido]butanamido]methyl]phenyl]-3-[(naphthalen-2-yl)methyl]-1,4,12-trioxo-2,5,11,13-tetraazahexadecane-10,14,16-tricarboxylic acid (<sup>18</sup>F)PSMA-1007). It may contain stabilisers such as ascorbic acid.

This monograph applies to an injection containing [<sup>18</sup>F]PSMA-1007 produced by nucleophilic substitution.

#### Content

- fluorine-18: 90 per cent to 110 per cent of the declared fluorine-18 radioactivity at the date and time stated on the label;
- PSMA-1007: maximum 0.1 mg per maximum recommended dose in millilitres.

#### CHARACTERS

##### Appearance

Clear, colourless or slightly yellow solution.

##### Half-life and nature of radiation of fluorine-18

See general chapter 5.7. Table of physical characteristics of radionuclides.

#### IDENTIFICATION

##### A. Gamma-ray spectrometry.

**Result** The principal gamma photons have an energy of 0.511 MeV and, depending on the measurement geometry, a sum peak of 1.022 MeV may be observed.

##### B. Approximate half-life: 105 min to 115 min.

**C. Examine the chromatograms obtained in the test for other radiochemical impurities under Radiochemical purity (see Tests).**

**Result** The principal peak in the radiochromatogram obtained with the test solution is similar in retention time to the principal peak in the chromatogram obtained with reference solution (a).

#### TESTS

##### pH (2.2.4)

4.5 to 8.5.

##### Impurity A (tetrabutylammonium) (2.4.33)

It complies with the test.

##### Impurity E

###### Spot test.

**Test solution** To 100 µL of the preparation to be examined add 400 µL of water R and mix.

Reference solution (a) water R.

Reference solution (b) Dissolve 11.0 mg of aminopolyether R (impurity E) in water R and dilute to 25.0 mL with the same solvent. Dilute 1.0 mL of the solution to V with water R, V being the maximum recommended dose in millilitres.

Plate TLC silica gel plate for aminopolyether test R.

Application 2.5 µL; as an additional spot, apply 2.5 µL of the test solution and then 2.5 µL of reference solution (b) at the same place.

Detection Visually compare the spots 1 min after application.

System suitability:

- the spot due to the application of both the test solution and reference solution (b) is similar in appearance to the spot due to reference solution (b), which is characterised by a number of concentric circles; the darker innermost circle (of intensity proportional to the concentration of impurity E) may be surrounded by a bluish-black ring, outside of which is a lighter circle surrounded by a peripheral dark edge;
- the spot due to reference solution (a) has a more diffuse inner circle, which is brownish-pink and without a distinct margin between it and the surrounding lighter zone;
- the spot due to reference solution (b) is clearly different from the spot due to reference solution (a).

Limit:

- the central portion of the spot due to the test solution is not more intense than that of the spot due to reference solution (b) (2.2mg/V).

#### PSMA-1007 and related substances

Liquid chromatography (2.2.29).

Solvent mixture anhydrous ethanol R, water R (40:60 V/V).

Solution A Dissolve 20 mg of potassium chloride R, 0.80 g of sodium chloride R, 20 mg of potassium dihydrogen phosphate R and 0.114 g of anhydrous disodium hydrogen phosphate R in water R and dilute to 100 mL with the same solvent. Mix 30 mL of the solution with 10 mL of the solvent mixture.

Test solution The preparation to be examined.

Reference solution (a) To 1.0 mg of PSMA-1007 R add 5 mL of solution A, sonicate for 5 min and dilute to 10.0 mL with solution A. Dilute 1.0 mL of the solution to V with solution A, V being the maximum recommended dose in millilitres.

Reference solution (b) Dissolve 1 mg of defluorohydroxy-PSMA-1007 R (impurity C) in 4 mL of anhydrous ethanol R. If necessary, add 1 mL of water R so that the solution is no longer opalescent. Sonicate for 5 min and dilute to 10 mL with water R.

Reference solution (c) Dissolve 1 mg of defluorotrimethylammonium-PSMA-1007 trifluoroacetate R (trifluoroacetate salt of impurity D) in 4 mL of anhydrous ethanol R. If necessary, add 1 mL of water R so that the solution is no longer opalescent. Sonicate for 5 min and dilute to 10 mL with water R.

Reference solution (d) To 1 mL of reference solution (b) add 1 mL of reference solution (c) and dilute to 10 mL with the solvent mixture.

Column:

- size:  $l = 0.15$  m,  $\varnothing = 4.6$  mm;
- stationary phase: solid core octadecylsilyl silica gel for chromatography R (2.7 µm);
- temperature: 30 °C.

Mobile phase:

- mobile phase A: to 1000 mL of a 3.12 g/L solution of sodium dihydrogen phosphate R add 10.0 mL of a 90 g/L solution of phosphoric acid R and adjust to  $\text{pH } 2.5 \pm 0.1$  with phosphoric acid R;
- mobile phase B: acetonitrile for chromatography R;

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 2	77	23
2 - 14	77 → 70	23 → 30
14 - 17	70 → 40	30 → 60
17 - 21	40	60

Flow rate 1.3 mL/min.

Detection Spectrophotometer at 225 nm and radioactivity detector connected in series.

Injection 20 µL.

Relative retention With reference to PSMA-1007 (retention time = about 11 min): impurity D = about 0.5; impurity C = about 0.6.

System suitability Reference solution (d) using the spectrophotometer:

- resolution: minimum 2.0 between the peaks due to impurities D and C.

Limits In the chromatogram obtained with the spectrophotometer:

- PSMA-1007: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (0.1mg/V);
- any other impurity: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1mg/V);
- total: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5mg/V);
- disregard limit: 0.3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.03mg/V).

#### Residual solvents

Limited according to the principles defined in general chapter 5.4. The preparation may be released for use before completion of the test.

Ethanol (2.4.24 or another suitable, validated method) Maximum 10 per cent V/V and maximum 2.5 g per administration, taking the density (2.2.5) to be 0.790 g/mL.

#### Sterility

It complies with the test for sterility prescribed in the monograph Radiopharmaceutical preparations (0125). The preparation may be released for use before completion of the test.

#### Bacterial endotoxins (2.6.14)

Less than 175/V IU/mL, V being the maximum recommended dose in millilitres. The preparation may be released for use before completion of the test.

#### RADIONUCLIDIC PURITY

The preparation may be released for use before completion of test B.

#### Fluorine-18

Minimum 99.9 per cent of the total radioactivity.

A. Gamma-ray spectrometry.

Limit Peaks in the gamma-ray spectrum corresponding to photons with an energy different from 0.511 MeV or

1.022 MeV represent not more than 0.1 per cent of the total radioactivity.

#### B. Gamma-ray spectrometry.

Determine the amount of fluorine-18 and radionuclidic impurities with a half-life longer than 2 h. For the detection and quantification of impurities, retain the preparation to be examined for at least 24 h to allow the fluorine-18 to decay to a level that permits the detection of impurities.

**Result** The total radioactivity due to radionuclidic impurities is not more than 0.1 per cent.

#### RADIOCHEMICAL PURITY

##### [<sup>18</sup>F]PSMA-1007

Minimum 91 per cent of the total radioactivity due to fluorine-18.

#### Impurity B

Thin-layer chromatography (2.2.27).

**Test solution** The preparation to be examined.

**Plate** TLC silica gel plate R.

**Mobile phase** water R, acetonitrile R (40:60 V/V).

**Application** About 2 µL.

**Development** Over 2/3 of the plate.

**Drying** In a current of warm air.

**Detection** Suitable detector to determine the distribution of radioactivity.

**Retardation factors** Impurity B = about 0; [<sup>18</sup>F]PSMA-1007 = about 0.7.

#### Limit:

— **impurity B:** maximum 5 per cent of the total radioactivity due to fluorine-18.

#### Other radiochemical impurities

Liquid chromatography (2.2.29) as described in the test for PSMA-1007 and related substances. If necessary, dilute the test solution with solution A to obtain a radioactivity concentration suitable for the radioactivity detector.

Examine the chromatogram recorded using the radioactivity detector and locate the peak due to [<sup>18</sup>F]PSMA-1007 by comparison with the chromatogram obtained with reference solution (a) using the spectrophotometer.

Calculate the total amount of [<sup>18</sup>F]PSMA-1007 of the preparation using the following expression:

$$(100 - B) \times T$$

- B** = percentage of radioactivity due to impurity B determined in the test for impurity B under Radiochemical purity;
- T** = proportion of the radioactivity in the peak due to [<sup>18</sup>F]PSMA-1007 relative to the total eluted radioactivity in the chromatogram obtained with the test solution in the liquid chromatography test for other radiochemical impurities. Disregard any peak with a relative retention with reference to PSMA-1007 of 0.8 or less.

#### RADIOACTIVITY

Determine the radioactivity using a calibrated instrument.

#### LABELLING

The label states the percentage content of ethanol in the preparation.

#### IMPURITIES

**Specified impurities** A, B, E.

**Other detectable impurities** (the following substances would, if present at a sufficient level, be detected by one or other of the tests in the monograph. They are limited by the general acceptance criterion for other/unspecified impurities. It is

therefore not necessary to identify these impurities for demonstration of compliance): C, D.

- A. *N,N,N*-tributylbutan-1-aminium (tetrabutylammonium),  
B. [<sup>18</sup>F]fluoride,

- C. (3*S*,10*S*,14*S*)-1-[4-[[[(2*S*)-4-carboxy-2-[(2*S*)-4-carboxy-2-(6-hydroxypyridin-3-amido)butanamido]butanamido]methyl]phenyl]-3-[(naphthalen-2-yl)methyl]-1,4,12-trioxo-2,5,11,13-tetraazahexadecane-10,14,16-tricarboxylic acid (defluorohydroxy-PSMA-1007),

- D. 5-[[[(2*S*)-4-carboxy-1-[[[(2*S*)-4-carboxy-1-[[[4-(3*S*,10*S*,14*S*)-10,14-dicarboxy-17-hydroxy-3-[(naphthalen-2-yl)methyl]-1,4,12,17-tetraoxo-2,5,11,13-tetraazaheptadecan-1-yl]phenyl]methyl]amino]-1-oxobutan-2-yl]amino]-1-oxobutan-2-yl]carbonyl]-*N,N,N*-trimethylpyridin-2-aminium (defluorotrimethylaminium-PSMA-1007),

- E. 4,7,13,16,21,24-hexaoxa-1,10-diazabicyclo[8.8.8]hexacosane (aminopolyether).

Ph Eur

## Raclopride ( $^{11}\text{C}$ Methoxy) Injection

(Ph. Eur. monograph 1924)

Ph Eur

### DEFINITION

Sterile solution of 3,5-dichloro-*N*-[(2*S*)-1-ethylpyrrolidin-2-yl]methyl]-2-hydroxy-6-( $^{11}\text{C}$ )methoxybenzamide.

### Content

90 per cent to 110 per cent of the declared carbon-11 radioactivity at the date and time stated on the label.

### Purity:

- minimum of 99 per cent of the total radioactivity corresponds to carbon-11,
- minimum of 95 per cent of the total radioactivity corresponds to carbon-11 in the form of [methoxy- $^{11}\text{C}$ ] raclopride.

*Content of raclopride:* maximum of 10 µg per maximum recommended dose in millilitres.

### PRODUCTION

#### RADIONUCLIDE PRODUCTION

Carbon-11 is a radioactive isotope of carbon most commonly produced by proton irradiation of nitrogen. Depending on the addition of either trace amounts of oxygen or small amounts of hydrogen, the radioactivity is obtained as [ $^{11}\text{C}$ ] carbon dioxide or [ $^{11}\text{C}$ ]methane, respectively.

#### RADIOCHEMICAL SYNTHESIS

[Methoxy- $^{11}\text{C}$ ]raclopride may be prepared by *O*-alkylation of the corresponding phenolate anion (*S*)-3,5-dichloro-2,6-dihydroxy-*N*-[(1-ethylpyrrolidin-2-yl)methyl]benzamide with iodo[ $^{11}\text{C}$ ]methane or [ $^{11}\text{C}$ ]methyl trifluoromethanesulfonate.

#### Synthesis of iodo[ $^{11}\text{C}$ ]methane

Iodo[ $^{11}\text{C}$ ]methane may be produced from [ $^{11}\text{C}$ ]carbon dioxide or from [ $^{11}\text{C}$ ]methane. The most frequently used method is reduction of [ $^{11}\text{C}$ ]carbon dioxide with lithium aluminium hydride. The lithium aluminium [ $^{11}\text{C}$ ]methanolate formed is reacted with hydroiodic acid to iodo [ $^{11}\text{C}$ ]methane via [ $^{11}\text{C}$ ]methanol. Alternatively [ $^{11}\text{C}$ ]methane, either obtained directly in the target or by on-line processes from [ $^{11}\text{C}$ ]carbon dioxide, is reacted with iodine.

#### Synthesis of [ $^{11}\text{C}$ ]methyl trifluoromethanesulfonate

[ $^{11}\text{C}$ ]Methyl trifluoromethanesulfonate may be prepared from iodo[ $^{11}\text{C}$ ]methane using a solid support such as graphitised carbon impregnated with silver trifluoromethanesulfonate.

#### Synthesis of [methoxy- $^{11}\text{C}$ ]raclopride

Methylation with iodo[ $^{11}\text{C}$ ]methane is performed under alkaline conditions in a solvent such as dimethyl sulfoxide. The methylation with [ $^{11}\text{C}$ ]methyl trifluoromethanesulfonate is performed in a solvent such as dimethylformamide or acetone. The resulting [methoxy- $^{11}\text{C}$ ]raclopride may be purified by semi-preparative liquid chromatography using, for example, a column packed with octadecylsilyl silica gel for chromatography eluted with a mixture of 25 volumes of acetonitrile and 75 volumes of 0.01 M phosphoric acid.

### PRECURSOR FOR SYNTHESIS

(*S*)-3,5-Dichloro-2,6-dihydroxy-*N*-[(1-ethylpyrrolidin-2-yl)methyl]benzamide hydrobromide

Melting point (2.2.14): 211 °C to 213 °C.

Specific optical rotation (2.2.7): + 11.3 to + 11.5, determined on a 15.0 g/L solution in ethanol *R* at 22 °C.

### CHARACTERS

#### Appearance

Clear, colourless solution.

#### Half-life and nature of radiation of carbon-11

See general chapter 5.7. *Table of physical characteristics of radionuclides.*

### IDENTIFICATION

#### A. Gamma-ray spectrometry.

*Results* The only gamma photons have an energy of 0.511 MeV and, depending on the measurement geometry, a sum peak of 1.022 MeV may be observed.

#### B. It complies with test B for radionuclidic purity (see Tests).

#### C. Examine the chromatograms obtained in the test for radiochemical purity.

*Results* The principal peak in the radiochromatogram obtained with the test solution is similar in retention time to the principal peak in the chromatogram obtained with reference solution (d).

### TESTS

#### pH (2.2.3)

4.5 to 8.5.

#### Sterility

It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations (0125)*. The injection may be released for use before completion of the test.

#### Bacterial endotoxins (2.6.14)

Less than 175/*V* IU/mL, *V* being the maximum recommended dose in millilitres. The injection may be released for use before completion of the test.

### CHEMICAL PURITY

#### Raclopride and impurity A

Liquid chromatography (2.2.29).

*Test solution* The preparation to be examined.

*Reference solution (a)* Dissolve 7.2 mg of raclopride tartrate *R* in water *R* and dilute to 50 mL with the same solvent.

*Reference solution (b)* Dissolve 1.2 mg of (*S*)-3,5-dichloro-2,6-dihydroxy-*N*-[(1-ethylpyrrolidin-2-yl)methyl]benzamide hydrobromide *R* in methanol *R* and dilute to 100 mL with the same solvent.

*Reference solution (c)* To 0.1 mL of reference solution (a) add 0.1 mL of reference solution (b) and dilute to *V* with water *R*, *V* being the maximum recommended dose in millilitres.

*Reference solution (d)* Dilute 1.0 mL of reference solution (a) to 10.0 mL with water *R*.

#### Column:

- size: *l* = 0.05 m,  $\varnothing$  = 4.6 mm,
- stationary phase: spherical end-capped octadecylsilyl silica gel for chromatography *R* (3.5 µm) with a specific surface area of 175 m<sup>2</sup>/g, a pore size of 12.5 nm, a pore volume of 0.7 cm<sup>3</sup>/g and a carbon loading of 15 per cent,
- temperature: 30 °C.

**Mobile phase** Dissolve 2 g of sodium heptanesulfonate R in 700 mL of water R, adjust to pH 3.9 with phosphoric acid R and dilute to 1000 mL with acetonitrile R.

**Flow rate** 1 mL/min.

**Detection** Spectrophotometer at 220 nm and radioactivity detector connected in series.

**Injection** Loop injector; inject the test solution and reference solutions (b) and (c).

**Run time** 10 min.

**Relative retention** With reference to raclopride: impurity A = about 0.46.

**System suitability** Reference solution (c):

— **resolution**: minimum of 5 between the peaks due to raclopride and to impurity A.

**Limits** Examine the chromatogram obtained with the spectrophotometer:

— **raclopride**: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (c) (10 µg/V),

— **impurity A**: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (c) (1 µg/V).

#### Residual solvents

Are limited according to the principles defined in the general chapter (5.4), using the general method (2.4.24).

The preparation may be released for use before completion of the test.

#### RADIONUCLIDIC PURITY

##### Carbon-11

Minimum 99 per cent of the total radioactivity.

The preparation may be released for use before completion of the test.

A. Gamma-ray spectrometry.

**Comparison** Standardised fluorine-18 solution, or by using a calibrated instrument. Standardised fluorine-18 solutions and/or standardisation services are available from the competent authority.

**Results** The spectrum obtained with the solution to be examined does not differ significantly from that obtained with a standardised fluorine-18 solution.

B. Half-life. 19.9 min to 20.9 min.

#### RADIOCHEMICAL PURITY

Liquid chromatography (2.2.29) as described in the test for raclopride and impurity A with the following modifications.

**Injection** Test solution and reference solution (d).

**Limits** examine the chromatogram obtained with the radioactivity detector:

— **[Methoxy-<sup>11</sup>C] raclopride**: minimum of 95 per cent of the total radioactivity.

#### RADIOACTIVITY

Measure the radioactivity using suitable equipment by comparison with a standardised fluorine-18 solution or by using a calibrated instrument.

#### LABELLING

The accompanying information specifies the maximum recommended dose in millilitres.

#### IMPURITIES

A. 3,5-dichloro-N-[[[(2S)-1-ethylpyrrolidin-2-yl]methyl]-2,6-dihydroxybenzamide.

Ph Eur

## Sodium Acetate ([1-<sup>11</sup>C]) Injection

(Ph. Eur. monograph 1920)

CH<sub>3</sub><sup>11</sup>COONa

Ph Eur

#### DEFINITION

Sterile solution of sodium [1-<sup>11</sup>C]acetate, in equilibrium with [1-<sup>11</sup>C]acetic acid.

#### Content

90 per cent to 110 per cent of the declared carbon-11 radioactivity at the date and time stated on the label.

#### PRODUCTION

##### RADIONUCLIDE PRODUCTION

Carbon-11 is a radioactive isotope of carbon which is most commonly produced by proton irradiation of nitrogen. By the addition of trace amounts of oxygen, the radioactivity is obtained as [<sup>11</sup>C]carbon dioxide.

##### RADIOCHEMICAL SYNTHESIS

[<sup>11</sup>C]Carbon dioxide may be separated from the target gas mixture by cryogenic trapping or by trapping on a molecular sieve at room temperature. [<sup>11</sup>C]Carbon dioxide is then released from the trap using an inert gas such as nitrogen at a temperature higher than the trapping temperature.

[1-<sup>11</sup>C]Acetate is usually prepared by reaction of [<sup>11</sup>C]carbon dioxide with methylmagnesium bromide in organic solvents such as ether or tetrahydrofuran.

Hydrolysis of the product yields [1-<sup>11</sup>C]acetic acid. It is purified by chromatographic procedures. The eluate is diluted with sodium chloride solution.

##### PRECURSOR FOR SYNTHESIS

##### Methylmagnesium bromide

The reactivity of methylmagnesium bromide is tested by decomposition of a defined amount with water. The amount of methane released during this reaction is not less than 90 per cent of the theoretical value.

#### CHARACTERS

##### Appearance

Clear, colourless solution.

##### Half-life and nature of radiation of carbon-11

See general chapter 5.7. Table of physical characteristics of radionuclides.

#### IDENTIFICATION

A. Gamma-ray spectrometry.

**Results** The only gamma photons have an energy of 0.511 MeV and, depending on the measurement geometry, a sum peak of 1.022 MeV may be observed.

B. It complies with test B for radionuclidic purity (see Tests).

C. Examine the chromatograms obtained in the test for radiochemical purity.

**Results** The principal peak in the radiochromatogram obtained with the test solution is similar in retention time to the principal peak in the chromatogram obtained with the reference solution.

#### TESTS

**pH (2.2.3)**  
4.5 to 8.5.

#### Sterility

It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations (0125)*. The injection may be released for use before completion of the test.

#### Bacterial endotoxins (2.6.14)

Less than  $175/V$  IU/mL,  $V$  being the maximum recommended dose in millilitres. The injection may be released for use before completion of the test.

#### CHEMICAL PURITY

##### Acetate

Liquid chromatography (2.2.29).

**Test solution** The preparation to be examined.

**Reference solution** Dissolve 28 mg of sodium acetate R in water R and dilute to  $V$ ,  $V$  being the maximum recommended dose in millilitres.

##### Column:

- size:  $l = 0.25$  m,  $\varnothing = 4.0$  mm;
- stationary phase: strongly basic anion-exchange resin for chromatography R (10  $\mu$ m);
- temperature: 25 °C.

**Mobile phase** 0.1 M sodium hydroxide protected from atmospheric carbon dioxide.

**Flow rate** 1 mL/min.

**Detection** Spectrophotometer at 220 nm and radioactivity detector connected in series.

**Injection** Loop injector.

**Run time** 10 min.

**System suitability** Reference solution:

- resolution: minimum 4.0 between the peaks due to hold-up volume and acetate.

**Limit** Examine the chromatograms obtained with the spectrophotometer:

- acetate: not more than the area of the corresponding peak in the chromatogram obtained with the reference solution (20 mg per  $V$ ).

Residual solvents are limited according to the principles defined in the general chapter (5.4), using the general method (2.4.24)

The preparation may be released for use before completion of the test.

#### RADIONUCLIDIC PURITY

##### Carbon-11

Minimum 99 per cent of the total radioactivity.

The preparation may be released for use before completion of the tests.

##### A. Gamma-ray spectrometry.

**Comparison** Standardised fluorine-18 solution, or by using a calibrated instrument. Standardised fluorine-18 solutions and/or standardisation services are available from laboratories recognised by the competent authority.

**Results** The spectrum obtained with the solution to be examined does not differ significantly from that obtained with a standardised fluorine-18 solution.

B. Half-life: 19.9 min to 20.9 min.

#### RADIOCHEMICAL PURITY

##### [1-<sup>11</sup>C]Acetate

Liquid chromatography (2.2.29) as described in the test for acetate.

**Limit** Examine the chromatograms obtained with the spectrophotometer and the radioactivity detector:

- total of [1-<sup>11</sup>C]acetate: minimum 95 per cent of the total radioactivity.

#### RADIOACTIVITY

Measure the radioactivity using suitable equipment by comparison with a standardised fluorine-18 solution or by measurement with a calibrated instrument.

#### LABELLING

The accompanying information specifies the maximum recommended dose in millilitres.

Ph Eur

## Sodium Chromate (<sup>51</sup>Cr) Sterile Solution

(Ph. Eur. monograph 0279)

Ph Eur

#### DEFINITION

Sterile solution of sodium [<sup>51</sup>Cr]chromate made isotonic by the addition of sodium chloride.

**Chromium-51** 90 per cent to 110 per cent of the declared chromium-51 radioactivity at the date and time stated on the label.

**Specific radioactivity** Minimum 370 MBq of chromium-51 per milligram of chromate ion.

#### CHARACTERS

##### Appearance

Clear, colourless or slightly yellow solution.

##### Half-life and nature of radiation of chromium-51

See general chapter 5.7. *Table of physical characteristics of radionuclides.*

#### IDENTIFICATION

##### A. Gamma-ray spectrometry.

**Result** The only gamma photon of chromium-51 has an energy of 0.320 MeV.

B. Examine the chromatogram obtained in the test for radiochemical purity (see Tests).

**Result** The retardation factor of the principal peak in the radiochromatogram obtained with the test solution is about 0.9.

#### TESTS

**pH (2.2.3)**  
6.0 to 8.5.

##### Total chromate

Maximum 2.7  $\mu$ g of chromate ion ( $\text{CrO}_4^{2-}$ ) per MBq.

**Test solution** The preparation to be examined.

**Reference solution** 1.7 mg/L solution of potassium chromate R. Measure the absorbance of the solutions (2.2.25) at the absorption maximum at 370 nm. If necessary, adjust the test

solution and the reference solution to pH 8.0 by adding sodium hydrogen carbonate solution R. Calculate the content of chromate in the preparation to be examined using the measured absorbances.

#### Sterility

It complies with the test for sterility prescribed in the monograph *Radiopharmaceutical preparations (0125)*. The preparation may be released for use before completion of the test.

#### RADIONUCLIDIC PURITY

##### Chromium-51

Gamma-ray spectrometry.

**Result** The spectrum obtained with the preparation to be examined does not differ significantly from that obtained with a standardised chromium-51 solution.

#### RADIOCHEMICAL PURITY

##### [<sup>51</sup>Cr]Chromate ion

Ascending paper chromatography (2.2.26).

**Test solution** The preparation to be examined.

**Paper** paper for chromatography R.

**Mobile phase** ammonia R, ethanol (96 per cent) R, water R (25:50:125 V/V/V).

**Application** A volume of the solution sufficient for the detection method.

**Development** Immediately, for 2.5 h.

**Detection** Suitable detector to determine the distribution of the radioactivity.

**Retardation factor** Impurity A = 0.0 to 0.1; chromate ion = about 0.9.

#### Limit:

— [<sup>51</sup>Cr]chromate ion: minimum 90 per cent of the total radioactivity due to chromium-51.

#### RADIOACTIVITY

Determine the radioactivity using a calibrated instrument.

#### IMPURITIES

A. [<sup>51</sup>Cr]chromium(III) ion.

Ph Eur

## Sodium Fluoride (<sup>18</sup>F) Injection

(Ph. Eur. monograph 2100)

Ph Eur

#### DEFINITION

Sterile solution containing fluorine-18 in the form of sodium fluoride. It may contain carrier fluoride and a suitable buffer.

#### Content

- **fluorine-18**: 90 per cent to 110 per cent of the declared fluorine-18 radioactivity at the date and hour stated on the label,
- **fluoride**: maximum 4.52 mg per maximum recommended dose in millilitres.

#### PRODUCTION

The radionuclide fluorine-18 is most commonly produced by proton irradiation of water enriched in oxygen-18. Fluorine-18 in the form of fluoride is recovered from the target water, generally by adsorption and desorption from anion-exchange resins or electrochemical deposition and redissolution.

#### CHARACTERS

##### Appearance

Clear, colourless solution.

##### Half-life and nature of radiation of fluorine-18

See general chapter 5.7. *Table of physical characteristics of radionuclides*.

#### IDENTIFICATION

A. Gamma-ray spectrometry.

**Results** The only gamma photons have an energy of 0.511 MeV and, depending on the measurement geometry, a sum peak of 1.022 MeV may be observed.

B. It complies with test B for radionuclidic purity (see Tests).

C. Examine the chromatograms obtained in the test for radiochemical purity (see Tests).

**Results** The principal peak in the radiochromatogram obtained with the test solution is similar in retention time to the principal peak in the chromatogram obtained with the reference solution. In the chromatogram obtained with the reference solution, the peak due to fluoride is negative.

#### TESTS

##### pH (2.2.3)

5.0 to 8.5.

##### Fluoride

Liquid chromatography (2.2.29).

**Test solution** The preparation to be examined.

**Reference solution** Dissolve 10 mg of sodium fluoride R in water R and dilute to V with the same solvent, V being the maximum recommended dose in millilitres.

#### Column:

- **size**:  $l = 0.25$  m,  $\varnothing = 4$  mm,
- **stationary phase**: strongly basic anion-exchange resin for chromatography R (10  $\mu$ m),
- **temperature**: constant, between 20 °C and 30 °C.

**Mobile phase** 4 g/L solution of sodium hydroxide R, protected from atmospheric carbon dioxide.

**Flow rate** 1 mL/min.

**Detection** Spectrophotometer at 220 nm and a radioactivity detector connected in series.

**Injection** 20  $\mu$ L.

**Run time** 15 min.

**System suitability** Examine the chromatogram obtained with the reference solution using the spectrophotometer:

- **signal-to-noise ratio**: minimum 10 for the principal peak,
- **retention time of fluoride**: minimum 3 times the hold-up time.

**Limit** Examine the chromatogram obtained with the spectrophotometer:

- **fluoride**: not more than the area of the corresponding peak in the chromatogram obtained with the reference solution (4.52 mg/V).

#### Sterility

It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations (0125)*. The injection may be released for use before completion of the test.

#### Bacterial endotoxins (2.6.14)

Less than 175/V IU/mL, V being the maximum recommended dose in millilitres. The injection may be released for use before completion of the test.

**RADIONUCLIDIC PURITY****Fluorine-18**

Minimum 99.9 per cent of the total radioactivity.

The preparation may be released for use before completion of the tests.

**A. Gamma-ray spectrometry.**

Determine the amount of fluorine-18 and radionuclidic impurities with a half-life longer than 2 h. For the detection and quantification of impurities, retain the preparation to be examined for a sufficient time to allow the fluorine-18 to decay to a level which permits the detection of impurities.

**Results** The spectrum obtained with the preparation to be examined does not differ significantly from that of a background spectrum.

**B. Half-life: 105 min to 115 min.****RADIOCHEMICAL PURITY****[<sup>18</sup>F]fluoride**

Liquid chromatography (2.2.29) as described in the test for fluoride. If necessary, dilute the test solution with *water R* to obtain a radioactivity concentration suitable for the radioactivity detector.

**Limit** Examine the chromatogram obtained with the radioactivity detector:

— [<sup>18</sup>F]fluoride: minimum 98.5 per cent of the total radioactivity.

**RADIOACTIVITY**

Determine the radioactivity using a calibrated instrument.

**LABELLING**

The label states the maximum recommended dose in millilitres.

Ph Eur

**Sodium Iodide (<sup>123</sup>I) Injection**

(Ph. Eur. monograph 0563)

Ph Eur

**DEFINITION**

Sterile solution containing iodine-123 in the form of sodium iodide; it may contain sodium thiosulfate or some other suitable reducing agent and a suitable buffer.

**Content**

90 per cent to 110 per cent of the declared iodine-123 radioactivity at the date and hour stated on the label.

**PRODUCTION**

Iodine-123 is obtained by proton irradiation of xenon enriched in xenon-124 (minimum 98 per cent) followed by the decay of xenon-123 which is formed directly and by the decay of caesium-123. No carrier iodide is added.

**CHARACTERS****Appearance**

Clear, colourless solution.

**Half-life and nature of radiation of iodine-123**

See general chapter 5.7. *Table of physical characteristics of radionuclides.*

**IDENTIFICATION****A. Gamma-ray spectrometry.**

**Results** The spectrum obtained with the preparation to be examined does not differ significantly from that of a

standardised iodine-123 solution. The most prominent gamma photon has an energy of 0.159 MeV and is accompanied by the principal X-ray of 0.027 MeV.

**B. Examine the chromatograms obtained in the test for radiochemical purity.**

**Results** The principal peak in the radiochromatogram obtained with the test solution is similar in retention time to the principal peak in the chromatogram obtained with reference solution (a).

**TESTS****pH (2.2.3)**

7.0 to 10.0.

**Sterility**

It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations (0125)*.

The preparation may be released for use before completion of the test.

**RADIONUCLIDIC PURITY****Iodine-123**

Minimum 99.65 per cent of the total radioactivity.

**Gamma-ray spectrometry.**

Determine the relative amounts of iodine-123, iodine-125, tellurium-121 and other radionuclidic impurities present. For the detection of tellurium-121 and iodine-125, retain the preparation to be examined for a sufficient time to allow iodine-123 to decay to a level which permits the detection of radionuclidic impurities. No radionuclides with a half-life longer than that of iodine-125 are detected.

The preparation may be released for use before completion of the test.

**RADIOCHEMICAL PURITY****[<sup>123</sup>I]iodide**

Liquid chromatography (2.2.29).

**Test solution** Dilute the preparation to be examined with a 2 g/L solution of *sodium hydroxide R* to a radioactive concentration suitable for the detector. Add an equal volume of a solution containing 1 g/L of *potassium iodide R*, 2 g/L of *potassium iodate R* and 10 g/L of *sodium hydrogen carbonate R* and mix.

**Reference solution (a)** Dilute 1 mL of a 26.2 mg/L solution of *potassium iodide R* to 10 mL with *water R*.

**Reference solution (b)** Dilute 1 mL of a 24.5 mg/L solution of *potassium iodate R* to 10 mL with *water R*. Mix equal volumes of this solution and reference solution (a).

**Column:**

— *size*:  $l = 0.25$  m,  $\varnothing = 4.0$  mm,

— *stationary phase*: octadecylsilyl silica gel for chromatography R (5  $\mu$ m),

— *temperature*: constant between 20 °C and 30 °C.

**Mobile phase** Dissolve 5.85 g of *sodium chloride R* in 1000 mL of *water R*, add 0.65 mL of *octylamine R* and adjust to pH 7.0 with *dilute phosphoric acid R*; add 50 mL of *acetonitrile R* and mix.

**Flow rate** 1.5 mL/min.

**Detection** Spectrophotometer at 220 nm and a radioactivity detector connected in series.

**Injection** 20  $\mu$ L.

**Run time** 12 min.

**Relative retention** With reference to iodide (retention time = about 5 min): iodate = 0.2 to 0.3.

**System suitability** Reference solution (b):

— **resolution:** minimum 2 between the peaks due to iodide and iodate in the chromatogram recorded with the spectrophotometer.

**Limit** Examine the chromatogram obtained with the test solution using the radioactivity detector and locate the peak due to iodide by comparison with the chromatogram obtained with reference solution (a) using the spectrophotometer:

— [<sup>123</sup>I]iodide: minimum 95 per cent of the total radioactivity.

#### RADIOACTIVITY

Determine the radioactivity using a calibrated instrument.

#### LABELLING

The label states the name of any excipient.

#### IMPURITIES

A. [<sup>123</sup>I]iodate ion.

Ph Eur

## Sodium Iodide (<sup>123</sup>I) Solution for Radiolabelling

(Ph. Eur. monograph 2314)

Ph Eur

#### DEFINITION

Strongly alkaline solution containing iodine-123 in the form of sodium iodide.

#### Content

90 per cent to 110 per cent of the declared iodine-123 radioactivity at the date and hour stated on the label.

#### PRODUCTION

Iodine-123 is obtained by proton irradiation of xenon highly enriched in xenon-124 followed by the decay of directly formed xenon-123 and by the decay of caesium-123. No carrier iodide or reducing agents are added.

Clear, colourless solution.

##### Half-life and nature of radiation of iodine-123

See general chapter 5.7. *Table of physical characteristics of radionuclides.*

#### IDENTIFICATION

A. Gamma-ray spectrometry.

**Results** The most prominent gamma photon of iodine-123 has an energy of 0.159 MeV and is accompanied by the principal X-ray of 0.027 MeV.

B. Examine the chromatograms obtained in the test for radiochemical purity (see Tests).

**Results** The principal peak in the radiochromatogram obtained with the test solution is similar in retention time to the principal peak in the chromatogram obtained with reference solution (a).

#### TESTS

##### Alkalinity (2.2.4)

The solution is strongly alkaline.

#### RADIONUCLIDIC PURITY

##### Iodine-123

Minimum 99.7 per cent of the total radioactivity.

Gamma-ray spectrometry.

Determine the relative amounts of iodine-123, iodine-125, tellurium-121 and other radionuclidic impurities present. For the detection of tellurium-121 and iodine-125, retain the solution to be examined for a sufficient time to allow iodine-123 to decay to a level which permits the detection of radionuclidic impurities. No radionuclides with a half-life longer than that of iodine-125 are detected.

The solution may be released for use before completion of the test.

#### RADIOCHEMICAL PURITY

##### [<sup>123</sup>I]iodide

Liquid chromatography (2.2.29).

**Test solution** Dilute the solution to be examined with an equal volume of a solution containing 1 g/L of potassium iodide R, 2 g/L of potassium iodate R and 10 g/L of sodium hydrogen carbonate R and mix. If necessary, first dilute the solution to be examined with a 2 g/L solution of sodium hydroxide R to ensure that the final mixture has a radioactivity concentration suitable for the radioactivity detector.

**Reference solution (a)** Dissolve 10 mg of potassium iodide R in water R and dilute to 10 mL with the same solvent.

**Reference solution (b)** Dissolve 20 mg of potassium iodate R in water R and dilute to 10 mL with the same solvent.

Mix equal volumes of this solution and reference solution (a).

##### Column:

— **size:**  $l = 0.25$  m,  $\varnothing = 4.0$  mm;

— **stationary phase:** octadecylsilyl silica gel for chromatography R (5  $\mu$ m);

— **temperature:** constant, between 20 °C and 30 °C.

Use stainless steel tubing.

**Mobile phase** Dissolve 5.85 g of sodium chloride R in 1000 mL of water R, add 0.65 mL of octylamine R and adjust to pH 7.0 with dilute phosphoric acid R; add 50 mL of acetonitrile R and mix.

**Flow rate** 1.5 mL/min.

**Detection** Spectrophotometer at 220 nm and a radioactivity detector connected in series.

**Injection** 20  $\mu$ L.

**Run time** 12 min.

**Relative retention** With reference to iodide (retention time = about 5 min): iodate = 0.2 to 0.3.

**System suitability** Reference solution (b):

— **resolution:** minimum 2 between the peaks due to iodide and iodate in the chromatogram recorded with the spectrophotometer.

Examine the chromatogram obtained with the test solution using the radioactivity detector and locate the peak due to iodide by comparison with the chromatogram obtained with reference solution (a) using the spectrophotometer.

**Limit:**

— [<sup>123</sup>I]iodide: minimum 95 per cent of the total radioactivity.

#### RADIOACTIVITY

Determine the radioactivity using a calibrated instrument.

#### LABELLING

The label states:

— the name of any excipient;

— that the solution is not for direct administration to humans.

**IMPURITIES**

- A. iodine-125,  
B. tellurium-121,  
C. [<sup>123</sup>I]iodate ion.

Ph Eur

## Sodium Iodide (<sup>131</sup>I) Capsules for Diagnostic Use

(Ph. Eur. monograph 0938)

Ph Eur

**DEFINITION**

Capsules for diagnostic use containing iodine-131 in the form of sodium iodide on a solid support; they may contain sodium thiosulfate or some other suitable reducing agents and a suitable buffering substance. A package contains 1 or more capsules.

**Content**

- iodine-131: maximum 37 MBq per capsule; the average radioactivity determined in the test for uniformity of content is 90 per cent to 110 per cent of the declared iodine-131 radioactivity at the date and hour stated on the label;
- iodide: maximum 20 µg per capsule.

**PRODUCTION**

Iodine-131 is obtained by neutron irradiation of tellurium or by extraction from uranium fission products. No carrier iodide is added.

**CHARACTERS**

*Half-life and nature of radiation of iodine-131* See general chapter 5.7. *Table of physical characteristics of radionuclides.*

**IDENTIFICATION**

A. Gamma-ray spectrometry.

*Results* The spectrum obtained with the preparation to be examined does not differ significantly from that of a standardised iodine-131 solution. The most prominent gamma photon has an energy of 0.365 MeV.

B. Examine the chromatograms obtained in the test for radiochemical purity.

*Results* The principal peak in the radiochromatogram obtained with test solution (b) is similar in retention time to the principal peak in the chromatogram obtained with reference solution (a).

**TESTS****Disintegration**

The contents of the capsule dissolve completely within 15 min.

In a water-bath at 37 °C, warm in a small beaker about 20 mL of a 2.0 g/L solution of *potassium iodide R*. Add a capsule to be examined. Stir magnetically at 20 r/min.

**Uniformity of content**

Determine the radioactivity of each of not fewer than 10 capsules. Calculate the average radioactivity per capsule. The radioactivity of no capsule differs by more than 10 per cent from the average, the relative standard deviation is not greater than 3.5 per cent.

**Iodide**

Liquid chromatography (2.2.29).

*Test solution (a)* Dissolve a capsule to be examined in 10 mL of *water R*. Filter through a 0.2 µm filter.

*Test solution (b)* Dissolve a capsule to be examined in *water R*. Filter through a 0.2 µm filter and dilute the filtrate with a 2 g/L solution of *sodium hydroxide R* to a radioactive concentration suitable for the detector. Add an equal volume of a solution containing 1 g/L of *potassium iodide R*, 2 g/L of *potassium iodate R* and 10 g/L of *sodium hydrogen carbonate R* and mix.

*Reference solution (a)* Dilute 1 mL of a 26.2 mg/L solution of *potassium iodide R* to 10 mL with *water R*.

*Reference solution (b)* Dilute 1 mL of a 24.5 mg/L solution of *potassium iodate R* to 10 mL with *water R*. Mix equal volumes of this solution and reference solution (a).

*Blank solution* Prepare a solution containing 2 mg/mL of each constituent stated on the label, apart from iodide.

**Column:**

- *size*:  $l = 0.25$  m,  $\varnothing = 4.0$  mm,
- *stationary phase*: octadecylsilyl silica gel for chromatography R (5 µm),
- *temperature*: constant between 20 °C and 30 °C.

*Mobile phase* Dissolve 5.85 g of *sodium chloride R* in 1000 mL of *water R*, add 0.65 mL of *octylamine R* and adjust to pH 7.0 with *dilute phosphoric acid R*; add 50 mL of *acetonitrile R* and mix.

*Flow rate* 1.5 mL/min.

*Detection* Spectrophotometer at 220 nm and radioactivity detector connected in series.

*Injection* 20 µL of test solution (a), reference solutions (a) and (b) and the blank solution.

*Run time* 12 min.

*Relative retention* With reference to iodide (retention time = about 5 min): iodate = 0.2 to 0.3.

**System suitability:**

- in the chromatogram obtained with the blank solution, none of the peaks has a retention time similar to that of the peak due to iodide,
- *resolution*: minimum 2 between the peaks due to iodide and iodate in the chromatogram obtained with reference solution (b) recorded with the spectrophotometer.

*Limit* Examine the chromatograms obtained with the spectrophotometer:

- *iodide*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (20 µg/capsule).

**RADIONUCLIDIC PURITY****Iodine-131**

Minimum 99.9 per cent of the total radioactivity.

Gamma-ray spectrometry.

Determine the relative amounts of iodine-131, iodine-133, iodine-135 and other radionuclidic impurities present.

**RADIOCHEMICAL PURITY****[<sup>131</sup>I]iodide**

Liquid chromatography (2.2.29) as described in the test for iodide with the following modifications.

*Injection* 20 µL of test solution (b) and reference solution (a).

*Limit* Examine the chromatogram obtained with the test solution using the radioactivity detector and locate the peak due to iodide by comparison with the chromatogram

obtained with reference solution (a) using the spectrophotometer:

— [<sup>131</sup>I]iodide: minimum 95 per cent of the total radioactivity.

#### RADIOACTIVITY

Determine the radioactivity of the package using a calibrated instrument.

#### LABELLING

The label states the name of any excipient and the number of capsules in the package.

#### IMPURITIES

A. [<sup>131</sup>I]iodate ion.

Ph Eur

## Sodium Iodide (<sup>131</sup>I) Capsules for Therapeutic Use

(Ph. Eur. monograph 2116)

Ph Eur

#### DEFINITION

Capsules for therapeutic use containing iodine-131 in the form of sodium iodide on a solid support; they contain sodium thiosulfate or some other suitable reducing agents and a suitable buffering substance.

#### Content

— iodine-131: 90 per cent to 110 per cent of the declared radioactivity at the date and hour stated on the label,  
— iodide: maximum 20 µg per capsule.

#### PRODUCTION

Iodine-131 is obtained by neutron irradiation of tellurium or by extraction from uranium fission products. No carrier iodide is added.

#### CHARACTERS

##### Half-life and nature of radiation of iodine-131

See general chapter 5.7. Table of physical characteristics of radionuclides.

#### IDENTIFICATION

A. Gamma-ray spectrometry.

*Results* The spectrum obtained with the preparation to be examined does not differ significantly from that of a standardised iodine-131 solution. The most prominent gamma photon of iodine-131 has an energy of 0.365 MeV.

B. Examine the chromatograms obtained in the test for radiochemical purity.

*Results* The principal peak in the radiochromatogram obtained with test solution (b) is similar in retention time to the principal peak in the chromatogram obtained with reference solution (a).

#### TESTS

##### Disintegration

The contents of the capsule dissolve completely within 15 min.

In a water-bath at 37 °C, warm in a small beaker about 20 mL of a 2.0 g/L solution of potassium iodide R. Add a capsule to be examined. Stir magnetically at a rotation rate of 20 r/min.

##### Iodide

Liquid chromatography (2.2.29).

*Test solution (a)* Dissolve a capsule to be examined in 10 mL of water R. Filter through a 0.2 µm filter.

*Test solution (b)* Dissolve a capsule to be examined in water R. Filter through a 0.2 µm filter and dilute the filtrate with an equal volume of a solution containing 1 g/L of potassium iodide R, 2 g/L of potassium iodate R and 10 g/L of sodium hydrogen carbonate R. If necessary, first dilute the filtrate with a 2 g/L solution of sodium hydroxide R to ensure that the final mixture has a radioactivity concentration suitable for the radioactivity detector.

*Reference solution (a)* Dilute 1.0 mL of a 26.2 mg/L solution of potassium iodide R to 10.0 mL with water R.

*Reference solution (b)* Dilute 1 mL of a 24.5 mg/L solution of potassium iodate R to 10 mL with water R. Mix equal volumes of this solution with reference solution (a).

*Blank solution* Prepare a solution containing 2 mg/mL of each excipient stated on the label, apart from iodide.

#### Column:

— size:  $l = 0.25$  m,  $\varnothing = 4.0$  mm,

— stationary phase: octadecylsilyl silica gel for chromatography R (5 µm),

— temperature: constant, between 20 °C and 30 °C.

Use stainless steel tubing.

*Mobile phase* Dissolve 5.85 g of sodium chloride R in 1000 mL of water R, add 0.65 mL of octylamine R and adjust to pH 7.0 with dilute phosphoric acid R; add 50 mL of acetonitrile R and mix.

*Flow rate* 1.5 mL/min.

*Detection* Spectrophotometer at 220 nm and radioactivity detector connected in series.

*Injection* 20 µL of test solution (a), reference solutions (a) and (b) and the blank solution.

*Run time* 12 min.

*Relative retention* With reference to iodide (retention time = about 5 min): iodate = 0.2 to 0.3.

#### System suitability:

— in the chromatogram obtained with the blank solution, none of the peaks has a retention time similar to that of the peak due to iodide;

— resolution: minimum 2 between the peaks due to iodide and iodate in the chromatogram obtained with reference solution (b) using the spectrophotometer.

*Limits* Examine the chromatograms obtained with the spectrophotometer; locate the peak due to iodide by comparison with the chromatogram obtained with reference solution (a):

— iodide: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (20 µg/capsule).

#### RADIONUCLIDIC PURITY

##### Iodine-131

Minimum 99.9 per cent of the total radioactivity.

Gamma-ray spectrometry.

Determine the relative amounts of iodine-130, iodine-131, iodine-133, iodine-135 and other radionuclidic impurities present.

#### RADIOCHEMICAL PURITY

##### [<sup>131</sup>I]Iodide

Liquid chromatography (2.2.29) as described in the test for iodide with the following modifications.

*Injection* 20 µL of test solution (b) and reference solution (a).

**Limits** Examine the chromatogram obtained with test solution (b) using the radioactivity detector and locate the peak due to iodide by comparison with the chromatogram obtained with reference solution (a) using the spectrophotometer:

—  $^{131}\text{I}$ iodide: minimum 95 per cent of the total radioactivity.

#### RADIOACTIVITY

Determine the radioactivity of each capsule using a calibrated instrument.

#### LABELLING

The label states the name of any excipient.

#### IMPURITIES

- A.  $^{131}\text{I}$ iodate ion,
- B. iodine-130,
- C. iodine-133,
- D. iodine-135.

Ph Eur

## Sodium Iodide ( $^{131}\text{I}$ ) Solution

(Ph. Eur. monograph 0281)

Ph Eur

#### DEFINITION

Solution containing iodine-131 in the form of sodium iodide and also sodium thiosulfate or some other suitable reducing agent. It may contain a suitable buffer.

#### Content

- *iodine-131*: 90 per cent to 110 per cent of the declared radioactivity at the date and hour stated on the label;
- *iodide*: maximum 20 µg in the maximum recommended dose in millilitres.

#### PRODUCTION

Iodine-131 is obtained by neutron irradiation of tellurium or by extraction from uranium fission products.

#### CHARACTERS

##### Appearance

Clear, colourless solution.

##### Half-life and nature of radiation of iodine-131

See general chapter 5.7. *Table of physical characteristics of radionuclides*.

#### IDENTIFICATION

A. Gamma-ray spectrometry.

**Results** The spectrum obtained with the preparation to be examined does not differ significantly from that of a standardised iodine-131 solution. The most prominent gamma photon has an energy of 0.365 MeV.

B. Examine the chromatograms obtained in the test for radiochemical purity.

**Results** The principal peak in the radiochromatogram obtained with test solution (b) is similar in retention time to the principal peak in the chromatogram obtained with reference solution (a).

#### TESTS

##### pH (2.2.3)

7.0 to 10.0.

#### Sterility

If intended for parenteral administration, it complies with the test for sterility prescribed in the monograph *Radiopharmaceutical preparations (0125)*. The solution may be released for use before completion of the test.

#### Iodide

Liquid chromatography (2.2.29).

**Test solution (a)** The preparation to be examined.

**Test solution (b)** Dilute the preparation to be examined with a measured volume of a 2 g/L solution of *sodium hydroxide R* until the radioactivity is equivalent to about 74 MBq/mL. Add an equal volume of a solution containing 1 g/L of *potassium iodide R*, 2 g/L of *potassium iodate R* and 10 g/L of *sodium hydrogen carbonate R* and mix.

**Reference solution (a)** Dilute 1 mL of a 26.2 mg/L solution of *potassium iodide R* to *V* with *water R*, *V* being the maximum recommended dose in millilitres.

**Reference solution (b)** Dilute 1 mL of a 24.5 mg/L solution of *potassium iodate R* to *V* with *water R*, *V* being the maximum recommended dose in millilitres. Mix equal volumes of this solution and reference solution (a).

**Blank solution** Prepare a solution containing 2 mg/mL of each of the components stated on the label, apart from iodide.

##### Column:

- *size*:  $l = 0.25$  m,  $\varnothing = 4.0$  mm;
- *stationary phase*: end-capped octadecylsilyl silica gel for chromatography R (5 µm);
- *temperature*: constant, between 20 °C and 30 °C.

Use stainless steel tubing.

**Mobile phase** Dissolve 5.85 g of *sodium chloride R* in 1000 mL of *water for chromatography R*, add 650 µL of *octylamine R* and adjust to pH 7.0 with *phosphoric acid R*; add 50 mL of *acetonitrile for chromatography R* and mix.

**Flow rate** 1.5 mL/min.

**Detection** Spectrophotometer at 220 nm and radioactivity detector connected in series.

**Injection** 20 µL of test solution (a), reference solutions (a) and (b) and the blank solution.

**Run time** 2.4 times the retention time of iodide.

**Relative retention** With reference to iodide (retention time = about 5 min): iodate = 0.2 to 0.3.

##### System suitability:

- in the chromatogram obtained with the blank solution, none of the peaks shows a retention time similar to that of the peak due to iodide;
- *resolution*: minimum 2.0 between the peaks due to iodate and iodide in the chromatogram obtained with reference solution (b) recorded with the spectrophotometer.

**Limit** Examine the chromatograms obtained with the spectrophotometer:

- *iodide*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a).

#### RADIONUCLIDIC PURITY

##### Iodine-131

Minimum 99.9 per cent of the total radioactivity.

Gamma-ray spectrometry.

Determine the relative amounts of iodine-131, iodine-133, iodine-135 and other radionuclidic impurities present.

**RADIOCHEMICAL PURITY****[<sup>131</sup>I]Iodide**

Liquid chromatography (2.2.29) as described in the test for iodide with the following modification.

**Injection** 20 µL of test solution (b) and reference solution (a).

**Limit** Examine the chromatogram obtained with test solution (b) using the radioactivity detector and locate the peak due to iodide by comparison with the chromatogram obtained with reference solution (a) using the spectrophotometer:

— [<sup>131</sup>I]iodide: minimum 95 per cent of the total radioactivity.

**RADIOACTIVITY**

Determine the radioactivity using a calibrated instrument.

**LABELLING**

The label states:

- the name of any excipient;
- the maximum recommended dose, in millilitres;
- where applicable, that the preparation is suitable for use in the manufacture of parenteral preparations.

**IMPURITIES**

- A. [<sup>131</sup>I]iodate ion,
- B. iodine-130,
- C. iodine-133,
- D. iodine-135.

Ph Eur

## Sodium Iodide (<sup>131</sup>I) Solution For Radiolabelling

(Ph. Eur. monograph 2121)

Ph Eur

**DEFINITION**

Strongly alkaline solution containing iodine-131 in the form of sodium iodide. It does not contain a reducing agent.

**Content**

90 per cent to 110 per cent of the declared iodine-131 radioactivity at the date and hour stated on the label.

**PRODUCTION**

Iodine-131 may be obtained by neutron irradiation of tellurium or by extraction from uranium fission products. No carrier iodide is added.

**CHARACTERS****Appearance**

Clear, colourless solution.

**Half-life and nature of radiation of iodine-131**

See general chapter 5.7. *Table of physical characteristics of radionuclides.*

**IDENTIFICATION****A. Gamma-ray spectrometry.**

**Results** The spectrum obtained with the preparation to be examined does not differ significantly from that of a standardised iodine-131 solution. The most prominent gamma photon of iodine-131 has an energy of 0.365 MeV.

**B.** Examine the chromatograms obtained in the test for radiochemical purity (see Tests).

**Results** The principal peak in the radiochromatogram obtained with the test solution is similar in retention time to the principal peak in the chromatogram obtained with reference solution (a).

**TESTS****Alkalinity (2.2.4)**

The preparation is strongly alkaline.

**RADIONUCLIDIC PURITY****Iodine-131**

Minimum 99.9 per cent of the total radioactivity.

Gamma-ray spectrometry.

Determine the relative amounts of iodine-130, iodine-131, iodine-133, iodine-135 and other radionuclidic impurities present.

**RADIOCHEMICAL PURITY****[<sup>131</sup>I]Iodide**

Liquid chromatography (2.2.29).

**Test solution** Dilute the preparation to be examined with an equal volume of a solution containing 1 g/L of *potassium iodide R*, 2 g/L of *potassium iodate R* and 10 g/L of *sodium hydrogen carbonate R* and mix. Mix equal volumes of this solution and reference solution (a).

**Column:**

- size:  $l = 0.25$  m,  $\varnothing = 4.0$  mm,
- stationary phase: octadecylsilyl silica gel for chromatography R (5 µm),
- temperature: constant, between 20 °C and 30 °C.

Use stainless steel tubing.

**Mobile phase** Dissolve 5.85 g of *sodium chloride R* in 1000 mL of *water R*, add 0.65 mL of *octylamine R* and adjust to pH 7.0 with *dilute phosphoric acid R*; add 50 mL of *acetonitrile R* and mix.

**Flow rate** 1.5 mL/min.

**Detection** Spectrophotometer at 220 nm and a radioactivity detector connected in series.

**Injection** 20 µL.

**Run time** 12 min.

**Relative retention** With reference to iodide (retention time = about 5 min): iodate = 0.2 to 0.3.

**System suitability** Reference solution (b):

- resolution: minimum 2 between the peaks due to iodide and iodate in the chromatogram recorded with the spectrophotometer.

**Limit** Examine the chromatogram obtained with the radioactivity detector:

- [<sup>131</sup>I]iodide: minimum 95 per cent of the total radioactivity.

**RADIOACTIVITY**

Determine the radioactivity using a calibrated instrument.

**LABELLING**

The label states:

- the method of production of iodine-131,

- the name of any excipient,
- that the preparation is not for direct human use.

**IMPURITIES**A. [<sup>131</sup>I]iodate ion.

Ph Eur

## Sodium Iodohippurate (<sup>123</sup>I) Injection

(Ph. Eur. monograph 0564)

Ph Eur

**DEFINITION**

Sterile solution of sodium (2-[<sup>123</sup>I]iodobenzamido)acetate. It may contain a suitable buffer and a suitable antimicrobial preservative such as benzyl alcohol.

**Iodine-123** 90 per cent to 110 per cent of the declared iodine-123 radioactivity at the date and time stated on the label.

**Specific radioactivity** 0.74 GBq to 10.0 GBq of iodine-123 per gram of sodium 2-iodohippurate.

**CHARACTERS****Appearance**

Clear, colourless solution.

**Half-life and nature of radiation of iodine-123**

See general chapter 5.7. Table of physical characteristics of radionuclides.

**IDENTIFICATION**

A. Gamma-ray and X-ray spectrometry.

**Results** The most prominent gamma photon has an energy of 0.159 MeV and is accompanied by an X-ray of 0.027 MeV.

B. Examine the chromatograms obtained in the test for radiochemical purity (see Tests).

**Result** The principal spot in the radiochromatogram obtained with the test solution is similar in retardation factor to the spot corresponding to 2-iodohippuric acid in the chromatogram obtained with the reference solution.

**TESTS****pH (2.2.3)**

3.5 to 8.5.

**Sterility**It complies with the test for sterility prescribed in the monograph *Radiopharmaceutical preparations (0125)*.

The preparation may be released for use before completion of the test.

**RADIONUCLIDIC PURITY**

The preparation may be released for use before completion of the test.

**Radionuclides other than iodine-123**

Maximum 0.35 per cent of the total radioactivity.

Gamma-ray and X-ray spectrometry.

Determine the relative amounts of iodine-125, tellurium-121 and other radionuclidic impurities present. For their detection, retain the preparation to be examined for a sufficient time to allow iodine-123 to decay to a level which permits the detection of radionuclidic impurities. Record the gamma-ray spectrum and X-ray spectrum of the decayed material. No radionuclides with a half-life longer than that of iodine-125 are detected.

**RADIOCHEMICAL PURITY****2-[<sup>123</sup>I]iodohippuric acid**

Thin-layer chromatography (2.2.27).

**Test solution** Dissolve 1 g of potassium iodide R in 10 mL of water R, add 1 volume of this solution to 10 volumes of the preparation to be examined and use within 10 min of mixing. If necessary, dilute with the reference solution (carrier) to give a radioactive concentration sufficient for the detection method, for example 3.7 MBq per millilitre.

**Reference solution (carrier).** Dissolve 40 mg of 2-iodobenzoic acid R and 40 mg of 2-iodohippuric acid R in 4 mL of a 4 g/L solution of sodium hydroxide R, add 10 mg of potassium iodide R and dilute to 10 mL with water R.

**Plate** TLC silica gel GF<sub>254</sub> plate R.

**Mobile phase** water R, glacial acetic acid R, butanol R, toluene R (1:4:20:80 V/V/V/V).

**Application** 10 µL.

**Development** Over a path of 12 cm in about 75 min.

**Drying** In air.

**Detection** Examine in ultraviolet light at 254 nm and determine the distribution of radioactivity using a suitable detector.

**Identification of spots** The chromatogram obtained with the reference solution shows a spot corresponding to 2-iodohippuric acid and nearer to the solvent front a spot corresponding to impurity D; impurity C remains near the point of application.

**Limits:**

- 2-[<sup>123</sup>I]iodohippuric acid: minimum 96 per cent of the total radioactivity due to iodine-123;
- impurity C: maximum 2 per cent of the total radioactivity due to iodine-123;
- impurity D: maximum 2 per cent of the total radioactivity due to iodine-123.

**RADIOACTIVITY**

Determine the radioactivity using a calibrated instrument.

**STORAGE**

Protected from light.

**LABELLING**

The label states whether or not the preparation is suitable for renal plasma-flow studies.

**IMPURITIES**

- A. iodine-125,
- B. tellurium-121,
- C. [<sup>123</sup>I]iodide,
- D. 2-[<sup>123</sup>I]iodobenzoic acid.

Ph Eur

## Sodium Iodohippurate (<sup>131</sup>I) Injection

(Ph. Eur. monograph 0282)

Ph Eur

**DEFINITION**

Sterile solution of sodium 2-(2-[<sup>131</sup>I]iodobenzamido)acetate. It may contain a suitable buffer and a suitable antimicrobial preservative such as benzyl alcohol.

**Iodine-131** 90 per cent to 110 per cent of the declared iodine-131 radioactivity at the date and time stated on the label.

**Specific radioactivity** 0.74 GBq to 7.4 GBq of iodine-131 per gram of sodium 2-iodohippurate.

#### CHARACTERS

##### Appearance

Clear, colourless solution.

##### Half-life and nature of radiation of iodine-131

See general chapter 5.7. *Table of physical characteristics of radionuclides.*

#### IDENTIFICATION

A. Gamma-ray spectrometry.

**Result** The most prominent gamma photon of iodine-131 has an energy of 0.365 MeV.

B. Examine the chromatograms obtained in the test for radiochemical purity (see Tests).

**Result** The principal peak in the radiochromatogram obtained with the test solution has a similar retardation factor as the spot corresponding to 2-iodohippuric acid in the chromatogram obtained with the reference solution.

#### TESTS

##### pH (2.2.3)

6.0 to 8.5.

##### Sterility

It complies with the test for sterility prescribed in the monograph *Radiopharmaceutical preparations (0125)*. The preparation may be released for use before completion of the test.

#### RADIONUCLIDIC PURITY

##### Iodine-131

Minimum 99.9 per cent of the total radioactivity.

Gamma-ray spectrometry.

Determine the relative amounts of iodine-131, iodine-133, iodine-135 and other radionuclidic impurities present.

#### RADIOCHEMICAL PURITY

##### 2-[<sup>131</sup>I]iodohippuric acid

Thin-layer chromatography (2.2.27).

**Test solution** Dissolve 1 g of *potassium iodide R* in 10 mL of *water R*, add 1 volume of this solution to 10 volumes of the preparation to be examined and use within 10 min of mixing. If necessary dilute with the reference solution (carrier) to give a radioactive concentration sufficient for the detection method, for example 3.7 MBq/mL.

**Reference solution** (carrier). Dissolve 40 mg of *2-iodobenzoic acid R* and 40 mg of *2-iodohippuric acid R* in 4 mL of a 4 g/L solution of *sodium hydroxide R*, add 10 mg of *potassium iodide R* and dilute to 10 mL with *water R*.

**Plate** TLC silica gel GF<sub>254</sub> plate R.

**Mobile phase** *water R*, *glacial acetic acid R*, *butanol R*, *toluene R* (1:4:20:80 V/V/V/V).

**Application** 10 µL.

**Development** Over a path of 12 cm in about 75 min.

**Drying** In air.

**Detection** In ultraviolet light at 254 nm and with a suitable detector to determine the distribution of radioactivity.

**Identification of spots** The chromatogram obtained with the reference solution shows a spot corresponding to 2-iodohippuric acid and nearer to the solvent front a spot corresponding to impurity C; impurity D remains near the point of application.

##### Limits:

- 2-[<sup>131</sup>I]iodohippuric acid: minimum 96 per cent of the total radioactivity due to iodine-131;
- impurity C: maximum 2 per cent of the total radioactivity due to iodine-131;
- impurity D: maximum 2 per cent of the total radioactivity due to iodine-131.

#### RADIOACTIVITY

Determine the radioactivity using a calibrated instrument.

#### STORAGE

Protected from light.

#### LABELLING

The label states that the preparation is not necessarily suitable for renal plasma-flow studies.

#### IMPURITIES

- A. iodine-133,
- B. iodine-135,
- C. 2-[<sup>131</sup>I]iodobenzoic acid,
- D. [<sup>131</sup>I]iodide.

Ph Eur

## Sodium Molybdate (<sup>99</sup>Mo) Solution (Fission)

(Ph. Eur. monograph 1923)

Ph Eur

#### DEFINITION

Alkaline solution of sodium [<sup>99</sup>Mo]molybdate obtained by extraction of fission products of uranium-235. It may contain stabilisers.

#### Content

90 per cent to 110 per cent of the declared molybdenum-99 radioactivity at the date and time stated on the label.

#### PRODUCTION

Molybdenum-99 is usually produced by fission of uranium enriched in uranium-235, which is caused by the absorption of a thermal neutron, resulting in high-specific-activity molybdenum-99. By the fission of uranium after neutron capture, more than 200 different radionuclides are produced. In approximately 6 per cent of the fissions, molybdenum-99 is formed after decay of a number of short-lived parent radionuclides. After dissolution of the target, the molybdenum-99 is separated from the mixture of nuclides and purified by using chromatographic processes in order to obtain molybdenum-99 with a high level of radionuclidic purity.

#### CHARACTERS

##### Appearance

Clear, colourless or almost colourless solution.

##### Half-life and nature of radiation of molybdenum-99

See general chapter 5.7. *Table of physical characteristics of radionuclides.*

#### IDENTIFICATION

A. Gamma-ray spectrometry.

**Results** The most prominent gamma photon of molybdenum-99 has an energy of 0.740 MeV; a peak with an energy of 0.141 MeV, due to technetium-99m is also visible.

B. Examine the chromatograms obtained in the test for radiochemical purity (see Tests).

**Results** The principal peak in the radiochromatogram obtained with the test solution has a similar retardation factor to the principal spot in the chromatogram obtained with the reference solution.

## TESTS

### Solution S

Dilute the preparation to be examined to a radioactivity concentration of approximately 370 MBq/mL with a 2.42 g/L solution of *sodium molybdate R*.

### Alkalinity

The preparation is alkaline (2.2.4).

## RADIONUCLIDIC PURITY

### Iodine-131, ruthenium-103 and tellurium-132

- *iodine-131*: maximum  $5 \times 10^{-3}$  per cent of the total radioactivity;
- *ruthenium-103*: maximum  $5 \times 10^{-3}$  per cent of the total radioactivity;
- *tellurium-132*: maximum  $5 \times 10^{-3}$  per cent of the total radioactivity.

The following method has been found to be suitable; other validated methods, approved by the competent authority, may be used.

Gamma-ray spectrometry.

Condition a column with an internal volume of approximately 1.5 mL of *strongly basic anion-exchange resin R* with a mixture of equal volumes of *glacial acetic acid R* and *water R*. All elutions of the column are made at a flow rate not exceeding 1 mL/min.

**Test solution** In a test-tube, successively add, with mixing, 1 mL of a 24.2 g/L solution of *sodium molybdate R*, 0.5 mL of *strong hydrogen peroxide solution R*, 2.5 mL of *glacial acetic acid R*, 1.0 mL of *iodine-123 and ruthenium-106 spiking solution R* and 1.0 mL of solution S. Allow to stand for 30 min at room temperature.

**Reference solution** Mix 1.0 mL of *iodine-123 and ruthenium-106 spiking solution R* and 4.0 mL of *water R*.

Apply the test solution to the column and elute. Just before the disappearance of the liquid from the top of the column, add 6 mL of a mixture of equal volumes of *glacial acetic acid R* and *water R* and elute. Transfer 5.0 mL of the combined eluates to a counting tube. Determine the radioactivity of iodine-123, iodine-131, ruthenium-103, ruthenium-106 and iodine-132 at the gamma-ray energies of 0.159 MeV for iodine-123, 0.365 MeV for iodine-131, 0.497 MeV for ruthenium-103, 0.512 MeV for ruthenium-106 and 0.668 MeV for iodine-132. Determine in the same way the radioactivity of iodine-123 and ruthenium-106 in the reference solution and calculate the recovery of iodine-123 and ruthenium-106 in the combined eluates.

Calculate the radioactivity of iodine-131, iodine-132 and ruthenium-103 in the combined eluates, taking into account the recovery, the fraction of eluate used, the counting efficiency and the radioactive decay. From the radioactivity of iodine-132 (daughter radionuclide of tellurium-132), calculate the radioactivity of tellurium-132, taking into account the time of the test and the time of separation of molybdenum-99.

### Total radioactivity due to strontium-89 and strontium-90

Maximum  $6 \times 10^{-5}$  per cent of the total radioactivity.

The following method has been found to be suitable; other validated methods, approved by the competent authority, may be used.

Liquid scintillation spectrometry.

Connect 2 columns, each with an internal volume of approximately 1.5 mL of *strongly basic anion-exchange resin R*, in series and condition the columns with 10 mL of a 4 g/L solution of *sodium hydroxide R*. All elutions of the columns are made at a flow rate not exceeding 1 mL/min.

**Test solution** In a test-tube, successively add, with mixing, 1.0 mL of solution S, 50  $\mu$ L of *strontium-85 spiking solution R* and 0.05 mL of *strong sodium hypochlorite solution R*. Allow to stand for 10 min at room temperature.

**Reference solution** Mix 50  $\mu$ L of *strontium-85 spiking solution R* with 5.0 mL of a 9.5 g/L solution of *nitric acid R* in a vial for liquid scintillation counting and add 10 mL of *liquid scintillation cocktail R*.

Apply the test solution to the upper of the 2 columns and elute. Just before the disappearance of the liquid from the top of the upper column, add 3 mL of a 4 g/L solution of *sodium hydroxide R* and elute until the columns are dry. Combine the eluates and add 4 mL of a 947 g/L solution of *nitric acid R* (molybdenum-poor eluate). Determine the radioactivity due to molybdenum-99 using gamma-ray spectrometry. If the radioactivity due to molybdenum-99 is higher than  $6 \times 10^{-7}$  per cent of the radioactivity due to molybdenum-99 in 1 mL of solution S, repeat the above procedure using 2 new columns.

Condition a column with an internal volume of approximately 2 mL of *strontium selective extraction resin R* with 5 mL of a 473 g/L solution of *nitric acid R* and dry the column. All elutions of the column are made at a flow rate not exceeding 1 mL/min. Apply to the column the molybdenum-poor eluate and elute. Just before the disappearance of the liquid from the top of the column, add 20 mL of a 473 g/L solution of *nitric acid R* and elute until the column is dry. Rinse the column with 2 mL of a 9.5 g/L solution of *nitric acid R*, dry the column and discard the eluate. Elute the column with 8.0 mL of a 9.5 g/L solution of *nitric acid R* until the column is dry. Transfer 5.0 mL of the eluate into a vial for liquid scintillation counting and add 10 mL of *liquid scintillation cocktail R*.

Determine the total radioactivity due to strontium-89 and strontium-90 in this solution by liquid scintillation spectrometry, and the radioactivity due to strontium-85 by gamma-ray spectrometry. Determine the radioactivity due to strontium-85 in the reference solution by gamma-ray spectrometry. Calculate the recovery of strontium-85 in the eluate. Calculate the measured total radioactivity of strontium-89 and strontium-90 in the eluate, taking into account the recovery of strontium and the fraction of eluate used.

### Total radioactivity due to alpha-particle-emitting impurities

Maximum  $1 \times 10^{-7}$  per cent of the total radioactivity.

The following method has been found to be suitable; other validated methods, approved by the competent authority, may be used.

Alpha-ray spectrometry.

**Test solution** To 0.2 mL of the preparation to be examined add 1.0 mL of *plutonium-242 spiking solution R*, 1.0 mL of *americium-243 spiking solution R* and 9.0 mL of a 927 g/L solution of *hydrochloric acid R*. Evaporate the sample to dryness. Dissolve the residue in 2 mL of a 927 g/L solution

of hydrochloric acid R. Evaporate again to dryness. Dissolve the residue in 2 mL of a 10.3 g/L solution of hydrochloric acid R.

Apply the test solution to a column containing 0.7 g of anion-exchange resin R1. Collect the eluate and wash the column with 1 mL of a 10.3 g/L solution of hydrochloric acid R. Evaporate the combined eluates to dryness and dissolve the residue in 2 mL of a 10.3 g/L solution of hydrochloric acid R. Apply this solution to a 2<sup>nd</sup> column containing 0.7 g of anion-exchange resin R1. Collect the eluate and wash the column with 1 mL of a 10.3 g/L solution of hydrochloric acid R. Evaporate the combined eluates to dryness and dissolve the residue in 1 mL of nitric acid R. Evaporate to dryness. Dissolve the residue again in 1 mL of nitric acid R.

Add 1 mL of a 42.6 g/L solution of anhydrous sodium sulfate R and evaporate to dryness. Add 0.3 mL of sulfuric acid R. Warm until the residue is dissolved. Add 4 mL of distilled water R and 0.01 mL of thymol blue solution R. Add concentrated ammonia R dropwise until the colour changes from red to yellow.

Prepare an electrodeposition cell as follows.

An electropolished stainless steel planchet is fitted in the cap of a 20 mL polyethylene scintillation vial. The bottom of the vial has been cut off and a hole has been drilled through the centre of the cap for electrical connection to the planchet cathode. The planchet, 20 mm in diameter and 0.5 mm thick, is rinsed with acetone R and water R prior to use. The anode, a platinum spiral, is introduced through the bottom of the vial and fitted 5 mm from the cathode.

Pour the solution prepared as described above into the electrodeposition cell and rinse the container with a total of 5 mL of a 10 g/L solution of sulfuric acid R (the solution becomes slightly pink). Adjust to pH 2.1-2.4, with concentrated ammonia R or with a 200 g/L solution of sulfuric acid R. Electrolyse at 1.2 A for 75 min without stirring.

Add 1 mL of concentrated ammonia R about 1 min prior to switching off the current. Rinse the planchet with a 57 g/L solution of ammonia R. Rinse the planchet with acetone R and remove any residual solvent by patting the planchet with absorbent paper. Heat the planchet on a hot plate at 180 °C for 10 min.

Determine the radioactivity of alpha emitters by alpha-ray spectrometry, taking into account the recovery of the alpha-particle-emitting radionuclides (measured using the plutonium-242 and americium-243 spiking solutions).

Total of gamma-ray-emitting radionuclides other than molybdenum-99, technetium-99m, iodine-131, ruthenium-103 and tellurium-132

Maximum  $1 \times 10^{-2}$  per cent of the total radioactivity.

The following method has been found to be suitable; other validated methods, approved by the competent authority, may be used.

Gamma-ray spectrometry.

Allow the preparation to decay for 4-6 weeks. Examine the gamma-ray spectrum for the presence of other gamma-ray-emitting impurities. Identify and quantify other gamma-ray-emitting impurities. The preparation may be released for use before completion of the test.

#### RADIOCHEMICAL PURITY

[<sup>99</sup>Mo]Molybdate

The following method has been found to be suitable; other validated methods, approved by the competent authority, may be used.

Thin-layer chromatography (2.2.27).

**Test solution** Dilute the preparation to be examined with a 4.0 g/L solution of sodium hydroxide R to a radioactivity concentration suitable for the detector.

**Reference solution** 50 g/L solution of sodium molybdate R in a 4.0 g/L solution of sodium hydroxide R.

**Plate** TLC silica gel plate R.

**Mobile phase** 10.6 g/L solution of anhydrous sodium carbonate R.

**Application** 5 µL of the test solution and 2 µL of the reference solution.

**Development** Over 2/3 of the plate.

**Drying** In a current of warm air.

**Detection** Determine the distribution of radioactivity using a suitable detector and spray with a 2 g/L solution of phenylhydrazine R in glacial acetic acid R; heat at 100-105 °C for 5 min.

**Retardation factor** Molybdate and pertechnetate = about 0.9.

**Limit:**

— sum of [<sup>99</sup>Mo]molybdate and [<sup>99m</sup>Tc]pertechnetate: minimum 95 per cent of the total radioactivity.

#### RADIOACTIVITY

Determine the radioactivity using a calibrated instrument.

#### LABELLING

The label states that the preparation is only suitable for the preparation of technetium-99m generators.

#### IMPURITIES

- iodine-131,
- ruthenium-103,
- tellurium-132,
- strontium-89,
- strontium-90.

Ph Eur

## Sodium Pertechnetate (<sup>99m</sup>Tc) Injection (Fission)

(Ph. Eur. monograph 0124)

Ph Eur

This monograph applies to sodium pertechnetate (<sup>99m</sup>Tc) injection obtained from molybdenum-99 extracted from fission products of uranium. Sodium pertechnetate (<sup>99m</sup>Tc) injection obtained from molybdenum-99 produced by neutron irradiation of molybdenum is described in the monograph Sodium pertechnetate (<sup>99m</sup>Tc) injection (non-fission) (0283).

#### DEFINITION

Sterile solution containing technetium-99m in the form of pertechnetate ion and made isotonic by the addition of sodium chloride. The injection may be prepared from a sterile preparation of molybdenum-99 under aseptic conditions.

**Technetium-99m** 90 per cent to 110 per cent of the declared technetium-99m radioactivity at the date and time stated on the label.

#### CHARACTERS

**Appearance**

Clear, colourless solution.

**Half-life and nature of radiation of technetium-99m**  
See general chapter 5.7. *Table of physical characteristics of radionuclides.*

#### IDENTIFICATION

Gamma-ray spectrometry.

*Result* The most prominent gamma photon of technetium-99m has an energy of 0.141 MeV.

#### TESTS

**pH (2.2.3)**

4.0 to 8.0.

#### Aluminium

Maximum 5 ppm.

*Test solution* In a test tube about 12 mm in internal diameter, mix 1 mL of acetate buffer solution pH 4.6 R and 2 mL of a 1 in 2.5 dilution of the preparation to be examined in water R. Add 0.05 mL of a 10 g/L solution of chromazurol S R.

*Reference solution* Prepare at the same time and in the same manner as the test solution and using 2 mL of aluminium standard solution (2 ppm Al) R.

After 3 min, the colour of the test solution is not more intense than that of the reference solution.

#### Sterility

It complies with the test for sterility prescribed in the monograph *Radiopharmaceutical preparations (0125)*.

The preparation may be released for use before completion of the test.

#### RADIONUCLIDIC PURITY

*Preliminary test* To obtain an approximate estimate before use of the preparation, take a volume equivalent to 37 MBq and determine the gamma-ray spectrum using a sodium iodide detector with a shield of lead, of thickness 6 mm, interposed between the sample and the detector.

The response in the region corresponding to the 0.740 MeV photon of molybdenum-99 does not exceed that obtained using 37 kBq of a standardised molybdenum-99 solution measured under the same conditions, when all measurements are expressed with reference to the date and time of administration.

*Definitive test* Retain a sample of the preparation to be examined for a sufficient time to allow the technetium-99m radioactivity to decay to a sufficiently low level to permit the detection of radionuclidic impurities. All measurements of radioactivity are expressed with reference to the date and time of administration.

— *Impurity A:* maximum  $5 \times 10^{-3}$  per cent of the total radioactivity.

Gamma-ray spectrometry. *Record the spectrum of the decayed material.*

*Comparison* Suitable instrument calibrated with the aid of a standardised iodine-131 solution.

*Results* The most prominent photon has an energy of 0.365 MeV; iodine-131 has a half-life of 8.04 days.

— *Impurity B:* maximum 0.1 per cent of the total radioactivity.

Gamma-ray spectrometry. *Record the spectrum of the decayed material.*

*Comparison* Suitable instrument calibrated with the aid of a standardised molybdenum-99 solution.

*Results* The most prominent photons have energies of 0.181 MeV, 0.740 MeV and 0.778 MeV; molybdenum-99 has a half-life of 66.0 h.

— *Impurity C:* maximum  $5 \times 10^{-3}$  per cent of the total radioactivity.

Gamma-ray spectrometry. *Record the spectrum of the decayed material.*

*Comparison* Suitable instrument calibrated using a standardised ruthenium-103 solution.

*Results* The most prominent photon has an energy of 0.497 MeV; ruthenium-103 has a half-life of 39.3 days.

— *Impurity D:* maximum  $6 \times 10^{-5}$  per cent of the total radioactivity.

Determine the presence of strontium-89 in the decayed material with an instrument suitable for the detection of beta rays. It is usually necessary first to carry out chemical separation of the strontium so that the standard and the sample may be compared in the same physical and chemical form.

*Comparison* Standardised strontium-89 solution.

*Results* Strontium-89 decays with a beta emission of 1.492 MeV maximum energy and has a half-life of 50.5 days.

— *Impurity E:* maximum  $6 \times 10^{-6}$  per cent of the total radioactivity.

Determine the presence of strontium-90 in the decayed material with an instrument suitable for the detection of beta rays. To distinguish strontium-90 from strontium-89, compare the radioactivity of yttrium-90, the daughter nuclide of strontium-90, with an yttrium-90 standard after the chemical separation of the yttrium. If prior chemical separation of the strontium is necessary, the conditions of radioactive equilibrium must be ensured. The yttrium-90 standard and the sample must be compared in the same physical and chemical form.

*Results* Strontium-90 and yttrium-90 decay with respective beta emissions of 0.546 MeV and 2.284 MeV maximum energy and half-lives of 29.1 years and 64.0 h.

— *Other gamma-emitting impurities:* maximum 0.01 per cent of the total radioactivity.

Gamma-ray spectrometry.

Examine the spectrum of the decayed material for the presence of other radionuclidic impurities, which should, where possible, be identified and quantified.

— *Alpha-emitting impurities:* maximum  $1 \times 10^{-7}$  per cent of the total radioactivity.

Measure the alpha radioactivity of the decayed material to detect any alpha-emitting radionuclidic impurities, which should, where possible, be identified and quantified.

#### RADIOCHEMICAL PURITY

##### [<sup>99m</sup>Tc]Pertechnetate ion

Descending paper chromatography (2.2.26).

*Test solution* Dilute the preparation to be examined with water R to a suitable radioactive concentration.

*Paper* paper for chromatography R.

*Mobile phase* water R, methanol R (20:80 V/V).

*Application* 5 µL.

*Development* For 2 h.

*Drying* In air.

*Detection* Suitable detector to determine the distribution of radioactivity.

*Retardation factor* [<sup>99m</sup>Tc]pertechnetate ion = about 0.6.

**Limit:**

— [ $^{99m}\text{Tc}$ ]pertechnetate ion: minimum 95 per cent of the total radioactivity due to technetium-99m.

**RADIOACTIVITY**

Determine the radioactivity using a calibrated instrument.

**IMPURITIES**

- A. iodine-131,
- B. molybdenum-99,
- C. ruthenium-103,
- D. strontium-89,
- E. strontium-90.

Ph Eur

## Sodium Phosphate (<sup>32</sup>P) Injection

(Ph. Eur. monograph 0284)

Ph Eur

### DEFINITION

Sterile solution of disodium and monosodium (<sup>32</sup>P) orthophosphates made isotonic by the addition of sodium chloride.

**Phosphorus-32** 90 per cent to 110 per cent of the declared phosphorus-32 radioactivity at the date and time stated on the label.

**Specific radioactivity** Minimum 11.1 MBq of phosphorus-32 per milligram of orthophosphate ion.

### CHARACTERS

#### Appearance

Clear, colourless solution.

#### Half-life and nature of radiation of phosphorus-32

See general chapter 5.7. *Table of physical characteristics of radionuclides.*

### IDENTIFICATION

A. Beta-ray spectrometry.

**Result** The maximum energy of the beta radiation is 1.71 MeV.

B. Examine the chromatogram obtained in the test for radiochemical purity (see Tests).

**Result** The principal peak in the radiochromatogram obtained with the test solution is similar in retardation factor to the principal peak in the chromatogram obtained with the reference solution.

### TESTS

**pH** (2.2.3)

6.0 to 8.0.

#### Phosphates

Maximum 89 µg/MBq.

**Test solution** Dilute the preparation to be examined with *water R* to give a radioactive concentration of 370 kBq of phosphorus-32 per millilitre. Mix in a volumetric flask, with shaking, 1.0 mL of this solution with a mixture of 0.5 mL of *ammonium molybdate solution R*, 0.5 mL of a 2.5 g/L solution of *ammonium vanadate R* and 1 mL of *perchloric acid R*, and dilute to 5.0 mL with *water R*.

**Reference solution** Prepare at the same time and in the same manner as the test solution, using 1.0 mL of a solution containing 33 mg of orthophosphate ion per litre.

After 30 min, the test solution is not more intensely coloured than the reference solution.

#### Sterility

It complies with the test for sterility prescribed in the monograph *Radiopharmaceutical preparations (0125)*. The preparation may be released for use before completion of the test.

### RADIONUCLIDIC PURITY

Beta-ray spectrometry.

**Result** The spectrum obtained with the preparation to be examined does not differ significantly from that obtained under the same conditions with a standardised phosphorus-32 solution.

### RADIOCHEMICAL PURITY

[<sup>32</sup>P]Phosphate

Ascending paper chromatography (2.2.26).

**Test solution** Dilute the preparation to be examined with *water R* until the radioactivity is equivalent to 10 000-20 000 counts per minute per 10 µL.

**Reference solution** A solution of *phosphoric acid R* containing 2 mg of phosphorus per millilitre.

**Paper** *paper for chromatography R*; use a strip of paper 25 mm wide and about 300 mm long.

**Mobile phase** Mixture of 0.3 mL of *ammonia R*, 5 g of *trichloroacetic acid R*, 25 mL of *water R* and 75 mL of *2-propanol R*.

**Application** 10 µL of the reference solution, then apply to the same point of application 10 µL of the test solution.

**Development** For 16 h.

**Drying** In air.

**Detection** Determine the position of the non-radioactive phosphoric acid by spraying with a 50 g/L solution of *perchloric acid R* and then with a 10 g/L solution of *ammonium molybdate R*. Expose the paper to *hydrogen sulfide R*. A blue colour develops. Determine the distribution of radioactivity using a suitable detector.

#### Limit:

— [<sup>32</sup>P]phosphate: minimum 95 per cent of the total radioactivity due to phosphorus-32.

### RADIOACTIVITY

Determine the radioactivity using a calibrated instrument.

Tetrasodium diphosphate decahydrate.

#### Content

98.0 per cent to 102.0 per cent.

### CHARACTERS

#### Appearance

Colourless or white or almost white, slightly efflorescent crystals.

#### Solubility

Soluble in water, practically insoluble in anhydrous ethanol.

### IDENTIFICATION

A. To 5 mL of solution S (see Tests), neutralised if necessary, add 5 mL of *silver nitrate solution R1*. A white precipitate is formed.

B. Solution S gives reaction (a) of sodium (2.3.1).

C. To 1 mL of a 10 g/L solution of the substance to be examined add 1 mL of a 72 g/L solution of *zinc sulfate R*; a white precipitate is formed. To 1 mL of the suspension add 1 mL of *dilute acetic acid R*; the precipitate remains. To the

rest of the suspension add *dilute ammonia R1* until alkaline; the precipitate dissolves. Heat the resulting solution to boiling; a white precipitate is formed.

D. pH (see Tests).

E. Assay (see Tests).

#### TESTS

##### Solution S

Dissolve 5.0 g in *carbon dioxide-free water R* and dilute to 100 mL with the same solvent.

##### Appearance of solution

Solution S is clear (2.2.1) and colourless (2.2.2, Method II).

##### pH (2.2.3)

9.5 to 11.0 for solution S.

##### Reducing substances

To 5 mL of solution S add 5 mL of *dilute sulfuric acid R* and 0.25 mL of a 3.2 g/L solution of *potassium permanganate R*. Heat on a water bath for 5 min. A slight red colour persists.

##### Phosphates

Maximum 0.1 per cent.

*Ammonium molybdate solution* Dissolve 2 g of *ammonium molybdate R* in 100 mL of *water R* and adjust to pH 1.7-1.9 with *hydrochloric acid R*.

Dissolve 1.0 g in *water R* and dilute to 300 mL with the same solvent. Adjust 30 mL of the solution to pH 1.7-1.9 with *dilute hydrochloric acid R* and add 12.5 mL of *2-butanol R1*, 12.5 mL of *ether R* and 25 mL of the *ammonium molybdate solution*. Shake for 20 s and discard the lower layer. Add 10 mL of a 1 g/L solution of *hydrochloric acid R*, shake for 10 s and discard the lower layer. To the upper layer add 0.2 mL of *stannous chloride solution R1*.

Prepare a reference solution in the same manner using a mixture of 20 mL of *phosphate standard solution (5 ppm PO<sub>4</sub>) R* and 10 mL of *water R*. Compare the colours after 10 min.

Any colour in the test solution is not more intense than that in the reference solution.

##### Water (2.5.32)

38.0 per cent to 42.0 per cent, determined on 30.0 mg using the evaporation technique at 100-110 °C.

#### ASSAY

Dissolve 2.0 g in *water R* and dilute to 50 mL with the same solvent. Carry out a potentiometric titration (2.2.20), using 1 M *hydrochloric acid*. Read the volume added at the 1<sup>st</sup> point of inflexion.

1 mL of 1 M *hydrochloric acid* is equivalent to 223.0 mg of Na<sub>4</sub>O<sub>7</sub>P<sub>2</sub>·10H<sub>2</sub>O.

#### STORAGE

In an airtight container.

Ph Eur

## Strontium (<sup>89</sup>Sr) Chloride Injection

(Ph. Eur. monograph 1475)

Ph Eur

#### DEFINITION

Sterile solution of [<sup>89</sup>Sr]strontium chloride.

*Strontium-89* 90 per cent to 110 per cent of the declared strontium-89 radioactivity at the date stated on the label.

*Specific radioactivity* Minimum 1.8 MBq of strontium-89 per milligram of strontium.

*Strontium* 6.0 mg/mL to 12.5 mg/mL.

#### CHARACTERS

##### Appearance

Clear, colourless solution.

##### Half-life and nature of radiation of strontium-89

See general chapter 5.7. *Table of physical characteristics of radionuclides*.

#### IDENTIFICATION

##### A. Gamma-ray and X-ray spectrometry.

*Result* The gamma photon detected has an energy of 0.909 MeV and is due to the short-lived daughter product, yttrium-89m (formed in 0.01 per cent of the disintegrations), in equilibrium with the strontium-89.

B. To 0.1 mL of the preparation to be examined, add 1 mL of a freshly prepared 1 g/L solution of *sodium rhodizonate R*. Mix and allow to stand for 1 min. A reddish-brown precipitate is formed.

C. To 0.1 mL of *silver nitrate solution R2* add 50 µL of the preparation to be examined. A white precipitate is formed.

#### TESTS

##### pH (2.2.3)

4.0 to 7.5.

*Note: the following tests for aluminium, iron and lead may be carried out simultaneously with the test for strontium. If this is not the case, the reference solutions are prepared such that they contain strontium at approximately the same concentration as in the test solution.*

##### Aluminium

Maximum 2 µg/mL.

Atomic emission spectrometry (plasma or arc method) (2.2.22, Method I).

*Test solution* Dilute 0.2 mL of the preparation to be examined to a suitable volume with *dilute nitric acid R*.

*Reference solutions* Prepare the reference solutions using *aluminium standard solution (10 ppm Al) R* diluted as necessary with *dilute nitric acid R*.

##### Iron

Maximum 5 µg/mL.

Atomic emission spectrometry (plasma or arc method) (2.2.22, Method I).

*Test solution* Dilute 0.2 mL of the preparation to be examined to a suitable volume with *dilute nitric acid R*.

*Reference solutions* Prepare the reference solutions using *iron standard solution (20 ppm Fe) R* diluted as necessary with *dilute nitric acid R*.

##### Lead

Maximum 5 µg/mL.

Atomic emission spectrometry (plasma or arc method) (2.2.22, Method I).

**Test solution** Dilute 0.2 mL of the preparation to be examined to a suitable volume with *dilute nitric acid R*.

**Reference solutions** Prepare the reference solutions using *lead standard solution (10 ppm Pb) R* diluted as necessary with *dilute nitric acid R*.

#### Strontium

6.0 mg/mL to 12.5 mg/mL.

Atomic emission spectrometry (2.2.22, *Method I*).

**Test solution** Dilute 0.2 mL of the preparation to be examined to a suitable volume with *dilute nitric acid R*.

**Reference solutions** Prepare the reference solutions using *strontium standard solution (1.0 per cent Sr) R* diluted as necessary with *dilute nitric acid R*.

#### Sterility

It complies with the test for sterility prescribed in the monograph *Radiopharmaceutical preparations (0125)*.

#### RADIONUCLIDIC PURITY

The total radioactivity due to radionuclides other than strontium-89 is not more than 0.6 per cent.

#### Gamma emitters other than yttrium-89m

Maximum 0.4 per cent of the total radioactivity.

Gamma-ray and X-ray spectrometry.

#### Beta emitters

Evaporate to dryness 100 µL of the preparation to be examined under a radiant heat source. Dissolve the residue in 2 mL of *47 per cent hydrobromic acid R*, evaporate to dryness under the radiant heat source and dissolve the residue in 2 mL of *dilute hydrobromic acid R1*. Transfer the solution to the top of a column, 5-6 mm in diameter, packed with approximately 2 mL of *cation-exchange resin R1* (100-250 µm), previously conditioned with *dilute hydrobromic acid R1* and elute the column with the same solvent until 10 mL of eluate has been collected into a container containing 50 µL of a 15 g/L solution of *anhydrous sodium sulfate R* in *1 M hydrochloric acid*.

To a liquid scintillation cocktail vial add an appropriate volume of *liquid scintillation cocktail R* followed by 1 mL of *water R*, 0.1 mL of a 15 g/L solution of *anhydrous sodium sulfate R* in *1 M hydrochloric acid* and 100 µL of eluate. Shake to obtain a clear solution. Using suitable counting equipment determine the radioactivity due to impurities A and B in the sample.

Taking into account the recovery efficiency of the separation, counting efficiency and radioactive decay, determine the radioactive concentration of impurities A and B in the sample and hence the percentage of total beta emitting impurities in the injection to be examined.

#### Result:

— *impurities A and B*: maximum 0.2 per cent of the total radioactivity.

#### RADIOACTIVITY

Determine the radioactivity using a calibrated instrument.

#### IMPURITIES

A. sulfur-35,

B. phosphorus-32.

Ph Eur

## Technetium (<sup>99m</sup>Tc) Albumin Injection

(*Technetium (<sup>99m</sup>Tc) Human Albumin Injection, Ph. Eur. monograph 0640*)

Ph Eur

#### DEFINITION

Sterile, apyrogenic solution of human albumin labelled with technetium-99m. It is prepared using *Sodium pertechnetate (<sup>99m</sup>Tc) injection (fission) (0124)* or *Sodium pertechnetate (<sup>99m</sup>Tc) injection (non fission) (0283)*. It contains a reducing substance, such as a tin salt in an amount not exceeding 1 mg of Sn per millilitre. Although, at present, no definite evidence tends to suggest the importance of keeping the ratio of tin to albumin as low as possible. It may contain a suitable buffer and an antimicrobial preservative. The human albumin used complies with the requirements of the monograph *Human albumin solution (0255)*.

**Technetium-99m** 90 per cent to 110 per cent of the declared technetium-99m radioactivity at the date and time stated on the label.

**Albumin** 90.0 per cent to 110.0 per cent of the quantity of albumin stated on the label.

#### CHARACTERS

##### Appearance

Clear, colourless or pale yellow solution.

##### Half-life and nature of radiation of technetium-99m

See general chapter 5.7. *Table of physical characteristics of radionuclides*.

#### IDENTIFICATION

##### A. Gamma-ray spectrometry.

**Result** The most prominent gamma photon of technetium-99m has an energy of 0.141 MeV.

**B.** Using a suitable range of species-specific antisera, carry out precipitation tests on the preparation to be examined. The test is to be carried out using antisera specific to the plasma proteins of each species of domestic animal currently used in the preparation of materials of biological origin in the country concerned. The preparation is shown to contain proteins of human origin and gives negative results with antisera specific to plasma proteins of other species.

**C.** Examine by a suitable immunoelectrophoresis technique. Using antiserum to normal human serum, compare normal human serum and the preparation to be examined, both diluted if necessary. The main component of the preparation to be examined corresponds to the main component of the normal human serum. The diluted preparation may show the presence of small quantities of other plasma proteins.

#### TESTS

##### pH (2.2.3)

2.0 to 6.5.

##### Albumin

**Test solution** The preparation to be examined.

**Reference solution** Dilute *human albumin solution R* with a 9 g/L solution of *sodium chloride R* to a concentration of 5 mg of albumin per millilitre.

To 1.0 mL of the test solution and to 1.0 mL of the reference solution add 4.0 mL of *biuret reagent R* and mix. After exactly 30 min, measure the absorbance (2.2.25) of each solution at 540 nm, using as the compensation liquid a 9 g/L solution of *sodium chloride R* treated in the same

manner. From the absorbances measured, calculate the content of albumin in the preparation to be examined in milligrams per millilitre.

#### Tin

Maximum 1 mg/mL.

**Test solution** To 1.0 mL of the preparation to be examined add 1.0 mL of a 206 g/L solution of *hydrochloric acid R*. Heat in a water-bath at 100 °C for 30 min. Cool and centrifuge at 300 g for 10 min. Dilute 1.0 mL of the supernatant to 10 mL with a 103 g/L solution of *hydrochloric acid R*.

**Reference solution** Dissolve 95 mg of *stannous chloride R* in a 103 g/L solution of *hydrochloric acid R* and dilute to 1000.0 mL with the same acid.

To 1.0 mL of each solution add 0.05 mL of *thioglycollic acid R*, 0.1 mL of *dithiol reagent R*, 0.4 mL of a 20 g/L solution of *sodium laurilsulfate R* and 3.0 mL of a 21 g/L solution of *hydrochloric acid R*. Mix. Measure the absorbance (2.2.25) of each solution at 540 nm, using a 21 g/L solution of *hydrochloric acid R* as the compensation liquid.

The absorbance of the test solution is not greater than that of the reference solution.

#### Physiological distribution

Inject a volume not greater than 0.5 mL and containing not more than 1.0 mg of albumin into a suitable vein such as a caudal vein or a saphenous vein of each of 3 male rats, each weighing 150-250 g. Measure the radioactivity in the syringe before and after the injection. Euthanise the rats 30 min after the injection. Take 1 mL of blood by a suitable method and remove the liver and, if a caudal vein has been used for the injection, the tail. Using a suitable instrument determine the radioactivity in these organs and blood. Determine the percentage of radioactivity in the liver and in 1 mL of blood with respect to the total radioactivity calculated as the difference between both measurements made on the syringe minus the activity in the tail (if a caudal vein has been used for the injection). Correct the blood radioactivity by multiplying by a factor of  $m/200$  where  $m$  is the body mass of the rat in grams. In not fewer than 2 of the 3 rats used, the radioactivity in the liver is not more than 15 per cent and that in blood, after correction, is not less than 3.5 per cent.

#### Sterility

It complies with the test for sterility prescribed in the monograph *Radiopharmaceutical preparations (0125)*. The preparation may be released for use before completion of the test.

#### Bacterial endotoxins (2.6.14)

Less than 175/ $V$  IU/mL,  $V$  being the maximum recommended dose in millilitres.

#### RADIOCHEMICAL PURITY

##### Impurity A

Thin-layer chromatography (2.2.27).

**Test solution** The preparation to be examined.

**Plate** TLC silica gel plate R<sub>2</sub>; use silica gel as the coating substance on a glass-fibre sheet, heated at 110 °C for 10 min.

**Mobile phase** methyl ethyl ketone R.

**Application** 5-10 µL and allow to dry.

**Development** Over a path of 10-15 cm in about 10 min.

**Drying** In air.

**Detection** Suitable detector to determine the distribution of radioactivity.

**Retardation factors** [<sup>99m</sup>Tc]technetium human albumin = 0.0 to 0.1; impurity A = 0.9 to 1.0.

#### Limit:

— *impurity A*: maximum 5.0 per cent of the total radioactivity due to technetium-99m.

[<sup>99m</sup>Tc]Technetium albumin fractions II to V  
Size-exclusion chromatography (2.2.30).

**Mobile phase (concentrated)** Dissolve 1.124 g of *potassium dihydrogen phosphate R*, 4.210 g of *disodium hydrogen phosphate dodecahydrate R*, 1.17 g of *sodium chloride R* and 0.10 g of *sodium azide R* in *water R* and dilute to 100 mL with the same solvent.

**Test solution** Mix 0.25 mL of the preparation to be examined with 0.25 mL of the mobile phase (concentrated). Use immediately after dilution.

#### Column:

— *size*:  $l = 0.6$  m,  $\varnothing = 7.5$  mm;  
— *stationary phase*: silica gel for size-exclusion chromatography R.

**Mobile phase** Mobile phase (concentrated), *water R* (50:50 V/V).

**Flow rate** 0.6 mL/min.

**Detection** Radioactivity detector set for technetium-99m.

**Injection** 200 µL.

**Run time** At least 10 min after background level is reached.

Retention times of eluted peaks:

I	High molecular mass compound	19-20 min
II	Poly III-albumin	23-24 min
III	Poly II-albumin	25-27 min
IV	Poly I-albumin	28-29 min
V	Human serum albumin	32-33 min
VI	Tin colloid	40-47 min
VII	Pertechnetate	48 min

#### Limit:

— [<sup>99m</sup>Tc]technetium albumin fractions II to V: minimum 80 per cent of the radioactivity due to technetium-99m applied to the column.

#### RADIOACTIVITY

Determine the radioactivity using a calibrated instrument.

#### LABELLING

*The label states:*

— the amount of albumin;  
— the amount of tin, if any.

#### IMPURITIES

A. [<sup>99m</sup>Tc]pertechnetate ion.

Ph Eur

## Technetium ( $^{99m}\text{Tc}$ ) Bicisate Injection

(Ph. Eur. monograph 2123)

Ph Eur

### DEFINITION

Sterile solution of a complex of technetium-99m with diethyl  $N,N'$ -ethylenedi-L-cysteinate. It may contain stabilisers and inert additives such as *Mannitol* (0559) and *Disodium edetate* (0232).

### Content

90 per cent to 110 per cent of the declared technetium-99m radioactivity at the date and hour stated on the label.

### PRODUCTION

It is prepared from  $N,N'$ -(1,2-ethylenediyl)bis[(2*R*)-2-amino-3-sulfanylpropanoic acid] diethyl ester and *Sodium pertechnetate* ( $^{99m}\text{Tc}$ ) injection (fission) (0124) or *Sodium pertechnetate* ( $^{99m}\text{Tc}$ ) injection (non-fission) (0283) in the presence of reducing agents such as a stannous salt.

### CHARACTERS

#### Appearance

Clear, colourless solution.

#### Half-life and nature of radiation of technetium-99m

See general chapter 5.7. *Table of physical characteristics of radionuclides*.

### IDENTIFICATION

#### A. Gamma-ray spectrometry.

**Results** The most prominent gamma photon of technetium-99m has an energy of 0.141 MeV.

#### B. Examine the chromatograms obtained in the test for radiochemical purity (see Tests).

**Results** The principal peak in the chromatogram obtained with the test solution is similar in retardation factor to the principal peak in the chromatogram obtained with reference solution (a).

### TESTS

#### pH (2.2.3)

6.5 to 7.5.

#### Sterility

It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations* (0125). The injection may be released for use before completion of the test.

### RADIOCHEMICAL PURITY

#### Impurities A, B, C, D, E, F, G

Thin-layer chromatography (2.2.27).

**Test solution** The preparation to be examined.

**Reference solution (a)** To vial B of *bicisate labelling kit CRS* in lead shielding add 2 mL of sodium pertechnetate ( $^{99m}\text{Tc}$ ) injection (fission or non-fission) containing 400-800 MBq. Dissolve the contents of vial A of *bicisate labelling kit CRS* in 3 mL of a 9 g/L solution of *sodium chloride R*. Immediately transfer 1.0 mL of the solution contained in vial A to vial B. Mix and allow to stand for 30 min at room temperature.

**Reference solution (b)** Sodium pertechnetate ( $^{99m}\text{Tc}$ ) injection (fission or non fission).

**Plate** TLC silica gel plate R.

**Mobile phase** ethyl acetate R.

**Application** 5  $\mu\text{L}$ , allow the spots to dry for 5-10 min.

**Development** Over 4/5 of the plate.

**Drying** In air.

**Detection** Determine the distribution of radioactivity using a suitable detector.

**Retardation factors** Technetium-99m bicisate = more than 0.4; impurities A, B, C, D, E, F and G = less than 0.2.

**System suitability** The retardation factor of the principal peak in the chromatogram obtained with reference solution (a) is clearly different from the retardation factor of the peak in the chromatogram obtained with reference solution (b).

#### Limits:

- sum of impurities A, B, C, D, E, F and G: not more than 10 per cent of the total radioactivity;
- *technetium-99m bicisate*: minimum 90 per cent of the total radioactivity.

### RADIOACTIVITY

Determine the radioactivity using a calibrated instrument.

### IMPURITIES

- A. technetium-99m in colloidal form,
- B. [ $^{99m}\text{Tc}$ ]pertechnetate ion,

- C. complex of technetium-99m with ethyl hydrogen  $N,N'$ -ethylenedi-L-cysteinate,

- D. complex of technetium-99m with  $N,N'$ -ethylenedi-L-cysteine,

- E. complex of technetium-99m with mannitol,

- F. complex of technetium-99m with disodium edetate,

- G. other complexes of technetium-99m with diethyl  $N,N'$ -ethylenedi-L-cysteinate.

Ph Eur

## Technetium ( $^{99m}\text{Tc}$ ) Colloidal Rhenium Sulfide Injection

Technetium ( $^{99m}\text{Tc}$ ) Colloidal Rhenium Sulphide Injection

(Ph. Eur. monograph 0126)

Ph Eur

### DEFINITION

Sterile colloidal dispersion of rhenium sulfide, the micelles of which are labelled with technetium-99m. It is prepared using *Sodium pertechnetate* ( $^{99m}\text{Tc}$ ) injection (fission) (0124) or *Sodium pertechnetate* ( $^{99m}\text{Tc}$ ) injection (non fission) (0283). It is stabilised with gelatin. The pH of the injection may be adjusted by the addition of a suitable buffer such as citrate buffer.

**Technetium-99m** 90 per cent to 110 per cent of the declared technetium-99m radioactivity at the date and time stated on the label.

**Rhenium** Maximum 0.22 mg/mL.

#### CHARACTERS

##### Appearance

Light brown liquid.

##### Half-life and nature of radiation of technetium-99m

See general chapter 5.7. *Table of physical characteristics of radionuclides.*

#### IDENTIFICATION

##### A. Gamma-ray spectrometry.

**Result** The most prominent gamma photon of technetium-99m has an energy of 0.141 MeV.

B. Examine the chromatogram obtained in the test for radiochemical purity (see Tests).

**Result** The retardation factor of the principal peak in the radiochromatogram obtained with the test solution is 0.0 to 0.1.

C. To 1 mL add 1 mL of a 200 g/L solution of *stannous chloride R* in *hydrochloric acid R*, 5 mL of *hydrochloric acid R* and 5 mL of a 50 g/L solution of *thiourea R*. A yellow colour develops.

#### TESTS

##### pH (2.2.3)

4.0 to 7.0.

##### Rhenium

Maximum 0.22 mg/mL.

**Test solution** The preparation to be examined.

**Reference solutions** Using a solution containing 100 µg of *potassium perrhenate R* (equivalent to 60 ppm of Re) and 240 µg of *sodium thiosulfate R* per millilitre, prepare a range of solutions and dilute to the same final volume with *water R*.

To 1 mL of the test solution and to 1 mL of each of the reference solutions add 1 mL of a 200 g/L solution of *stannous chloride R* in *hydrochloric acid R*, 5 mL of *hydrochloric acid R* and 5 mL of a 50 g/L solution of *thiourea R* and dilute to 25.0 mL with *water R*. Allow to stand for 40 min and measure the absorbance (2.2.25) of each solution at 400 nm, using a reagent blank as the compensation liquid. Using the absorbances obtained with the reference solutions, draw a calibration curve and calculate the concentration of rhenium in the preparation to be examined.

##### Physiological distribution

Inject a volume not greater than 0.2 mL into a caudal vein of each of 3 mice each weighing 20-25 g. Euthanise the mice 20 min after the injection, remove the liver, spleen and lungs and measure the radioactivity in the organs using a suitable instrument. Measure the radioactivity in the rest of the body after having removed the tail. Determine the percentage of radioactivity in the liver, the spleen and the lungs using the following expression:

$$\frac{A}{B} \times 100$$

*A* = radioactivity of the organ concerned;  
*B* = total radioactivity in the liver, the spleen, the lungs and the rest of the body.

In each of the 3 mice at least 80 per cent of the radioactivity is found in the liver and spleen and not more than 5 per cent in the lungs. If the distribution of radioactivity in 1 of the 3 mice does not correspond to the prescribed proportions,

repeat the test on a further 3 mice. The preparation complies with the test if the prescribed distribution of radioactivity is found in 5 of the 6 mice used. The preparation may be released for use before completion of the test.

##### Sterility

It complies with the test for sterility prescribed in the monograph *Radiopharmaceutical preparations (0125)*. The preparation may be released for use before completion of the test.

##### Bacterial endotoxins (2.6.14)

Less than 175/*V* IU/mL, *V* being the maximum recommended dose in millilitres.

#### RADIOCHEMICAL PURITY

##### [<sup>99m</sup>Tc]Technetium in colloidal form

Ascending paper chromatography (2.2.26).

**Test solution** The preparation to be examined.

**Paper** paper for chromatography R.

**Mobile phase** 9 g/L solution of *sodium chloride R*.

**Application** 10 µL.

**Development** Immediately over a path of 10-15 cm.

**Drying** In air.

**Detection** Suitable detector to determine the distribution of radioactivity.

**Retardation factors** [<sup>99m</sup>Tc]technetium in colloidal form = 0.0 to 0.1; impurity A = about 0.6; other impurities = 0.8 to 0.9.

##### Limit:

— [<sup>99m</sup>Tc]technetium in colloidal form: minimum 92 per cent of the total radioactivity due to technetium-99m.

#### RADIOACTIVITY

Determine the radioactivity using a calibrated instrument.

#### LABELLING

The label states the concentration of rhenium expressed in milligrams per millilitre.

#### IMPURITIES

A. [<sup>99m</sup>Tc]pertechnetate ion.

Ph Eur

## Technetium (<sup>99m</sup>Tc) Colloidal Sulfur Injection

Technetium (<sup>99m</sup>Tc) Colloidal Sulphur Injection

(Ph. Eur. monograph 0131)

Ph Eur

#### DEFINITION

Sterile, apyrogenic colloidal dispersion of sulfur, the micelles of which are labelled with technetium-99m. It is prepared using *Sodium pertechnetate (<sup>99m</sup>Tc) injection (fission) (0124)* or *Sodium pertechnetate (<sup>99m</sup>Tc) injection (non fission) (0283)*. It may be stabilised with a colloid-protecting substance based on gelatin. The pH of the injection may be adjusted by the addition of a suitable buffer, such as an acetate, citrate or phosphate buffer solution. The injection contains a variable quantity of colloidal sulfur, according to the method of preparation.

**Technetium-99m** 90 per cent to 110 per cent of the declared technetium-99m radioactivity at the date and time stated on the label.

**CHARACTERS****Appearance**

Clear or opalescent, colourless or yellowish liquid.

**Half-life and nature of radiation of technetium-99m**

See general chapter 5.7. *Table of physical characteristics of radionuclides.*

**IDENTIFICATION****A. Gamma-ray spectrometry.**

**Result** The most prominent gamma photon of technetium-99m has an energy of 0.141 MeV.

**B. Examine the chromatogram obtained in the test for radiochemical purity (see Tests).**

**Result** The retardation factor of the principal peak in the radiochromatogram obtained with the test solution is 0.0 to 0.1.

**C.** In a test-tube 100 mm long and 16 mm in internal diameter, evaporate 0.2 mL of the preparation to be examined to dryness. Dissolve the sulfur by shaking the residue with 0.2 mL of *pyridine R* and add about 20 mg of *benzoin R*. Cover the open end of the tube with a filter paper moistened with *lead acetate solution R*. Heat the test-tube in a bath containing glycerol at 150 °C. The paper slowly becomes brown.

**TESTS****pH (2.2.3)**

4.0 to 7.0.

**Physiological distribution**

Inject a volume not greater than 0.2 mL into the caudal vein of each of 3 mice, each weighing 20-25 g. Euthanise the mice 20 min after the injection, remove the liver, spleen and lungs and measure the radioactivity in these organs using a suitable instrument. Measure the radioactivity in the rest of the body of each animal after having removed the tail. Determine the percentage of radioactivity in the liver, the spleen and the lungs using the following expression:

$$\frac{A}{B} \times 100$$

**A** = radioactivity of the organ concerned;  
**B** = total radioactivity in the liver, the spleen, the lungs and the rest of the body.

In each of the 3 mice at least 80 per cent of the radioactivity is found in the liver and spleen and not more than 5 per cent in the lungs. If the distribution of radioactivity in 1 of the 3 mice does not correspond to the prescribed proportions, repeat the test on a further 3 mice. The preparation to be examined complies with the test if the prescribed distribution of radioactivity is found in 5 of the 6 mice used. The preparation may be released for use before completion of the test.

**Sterility**

It complies with the test for sterility prescribed in the monograph *Radiopharmaceutical preparations (0125)*. The preparation may be released for use before completion of the test.

**Pyrogens**

It complies with the test for pyrogens prescribed in the monograph *Radiopharmaceutical preparations (0125)*. Inject, per kilogram of the rabbit's mass, not less than 0.1 mL. The preparation may be released for use before completion of the test.

**RADIOCHEMICAL PURITY****[<sup>99m</sup>Tc]Technetium in colloidal form**

Ascending paper chromatography (2.2.26).

**Test solution** The preparation to be examined.

**Paper** paper for chromatography R.

**Mobile phase** 9 g/L solution of *sodium chloride R*.

**Application** 10 µL.

**Development** Immediately, over a path of 10-15 cm.

**Drying** In air.

**Detection** Suitable detector to determine the distribution of radioactivity.

**Retardation factors** [<sup>99m</sup>Tc]technetium in colloidal form = 0.0 to 0.1; impurity A = about 0.6; other impurities = 0.8 to 0.9.

**Limit:**

— [<sup>99m</sup>Tc]technetium in colloidal form: minimum 92 per cent of the total radioactivity due to technetium-99m.

**RADIOACTIVITY**

Determine the radioactivity using a calibrated instrument.

**IMPURITIES**

A. [<sup>99m</sup>Tc]pertechnetate ion.

Ph Eur

**Technetium (<sup>99m</sup>Tc) Colloidal Tin Injection**

(Ph. Eur. monograph 0689)

Ph Eur

**DEFINITION**

Sterile, colloidal dispersion of tin labelled with technetium-99m. It is prepared using *Sodium pertechnetate (<sup>99m</sup>Tc) injection (fission) (0124)* or *Sodium pertechnetate (<sup>99m</sup>Tc) injection (non fission) (0283)*. The injection contains a variable quantity of tin not exceeding 1 mg of Sn per millilitre; it contains fluoride ions, it may be stabilised with a suitable, apyrogenic colloid-protecting substance and it may contain a suitable buffer.

**Technetium-99m** 90 per cent to 110 per cent of the declared technetium-99m radioactivity at the date and time stated on the label.

**Tin** Maximum 1 mg/mL.

**CHARACTERS****Appearance**

Clear or opalescent, colourless solution.

**Half-life and nature of radiation of technetium-99m**

See general chapter 5.7. *Table of physical characteristics of radionuclides.*

**IDENTIFICATION****A. Gamma-ray spectrometry.**

**Result** The most prominent gamma photon of technetium-99m has an energy of 0.141 MeV.

**B.** Mix 0.05 mL of *zirconyl nitrate solution R* with 0.05 mL of *alizarin S solution R*. Add 0.05 mL of the preparation to be examined. A yellow colour is produced.

**TESTS****pH (2.2.3)**

4.0 to 7.0.

**Tin**

Maximum 1 mg/mL.

**Test solution** Dilute 3.0 mL of the preparation to be examined to 50.0 mL with a 103 g/L solution of hydrochloric acid R.

**Reference solution** Dissolve 0.115 g of stannous chloride R in a 103 g/L solution of hydrochloric acid R and dilute to 1000.0 mL with the same acid.

To 1.0 mL of each solution add 0.05 mL of thioglycolic acid R, 0.1 mL of dithiol reagent R, 0.4 mL of a 20 g/L solution of sodium laurilsulfate R and 3.0 mL of a 21 g/L solution of hydrochloric acid R. Mix. Measure the absorbance (2.2.25) of each solution at 540 nm, using a 21 g/L solution of hydrochloric acid R as the compensation liquid. The absorbance of the test solution is not greater than that of the reference solution.

**Physiological distribution**

Inject not more than 0.2 mL into a caudal vein of each of 3 mice, each weighing 20-25 g. Euthanise the mice 20 min after the injection and remove the liver, spleen and lungs. Measure the radioactivity in the organs using a suitable instrument. Measure the radioactivity in the rest of the body of each animal, after having removed the tail. Determine the percentage of radioactivity in the liver, the spleen and the lungs with respect to the total radioactivity of all organs and the rest of the body excluding the tail.

In each of the 3 mice at least 80 per cent of the radioactivity is found in the liver and spleen and not more than 5 per cent in the lungs. If the distribution of radioactivity in 1 of the 3 mice does not correspond to the prescribed proportions, repeat the test on a further 3 mice. The preparation to be examined complies with the test if the prescribed distribution of radioactivity is found in 5 of the 6 mice used.

**Sterility**

It complies with the test for sterility prescribed in the monograph *Radiopharmaceutical preparations* (0125). The preparation may be released for use before completion of the test.

**RADIOCHEMICAL PURITY****[<sup>99m</sup>Tc]Technetium in colloidal form**

Thin-layer chromatography (2.2.27).

**Test solution** The preparation to be examined.

**Plate** TLC silica gel plate R; use silica gel as the coating substance on a glass-fibre sheet heated at 110 °C for 10 min.

**Mobile phase** 9 g/L solution of sodium chloride R purged with nitrogen R.

**Application** 5-10 µL.

**Development** Over a path of 10-15 cm in about 10 min.

**Drying** In air.

**Detection** Suitable detector to determine the distribution of radioactivity.

**Retardation factors** [<sup>99m</sup>Tc]technetium in colloidal form = 0.0 to 0.1; impurity A = 0.9 to 1.0.

**Limit:**

— [<sup>99m</sup>Tc]technetium in colloidal form: minimum 95 per cent of the radioactivity due to technetium-99m.

**RADIOACTIVITY**

Determine the radioactivity using a calibrated instrument.

**IMPURITIES**

A. [<sup>99m</sup>Tc]pertechnetate ion.

**Technetium (<sup>99m</sup>Tc) Etifenin Injection**

(Ph. Eur. monograph 0585)

$C_{32}H_{40}N_4O_{10}^{99m}Tc$  740

Ph Eur

**DEFINITION**

Sterile solution of a complex of technetium-99m with etifenin. It is prepared by mixing Sodium pertechnetate (<sup>99m</sup>Tc) injection (fission) (0124) or Sodium pertechnetate (<sup>99m</sup>Tc) injection (non-fission) (0283) with solutions of [2,6-diethylphenyl]carbonyl]methyl]imino]diacetic acid (etifenin) and stannous chloride. It may contain stabilisers and inert additives.

**Technetium-99m** 90 per cent to 110 per cent of the declared technetium-99m radioactivity at the date and time stated on the label.

**CHARACTERS****Appearance**

Clear, colourless solution.

**Half-life and nature of radiation of technetium-99m**

See general chapter 5.7. *Table of physical characteristics of radionuclides*.

**IDENTIFICATION**

A. Gamma-ray spectrometry.

**Result** The most prominent gamma photon of technetium-99m has an energy of 0.141 MeV.

B. Liquid chromatography (2.2.29).

**Test solution** The preparation to be examined.

**Reference solution** To 40 mg of etifenin CRS add 2 mL of water R and shake. While shaking, add dropwise a 20 g/L solution of sodium hydroxide R until complete dissolution. Adjust to pH 7 with a 51.5 g/L solution of hydrochloric acid R and dilute to 4 mL with water R. Introduce this solution into a closed vial filled with nitrogen R. Add 0.1 mL of a 5 g/L solution of stannous chloride R in a 5 g/L solution of hydrochloric acid R. Add 1 mL of a solution of sodium pertechnetate (<sup>99m</sup>Tc) injection (fission or non-fission) containing 100-200 MBq. Allow to stand for 15 min.

**Column:**

- size:  $l = 0.25$  m,  $\varnothing = 4.6$  mm;
- stationary phase: end-capped polar-embedded octadecylsilyl amorphous organosilica polymer R (5 µm).

**Mobile phase:**

- mobile phase A: 3.85 g/L solution of ammonium acetate R;
- mobile phase B: acetonitrile R;

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 20	70	30
20 - 25	70 → 0	30 → 100
25 - 30	0	100

Flow rate 1.0 mL/min.

**Detection** Radioactivity detector.

**Injection** 20 µL.

**Result** The principal peak in the chromatogram obtained with the test solution is similar in retention time to the principal peak in the chromatogram obtained with the reference solution.

#### TESTS

**pH (2.2.3)**

4.0 to 6.0.

**Tin**

Maximum 0.2 mg/mL.

**Test solution** Dilute 1.0 mL of the preparation to be examined to 5.0 mL with a 103 g/L solution of hydrochloric acid R.

**Reference solution** Dissolve 7.5 mg of stannous chloride R in a 103 g/L solution of hydrochloric acid R and dilute to 100 mL with the same acid.

To 1.0 mL of each solution add successively 0.4 mL of a 20 g/L solution of sodium laurilsulfate R, 0.05 mL of thioglycolic acid R, 0.1 mL of dithiol reagent R and 3.0 mL of a 21 g/L solution of hydrochloric acid R. Mix. Measure the absorbance (2.2.25) of each solution at 540 nm, using a 21 g/L solution of hydrochloric acid R as the compensation liquid. The absorbance of the test solution is not greater than that of the reference solution.

**Sterility**

It complies with the test for sterility prescribed in the monograph *Radiopharmaceutical preparations (0125)*.

The preparation may be released for use before completion of the test.

**Bacterial endotoxins (2.6.14)**

Less than 175/V IU/mL, V being the maximum recommended dose in millilitres.

#### RADIOCHEMICAL PURITY

##### A. Impurity A

Ascending paper chromatography (2.2.26).

**Test solution** The preparation to be examined.

**Reference solution** To 1 mL of a 1 g/L solution of stannous chloride R in a 5 g/L solution of hydrochloric acid R in a closed vial, add 2 mL of sodium pertechnetate (<sup>99m</sup>Tc) injection (fission or non-fission) containing 100-200 MBq. Use within 30 min.

**Paper** paper for chromatography R.

**Mobile phase** water R, acetonitrile R (40:60 V/V).

**Application** About 5 µL.

**Development** Immediately, over a path of 10 cm.

**Drying** In air.

**Detection** Suitable detector to determine the distribution of radioactivity.

**Retardation factors** Impurity A = 0.0-0.1; impurity B and [<sup>99m</sup>Tc]technetium etifenin = 0.9-1.0.

**System suitability** The retardation factor of the principal peak in the chromatogram obtained with the reference solution is not more than 0.15; the retardation factor of the principal peak in the chromatogram obtained with the test solution is more than 0.7.

##### B. Impurity B

Ascending paper chromatography (2.2.26).

**Test solution** The preparation to be examined.

**Reference solution** Sodium pertechnetate (<sup>99m</sup>Tc) injection (fission or non-fission).

**Paper** paper for chromatography R saturated with a 25 g/L solution of sodium hydrogen carbonate R and stored protected from moisture after drying at 80 °C.

**Mobile phase** methyl ethyl ketone R.

**Application** About 5 µL.

**Development** Immediately, over a path of 10 cm.

**Drying** In air.

**Detection** Suitable detector to determine the distribution of radioactivity.

**Retardation factors** Impurity A and [<sup>99m</sup>Tc]technetium etifenin = 0.0-0.1; impurity B = 0.9-1.0.

**System suitability** The retardation factor of the principal peak in the chromatogram obtained with the test solution is not more than 0.15; the retardation factor of the principal peak in the chromatogram obtained with the reference solution is more than 0.7.

**Limits:**

- **impurity A:** not more than 3.0 per cent of the total radioactivity due to technetium-99m in the chromatogram obtained in test A;
- **impurity B:** not more than 3.0 per cent of the total radioactivity due to technetium-99m in the chromatogram obtained in test B;
- **sum of impurities A and B:** maximum 5.0 per cent of the total radioactivity due to technetium-99m in the chromatograms obtained in tests A and B.

#### RADIOACTIVITY

Determine the radioactivity using a calibrated instrument.

#### IMPURITIES

- A. [<sup>99m</sup>Tc]technetium in colloidal form,
- B. [<sup>99m</sup>Tc]pertechnetate ion.

Ph Eur

## Technetium (<sup>99m</sup>Tc) Exametazime Injection

(Ph. Eur. monograph 1925)

Ph Eur

#### DEFINITION

Sterile solution of lipophilic technetium-99m exametazime which may be prepared by dissolving a racemic mixture of (3*RS*,9*RS*)-4,8-diaza-3,6,6,9-tetramethylundecane-2,10-dione bisoxime in the presence of a stannous salt in *Sodium pertechnetate (<sup>99m</sup>Tc) injection (fission) (0124)* or *Sodium pertechnetate (<sup>99m</sup>Tc) injection (non-fission) (0283)*. It may contain stabilisers and inert additives.

#### Content

90 per cent to 110 per cent of the declared technetium-99m radioactivity at the date and time stated on the label.

**Purity:** minimum of 80 per cent of the total radioactivity corresponds to lipophilic technetium-99m exametazime and its *meso* isomer.

**CHARACTERS****Appearance**

Clear solution.

**Half-life and nature of radiation of technetium-99m**

See general chapter 5.7. *Table of physical characteristics of radionuclides.*

**IDENTIFICATION****A. Gamma-ray spectrometry.**

**Comparison** Standardised technetium-99m solution, or by using a calibrated instrument. Standardised technetium-99m solutions and/or standardisation services are available from the competent authority.

**Results** The spectrum obtained with the solution to be examined does not differ significantly from that obtained with a standardised technetium-99m solution. The most prominent gamma photon has an energy of 0.141 MeV.

**B. Examine the chromatograms obtained in the test Impurity A under Radiochemical purity.**

**Results** The principal peak in the chromatogram obtained with the test solution is similar in retention time to the peak due to lipophilic technetium-99m exametazime in the chromatogram obtained with the reference solution.

**TESTS****pH (2.2.3)**

5.0 to 10.0.

**Sterility**

It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations (0125)*. The injection may be released for use before completion of the test.

**RADIOCHEMICAL PURITY****Impurity C**

Thin-layer chromatography (2.2.27).

**Test solution** The preparation to be examined.

**Plate** TLC silica gel plate R; use a glass-fibre plate.

**Mobile phase** 9 g/L solution of sodium chloride R.

**Application** About 5 µL.

**Development** Immediate, over 2/3 of the plate.

**Drying** In air.

**Detection** Determine the distribution of radioactivity using a suitable detector.

**Retardation factors** Impurity C = 0.8 to 1.0; lipophilic technetium-99m exametazime and impurities A, B, D and E do not migrate.

**Limits:**

— **impurity C:** maximum 10 per cent of the total radioactivity.

**Total of lipophilic technetium-99m exametazime and impurity A**

Thin-layer chromatography (2.2.27).

**Test solution** The preparation to be examined.

**Plate** TLC silica gel plate R; use a glass-fibre plate.

**Mobile phase** methyl ethyl ketone R.

**Application** About 5 µL.

**Development** Immediate, over 2/3 of the plate.

**Drying** In air.

**Detection** Determine the distribution of radioactivity using a suitable detector.

**Retardation factors** Lipophilic technetium-99m exametazime = 0.8 to 1.0, impurity A = 0.8 to 1.0, impurity C = 0.8 to 1.0; impurities B, D and E do not migrate.

**Limits** Calculate the percentage of radioactivity due to impurities B, D and E from test B (B) and the percentage of the radioactivity due to impurity C from test A (A). Calculate the total percentage of lipophilic technetium-99m exametazime and impurity A from the expression:

$$100 - A - B$$

— **total of lipophilic technetium-99m exametazime and impurity A:** minimum 80 per cent of the total radioactivity.

**Impurity A**

Liquid chromatography (2.2.29).

**Test solution** The preparation to be examined.

**Reference solution** Dissolve the contents of a vial of *meso-rich exametazime CRS* in 0.5 mL of a 9 g/L solution of sodium chloride R and transfer to a lead-shielded, nitrogen-filled vial. Add 6 µL of a freshly prepared 1 g/L solution of stannous chloride R in 0.05 M hydrochloric acid and 2.5 mL of sodium pertechnetate (<sup>99m</sup>Tc) injection (fission or non-fission) containing 370-740 MBq. Mix carefully and use within 30 min of preparation.

**Column:**

— **size:**  $l = 0.25$  m,  $\varnothing = 4.6$  mm,

— **stationary phase:** spherical base-deactivated end-capped octadecylsilyl silica gel for chromatography R (5 µm) with a pore size of 13 nm and a carbon loading of 11 per cent.

**Mobile phase** Mix 33 volumes of acetonitrile R and 67 volumes of 0.1 M phosphate buffer solution pH 3.0 R.

**Flow rate** 1.5 mL/min.

**Detection** Radioactivity detector.

**Injection** Loop injector.

**Run time** 20 min.

**Relative retention** With reference to lipophilic technetium-99m exametazime: impurity A = about 1.2.

**System suitability** Reference solution:

— chromatogram similar to the chromatogram provided with *meso-rich exametazime CRS*,

— **resolution:** minimum of 2 between the peaks due to lipophilic technetium-99m exametazime and to impurity A.

**Limits:**

— **impurity A:** maximum 5 per cent of the radioactivity due to lipophilic technetium-99m exametazime and impurity A.

**RADIOACTIVITY**

Measure the radioactivity using suitable equipment by comparison with a standardised technetium-99m solution or by using a calibrated instrument.

## IMPURITIES

- A. *meso* isomer of lipophilic technetium-99m exametazime,  
 B. technetium-99m in colloidal form,  
 C. [<sup>99m</sup>Tc]pertechnetate ion,  
 D. non lipophilic technetium-99m exametazime complex,  
 E. *meso* isomer of non lipophilic technetium-99m exametazime complex.

Ph Eur

## Technetium (<sup>99m</sup>Tc) Gluconate Injection

(Ph. Eur. monograph 1047)

Ph Eur

## DEFINITION

Sterile solution of a complex of technetium-99m with calcium gluconate. It is prepared using *Sodium pertechnetate* (<sup>99m</sup>Tc) injection fission (0124) or *Sodium pertechnetate* (<sup>99m</sup>Tc) injection non fission (0283).

*Technetium-99m* 90 per cent to 110 per cent of the declared technetium-99m radioactivity at the date and time stated on the label.

## CHARACTERS

## Appearance

Slightly opalescent solution.

## Half-life and nature of radiation of technetium-99m

See general chapter 5.7. *Table of characteristics of radionuclides*.

## IDENTIFICATION

## A. Gamma-ray spectrometry.

*Result* The most prominent gamma photon of technetium-99m has an energy of 0.141 MeV.

B. 5 µL of the preparation to be examined complies with identification A prescribed in the monograph *Calcium gluconate* (0172).

C. Examine the chromatograms obtained in tests A and B for radiochemical purity (see Tests).

## Results:

- the retardation factor of the principal peak in the radiochromatogram obtained with the test solution in test A is 0.9 to 1.0;
- the retardation factor of the principal peak in the radiochromatogram obtained with the test solution in test B is 0.0 to 0.1.

## TESTS

## pH (2.2.3)

6.0 to 8.5.

## Physiological distribution

Inject a volume not greater than 0.2 mL into the caudal vein of each of 3 rats weighing 150-250 g. Measure the radioactivity of the syringe before and after injection. Euthanise the rats 30 min after the injection. Remove at least

1 g of blood by a suitable method and remove the kidneys, the liver, the bladder plus voided urine and the tail. Weigh the sample of blood.

Determine the radioactivity in the organs, the blood sample and the tail using a suitable instrument. Calculate the percentage of radioactivity in each organ and in 1 g of blood with respect to the total radioactivity calculated as the difference between the 2 measurements made on the syringe minus the activity in the tail. Correct the blood concentration by multiplying by a factor of  $m/200$  where  $m$  is the body mass of the rat in grams.

In not fewer than 2 of the 3 rats used, the radioactivity is:

- in the kidneys: minimum 15 per cent,
- in the bladder plus voided urine: minimum 20 per cent,
- in the liver: maximum 5 per cent.
- in the blood, after correction: maximum 0.50 per cent.

## Sterility

It complies with the test for sterility prescribed in the monograph *Radiopharmaceutical preparations* (0125).

The preparation may be released for use before completion of the test.

## RADIOCHEMICAL PURITY

## A. Impurity A. Thin-layer chromatography (2.2.27).

*Test solution* The preparation to be examined.

*Plate* TLC silica gel plate R; use silica gel as the coating substance on a glass-fibre sheet heated at 110 °C for 10 min.

*Mobile phase* 9 g/L solution of sodium chloride R.

*Application* 5-10 µL.

*Development* Immediately over a path of 10-15 cm in about 10 min.

*Drying* In air.

*Detection* Suitable detector to determine the distribution of radioactivity.

*Retardation factors* Impurity A = 0.0 to 0.1; [<sup>99m</sup>Tc] technetium gluconate and impurity B = 0.9 to 1.0.

## B. Impurity B. Thin-layer chromatography (2.2.27).

*Test solution* The preparation to be examined.

*Plate* TLC silica gel plate R; use silica gel as the coating substance on a glass-fibre sheet heated at 110 °C for 10 min.

*Mobile phase* methyl ethyl ketone R.

*Application* 5-10 µL and allow to dry.

*Development* Over a path of 10-15 cm in about 10 min.

*Drying* In a current of warm air.

*Detection* Suitable detector to determine the distribution of radioactivity.

*Retardation factors* [<sup>99m</sup>Tc]technetium gluconate and impurity A = 0.0 to 0.1; impurity B = 0.9 to 1.0.

## Limit:

- sum of impurities A and B: maximum 10 per cent of the radioactivity due to technetium-99m in the chromatograms obtained in tests A and B.

## RADIOACTIVITY

Determine the radioactivity using a calibrated instrument.

## IMPURITIES

- A. [<sup>99m</sup>Tc]technetium in colloidal form,  
 B. [<sup>99m</sup>Tc]pertechnetate ion.

Ph Eur

## Technetium (<sup>99m</sup>Tc) Macrosalb Injection

(Ph. Eur. monograph 0296)

Ph Eur

### DEFINITION

Sterile suspension of human albumin in the form of irregular insoluble aggregates obtained by denaturing human albumin in aqueous solution. It is prepared using *Sodium pertechnetate (<sup>99m</sup>Tc) injection (fission) (0124)* or *Sodium pertechnetate (<sup>99m</sup>Tc) injection (non fission) (0283)*. The particles are labelled with technetium-99m and have a typical diameter between 10 µm and 100 µm. The injection contains reducing substances, such as tin salts; it may contain a suitable buffer such as acetate, citrate or phosphate buffer and also non-denatured human albumin and an antimicrobial preservative such as benzyl alcohol.

The human albumin employed complies with the requirements prescribed in the monograph *Human albumin solution (0255)*.

**Technetium-99m** 90 per cent to 110 per cent of the declared technetium-99m radioactivity at the date and time stated on the label.

**Specific radioactivity** Minimum 37 MBq of technetium-99m per milligram of aggregated albumin at the date and time of administration.

### CHARACTERS

#### Appearance

White suspension which may separate on standing.

#### Half-life and nature of radiation of technetium-99m

See general chapter 5.7. *Table of physical characteristics of radionuclides*.

### IDENTIFICATION

#### A. Gamma-ray spectrometry.

**Result** The most prominent gamma photon of technetium-99m has an energy of 0.141 MeV.

B. The tests for non-filterable radioactivity and particle size contribute to the identification of the preparation (see Tests).

C. Transfer 1 mL of the preparation to be examined to a centrifuge tube and centrifuge at 2500 g for 5-10 min. Decant the supernatant. To the residue add 5 mL of *cupri-tartaric solution R2*, mix and allow to stand for 10 min.

If necessary, heat to dissolve the particles and allow to cool. Add rapidly 0.5 mL of *dilute phosphomolybdotungstic reagent R*, mixing immediately. A blue colour develops.

### TESTS

#### pH (2.2.3)

3.8 to 7.5.

#### Non-filterable radioactivity

Minimum 90 per cent of the total radioactivity.

Use a polycarbonate membrane filter 13-25 mm in diameter, 10 µm thick and with circular pores 3 µm in diameter.

Fit the membrane into a suitable holder. Place 0.2 mL of the preparation to be examined on the membrane and filter, adding 20 mL of a 9 g/L solution of *sodium chloride R* during the filtration. Determine the radioactivity remaining on the membrane.

#### Particle size

Not more than 10 particles have a maximum dimension greater than 100 µm and no particle having a maximum dimension greater than 150 µm is present.

Examine using a microscope. Dilute the preparation to be examined if necessary so that the number of particles is just low enough for individual particles to be distinguished. Using a syringe fitted with a needle having a calibre not less than 0.35 mm, place a suitable volume in a suitable counting chamber such as a haemocytometer cell, taking care not to overflow the chamber. Allow the preparation to be examined to settle for 1 min and, carefully add a cover slide without squeezing the sample. Scan an area corresponding to at least 5000 particles.

#### Aggregated albumin

**Test solution** Transfer a volume of the preparation to be examined containing about 1 mg of aggregated albumin to a centrifuge tube and centrifuge at about 2500 g for 5-10 min. Decant the supernatant. Resuspend the residue in 2.0 mL of a 9 g/L solution of *sodium chloride R*. Centrifuge at 2500 g for 5-10 min. Decant the supernatant. Resuspend the residue in 5.0 mL of *sodium carbonate solution R1*. Heat in a water-bath at 80-90 °C to dissolve the aggregated albumin. Allow to cool, transfer to a volumetric flask and dilute to 10.0 mL with *sodium carbonate solution R1*.

**Reference solutions** Prepare a range of solutions containing 0.05-0.2 mg of human albumin per millilitre by diluting *human albumin solution R* with *sodium carbonate solution R1*.

Introduce 3.0 mL of each solution separately into 25 mL flasks. To each flask add 15.0 mL of *cupri-tartaric solution R2*, mix and allow to stand for 10 min. Add rapidly 1.5 mL of *dilute phosphomolybdotungstic reagent R* and mix immediately. Allow to stand for 30 min and measure the absorbance (2.2.25) of each solution at 750 nm using *sodium carbonate solution R1* as the compensation liquid. Using the absorbances obtained with the reference solutions, draw a calibration curve and calculate the content of aggregated albumin in the preparation to be examined.

#### Tin

Maximum 3 mg/mL.

**Test solution** To 1.0 mL of the preparation to be examined, add 1.0 mL of a 206 g/L solution of *hydrochloric acid R*. Heat in a water-bath for 30 min. Cool and centrifuge for 10 min at 300 g. Dilute 1.0 mL of the supernatant to 25.0 mL with a 103 g/L solution of *hydrochloric acid R*.

**Reference solution** Dissolve 0.115 g of *stannous chloride R* in a 103 g/L solution of *hydrochloric acid R* and dilute to 1000.0 mL with the same acid.

To 1.0 mL of each solution, add 0.05 mL of *thioglycolic acid R*, 0.1 mL of *dithiol reagent R*, 0.4 mL of a 20 g/L solution of *sodium laurilsulfate R* and 3.0 mL of a 21 g/L solution of *hydrochloric acid R*. Mix. Measure the absorbance (2.2.25) of each solution at 540 nm, using a 21 g/L solution of *hydrochloric acid R* as the compensation liquid.

The absorbance of the test solution is not greater than that of the reference solution.

#### Physiological distribution

Inject a volume not greater than 0.2 mL into a caudal vein of each of 3 rats weighing 150-250 g. Euthanise the rats 15 min after the injection, remove the liver, the spleen and the lungs and measure the radioactivity in the organs using a suitable instrument. Measure the radioactivity in the rest of the body, including the blood, after having removed the tail. Determine the percentage of radioactivity in the lungs, the liver and the spleen from the following expression:

$$\frac{A}{B} \times 100$$

- A* = radioactivity of the organ concerned;  
*B* = total radioactivity in the liver, the spleen, the lungs and the rest of the body.

In not fewer than 2 of the 3 rats used, at least 80 per cent of the radioactivity is found in the lungs and not more than a total of 5 per cent in the liver and spleen. The preparation may be released for use before completion of the test.

#### Sterility

It complies with the test for sterility prescribed in the monograph *Radiopharmaceutical preparations (0125)*. The preparation may be released for use before completion of the test.

#### Bacterial endotoxins (2.6.14)

Less than 175/*V* IU/mL, *V* being the maximum recommended dose in millilitres.

#### RADIOACTIVITY

Determine the radioactivity using a calibrated instrument.

#### LABELLING

The label states:

- the concentration of tin expressed in milligrams per millilitre, if any;
- that the preparation is to be shaken before use;
- that the preparation is not to be used if after shaking, the suspension does not appear homogeneous.

Ph Eur

## Technetium (<sup>99m</sup>Tc) Mebrofenin Injection

(Ph. Eur. monograph 2393)

Ph Eur

#### DEFINITION

Sterile solution of a complex of technetium-99m with mebrofenin. It may contain stabilisers and inert additives.

#### Content

90 per cent to 110 per cent of the declared technetium-99m radioactivity at the date and time stated on the label.

#### PRODUCTION

It is prepared by dissolving [[2-(3-bromo-2,4,6-trimethylanilino)-2-oxoethyl]azanediyl]diacetic acid (mebrofenin) in *Sodium pertechnetate (<sup>99m</sup>Tc) injection (fission) (0124)* or *Sodium pertechnetate (<sup>99m</sup>Tc) injection (non-fission) (0283)* in the presence of a reducing agent such as a stannous salt.

#### CHARACTERS

##### Appearance

Clear, colourless solution.

##### Half-life and nature of radiation of technetium-99m

See general chapter 5.7. *Table of physical characteristics of radionuclides*.

#### IDENTIFICATION

A. Gamma-ray spectrometry.

**Results** The most prominent gamma photon of technetium-99m has an energy of 0.141 MeV.

B. Examine the chromatogram obtained in the test for other radiochemical impurities (see Tests).

**Results** The principal peak in the chromatogram obtained with the test solution is similar in retention time to the peak due to technetium-99m mebrofenin in the chromatogram obtained with the reference solution.

#### TESTS

##### pH (2.2.3)

4.0 to 7.5.

##### Sterility

It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations (0125)*. The injection may be released for use before completion of the test.

##### Bacterial endotoxins (2.6.14)

Less than 175/*V* IU/mL, *V* being the maximum recommended dose in millilitres.

#### RADIOCHEMICAL PURITY

*Technetium-99m mebrofenin* Minimum 90 per cent of the total radioactivity.

##### Impurity A

Thin-layer chromatography (2.2.27).

**Test solution** The preparation to be examined.

**Reference solution (a)** To 1 mL of a 1 g/L solution of stannous chloride R in 0.05 M hydrochloric acid in a closed vial, add 2 mL of sodium pertechnetate (<sup>99m</sup>Tc) injection (fission or non-fission). Use within 30 min after preparation.

**Reference solution (b)** Dissolve 40 mg of mebrofenin CRS in 2 mL of a 4 g/L solution of sodium hydroxide R and adjust to pH 6.5 with 1 M hydrochloric acid or a 40 g/L solution of sodium hydroxide R. To this solution add 25 µL of a 20 mg/mL solution of stannous chloride R in 0.05 M hydrochloric acid and 400 MBq of sodium pertechnetate (<sup>99m</sup>Tc) injection (fission or non-fission) in a volume of 2 mL. Allow to stand for 30–60 min.

**Plate** TLC silica gel plate R; use a glass-fibre plate.

**Mobile phase** water R, acetonitrile R (40:60 V/V).

**Application** About 5 µL.

**Development** Immediately, over 4/5 of the plate.

**Drying** In air.

**Detection** Determine the distribution of radioactivity using a suitable detector.

**Retardation factor** Impurity A = 0.0 to 0.1.

**System suitability** The retardation factor of the principal peak in the chromatogram obtained with reference solution (a) is not more than 0.1; the retardation factor of the principal peak in the chromatogram obtained with reference solution (b) is more than 0.7.

##### Limit:

— **impurity A**: maximum 5 per cent of the total radioactivity.

##### Other radiochemical impurities

Liquid chromatography (2.2.29).

**Test solution** The preparation to be examined.

**Reference solution** Use reference solution (b) of the test for impurity A.

##### Column:

— **size**: *l* = 0.25 m,  $\varnothing$  = 4.0 mm;

— **stationary phase**: end-capped polar-embedded octadecylsilyl amorphous organosilica polymer R (5 µm).

**Mobile phase:**

- mobile phase A: 3.85 g/L solution of ammonium acetate R;
- mobile phase B: acetonitrile R;

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 20	70	30
20 - 25	70 → 0	30 → 100
25 - 30	0	100

**Flow rate** 1.0 mL/min.

**Detection** Radioactivity detector.

**Injection** 20 µL.

**Relative retention** With reference to technetium-99m mebrofenin (retention time = about 20 min): impurity B = about 0.17.

**Limits:**

- sum of the areas of the peaks eluted before the principal peak (corresponding to hydrophilic impurities, including impurity B): maximum 6 per cent of the total area of the peaks in the chromatogram obtained with the test solution.

**RADIOACTIVITY**

Determine the radioactivity using a calibrated instrument.

**IMPURITIES**

- A. technetium-99m in colloidal form,
- B. [<sup>99m</sup>Tc]pertechnetate ion.

Ph Eur

## Technetium (<sup>99m</sup>Tc) Medronate Injection

(Ph. Eur. monograph 0641)

Ph Eur

**DEFINITION**

Sterile solution of a complex of technetium-99m with sodium methylenediphosphonate. It is prepared using Sodium pertechnetate (<sup>99m</sup>Tc) injection (fission) (0124) or Sodium pertechnetate (<sup>99m</sup>Tc) injection (non-fission) (0283). It may contain antimicrobial preservatives, antioxidants, stabilisers and buffers.

**Technetium-99m** 90 per cent to 110 per cent of the declared technetium-99m radioactivity at the date and time stated on the label.

**CHARACTERS****Appearance**

Clear, colourless solution.

**Half-life and nature of radiation of technetium-99m**

See general chapter 5.7. Table of physical characteristics of radionuclides.

**IDENTIFICATION**

A. Gamma-ray spectrometry.

**Result** The most prominent gamma photon of technetium-99m has an energy of 0.141 MeV.

B. Examine the chromatograms obtained in the tests for Impurity A and Impurity B under Radiochemical purity (see Tests).

**Results** The principal peak in the chromatogram obtained with the test solution is, in each of the tests, similar in

retardation factor to the principal peak in the chromatogram obtained with reference solution (b).

C. Thin-layer chromatography (2.2.27).

**Test solution** Dilute the preparation to be examined with water R to obtain a solution containing about 0.1 mg/mL of medronic acid.

**Reference solution (a)** Dissolve 3 mg of sodium oxidronate R in water R and dilute to 10 mL with the same solvent.

**Reference solution (b)** Dissolve 1 mg of medronic acid R in water R and dilute to 10 mL with the same solvent.

**Plate cellulose for chromatography R** as the coating substance.

**Mobile phase** To 30 mL of water R add 35 mL of ethanol (96 per cent) R, 15 mL of 2-methylpropanol R, 0.4 mL of concentrated ammonia R, 5 g of trichloroacetic acid R and 20 mL of 2-propanol R and mix.

**Application** About 5 µL, applied in 1 µL portions with drying after each application.

**Development** Over 2/3 of the plate.

**Drying** In air for at least 14 h.

**Detection** Spray with a solution prepared as follows: to 25 mL of a 40 g/L solution of ammonium molybdate R add 63 mL of water R, 2 mL of hydrochloric acid R, 2 mL of sulfuric acid R and 8 mL of perchloric acid R and mix. Expose the plate to ultraviolet light at 254 nm for 15 min.

**System suitability:**

- the retardation factor of the spot in the chromatogram obtained with reference solution (b) is about 0.6 and clearly different from that obtained with reference solution (a), which is about 0.5.

**Results** The principal spot in the chromatogram obtained with the test solution is similar in position and colour to the principal spot in the chromatogram obtained with reference solution (b).

The preparation may be released for use before completion of the test.

**TESTS****pH (2.2.3)**

3.5 to 7.5.

**Tin**

Maximum 3 mg/V, V being the maximum recommended dose in millilitres.

Determine the content of tin using a semi-quantitative tin test kit R, following the instructions given by the test kit manufacturer. If necessary, dilute the preparation to be examined with water R to obtain a concentration of tin within the measurement range of the test kit.

**Sterility**

It complies with the test for sterility prescribed in the monograph Radiopharmaceutical preparations (0125). The preparation may be released for use before completion of the test.

**Bacterial endotoxins (2.6.14)**

Less than 175/V IU/mL, V being the maximum recommended dose in millilitres.

**RADIOCHEMICAL PURITY****Impurity A**

Thin-layer chromatography (2.2.27).

**Test solution** The preparation to be examined.

**Reference solution (a)** To 1 mL of a 1 g/L solution of stannous chloride R in a 5.15 g/L solution of hydrochloric acid R in a closed vial, add 2 mL of sodium pertechnetate

$^{99m}\text{Tc}$  injection (fission) (0124) or sodium pertechnetate  $^{99m}\text{Tc}$  injection (non-fission) (0283) containing 100-400 MBq. Use within 30 min.

**Reference solution (b)** To a vial of medronate for radiochemical purity testing CRS add 2 mL of sodium pertechnetate  $^{99m}\text{Tc}$  injection (fission) (0124) or sodium pertechnetate  $^{99m}\text{Tc}$  injection (non-fission) (0283) containing 100-400 MBq. Allow to stand for 15 min.

**Plate** TLC silica gel plate R; use a glass-fibre plate.

**Mobile phase** 136 g/L solution of sodium acetate R.

**Application** About 2  $\mu\text{L}$ .

**Development** Immediately, over 4/5 of the plate.

**Drying** In air.

**Detection** Suitable detector to determine the distribution of radioactivity.

**Retardation factors** Impurity A = 0.0-0.1; impurity B and  $^{99m}\text{Tc}$  technetium medronate = 0.9-1.0.

#### Impurity B

Thin-layer chromatography (2.2.27).

**Test solution** The preparation to be examined.

**Reference solution (a)** Sodium pertechnetate  $^{99m}\text{Tc}$  injection (fission) (0124) or sodium pertechnetate  $^{99m}\text{Tc}$  injection (non-fission) (0283).

**Reference solution (b)** Reference solution (b) of the test for impurity A.

**Plate** TLC silica gel plate R; use a glass-fibre plate.

**Mobile phase** methyl ethyl ketone R.

**Application** About 2  $\mu\text{L}$ .

**Development** Immediately, over 4/5 of the plate.

**Drying** In air.

**Detection** Suitable detector to determine the distribution of radioactivity.

**Retardation factors** Impurity A and  $^{99m}\text{Tc}$  technetium medronate = 0.0-0.1 and impurity B = 0.9-1.0.

#### Limit:

—  $^{99m}\text{Tc}$  technetium medronate: minimum 95 per cent of the total radioactivity due to technetium-99m.

Calculate the percentage of radioactivity due to  $^{99m}\text{Tc}$  technetium medronate using the following expression:

$$100 - (A + B)$$

**A** = percentage of radioactivity due to impurity A determined in the test for impurity A under Radiochemical purity;

**B** = percentage of radioactivity due to impurity B determined in the test for impurity B under Radiochemical purity.

#### RADIOACTIVITY

Determine the radioactivity using a calibrated instrument.

#### IMPURITIES

**Specified impurities** A, B.

A.  $^{99m}\text{Tc}$  technetium in colloidal form,

B.  $^{99m}\text{Tc}$  pertechnetate ion.

Ph Eur

## Technetium ( $^{99m}\text{Tc}$ ) Mertiatide Injection

(Ph. Eur. monograph 1372)

Ph Eur

#### DEFINITION

Sterile solution of disodium oxo[N-[N-[N-(sulfanylacetyl)glycyl]glycyl]glycynato(5-)- $\kappa^4\text{N},\text{N}',\text{N}'',\text{S}$ ]  $^{99m}\text{Tc}$  technetate(V). It may be prepared by either heating a mixture containing S-benzoylmercaptoacetyltriglycine (betiatide), a weak chelating agent such as tartrate, a stannous salt and Sodium pertechnetate  $^{99m}\text{Tc}$  injection fission (0124) or Sodium pertechnetate  $^{99m}\text{Tc}$  injection non-fission (0283), or by mixing solutions of mercaptoacetyltriglycine (mertiatide), a stannous salt and Sodium pertechnetate  $^{99m}\text{Tc}$  injection fission (0124) or Sodium pertechnetate  $^{99m}\text{Tc}$  injection non-fission (0283) at alkaline pH. It may contain stabilisers and a buffer.

**Technetium-99m** 90 per cent to 110 per cent of the declared technetium-99m radioactivity at the date and time stated on the label.

#### CHARACTERS

##### Appearance

Clear, colourless solution.

##### Half-life and nature of radiation of technetium-99m

See general chapter 5.7. Table of physical characteristics of radionuclides.

#### IDENTIFICATION

A. Gamma-ray spectrometry.

**Result** The most prominent gamma photon of technetium-99m has an energy of 0.141 MeV.

B. Examine the chromatograms obtained in the test of other radiochemical impurities in the section Radiochemical purity (see Tests).

**Result** The principal peak in the radiochromatogram obtained with the test solution is similar in retention time to the principal peak in the chromatogram obtained with the reference solution.

#### TESTS

**pH** (2.2.3)

5.0 to 7.5.

##### Sterility

It complies with the test for sterility prescribed in the monograph Radiopharmaceutical preparations (0125).

The preparation may be released for use before completion of the test.

#### RADIOCHEMICAL PURITY

##### Impurity A

Ascending paper chromatography (2.2.26).

**Test solution** The preparation to be examined.

**Paper** paper for chromatography R.

Mobile phase water R, acetonitrile R (40:60 V/V).

Application 2 µL.

Development Over a path of 15 cm.

Drying In air.

Detection Suitable detector to determine the distribution of radioactivity.

Retardation factor Impurity A = 0.0-0.1.

Limits:

— impurity A: maximum 2.0 per cent of the total radioactivity.

#### Other radiochemical impurities

Liquid chromatography (2.2.29).

Test solution The preparation to be examined.

Reference solution Dissolve with heating on a water-bath 5 mg of *S*-benzylmercaptoacetyltryglycine CRS in 5 mL of water R. To 1 mL of this solution in a closed vial filled with nitrogen R, add 0.5 mL of a 40 g/L solution of sodium potassium tartrate R, 25 µL of a 4 g/L solution of stannous chloride R in a 5 g/L solution of hydrochloric acid R and 370-740 MBq of sodium pertechnetate (<sup>99m</sup>Tc) injection (fission or non-fission) in a volume not exceeding 3 mL. Heat the mixture on a water-bath for 10 min and allow to cool to room temperature.

Column:

— size:  $l = 0.25$  m,  $\varnothing = 4.0$  mm;

— stationary phase: octadecylsilyl silica gel for chromatography R (5 µm).

Mobile phase A Mix 7 volumes of anhydrous ethanol R with 93 volumes of a 1.36 g/L solution of potassium dihydrogen phosphate R, adjusted to pH 6.0 with a 4 g/L solution of sodium hydroxide R.

Mobile phase B water R, methanol R (10:90 V/V).

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 10	100	0
10 - 25	0	100

Flow rate 1.0 mL/min.

Detection Suitable detector to determine the distribution of radioactivity.

Equilibration With mobile phase A for 20 min.

Injection 20 µL.

Limits:

- sum of the areas preceding the principal peak (corresponding to hydrophilic impurities, including impurity B): maximum 3.0 per cent of the sum of the areas of all peaks in the chromatogram obtained with the test solution;
- sum of the peaks following the principal peak (corresponding to lipophilic impurities): maximum 4.0 per cent of the sum of the area of all peaks in the chromatogram obtained with the test solution;
- [<sup>99m</sup>Tc]technetium mertiatide: minimum 94 per cent of the radioactivity due to technetium-99m.

#### RADIOACTIVITY

Determine the radioactivity using a calibrated instrument.

#### IMPURITIES

- A. [<sup>99m</sup>Tc]technetium in colloidal form,
- B. [<sup>99m</sup>Tc]pertechnetate ion.

## Technetium (<sup>99m</sup>Tc) Microspheres Injection

(Ph. Eur. monograph 0570)

Ph Eur

#### DEFINITION

Sterile suspension of human albumin which has been denatured to form spherical insoluble particles. The particles are labelled with technetium-99m and have a typical diameter of 10-50 µm. It is prepared using Sodium pertechnetate (<sup>99m</sup>Tc) injection (fission) (0124) or Sodium pertechnetate (<sup>99m</sup>Tc) injection (non fission) (0283).

The injection contains reducing substances, such as tin salts. It may contain a suitable buffer such as acetate, citrate or phosphate and additives such as wetting agents.

The human albumin used complies with the requirements of the monograph Human albumin solution (0255).

Technetium-99m 90 per cent to 110 per cent of the declared technetium-99m radioactivity at the date and time stated on the label.

Radioactivity Minimum 185 MBq of technetium-99m per million particles at the date and time of administration.

#### CHARACTERS

##### Appearance

Suspension of white, yellow or artificially coloured particles which may separate on standing.

##### Half-life and nature of radiation of technetium-99m

See general chapter 5.7. Table of physical characteristics of radionuclides.

#### IDENTIFICATION

A. Gamma-ray spectrometry.

Result The most prominent gamma photon of technetium-99m has an energy of 0.141 MeV.

B. The tests for non-filterable radioactivity and particle size (see Tests) contribute to the identification of the preparation.

C. Transfer 1 mL of the preparation to be examined to a centrifuge tube and centrifuge at 2500 g for 5-10 min. Decant the supernatant. To the residue add 5 mL of cupri-tartaric solution R2, mix and allow to stand for 10 min. If necessary, heat to dissolve the particles and allow to cool. Add rapidly 0.5 mL of dilute phosphomolybdotungstic reagent R, mix immediately. A blue colour develops.

#### TESTS

pH (2.2.3)

4.0 to 9.0.

##### Non-filterable radioactivity

Minimum 95 per cent of the total radioactivity.

Use a polycarbonate membrane filter 13-25 mm in diameter, 10 µm thick and with circular pores 3 µm in diameter. Fit the membrane into a suitable holder. Place 0.2 mL of the preparation to be examined on the membrane and filter, adding 20 mL of a 9 g/L solution of sodium chloride R during the filtration. Determine the radioactivity remaining on the membrane.

##### Particle size

Maximum 10 particles have a maximum dimension greater than 75 µm but no particle have a maximum dimension greater than 100 µm.

Examine using a microscope. Dilute the preparation if necessary so that the number of particles is just low enough for individual particles to be distinguished. Using a syringe

Ph Eur

fitted with a needle having a calibre not less than 0.35 mm, place a suitable volume in a suitable counting chamber such as a haemocytometer cell, taking care not to overfill the chamber. Allow the suspension to settle for 1 min and carefully add a cover slide without squeezing the sample. Scan an area corresponding to at least 5000 particles. The particles have a uniform spherical appearance.

#### Number of particles

Examine using a microscope. Fill a suitable counting chamber such as a haemocytometer cell with a suitable dilution of the preparation taking care that particles do not separate during the transfer. Count the number of particles in the chamber. Repeat this procedure twice and calculate the number of particles per millilitre of the preparation to be examined.

#### Tin

Maximum 3 mg/mL.

**Test solution** To 1.0 mL of the preparation to be examined add 0.5 mL of *sulfuric acid R* and 1.5 mL of *nitric acid R*. Heat and evaporate to approximately 1 mL. Add 2 mL of *water R* and evaporate again to approximately 1 mL. Repeat this procedure twice, cool and dilute to 25.0 mL with a 103 g/L solution of *hydrochloric acid R*.

**Reference solution** Dissolve 0.115 g of *stannous chloride R* in a 103 g/L solution of *hydrochloric acid R* and dilute to 1000.0 mL with the same acid.

To 1.0 mL of each solution add 0.4 mL of a 20 g/L solution of *sodium laurilsulfate R*, 0.05 mL of *thioglycollic acid R*, 0.1 mL of *dithiol reagent R* and 3.0 mL of a 21 g/L solution of *hydrochloric acid R*. Mix. Measure the absorbance (2.2.25) of each solution at 540 nm, using a 21 g/L solution of *hydrochloric acid R* as the compensation liquid.

The absorbance of the test solution is not greater than that of the reference solution.

#### Physiological distribution

Inject a volume not greater than 0.2 mL into a caudal vein of each of 3 rats weighing 150-250 g. Euthanise the rats 15 min after the injection, remove the liver, the spleen and the lungs and measure the radioactivity in these organs using a suitable instrument. Measure the radioactivity in the rest of the body, including the blood and voided urine, after having removed the tail. Determine the percentage of radioactivity in the liver, the spleen and the lungs, using the following expression:

$$\frac{A}{B} \times 100$$

- A* = radioactivity of the organ concerned;  
*B* = total radioactivity in the liver, the spleen, the lungs and the rest of the body, including voided urine.

In not fewer than 2 of the 3 rats used, not less than 80 per cent of the radioactivity is found in the lungs and not more than a total of 5 per cent in the liver and spleen. The preparation may be released for use before completion of the test.

#### Sterility

It complies with the test for sterility prescribed in the monograph *Radiopharmaceutical preparations (0125)*. The preparation may be released for use before completion of the test.

#### Bacterial endotoxins (2.6.14)

Less than 175/*V* IU/mL, *V* being the maximum recommended dose in millilitres.

#### RADIOACTIVITY

Determine the radioactivity using a calibrated instrument.

#### LABELLING

The label states:

- the concentration of tin expressed in milligrams per millilitre, if any,
- that the preparation is to be shaken before use.

Ph Eur

## Technetium (<sup>99m</sup>Tc) Oxidronate Injection

(Ph. Eur. monograph 2376)

Ph Eur

#### DEFINITION

Sterile solution of a complex of technetium-99m with sodium hydroxymethylenediphosphonate (sodium oxidronate). It is prepared by dissolving sodium oxidronate in *Sodium pertechnetate (<sup>99m</sup>Tc) injection (fission) (0124)* or *Sodium pertechnetate (<sup>99m</sup>Tc) injection (non-fission) (0283)* in the presence of a reducing agent. It may contain stabilisers and inert additives.

**Technetium-99m** 90 per cent to 110 per cent of the declared technetium-99m radioactivity at the date and time stated on the label.

#### CHARACTERS

##### Appearance

Clear or opalescent, colourless or yellowish solution.

##### Half-life and nature of radiation of technetium-99m

See general chapter 5.7. *Table of physical characteristics of radionuclides*.

#### IDENTIFICATION

A. Gamma-ray spectrometry.

**Result** The most prominent gamma photon of technetium-99m has an energy of 0.141 MeV.

B. Examine the chromatograms obtained in the tests for Impurity A and Impurity B under Radiochemical purity (see Tests).

**Results** The principal peak in the chromatogram obtained with the test solution is, in each of the tests, similar in retardation factor to the principal peak in the chromatogram obtained with reference solution (b).

C. Thin-layer chromatography (2.2.27).

**Test solution** Dilute the preparation to be examined with *water R* to obtain a solution containing about 0.3 mg/mL of sodium oxidronate.

**Reference solution (a)** Dissolve 3 mg of *sodium oxidronate R* in *water R* and dilute to 10 mL with the same solvent.

**Reference solution (b)** Dissolve 1 mg of *medronic acid R* in *water R* and dilute to 10 mL with the same solvent.

**Plate** *cellulose for chromatography R* as the coating substance.

**Mobile phase** To 30 mL of *water R* add 35 mL of *ethanol (96 per cent) R*, 15 mL of *2-methylpropanol R*, 0.4 mL of *concentrated ammonia R*, 5 g of *trichloroacetic acid R* and 20 mL of *2-propanol R* and mix.

**Application** About 5 µL, applied in 1 µL portions with drying after each application.

**Development** Over 2/3 of the plate.

**Drying** In air for at least 14 h.

**Detection** Spray with a solution prepared as follows: to 25 mL of a 40 g/L solution of *ammonium molybdate R* add

63 mL of water R, 2 mL of hydrochloric acid R, 2 mL of sulfuric acid R and 8 mL of perchloric acid R and mix. Expose the plate to ultraviolet light at 254 nm for 15 min.

**System suitability:**

- the retardation factor of the spot in the chromatogram obtained with reference solution (b) is about 0.6 and clearly different from that obtained with reference solution (a), which is about 0.5.

**Results** The principal spot in the chromatogram obtained with the test solution is similar in position and colour to the principal spot in the chromatogram obtained with reference solution (a).

The preparation may be released for use before completion of the test.

**TESTS**

**pH (2.2.3)**  
4.0 to 7.0.

**Sterility**

It complies with the test for sterility prescribed in the monograph *Radiopharmaceutical preparations (0125)*. The preparation may be released for use before completion of the test.

**Bacterial endotoxins (2.6.14)**

Less than 175/V IU/mL, V being the maximum recommended dose in millilitres.

**RADIOCHEMICAL PURITY**

**Impurity A**

Ascending paper chromatography (2.2.26).

**Test solution** The preparation to be examined.

**Reference solution (a)** To 1 mL of a 1 g/L solution of stannous chloride R in a 5.15 g/L solution of hydrochloric acid R in a closed vial, add 2 mL of Sodium pertechnetate ( $^{99m}\text{Tc}$ ) injection (fission) (0124) or Sodium pertechnetate ( $^{99m}\text{Tc}$ ) injection (non-fission) (0283) containing 100-400 MBq. Use within 30 min.

**Reference solution (b)** To a vial of oxidronate for radiochemical purity testing CRS add 2 mL of Sodium pertechnetate ( $^{99m}\text{Tc}$ ) injection (fission) (0124) or Sodium pertechnetate ( $^{99m}\text{Tc}$ ) injection (non-fission) (0283) containing 100-400 MBq. Allow to stand for 10 min.

**Paper** paper for chromatography R.

**Mobile phase** 9 g/L solution of sodium chloride R.

**Application** About 5  $\mu\text{L}$ .

**Development** Immediately, over a path of 15 cm.

**Drying** In air.

**Detection** Suitable detector to determine the distribution of radioactivity.

**Retardation factors** Impurity A = 0.0-0.1; impurity B = 0.6-0.8; [ $^{99m}\text{Tc}$ ]technetium oxidronate = 0.9-1.0.

**Impurity B**

Thin-layer chromatography (2.2.27).

**Test solution** The preparation to be examined.

**Reference solution (a)** Sodium pertechnetate ( $^{99m}\text{Tc}$ ) injection (fission) (0124) or Sodium pertechnetate ( $^{99m}\text{Tc}$ ) injection (non-fission) (0283).

**Reference solution (b)** Reference solution (b) of the test for impurity A.

**Plate** TLC silica gel plate R; use a glass-fibre plate.

**Mobile phase** methyl ethyl ketone R.

**Application** About 5  $\mu\text{L}$ .

**Development** Immediately, over 4/5 of the plate.

**Drying** In air.

**Detection** Suitable detector to determine the distribution of radioactivity.

**Retardation factors** Impurity A and [ $^{99m}\text{Tc}$ ]technetium oxidronate = 0.0-0.1; impurity B = 0.9-1.0.

**Limit:**

— [ $^{99m}\text{Tc}$ ]technetium oxidronate: minimum 95 per cent of the total radioactivity due to technetium-99m.

Calculate the percentage of radioactivity due to [ $^{99m}\text{Tc}$ ]technetium oxidronate using the following expression:

$$100 - (A + B)$$

- A = percentage of radioactivity due to impurity A determined in the test for impurity A under Radiochemical purity;  
B = percentage of radioactivity due to impurity B determined in the test for impurity B under Radiochemical purity.

**RADIOACTIVITY**

Determine the radioactivity using a calibrated instrument.

**IMPURITIES**

**Specified impurities** A, B.

A. [ $^{99m}\text{Tc}$ ]technetium in colloidal form,

B. [ $^{99m}\text{Tc}$ ]pertechnetate ion.

Ph Eur

## Technetium ( $^{99m}\text{Tc}$ ) Pentetate Injection

(Ph. Eur. monograph 0642)

Ph Eur

**DEFINITION**

Sterile solution of a complex of technetium-99m with sodium pentetate or calcium trisodium pentetate. It is prepared using Sodium pertechnetate ( $^{99m}\text{Tc}$ ) injection (fission) (0124) or Sodium pertechnetate ( $^{99m}\text{Tc}$ ) injection (non fission) (0283).

It may contain suitable antimicrobial preservatives, antioxidants, stabilisers and buffers.

**Technetium-99m** 90 per cent to 110 per cent of the declared technetium-99m radioactivity at the date and time stated on the label.

**CHARACTERS**

**Appearance**

Clear, colourless or slightly yellow solution.

**Half-life and nature of radiation of technetium-99m** See general chapter 5.7. Table of physical characteristics of radionuclides.

**IDENTIFICATION**

A. Gamma-ray spectrometry.

**Result** The most prominent gamma photon of technetium-99m has an energy of 0.141 MeV.

B. Examine the chromatograms obtained in tests A and B for radiochemical purity (see Tests).

**Results:**

- the retardation factor of the principal peak in the radiochromatogram obtained with the test solution in test A is 0.9 to 1.0;
- the retardation factor of the principal peak in the radiochromatogram obtained with the test solution in test B is 0.0 to 0.1.

**C. Test solution.** In a clean, dry, 10 mL glass tube, place a volume of the preparation to be examined containing 2 mg of pentetate. Dilute, if necessary, to 1 mL with *water R*.

**Reference solution** In a clean, dry, 10 mL glass tube, place 1 mL of *water R*.

To each tube add 0.1 mL of a 1 g/L solution of *nickel sulfate R*, 0.5 mL of a 50 per cent *V/V* solution of *glacial acetic acid R* and 0.75 mL of a 50 g/L solution of *sodium hydroxide R*. Mix and check that the pH is not above 5. To each tube add 0.1 mL of a 10 g/L solution of *dimethylglyoxime R* in *ethanol (96 per cent) R*. Mix and allow to stand for 2 min. Adjust the pH in each tube to not less than 12 by adding a 100 g/L solution of *sodium hydroxide R*. Mix and check that the pH is not below 12. Allow to stand for 2 min. Heat the tubes gently on a water-bath for 2 min.

**Results:**

- the test solution remains clear and colourless throughout;
- the reference solution becomes red on addition of dimethylglyoxime solution and a red precipitate is formed when the tube is heated on the water-bath.

## TESTS

**pH (2.2.3)**

4.0 to 7.5.

**Tin**

Maximum 1 mg/mL.

**Test solution** Dilute 1.5 mL of the preparation to be examined to 25.0 mL with a 103 g/L solution of *hydrochloric acid R*.

**Reference solution** Dissolve 0.115 g of *stannous chloride R* in a 103 g/L solution of *hydrochloric acid R* and dilute to 1000.0 mL with the same acid.

To 1.0 mL of each solution add 0.05 mL of *thioglycollic acid R*, 0.1 mL of *dithiol reagent R*, 0.4 mL of a 20 g/L solution of *sodium laurilsulfate R* and 3.0 mL of a 21 g/L solution of *hydrochloric acid R*. Mix. Measure the absorbance (2.2.25) of each solution at 540 nm, using a 21 g/L solution of *hydrochloric acid R* as the compensation liquid.

The absorbance of the test solution is not greater than that of the reference solution.

## Sterility

It complies with the test for sterility prescribed in the monograph *Radiopharmaceutical preparations (0125)*.

The preparation may be released for use before completion of the test.

## RADIOCHEMICAL PURITY

### A. Impurity A

Thin-layer chromatography (2.2.27).

**Test solution** The preparation to be examined.

**Plate** TLC silica gel plate *R*; use silica gel as the coating substance on a glass-fibre sheet, previously heated at 110 °C for 10 min.

**Mobile phase** 9 g/L solution of *sodium chloride R*.

**Application** 5-10 µL.

**Development** Immediately, over a path of 10-15 cm in about 10 min.

**Drying** In air.

**Detection** Suitable detector to determine the distribution of radioactivity.

**Retardation factors** Impurity A = 0.0 to 0.1; [<sup>99m</sup>Tc] technetium pentetate and impurity B = 0.9 to 1.0.

### B. Impurity B

Thin-layer chromatography (2.2.27).

**Test solution** The preparation to be examined.

**Plate** TLC silica gel plate *R*; use silica gel as the coating substance on a glass-fibre sheet, previously heated at 110 °C for 10 min.

**Mobile phase** methyl ethyl ketone *R*.

**Application** 5-10 µL; allow to dry.

**Development** Over a path of 10-15 cm in about 10 min.

**Drying** In air.

**Detection** Suitable detector to determine the distribution of radioactivity.

**Retardation factors** [<sup>99m</sup>Tc]technetium pentetate and impurity A = 0.0 to 0.1; impurity B = 0.9 to 1.0.

**Limit:**

- sum of impurities A and B: maximum 5.0 per cent of the radioactivity due to technetium-99m in the chromatograms obtained in tests A and B.

## RADIOACTIVITY

Determine the radioactivity using a calibrated instrument.

## IMPURITIES

A. [<sup>99m</sup>Tc]technetium in colloidal form,

B. [<sup>99m</sup>Tc]pertechnetate ion.

Ph Eur

## Technetium (<sup>99m</sup>Tc) Sestamibi Injection

(Ph. Eur. monograph 1926)

Ph Eur

## DEFINITION

Sterile solution of (OC-6-11)-hexakis[1-(isocyano-κC)-2-methoxy-2-methylpropane][<sup>99m</sup>Tc]technetium(I) chloride, which may be prepared by heating a mixture containing [tetrakis(2-methoxy-2-methylpropyl-1-isocyanide) copper (1+)] tetrafluoroborate, a weak chelating agent, a stannous salt and *Sodium pertechnetate (<sup>99m</sup>Tc) injection (fission) (0124)* or *Sodium pertechnetate (<sup>99m</sup>Tc) injection (non-fission) (0283)*.

## Content

90 per cent to 110 per cent of the declared technetium-99m radioactivity at the date and hour stated on the label.

## CHARACTERS

### Appearance

Clear, colourless solution.

**Half-life and nature of radiation of technetium-99m**  
See general chapter 5.7. *Table of physical characteristics of radionuclides.*

### IDENTIFICATION

#### A. Gamma-ray spectrometry.

**Results** The spectrum obtained with the solution to be examined does not differ significantly from that of a standardised technetium-99m solution. The most prominent gamma photon has an energy of 0.141 MeV.

#### B. Examine the chromatograms obtained in the test for impurity C under Radiochemical purity.

**Results** The principal peak in the radiochromatogram obtained with the test solution is similar in retention time to the principal peak in the radiochromatogram obtained with the reference solution.

### TESTS

#### pH (2.2.3)

5.0 to 6.0.

#### Sterility

It complies with the test for sterility prescribed in the monograph on *Radiopharmaceutical preparations (0125)*. The injection may be released for use before completion of the test.

### RADIOCHEMICAL PURITY

#### Impurity A and other polar impurities

Thin-layer chromatography (2.2.27).

**Test solution** The preparation to be examined.

**Plate** TLC octadecylsilyl silica gel plate R.

**Mobile phase** Mix 10 volumes of tetrahydrofuran R, 20 volumes of a 38.5 g/L solution of ammonium acetate R, 30 volumes of methanol R and 40 volumes of acetonitrile R.

**Application** About 5 µL.

**Development** Immediately over a path of 6 cm.

**Drying** In air.

**Detection** Determine the distribution of radioactivity using a radioactivity detector.

**Retardation factors** Impurity B and apolar impurities = 0 to 0.1; impurity C and technetium-99m sestamibi = 0.3 to 0.6; impurity A and other polar impurities = 0.9 to 1.0.

**Limit** See test for impurity B.

#### Impurity B

Paper chromatography (2.2.26). *If no activity is found at retardation factor 0 to 0.1 in the test for impurity A and other polar impurities, impurity B is absent and the test for impurity B may be omitted.*

**Test solution** The preparation to be examined.

**Paper** paper for chromatography R.

**Mobile phase** Mix equal volumes of acetonitrile R, a 30 g/L solution of glacial acetic acid R and a 20 g/L solution of sodium chloride R.

**Application** About 5 µL.

**Development** Over a path of 10 cm.

**Drying** In air.

**Detection** Determine the distribution of radioactivity using a radioactivity detector.

**Retardation factors** Impurity B = 0 to 0.1; impurity A, impurity C and technetium-99m sestamibi = 0.8 to 1.0.

**Limit:**

— sum of impurity A and other polar impurities, and impurity B: maximum 5 per cent of the total radioactivity.

#### Impurity C

Liquid chromatography (2.2.29).

**Test solution** The preparation to be examined.

**Reference solution** To a vial of *sestamibi labelling kit CRS* add 3 mL of a 9 g/L solution of sodium chloride R containing 700 MBq to 900 MBq of sodium pertechnetate (<sup>99m</sup>Tc) injection (fission or non-fission). Heat the mixture in a water-bath for 10 min and allow to cool to room temperature.

**Column:**

— size:  $l = 0.25$  m,  $\varnothing = 4.6$  mm,

— stationary phase: spherical base-deactivated end-capped octadecylsilyl silica gel for chromatography R (5 µm).

**Mobile phase** Mix 20 volumes of acetonitrile R, 35 volumes of a 6.6 g/L solution of ammonium sulfate R and 45 volumes of methanol R.

**Flow rate** 1.5 mL/min.

**Detection** Radioactivity detector.

**Injection** 25 µL.

**Run time** 25 min.

**Relative retention** With reference to technetium-99m sestamibi: impurity C = about 1.3.

**System suitability** Reference solution:

- the chromatogram is similar to the chromatogram provided with *sestamibi labelling kit CRS*,
- relative retention with reference to technetium-99m sestamibi: impurity C = minimum 1.2.

**Limits:**

- impurity C: not more than 3 per cent of the total radioactivity,
- technetium-99m sestamibi: minimum 94 per cent of the total radioactivity.

Calculate the percentage of radioactivity due to technetium-99m sestamibi from the expression:

$$\frac{(100 - B) \times T}{100}$$

- B = percentage of radioactivity due to impurity B determined in the test for impurity B under Radiochemical purity,  
T = area of the peak due to technetium-99m sestamibi in the chromatogram obtained with the test solution.

### RADIOACTIVITY

Determine the radioactivity using a calibrated instrument.

### IMPURITIES

- A. [<sup>99m</sup>Tc]O<sub>4</sub><sup>-</sup>: (<sup>99m</sup>Tc)pertechnetate ion,  
B. technetium-99m in colloidal form,

- C. (OC-6-22)-pentakis[1-(isocyano-κC)-2-methoxy-2-methylpropane][1-(isocyano-κC)-2-methylprop-1-ene][<sup>99m</sup>Tc]technetium (1+).

Ph Eur

## Technetium ( $^{99m}\text{Tc}$ ) Succimer Injection

(Ph. Eur. monograph 0643)

Ph Eur

### DEFINITION

Sterile solution of a complex of technetium-99m with meso-2,3-dimercaptosuccinic acid. It is prepared using Sodium pertechnetate ( $^{99m}\text{Tc}$ ) injection (fission) (0124) or Sodium pertechnetate ( $^{99m}\text{Tc}$ ) injection (non fission) (0283). It contains a reducing substance, such as tin salt and may contain stabilisers, antioxidants such as ascorbic acid, and inert additives.

**Technetium-99m** 90 per cent to 110 per cent of the declared technetium-99m radioactivity at the date and time stated on the label.

### CHARACTERS

#### Appearance

Clear, colourless solution.

#### Half-life and nature of radiation of technetium-99m

See general chapter 5.7. Table of physical characteristics of radionuclides.

### IDENTIFICATION

#### A. Gamma-ray spectrometry.

**Result** The most prominent gamma photon of technetium-99m has an energy of 0.141 MeV.

#### B. Examine the chromatogram obtained in the test for radiochemical purity (see Tests).

**Result** The retardation factor of the principal peak in the radiochromatogram obtained with the test solution is 0.0 to 0.1.

C. Place 1 mL of the preparation to be examined in a test-tube and add 0.1 mL of glacial acetic acid R and 1 mL of a 20 g/L solution of sodium nitroprusside R. Mix. Carefully place a layer of concentrated ammonia R at the top of the solution. A violet ring develops between the layers.

### TESTS

#### pH (2.2.3)

2.3 to 3.5.

#### Tin

Maximum 1 mg/mL.

**Test solution** Dilute 1.5 mL of the preparation to be examined to 25.0 mL with a 103 g/L solution of hydrochloric acid R.

**Reference solution** Dissolve 0.115 g of stannous chloride R in a 103 g/L solution of hydrochloric acid R and dilute to 1000.0 mL with the same solution.

To 1.0 mL of each solution add 0.05 mL of thioglycolic acid R, 0.1 mL of dithiol reagent R, 0.4 mL of a 20 g/L solution of sodium laurilsulfate R and 3.0 mL of a 21 g/L solution of hydrochloric acid R. Mix. Allow to stand for 60 min. Measure the absorbance (2.2.25) of each solution at 540 nm, using a 21 g/L solution of hydrochloric acid R as the compensation liquid. The absorbance of the test solution is not greater than that of the reference solution.

#### Physiological distribution

Inject a volume not greater than 0.2 mL and containing not more than 0.1 mg of dimercaptosuccinic acid into a suitable vein, such as a caudal vein or a saphenous vein, of each of 3 rats each weighing 150-250 g. Measure the radioactivity in the syringe before and after the injection. Euthanise the rats

1 h after the injection. Remove the kidneys, the liver, the stomach, the lungs and, if a caudal vein has been used for the injection, the tail. Using a suitable instrument determine the radioactivity in these organs. Determine the percentage of radioactivity in each organ with respect to the total radioactivity calculated as the difference between the 2 measurements made on the syringe minus the activity in the tail (if a caudal vein has been used for the injection).

In not fewer than 2 of the 3 rats used, the radioactivity is:

- in the kidneys: minimum 40 per cent;
- in the liver: maximum 10.0 per cent;
- in the lungs: maximum 5.0 per cent;
- in the stomach: maximum 2.0 per cent.

#### Sterility

It complies with the test for sterility prescribed in the monograph Radiopharmaceutical preparations (0125).

The preparation may be released for use before completion of the test.

### RADIOCHEMICAL PURITY

#### Impurity A

Thin-layer chromatography (2.2.27).

**Test solution** The preparation to be examined.

**Plate** TLC silica gel plate R; use silica gel plate as the coating substance on a glass-fibre sheet, heated at 110 °C for 10 min.

**Mobile phase** methyl ethyl ketone R.

**Application** 5-10  $\mu\text{L}$ .

**Development** Immediately, over a path of 10-15 cm in about 10 min.

**Drying** In air.

**Detection** Suitable detector to determine the distribution of radioactivity.

**Retardation factors** [ $^{99m}\text{Tc}$ ]technetium succimer = 0.0 to 0.1; impurity A = 0.9 to 1.0.

#### Limits:

- [ $^{99m}\text{Tc}$ ]technetium succimer: minimum 95.0 per cent of the total radioactivity due to technetium-99m;
- impurity A: maximum 2.0 per cent of the total radioactivity due to technetium-99m.

### RADIOACTIVITY

Determine the radioactivity using a calibrated instrument.

### STORAGE

Protected from light.

### IMPURITIES

A. [ $^{99m}\text{Tc}$ ]pertechnetate ion.

Ph Eur

## Technetium ( $^{99m}\text{Tc}$ ) Tin Pyrophosphate Injection

(Ph. Eur. monograph 0129)

Ph Eur

### DEFINITION

Sterile solution which may be prepared by mixing solutions of sodium pyrophosphate and stannous chloride with Sodium pertechnetate ( $^{99m}\text{Tc}$ ) injection (fission) (0124) or Sodium pertechnetate ( $^{99m}\text{Tc}$ ) injection (non fission) (0283).

**Technetium-99m** 90 per cent to 110 per cent of the declared technetium-99m radioactivity at the date and time stated on the label.

**Sodium pyrophosphate** ( $\text{Na}_4\text{P}_2\text{O}_7 \cdot 10\text{H}_2\text{O}$ ): 1 mg/mL to 50 mg/mL.

**Tin** Maximum 3.0 mg/mL.

### CHARACTERS

#### Appearance

Clear, colourless solution.

#### Half-life and nature of radiation of technetium-99m

See general chapter 5.7. *Table of physical characteristics of radionuclides.*

### IDENTIFICATION

#### A. Gamma-ray spectrometry.

**Result** The most prominent gamma photon of technetium-99m has an energy of 0.141 MeV.

B. Examine the chromatograms obtained in the tests A and B for radiochemical purity (see Tests).

#### Results:

- the retardation factor of the principal peak in the radiochromatogram obtained with the test solution in the test A is 0.9 to 1.0,
- the retardation factor of the principal peak in the radiochromatogram obtained with the test solution in the test B is 0.0 to 0.1.

C. To 1 mL add 1 mL of *acetic acid R*. Heat on a water-bath for 1 h. After cooling, add 10 mL of nitro-molybdovanadic reagent R and allow to stand for 30 min. A yellow colour develops.

D. To 1 mL add 0.05 mL of *thioglycollic acid R*, 0.1 mL of *dithiol reagent R*, 0.4 mL of a 20 g/L solution of *sodium laurilsulfate R*, 1 mL of *hydrochloric acid R*, 2 mL of a 30 per cent *V/V* solution of *sulfuric acid R* and allow to stand for 30 min. A pink colour develops.

### TESTS

#### pH (2.2.3)

6.0 to 7.0.

#### Sodium pyrophosphate

1 mg/mL to 50 mg/mL.

**Test solution** Use 1 mL of the preparation to be examined or a suitable dilution of it.

**Reference solutions** Using a solution containing *sodium pyrophosphate R* and *stannous chloride R* in the same proportions as in the test solution, prepare a range of solutions and dilute to the same final volume with *water R*.

To the test solution and to 1 mL of each of the reference solutions add successively 10 mL of a 1 g/L solution of *disodium hydrogen phosphate dodecahydrate R*, 10 mL of *iron standard solution (8 ppm Fe) R*, 5 mL of *glacial acetic acid R* and 5 mL of a 1 g/L solution of *hydroxylamine hydrochloride R*. Dilute each solution to 40 mL with *water R* and heat in a water-bath at 40 °C for 1 h. To each solution, add 4 mL of a 1 g/L solution of *phenanthroline hydrochloride R* and dilute to 50.0 mL with *water R*. Measure the absorbance (2.2.25) of each solution at 515 nm using as the compensation liquid a reagent blank containing hydrochloric acid (1.1 g/L HCl) instead of the *iron standard solution (8 ppm Fe) R*. Using the absorbances obtained with each of the reference solutions, draw a calibration curve and calculate the concentration of sodium pyrophosphate in the preparation to be examined.

#### Tin

Maximum 3.0 mg/mL.

**Test solution** Use 1 mL of the preparation to be examined or a suitable dilution of it.

**Reference solutions** Using a solution in hydrochloric acid (6.2 g/L HCl) containing *sodium pyrophosphate R* and *stannous chloride R* in the same proportions as in the test solution, prepare a range of solutions and dilute to the same final volume with hydrochloric acid (6.2 g/L HCl).

To the test solution and to 1 mL of each of the reference solutions add 0.05 mL of *thioglycollic acid R*, 0.1 mL of *dithiol reagent R*, 0.4 mL of a 20 g/L solution of *sodium laurilsulfate R*, 1 mL of *hydrochloric acid R* and 2 mL of a 300 g/L solution of *sulfuric acid R*, and dilute to 15 mL with hydrochloric acid (6.2 g/L HCl). Allow the solutions to stand for 30 min and measure the absorbance (2.2.25) of each solution at 530 nm, using as the compensation liquid a reagent blank containing the same quantity of *sodium pyrophosphate R* as the test solution. Using the absorbances obtained with each of the reference solutions, draw a calibration curve and calculate the concentration of tin in the preparation to be examined.

#### Sterility

Lt complies with the test for sterility prescribed in the monograph *Radiopharmaceutical preparations (0125)*. The preparation may be released for use before completion of the test.

#### Bacterial endotoxins (2.6.14)

Less than 175/V IU/mL, V being the maximum recommended dose in millilitres.

### RADIOCHEMICAL PURITY

#### A. Impurity A

Thin-layer chromatography (2.2.27).

**Test solution** The preparation to be examined.

**Plate** TLC silica gel plate R; use silica gel plate as the coating substance on a glass-fibre sheet heated at 110 °C for 10 min.

**Mobile phase** 136 g/L solution of *sodium acetate R*.

**Application** 5-10 µL.

**Development** Immediately, over a path of 10-15 cm in about 10 min.

**Drying** In air.

**Detection** Suitable detector to determine the distribution of radioactivity.

**Retardation factors** Impurity A = 0.0 to 0.1; [ $^{99\text{m}}\text{Tc}$ ] technetium tin pyrophosphate and impurity B = 0.9 to 1.0.

#### B. Impurity B

Thin-layer chromatography (2.2.27).

**Test solution** The preparation to be examined.

**Plate** TLC silica gel plate R; use silica gel plate as the coating substance on a glass-fibre sheet heated at 110 °C for 10 min.

**Mobile phase** *methyl ethyl ketone R* through which nitrogen has been bubbled in the chromatographic tank for 10 min immediately before the chromatography.

**Application** 5-10 µL and dry in a steam of nitrogen.

**Development** Over a path of 10-15 cm in about 10 min.

**Drying** In air.

**Detection** Suitable detector to determine the distribution of radioactivity.

**Retardation factors** [ $^{99\text{m}}\text{Tc}$ ]technetium tin pyrophosphate = 0.0 to 0.1; impurity B = 0.95 to 1.0.

#### Limit:

- *sum of impurities A and B*: maximum 10 per cent of the total radioactivity due to technetium-99m in the chromatograms obtained in tests A and B.

**RADIOACTIVITY**

Determine the radioactivity using a calibrated instrument.

**LABELLING**

The label states:

- the concentration of sodium pyrophosphate expressed in milligrams per millilitre;
- the concentration of tin expressed in milligrams per millilitre.

**IMPURITIES**

- A. [<sup>99m</sup>Tc]technetium in colloidal form,
- B. [<sup>99m</sup>Tc]pertechnetate ion.

Ph Eur

**Thallos (<sup>201</sup>Tl) Chloride Injection**

(Ph. Eur. monograph 0571)

Ph Eur

**DEFINITION**

Sterile solution of thallium-201 in the form of thallos chloride. It may be made isotonic by the addition of *Sodium chloride (0193)* and may contain a suitable antimicrobial preservative such as *Benzyl alcohol (0256)*.

**Thallium-201** 90 per cent to 110 per cent of the declared thallium-201 radioactivity, at the date and time stated on the label.

**Specific radioactivity** Minimum 3.7 GBq per milligram of thallium.

**CHARACTERS****Appearance**

Clear, colourless solution.

**Half-life and nature of radiation of thallium-201**

See general chapter 5.7. *Table of physical characteristics of radionuclides.*

**IDENTIFICATION**

A. Gamma-ray and X-ray spectrometry.

**Results** The most prominent gamma photons of thallium-201 have energies of 0.135 MeV, 0.166 MeV and 0.167 MeV; the X-rays have energies of 0.069 MeV to 0.083 MeV.

B. Examine the electropherogram obtained in the test for radiochemical purity (see Tests). The distribution of radioactivity contributes to the identification of the preparation.

**TESTS****pH (2.2.3)**

4.0 to 7.0.

**Thallium**

**Test solution** To 0.5 mL of the preparation to be examined add 0.5 mL of hydrochloric acid (220 g/L HCl) and 0.05 mL of *bromine water R*, and mix. Add 0.1 mL of a 30 g/L solution of *sulfosalicylic acid R*. After decolorisation add 1.0 mL of a 1 g/L solution of *rhodamine B R*. Add 4 mL of *toluene R* and shake for 60 s. Separate the toluene layer.

**Reference solution** Prepare at the same time and in the same manner as the test solution, using 0.5 mL of *thallium standard solution (10 ppm Tl) R*.

The toluene layer of the test solution is not more intensely coloured than the toluene layer of the reference solution.

**Sterility**

It complies with the test for sterility prescribed in the monograph *Radiopharmaceutical preparations (0125)*.

The preparation may be released for use before completion of the test.

**RADIONUCLIDIC PURITY****Thallium-201**

Minimum 97.0 per cent of the total radioactivity.

Gamma-ray and X-ray spectrometry.

Determine the relative amounts of thallium-200, thallium-201, thallium-202, lead-201, lead-203 and other radionuclidic impurities present.

**Result** The total radioactivity due to thallium-202 is not more than 2.0 per cent.

**RADIOCHEMICAL PURITY****[<sup>201</sup>Tl]Thallos ions**

Zone electrophoresis (2.2.31).

Use a suitable cellulose acetate strip as the supporting medium and a 18.6 g/L solution of *sodium edetate R* as the electrolyte solution. Soak the strip in the electrolyte solution for 45–60 min. Remove the strip with forceps taking care to handle the outer edges only. Place the strip between 2 absorbent pads and blot to remove excess solution.

**Test solution** Mix equal volumes of the preparation to be examined and the electrolyte solution.

Apply not less than 5 µL of the test solution to the centre of the strip and mark the point of application. Apply an electric field of 17 V/cm for at least 10 min. Allow the strip to dry in air. Determine the distribution of radioactivity using suitable detector.

**Result** Minimum 95.0 per cent of the radioactivity migrates towards the cathode.

**RADIOACTIVITY**

Determine the radioactivity using a calibrated instrument.

**IMPURITIES**

- A. lead-201,
- B. lead-203,
- C. thallium-200,
- D. thallium-202,
- E. [<sup>201</sup>Tl]thallic(III) ion,

Ph Eur

**Tritiated (<sup>3</sup>H) Water Injection**

(Ph. Eur. monograph 0112)

Ph Eur

**DEFINITION**

Water for injections in which some of the water molecules contain tritium atoms in place of protium atoms. It may be made isotonic by the addition of sodium chloride.

**Tritium** 90 per cent to 110 per cent of the declared tritium radioactivity at the date stated on the label.

**CHARACTERS****Appearance**

Clear, colourless solution.

**Half-life and nature of radiation of tritium**

See general chapter 5.7. *Table of physical characteristics of radionuclides.*

**IDENTIFICATION**

Beta-ray spectrometry as described in test A for radionuclidic purity (see Tests).

**Result** The maximum energy of the beta radiation is 0.019 MeV.

**TESTS**

**pH (2.2.3)**  
4.5 to 7.0.

**Sterility**

It complies with the test for sterility prescribed in the monograph *Radiopharmaceutical preparations (0125)*.

**RADIONUCLIDIC PURITY**

**A. Test solution.** Mix 100 µL of a suitable dilution of the preparation to be examined with 10 mL of *liquid scintillation cocktail R1*.

**Reference solution** A standardised tritiated (<sup>3</sup>H) water having approximately the same radioactivity as the test solution.

Measure the radioactivity of the test solution in a liquid scintillation counter fitted with a discriminator. The count should be about 5000 impulses per second at the lowest setting of the discriminator. Record the count at different discriminator settings. For each measurement, count at least 10 000 impulses over a period of at least 1 min. Immediately determine in the same conditions the count for the reference solution.

Plot the counts at each discriminator setting, correcting for background activity, on semi-logarithmic paper, the discriminator settings being in arbitrary units as the abscissae. The vertical distance between the 2 curves obtained is constant. They obey the following mathematical relationship:

$$\frac{\frac{A_1}{B_1} - \frac{A_2}{B_2}}{\frac{A_1}{B_1}} \times 100 < 20$$

- $A_1$  = radioactivity recorded for the reference solution at the lowest discriminator setting;  
 $B_1$  = radioactivity recorded for the test solution at the lowest discriminator setting;  
 $A_2$  = radioactivity recorded for the reference solution at the discriminator setting such that  $A_2 \approx A_1 \times 10^{-2}$ ;  
 $B_2$  = radioactivity recorded for the test solution at the latter discriminator setting.

**B. Gamma-ray spectrometry.** The instrument registers only background activity.

**RADIOCHEMICAL PURITY**

Place a quantity of the preparation to be examined equivalent to about 74 kBq, diluted to 50 mL with *water R*, in an all-glass distillation apparatus of the type used for the determination of distillation range (2.2.11). Determine the radioactive concentration. Distil until about 25 mL of distillate has been collected. Precautions must be taken to avoid contamination of the air. If the test is carried out in a fume cupboard, the equipment must be protected from draughts. Determine the radioactive concentration of the distillate and of the liquid remaining in the distillation flask. Neither of the radioactive concentrations determined after distillation differs by more than 5 per cent from the value determined before distillation.

**RADIOACTIVITY**

Determine the radioactivity using a liquid scintillation counter.

**Water (<sup>15</sup>O) Injection**

(Ph. Eur. monograph 1582)

Ph Eur

**DEFINITION**

Sterile solution of [<sup>15</sup>O]water for diagnostic use.

**Oxygen-15** 90 per cent to 110 per cent of the declared oxygen-15 radioactivity at the date and time stated on the label.

**CHARACTERS****Appearance**

Clear, colourless liquid.

**Half-life and nature of radiation of oxygen-15**

See general chapter 5.7. *Table of physical characteristics of radionuclides*.

**IDENTIFICATION**

**A. Gamma-ray spectrometry.**

**Results** The only gamma photons of [<sup>15</sup>O]water have an energy of 0.511 MeV and, depending on the measurement geometry, a sum peak of 1.022 MeV may be observed.

**B. Radionuclidic purity (see Tests).**

**C. Examine the chromatogram obtained in the test for radiochemical purity (see Tests).** The retention time of the 2<sup>nd</sup> peak is due to the radioactivity eluting in the void volume.

**TESTS**

**pH (2.2.3)**  
5.5 to 8.5.

**Ammonium (2.4.1)**

Maximum 10 ppm, determined on 1 mL. The preparation may be released for use before completion of the test.

**Nitrates**

Maximum 10 ppm. The preparation may be released for use before completion of the test.

**Test solution** To 1 mL add 49 mL of *nitrate-free water R*. Place 5 mL of this solution in a test-tube immersed in iced water, add 0.4 mL of a 100 g/L solution of *potassium chloride R*, 0.1 mL of *diphenylamine solution R* and, dropwise with shaking, 5 mL of *sulfuric acid R*. Transfer the tube to a water-bath at 50 °C.

**Reference solution** Prepare at the same time in the same manner as the test solution, using a mixture of 4.5 mL of *nitrate-free water R* and 0.5 mL of *nitrate standard solution (2 ppm NO<sub>3</sub>) R*.

After 15 min, any blue colour in the test solution is not more intense than that in the reference solution.

**Sterility**

It complies with the test for sterility prescribed in the monograph *Radiopharmaceutical preparations (0125)*. The preparation may be released for use before completion of the test.

**Bacterial endotoxins (2.6.14)**

Less than 175/V IU/mL, V being the maximum recommended dose in millilitres. The preparation may be released for use before completion of the test.

**RADIONUCLIDIC PURITY**

The preparation may be released for use before completion of the test.

**Oxygen-15**

Minimum 99 per cent of total radioactivity.

Ph Eur

Gamma-ray spectrometry.

**Results:**

- the spectrum obtained with the preparation to be examined does not differ significantly from that obtained with a standardised fluorine-18 solution;
- the half-life is between 1.9 min and 2.2 min.

#### RADIOCHEMICAL PURITY

The preparation may be released for use before completion of the test.

[<sup>15</sup>O]Water

Liquid chromatography (2.2.29).

**Test solution** The preparation to be examined.

**Column:**

- size:  $l = 0.25$  m,  $\varnothing = 4.0$  mm;
- stationary phase: aminopropylsilyl silica gel for chromatography R (10  $\mu$ m);
- temperature: constant, at 20–30 °C.

**Mobile phase** 10 g/L solution of potassium dihydrogen phosphate R adjusted to pH 3 with phosphoric acid R.

**Flow rate** 1 mL/min.

**Detection** Suitable detector to determine the distribution of radioactivity and internal recovery detection system, consisting of a loop of the chromatographic tubing between the injector and the column through the radioactivity detector, which has been calibrated for count recovery.

**Run time** 10 min.

**Identification of peaks** In the chromatogram obtained with the test solution, the 1<sup>st</sup> peak corresponds to the injected radioactivity of the test solution, the 2<sup>nd</sup> peak corresponds to the amount of radioactivity as [<sup>15</sup>O]water.

**Limit:**

- [<sup>15</sup>O]water: minimum 99 per cent of the total radioactivity due to oxygen-15.

#### RADIOACTIVITY

Determine the radioactivity using a calibrated instrument.

Ph Eur

## Xenon (<sup>133</sup>Xe) Injection

(Ph. Eur. monograph 0133)

Ph Eur

#### DEFINITION

Sterile solution of xenon-133 that may be made isotonic by the addition of sodium chloride.

**Xenon-133** 80 per cent to 130 per cent of the declared xenon-133 radioactivity at the date and time stated on the label.

The injection is presented in a container that allows the contents to be removed without introducing air bubbles. The container is filled as completely as possible and any gas bubble present does not occupy more than 1 per cent of the volume of the injection as judged by visual comparison with a suitable standard.

#### CHARACTERS

##### Appearance

Clear, colourless solution.

##### Half-life and nature of radiation of xenon-133

See general chapter 5.7. Table of physical characteristics of radionuclides.

#### IDENTIFICATION

Gamma-ray and X-ray spectrometry.

**Comparison** Standardised xenon-133 solution in a 9 g/L solution of sodium chloride R.

**Results** The most prominent gamma photon of xenon-133 has an energy of 0.081 MeV and there is an X-ray (resulting from internal conversion) of 0.030 MeV to 0.035 MeV.

#### TESTS

**pH (2.2.3)**

5.0 to 8.0.

#### Sterility

It complies with the test for sterility prescribed in the monograph *Radiopharmaceutical preparations (0125)*.

The preparation may be released for use before completion of the test.

#### RADIONUCLIDIC PURITY

A. Gamma-ray and X-ray spectrometry.

**Comparison** Standardised xenon-133 solution in a 9 g/L solution of sodium chloride R.

**Result** The spectrum obtained with the preparation to be examined does not differ significantly from that obtained with a standardised xenon-133 solution in a 9 g/L solution of sodium chloride R, apart from any differences attributable to the presence of xenon-131m and xenon-133m.

B. Transfer 2 mL of the preparation to be examined to an open flask and pass a current of air through the solution for 30 min, taking suitable precautions concerning the dispersion of radioactivity. Measure the residual beta and gamma activity of the solution. The activity does not differ significantly from the background activity detected by the instrument.

#### RADIOACTIVITY

Weigh the container with its contents. Determine its total radioactivity using suitable counting equipment by comparison with a standardised xenon-133 solution or by measurement in an instrument calibrated with the aid of such a solution, operating in strictly identical conditions. If an ionisation chamber is used its inner wall should be such that the radiation is not seriously attenuated. Remove at least half the contents and re-weigh the container. Measure the total residual radioactivity of the container and the remaining contents as described above. From the measurements, calculate the radioactive concentration of xenon-133 in the preparation to be examined.

#### CAUTION

Significant amounts of xenon-133 may be present in the closures and on the walls of the container. This must be taken into account in applying the rules concerning the transport and storage of radioactive substances and in disposing of used containers

#### IMPURITIES

A. xenon-131m.

Ph Eur

## Yttrium (<sup>90</sup>Y) Chloride Solution for Radiolabelling

(Ph. Eur. monograph 2803)

<sup>90</sup>YCl<sub>3</sub>

196.3

39271-65-3

Ph Eur

### DEFINITION

Sterile solution containing yttrium-90 derived from fission-produced strontium-90, in the form of yttrium chloride in dilute hydrochloric acid.

### Content

— *yttrium-90*: 90 per cent to 110 per cent of the declared yttrium-90 radioactivity at the date and time stated on the label.

### PRODUCTION

#### Alpha-emitting impurities

Maximum  $1 \times 10^{-5}$  per cent of the total radioactivity, determined on the parent radionuclide strontium-90 by a suitable, validated method.

### CHARACTERS

#### Appearance

Clear, colourless solution.

#### Half-life and nature of radiation of yttrium-90

See general chapter 5.7. *Table of physical characteristics of radionuclides*.

### IDENTIFICATION

#### A. Beta-particle spectrometry.

*Result* The beta-particle spectrum obtained with the preparation to be examined is qualitatively similar to the beta-particle spectrum obtained with a certified yttrium-90 reference material.

#### B. pH (see Tests).

C. To 100 µL of *silver nitrate solution R2* add 50 µL of the preparation to be examined. A white precipitate is formed.

D. Examine the chromatograms obtained in the test for radiochemical purity.

*Result* The retardation factor of the principal peak in the chromatogram obtained with the test solution is 0.4 to 0.7.

### TESTS

#### pH (2.2.4)

1 to 2.

#### Cadmium (2.4.20)

Maximum 0.6 µg/GBq.

#### Copper (2.4.20)

Maximum 0.6 µg/GBq.

#### Iron (2.4.20)

Maximum 6.0 µg/GBq.

#### Lead (2.4.20)

Maximum 3.0 µg/GBq.

#### Zinc (2.4.20)

Maximum 3.0 µg/GBq.

#### Sterility

It complies with the test for sterility prescribed in the monograph *Radiopharmaceutical preparations (0125)*. The preparation may be released for use before completion of the test.

#### Bacterial endotoxins (2.6.14)

Less than 25 IU/mL, if intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins.

### RADIONUCLIDIC PURITY

The preparation may be released for use before completion of test B for yttrium-90.

#### Strontium-90

Beta-particle spectrometry (2.2.66).

*Limit* Maximum 0.002 per cent of the total yttrium-90 radioactivity.

Determine the relative amount of strontium-90 after its separation from the examined sample of the preparation to be examined.

Soak 100 mg of *extraction resin R* (50-100 µm) in 1 mL of a 94.7 g/L solution of *nitric acid R* for at least 24 h. Stir the resin suspension for 10 min using a magnetic stirrer at about 800 r/min. Into a polypropylene column with a suitable bed support at the bottom, introduce 1 mL of the resin suspension. Cover the resin in the column with another bed support. Keep the resin bed covered with a 94.7 g/L solution of *nitric acid R* and free from air bubbles.

*Test solution* Add a volume of the preparation to be examined corresponding to 100-200 MBq to 4 mL of a 100 mg/mL solution of *strontium chloride hexahydrate R* in a 474 g/L solution of *nitric acid R*. Measure the radioactivity of this solution using a calibrated instrument. Add 50 µL of *strontium-85 spiking solution R* and mix.

*Reference solution* Mix 50 µL of *strontium-85 spiking solution R* and 2.5 mL of a 9.5 g/L solution of *nitric acid R* in a vial for liquid scintillation counting and add 10 mL of *liquid scintillation cocktail R*.

Condition the extraction resin column with 2 mL of a 474 g/L solution of *nitric acid R*. Apply the test solution to the top of the column. Collect the eluate in a tared vial. Rinse the column with 4 mL of a 474 g/L solution of *nitric acid R* and collect the eluate in the tared vial. Perform the elutions of the column at a flow rate not exceeding 1 mL/min (0.6 mL/min is recommended). Combine the eluates and weigh the resulting mixture.

Transfer 1 mL of the eluate to a vial for liquid scintillation counting and determine the mass of the sample, then add 1.5 mL of *water R* and 10 mL of *liquid scintillation cocktail R* and mix (eluate mixture).

Within 20 min following collection of the eluate determine the total radioactivity due to strontium-90, yttrium-90 and strontium-85 in the eluate mixture and in the reference solution by liquid scintillation spectrometry.

The recommended counting time is 900 s.

Calculate the recovery of strontium-85 in the eluate mixture.

Calculate the total radioactivity due to strontium-90 and yttrium-90 in the eluate, taking into account the recovery of strontium and the fraction of eluate in the eluate mixture.

#### System suitability:

— the radioactivity due to yttrium-90 in the eluate does not exceed 50 per cent of the radioactivity due to strontium-90.

#### Yttrium-90

Minimum 99.9 per cent of the total radioactivity.

A. Gamma-ray-emitting impurities. Gamma-ray spectrometry. Preliminary test.

Place a volume of the preparation to be examined corresponding to about 200 MBq in a glass vial and measure the radioactivity in an ionisation chamber.

Place the vial in a lead container with 10 mm-thick walls.

Place the lead container in a gamma-spectrometer chamber

and perform the measurement with the acquisition time set to 3600 s.

If any impurities are detected, calculate their radioactivities corrected to correspond to the time that the radioactivity of the sample of the preparation to be examined was measured. Calculate the relative impurity content in the sample of the preparation to be examined.

**B. Gamma-ray-emitting impurities. Gamma-ray spectrometry.**

Determine the relative amounts of gamma-ray-emitting impurities present. For the detection and quantification of gamma-ray-emitting impurities, retain the preparation to be examined for a sufficient time to allow yttrium-90 to decay to a level that permits the detection of radionuclidic impurities.

*Result* The total radioactivity due to radionuclidic impurities is not greater than 0.1 per cent.

#### **RADIOCHEMICAL PURITY**

**Yttrium in the form of  $Y^{3+}$  ion**

Thin-layer chromatography (2.2.27).

*Test solution* The preparation to be examined.

*Reference solution* To 1.0 mL of the test solution add 0.4 mL of a 10 g/L solution of *pentetic acid R* in a 4 g/L solution of *sodium hydroxide R*.

*Plate* TLC silica gel plate *R*; use a glass-fibre plate.

*Mobile phase* 9.0 g/L solution of *sodium chloride R* adjusted to pH  $2.3 \pm 0.05$  with *dilute hydrochloric acid R*.

*Application* 5  $\mu$ L.

*Development* Immediately, over 2/3 of the plate.

*Drying* In a current of cold air.

*Detection* Suitable detector to determine the distribution of radioactivity.

*Retardation factors* Impurity B = less than 0.2; yttrium-90 in the form of  $Y^{3+}$  ion = 0.4 to 0.7; yttrium-90 in the form of yttrium pentetate = greater than 0.9.

*System suitability* The retardation factor of the principal peak in the radiochromatogram obtained with the test solution is clearly different from that of the principal peak in the chromatogram obtained with the reference solution.

*Limit:*

— yttrium in the form of  $Y^{3+}$  ion: minimum 99 per cent of the total radioactivity due to yttrium-90.

#### **RADIOACTIVITY**

Determine the radioactivity using a calibrated instrument.

#### **LABELLING**

The label states:

- that the solution is not for direct administration to humans;
- the concentration of hydrochloric acid;
- the content of cadmium, copper, iron, lead, zinc and strontium-90;
- that it is the user's obligation to verify that the content of metal impurities and strontium-90 is sufficiently low for the intended application;
- that the solution is intended for use in the preparation of yttrium-90-labelled radiopharmaceuticals.

#### **IMPURITIES**

A. strontium-90,

B. yttrium-90 in colloidal form.

Ph Eur

# Surgical Materials

## Absorbent Cotton

(Ph. Eur. monograph 0036)

Ph Eur

### DEFINITION

Absorbent cotton consists of new fibres or good quality combers obtained from the seed-coat of various species of the genus *Gossypium* L., cleaned, purified, bleached and carefully carded. It may not contain any compensatory colouring matter.

### CHARACTERS

It is white or almost white and is composed of fibres of average length not less than 10 mm, determined by a suitable method, and contains not more than traces of leaf residue, pericarp, seed-coat or other impurities. It offers appreciable resistance when pulled. It does not shed any appreciable quantity of dust when gently shaken.

### IDENTIFICATION

A. Examined under a microscope, each fibre is seen to consist of a single cell, up to about 4 cm long and up to 40 µm wide, in the form of a flattened tube with thick and rounded walls and often twisted.

B. When treated with *iodinated zinc chloride solution R*, the fibres become violet.

C. To 0.1 g add 10 mL of *zinc chloride-formic acid solution R*. Heat to 40 °C and allow to stand for 2 h 30 min, shaking occasionally. It does not dissolve.

### TESTS

#### Solution S

Place 15.0 g in a suitable vessel, add 150 mL of *water R*, close the vessel and allow to macerate for 2 h. Decant the solution, squeeze the residual liquid carefully from the sample with a glass rod and mix. Reserve 10 mL of the solution for the test for surface-active substances and filter the remainder.

#### Acidity or alkalinity

To 25 mL of solution S add 0.1 mL of *phenolphthalein solution R* and to another 25 mL add 0.05 mL of *methyl orange solution R*. Neither solution is pink.

#### Foreign fibres

Examined under a microscope, it is seen to consist exclusively of typical cotton fibres, except that occasionally a few isolated foreign fibres may be present.

#### Fluorescence

Examine a layer about 5 mm in thickness under ultraviolet light at 365 nm. It displays only a slight brownish-violet fluorescence and a few yellow particles. It shows no intense blue fluorescence, apart from that which may be shown by a few isolated fibres.

#### Neps

Spread about 1 g evenly between 2 colourless transparent plates each 10 cm square. Examine for neps by transmitted light and compare with *Cotton wool standard for neps CRS*. The product to be examined is not more neppy than the standard.

#### Absorbency

**Apparatus** A dry cylindrical copper wire basket 8.0 cm high and 5.0 cm in diameter. The wire of which the basket is constructed is about 0.4 mm in diameter, the mesh is 1.5 cm to 2.0 cm wide and the mass of the basket is  $2.7 \pm 0.3$  g.

**Sinking time** Not more than 10 s. Weigh the basket to the nearest centigram ( $m_1$ ). Take a total of 5.00 g in approximately equal quantities from 5 different places in the product to be examined, place loosely in the basket and weigh the filled basket to the nearest centigram ( $m_2$ ). Fill a beaker 11 cm to 12 cm in diameter to a depth of 10 cm with water at about 20 °C. Hold the basket horizontally and drop it from a height of about 10 mm into the water. Measure with a stopwatch the time taken for the basket to sink below the surface of the water. Calculate the result as the average of 3 tests.

**Water-holding capacity** Not less than 23.0 g of water per gram. After the sinking time has been measured, remove the basket from the water, allow it to drain for exactly 30 s suspended in a horizontal position over the beaker, transfer it to a tared beaker ( $m_3$ ) and weigh to the nearest centigram ( $m_4$ ). Calculate the water-holding capacity per gram of absorbent cotton using the following expression:

$$\frac{m_4 - (m_2 + m_3)}{m_2 - m_1}$$

Calculate the result as the average of 3 tests.

#### Ether-soluble substances

Not more than 0.50 per cent. In an extraction apparatus, extract 5.00 g with *ether R* for 4 h at a rate of at least 4 extractions per hour. Evaporate the ether extract and dry the residue to constant mass at 100 °C to 105 °C.

#### Extractable colouring matter

In a narrow percolator, slowly extract 10.0 g with *alcohol R* until 50 mL of extract is obtained. The liquid obtained is not more intensely coloured (2.2.2, *Method II*) than reference solution Y<sub>5</sub>, GY<sub>6</sub> or a reference solution prepared as follows: to 3.0 mL of blue primary solution add 7.0 mL of hydrochloric acid (10 g/L HCl). Dilute 0.5 mL of this solution to 10.0 mL with hydrochloric acid (10 g/L HCl).

#### Surface-active substances

Introduce the 10 mL portion of solution S reserved before filtration into a 25 mL graduated ground-glass-stoppered cylinder with an external diameter of 20 mm and a wall thickness of not greater than 1.5 mm, previously rinsed 3 times with *sulfuric acid R* and then with *water R*. Shake vigorously 30 times in 10 s, allow to stand for 1 min and repeat the shaking. After 5 min, any foam present must not cover the entire surface of the liquid.

#### Water-soluble substances

Not more than 0.50 per cent. Boil 5.000 g in 500 mL of *water R* for 30 min, stirring frequently. Replace the water lost by evaporation. Decant the liquid, squeeze the residual liquid carefully from the sample with a glass rod and mix. Filter the liquid whilst hot. Evaporate 400 mL of the filtrate (corresponding to 4/5 of the mass of the sample taken) and dry the residue to constant mass at 100 °C to 105 °C.

#### Loss on drying (2.2.32)

Not more than 8.0 per cent, determined on 5.000 g by drying in an oven at 105 °C.

#### Sulfated ash (2.4.14)

Not more than 0.40 per cent. Introduce 5.00 g into a previously heated and cooled, tared crucible. Heat cautiously over a naked flame and then carefully to dull redness at 600 °C. Allow to cool, add a few drops of *dilute sulfuric acid R*, then heat and incinerate until all the black particles have disappeared. Allow to cool. Add a few drops of *ammonium carbonate solution R*. Evaporate and incinerate

carefully, allow to cool and weigh again. Repeat the incineration for periods of 5 min to constant mass.

#### STORAGE

Store in a dust-proof package in a dry place.

Ph Eur

## Absorbent Viscose Wadding

(Ph. Eur. monograph 0034)

Ph Eur

#### DEFINITION

Absorbent viscose wadding consists of bleached, carefully carded, new fibres of regenerated cellulose obtained by the viscose process, with or without the addition of titanium dioxide, of linear density 1.0 dtex to 8.9 dtex (dtex = mass of 10 000 m of fibre, expressed in grams) and cut to a suitable staple length. It does not contain any compensatory colouring matter.

#### CHARACTERS

It is white or very slightly yellow, has a lustrous or matt appearance, and is soft to the touch.

#### IDENTIFICATION

A. Viscose rayon fibres may be solid or hollow; hollow fibres may have a continuous lumen or be compartmented. The fibres have an average length of 25 mm to 80 mm and when examined under a microscope in the dry state, or when mounted in *alcohol R* and *water R*, the following characters are observed. They are usually of a more or less uniform width, with many longitudinal parallel lines distributed unequally over the width. The ends are cut more or less straight. Matt fibres contain numerous granular particles of approximately 1 µm average diameter.

**Solid fibres** In longitudinal view, the surface of the fibres may be uneven or crenate. Fibres having an approximately circular or elliptical cross section have a diameter of about 10 µm to 20 µm and those that are flattened and twisted ribbons vary in width from 15 µm to 20 µm as the twisting of the filament reveals first the major axis and then the minor axis. They are about 4 µm in thickness. Other solid cross sections are Y-shaped and have protruding limbs with the major axis 5 µm to 25 µm in length and the minor axis 2 µm to 8 µm wide.

**Hollow fibres** Fibres with a continuous, hollow lumen have a diameter of up to about 30 µm; they are thin-walled, with a wall thickness of about 5 µm. When mounted in *alcohol R* and *water R*, the lumen is clearly indicated in many fibres by the presence of many entrapped air bubbles.

**Compartmented fibres** These fibres may have a diameter of up to 80 µm; they are hollow, having a central lumen which is divided up into several compartments. Individual compartments vary in size but typically may be up to about 60 µm in length and there may be more than one compartment across the width of each fibre. Some compartments show entrapped air bubbles when the fibres are mounted in *alcohol R* and *water R*.

B. When treated with *iodinated zinc chloride solution R*, the fibres become violet.

C. To 0.1 g add 10 mL of *zinc chloride-formic acid solution R*. Heat to 40 °C and allow to stand for 2 h 30 min, shaking occasionally. It dissolves completely except for the matt variety where titanium dioxide particles remain.

D. Dissolve the residue obtained in the test for sulfated ash by warming gently with 5 mL of *sulfuric acid R*. Allow to cool and add 0.2 mL of *dilute hydrogen peroxide solution R*. The solution obtained from the lustrous variety undergoes no change in colour; that from the matt variety shows an orange-yellow colour, the intensity of which depends on the quantity of titanium dioxide present.

#### TESTS

##### Solution S

Place 15.0 g in a suitable vessel, add 150 mL of *water R*, close the vessel and allow to macerate for 2 h. Decant the solution, squeeze the residual liquid carefully from the sample with a glass rod and mix. Reserve 10 mL of the solution for the test for surface-active substances and filter the remainder.

##### Acidity or alkalinity

To 25 mL of solution S add 0.1 mL of *phenolphthalein solution R* and to another 25 mL add 0.05 mL of *methyl orange solution R*. Neither solution is pink.

##### Foreign fibres

Examined under a microscope, it is seen to consist exclusively of viscose fibres, except that occasionally a few isolated foreign fibres may be present.

##### Fluorescence

Examine a layer about 5 mm in thickness under ultraviolet light at 365 nm. It displays only a slight brownish-violet fluorescence. It shows no intense blue fluorescence, apart from that which may be shown by a few isolated fibres.

##### Absorbency

**Apparatus** A dry cylindrical copper-wire basket 8.0 cm high and 5.0 cm in diameter. The wire of which the basket is constructed is about 0.4 mm in diameter, the mesh is 1.5 cm to 2.0 cm wide and the mass of the basket is  $2.7 \pm 0.3$  g.

**Sinking time** Not more than 10 s. Weigh the basket to the nearest centigram ( $m_1$ ). Take a total of 5.00 g in approximately equal quantities from 5 different places in the product to be examined, place loosely in the basket and weigh the filled basket to the nearest centigram ( $m_2$ ). Fill a beaker 11 cm to 12 cm in diameter to a depth of 10 cm with water at about 20 °C. Hold the basket horizontally and drop it from a height of about 10 mm into the water. Measure with a stopwatch the time taken for the basket to sink below the surface of the water. Calculate the result as the average of 3 tests.

**Water-holding capacity** Not less than 18.0 g of water per gram. After the sinking time has been measured, remove the basket from the water, allow it to drain for exactly 30 s suspended in a horizontal position over the beaker, transfer it to a tared beaker ( $m_3$ ) and weigh to the nearest centigram ( $m_4$ ). Calculate the water-holding capacity per gram of absorbent viscose wadding using the following expression:

$$\frac{m_4 - (m_2 + m_3)}{m_2 - m_1}$$

Calculate the result as the average of 3 tests.

##### Ether-soluble substances

Not more than 0.30 per cent. In an extraction apparatus, extract 5.00 g with *ether R* for 4 h at a rate of at least 4 extractions per hour. Evaporate the ether extract and dry the residue to constant mass at 100 °C to 105 °C.

##### Extractable colouring matter

In a narrow percolator, slowly extract 10.0 g with *alcohol R* until 50 mL of extract is obtained. The liquid obtained is not

more intensely coloured (2.2.2, *Method 1*) than reference solution Y<sub>5</sub>, GY<sub>6</sub> or a reference solution prepared as follows: to 3.0 mL of blue primary solution add 7.0 mL of hydrochloric acid (10 g/L HCl) and dilute 0.5 mL of this solution to 10.0 mL with hydrochloric acid (10 g/L HCl).

#### Surface-active substances

Introduce the 10 mL portion of solution S reserved before filtration into a 25 mL graduated ground-glass-stoppered cylinder with an external diameter of 20 mm and a wall thickness of not greater than 1.5 mm, previously rinsed 3 times with *sulfuric acid R* and then with *water R*. Shake vigorously 30 times in 10 s, allow to stand for 1 min and repeat the shaking. After 5 min, any foam present does not cover the entire surface of the liquid.

#### Water-soluble substances

Not more than 0.70 per cent. Boil 5.00 g in 500 mL of *water R* for 30 min, stirring frequently. Replace the water lost by evaporation. Decant the liquid, squeeze the residual liquid carefully from the sample with a glass rod and mix. Filter the liquid whilst hot. Evaporate 400 mL of the filtrate (corresponding to 4/5 of the mass of the sample taken) and dry the residue to constant mass at 100 °C to 105 °C.

#### Hydrogen sulfide

To 10 mL of solution S add 1.9 mL of *water R*, 0.15 mL of *dilute acetic acid R* and 1 mL of *lead acetate solution R*. After 2 min, the solution is not more intensely coloured than a reference solution prepared at the same time using 0.15 mL of *dilute acetic acid R*, 1.2 mL of *thioacetamide reagent R*, 1.7 mL of *lead standard solution (10 ppm Pb) R* and 10 mL of solution S.

#### Loss on drying (2.2.32)

Not more than 13.0 per cent, determined on 5.000 g by drying in an oven at 105 °C.

#### Sulfated ash (2.4.14)

Not more than 0.45 per cent for the lustrous variety and not more than 1.7 per cent for the matt variety. Introduce 5.00 g into a previously heated and cooled, tared crucible. Heat cautiously over a naked flame and then carefully to dull redness at 600 °C. Allow to cool, add a few drops of *dilute sulfuric acid R*, then heat and incinerate until all the black particles have disappeared. Allow to cool. Add a few drops of *ammonium carbonate solution R*. Evaporate and incinerate carefully, allow to cool and weigh again. Repeat the incineration for periods of 5 min to constant mass.

#### STORAGE

Store in a dust-proof package in a dry place.

Ph Eur

## Sutures for Human Use: Introduction

(Ph. Eur. monograph 90004)

Ph Eur

Sutures for human use are medical devices as defined in Regulation (EU) 2017/745 and any subsequent amendments. Monographs can be applied to show compliance with certain requirements therein.

Ph Eur

## Sterile Catgut

(Ph. Eur. monograph 0317)

Ph Eur

### DEFINITION

Sterile catgut consists of sutures prepared from collagen taken from the intestinal membranes of mammals. After cleaning, the membranes are split longitudinally into strips of varying width, which, when assembled in small numbers, according to the diameter required, are twisted under tension, dried, polished, selected and sterilised. The sutures may be treated with chemical substances such as chromium salts to prolong absorption and glycerol to make them supple, provided such substances do not reduce tissue acceptability.

Appropriate harmonised standards may be considered when assessing compliance with respect to origin and processing of raw materials and with respect to biocompatibility.

Sterile catgut is a surgical wound-closure device. Being an absorbable suture it serves to approximate tissue during the healing period and is subsequently metabolised by proteolytic activity.

### PRODUCTION

Production complies with relevant regulations on the use of animal tissues in medical devices notably concerning the risk of transmission of animal spongiform encephalopathy agents. Appropriate harmonised standards may apply with respect to appropriate validated methods of sterilisation, environmental control during manufacturing, labelling and packaging.

It is essential for the effectiveness and the performance characteristics during use and during the functional lifetime of catgut that the following physical properties are specified: consistent diameter, sufficient initial strength and firm needle attachment.

The requirements outlined below have been established, taking into account stresses which occur during normal conditions of use. These requirements can be used to demonstrate that individual production batches of sterile catgut are suitable for wound closure according to usual surgical techniques.

### TESTS

If stored in a preserving liquid, remove the sutures from the sachet and measure promptly and in succession the length, diameter and breaking load. If stored in the dry state, immerse the sutures in *alcohol R* or a 90 per cent V/V solution of 2-propanol *R* for 24 h and proceed with the measurements as indicated below.

#### Length

Measure the length without applying to the suture more tension than is necessary to keep it straight. The length of each suture is not less than 90 per cent of the length stated on the label and does not exceed 350 cm.

#### Diameter

Carry out the test on 5 sutures. Use a suitable instrument capable of measuring with an accuracy of at least 0.002 mm and having a circular pressor foot 10 mm to 15 mm in diameter. The pressor foot and the moving parts attached to it are weighted so as to apply a total load of  $100 \pm 10$  g to the suture being tested. When making the measurement, lower the pressor foot slowly to avoid crushing the suture. Measure the diameter at intervals of 30 cm over the whole length of the suture. For a suture less than 90 cm in length, measure at 3 points approximately evenly spaced along the suture. The suture is not subjected to more tension than is

necessary to keep it straight during measurement. The average of the measurements carried out on the sutures being tested and not less than two-thirds of the measurements taken on each suture are within the limits given in the columns under A in Table 0317.-1 for the gauge number concerned. None of the measurements is outside the limits given in the columns under B in Table 0317.-1 for the gauge number concerned.

Table 0317.-1. - *Diameters and Breaking Loads*

Gauge number	Diameter (millimetres)				Breaking load (newtons)	
	A		B		C	D
	min.	max.	min.	max.		
0.1	0.010	0.019	0.005	0.025	-	-
0.2	0.020	0.029	0.015	0.035	-	-
0.3	0.030	0.039	0.025	0.045	0.20	0.05
0.4	0.040	0.049	0.035	0.060	0.30	0.10
0.5	0.050	0.069	0.045	0.085	0.40	0.20
0.7	0.070	0.099	0.060	0.125	0.70	0.30
1	0.100	0.149	0.085	0.175	1.8	0.40
1.5	0.150	0.199	0.125	0.225	3.8	0.70
2	0.200	0.249	0.175	0.275	7.5	1.8
2.5	0.250	0.299	0.225	0.325	10	3.8
3	0.300	0.349	0.275	0.375	12.5	7.5
3.5	0.350	0.399	0.325	0.450	20	10
4	0.400	0.499	0.375	0.550	27.5	12.5
5	0.500	0.599	0.450	0.650	38.0	20.0
6	0.600	0.699	0.550	0.750	45.0	27.5
7	0.700	0.799	0.650	0.850	60.0	38.0
8	0.800	0.899	0.750	0.950	70.0	45.0

**Minimum breaking load**

The minimum breaking load is determined over a simple knot formed by placing one end of a suture held in the right hand over the other end held in the left hand, passing one end over the suture and through the loop so formed (see Figure 0317.-1) and pulling the knot tight. Carry out the test on 5 sutures. Submit sutures of length greater than 75 cm to 2 measurements and shorter sutures to one measurement. Determine the breaking load using a suitable tensiometer. The apparatus has 2 clamps for holding the suture, one of which is mobile and is driven at a constant rate of 30 cm/min. The clamps are designed so that the suture being tested can be attached without any possibility of slipping. At the beginning of the test the length of suture between the clamps is 12.5 cm to 20 cm and the knot is midway between the clamps. Set the mobile clamp in motion and note the force required to break the suture. If the suture breaks in a clamp or within 1 cm of it, the result is discarded and the test repeated on another suture. The average of all the results, excluding those legitimately discarded, is equal to or greater than the value given in column C in Table 0317.-1 and no individual result is less than that given in column D for the gauge number concerned.

Figure 0317.-1. - *Simple knot*

**Soluble chromium compounds**

Place 0.25 g in a conical flask containing 1 mL of water R per 10 mg of catgut. Stopper the flask, allow to stand at 37 ± 0.5 °C for 24 h, cool and decant the liquid. Transfer 5 mL to a small test tube and add 2 mL of a 10 g/L solution of diphenylcarbazine R in alcohol R and 2 mL of dilute sulfuric acid R. The solution is not more intensely coloured than a standard prepared at the same time using 5 mL of a solution containing 2.83 µg of potassium dichromate R per millilitre, 2 mL of dilute sulfuric acid R and 2 mL of a 10 g/L solution of diphenylcarbazine R in alcohol R (1 ppm of Cr).

**Needle attachment**

If the catgut is supplied with an eyeless needle attached that is not stated to be detachable, it complies with the test for needle attachment. Carry out the test on 5 sutures. Use a suitable tensiometer, such as that described for the determination of the minimum breaking load. Fix the needle and suture (without knot) in the clamps of the apparatus in such a way that the swaged part of the needle is completely free of the clamp and in line with the direction of pull on the suture. Set the mobile clamp in motion and note the force required to break the suture or to detach it from the needle. The average of the 5 determinations and all individual values are not less than the respective values given in Table 0317.-2 for the gauge number concerned. If not more than one individual value fails to meet the individual requirement, repeat the test on an additional 10 sutures. The catgut complies with the test if none of these 10 values is less than the individual value in Table 0317.-2 for the gauge number concerned.

Table 0317.-2. - *Minimum Strengths of Needle Attachment*

Gauge number	Mean value (newtons)	Individual values (newtons)
0.5	0.50	0.25
0.7	0.80	0.40
1	1.7	0.80
1.5	2.3	1.1
2	4.5	2.3
2.5	5.6	2.8
3	6.8	3.4
3.5	11.0	4.5
4	15.0	4.5
5	18.0	6.0

**STORAGE (PACKAGING)**

Sterile catgut sutures are presented in individual sachets that maintain sterility and allow the withdrawal and use of the sutures in aseptic conditions. Sterile catgut may be stored dry

SURGICAL MATERIALS

or in a preserving liquid to which an antimicrobial agent but not an antibiotic may be added.

Sutures in their individual sachets (primary packaging) are kept in a protective cover (box) which maintains the physical and mechanical properties until the time of use.

The application of appropriate harmonised standards for packaging of medical devices shall be considered.

#### LABELLING

Reference may be made to the appropriate harmonised standards for labelling of medical devices.

The details strictly necessary for the user to identify the product properly are indicated on or in each sachet (primary packaging) and on the protective cover (box) and include at least:

- gauge number,
- length in centimetres or metres,
- if appropriate, that the needle is detachable,
- name of the product,
- intended use (surgical suture, absorbable).

Ph Eur

## Sterile Synthetic Absorbable Braided Sutures

(Ph. Eur. monograph 0667)

Ph Eur

#### DEFINITION

Sterile synthetic absorbable braided sutures consist of sutures prepared from a synthetic polymer, polymers or copolymers which, when introduced into a living organism, are absorbed by that organism and cause no undue tissue irritation. They consist of completely polymerised material. They occur as multifilament sutures consisting of elementary fibres which are assembled by braiding. The sutures may be treated to facilitate handling and they may be coloured.

Appropriate harmonised standards may be considered when assessing compliance with respect to origin and processing of raw materials and with respect to biocompatibility.

Sterile synthetic absorbable braided sutures are wound-closure devices. Being absorbable they serve to approximate tissue during the healing period and subsequently lose tensile strength by hydrolysis.

#### PRODUCTION

Appropriate harmonised standards may apply with respect to appropriate validated methods of sterilisation, environmental control during manufacturing, labelling and packaging.

It is essential for the effectiveness and the performance characteristics during use and during the functional lifetime of these sutures that the following physical properties are specified: consistent diameter, sufficient initial strength and firm needle attachment.

The requirements below have been established, taking into account stresses which occur during normal conditions of use. These requirements can be used to demonstrate that individual production batches of these sutures are suitable for wound closure according to usual surgical techniques.

#### TESTS

Carry out the following tests on the sutures in the state in which they are removed from the sachet.

#### Length

Measure the length of the suture without applying more tension than is necessary to keep it straight. The length of each suture is not less than 95 per cent of the length stated on the label and does not exceed 400 cm.

#### Diameter

Unless otherwise prescribed, measure the diameter by the following method, using five sutures in the condition in which they are presented. Use a suitable instrument capable of measuring with an accuracy of at least 0.002 mm and having a circular pressor foot 10 mm to 15 mm in diameter. The pressor foot and the moving parts attached to it are weighted so as to apply a total load of  $100 \pm 10$  g to the suture being tested. When making the measurements, lower the pressor foot slowly to avoid crushing the suture. Measure the diameter at intervals of 30 cm over the whole length of the suture. For a suture less than 90 cm in length, measure at three points approximately evenly spaced along the suture. During the measurement, submit the sutures to a tension not greater than one-fifth of the minimum breaking load shown in column C of Table 0667.-1 appropriate to the gauge number and type of material or 10 N whichever is less.

For sutures of gauge number above 1.5 make two measurements at each point, the second measurement being made after rotating the suture through 90°. The diameter of that point is the average of the two measurements.

The average of the measurements carried out on the sutures being tested and not less than two-thirds of the measurements taken on each suture are within the limits given in the columns under A in Table 0667.-1 for the gauge number concerned. None of the measurements is outside the limits given in the columns under B in Table 0667.-1 for the gauge number concerned.

#### Minimum breaking load

The minimum breaking load is determined over a simple knot formed by placing one end of a suture held in the right hand over the other end held in the left hand, passing one end over the suture and through the loop so formed (see Figure 0667.-1) and pulling the knot tight.

Carry out the test on five sutures. Submit sutures of length greater than 75 cm to two measurements and shorter sutures to one measurement. Determine the breaking load using a suitable tensiometer. The apparatus has two clamps for holding the suture, one of which is mobile and is driven at a constant rate of 25 cm to 30 cm per minute. The clamps are designed so that the suture being tested can be attached without any possibility of slipping. At the beginning of the test the length of suture between the clamps is 12.5 cm to 20 cm and the knot is midway between the clamps. Set the mobile clamp in motion and note the force required to break the suture. If the suture breaks in a clamp or within 1 cm of it, the result is discarded and the test repeated on another suture. The average of all the results excluding those legitimately discarded is equal to or greater than the value given in column C in Table 0667.-1 and no individual result is less than that given in column D for the gauge number concerned.

Figure 0667.-1. – Simple knot

Table 0667.-1. – Diameters and breaking loads

Gauge number	Diameter (millimetres)				Breaking load (newtons)	
	A		B		C	D

7	0.700	0.799	0.650	0.850	-	-

**Needle attachment**

If the suture is supplied with an eyeless needle attached that is not stated to be detachable the attachment, it complies with the test for needle attachment. Carry out the test on five sutures. Use a suitable tensiometer, such as that described for the determination of the minimum breaking load. Fix the needle and suture (without knot) in the clamps of the apparatus in such a way that the swaged part of the needle is completely free of the clamp and in line with the direction of pull on the suture. Set the mobile clamp in motion and note the force required to break the suture or to detach it from the needle. The average of the five determinations and all individual values are not less than the respective values given in Table 0667.-2 for the gauge number concerned. If not more than one individual value fails to meet the individual requirement, repeat the test on an additional ten sutures.

The attachment complies with the test if none of the ten values is less than the individual value in Table 0667.-2 for the gauge number concerned.

Table 0667.-2. – Minimum strengths of needle attachment

Gauge number	Mean value (newtons)	Individual value (newtons)
0.4	0.50	0.25
0.5	0.80	0.40
0.7	1.7	0.80
1	2.3	1.1
1.5	4.5	2.3
2	6.8	3.4
2.5	9.0	4.5
3	11.0	4.5
3.5	15.0	4.5
4	18.0	6.0
5	18.0	7.0

**STORAGE (PACKAGING)**

Sterile synthetic absorbable braided sutures are presented in a suitable sachet that maintains sterility and allows the withdrawal and use of the sutures in aseptic conditions. The sutures must be stored dry.

They are intended to be used only on the occasion when the sachet is first opened.

Sutures in their individual sachets (primary packaging) are kept in a protective cover (box) which maintains the physical and mechanical properties until the time of use.

The application of appropriate harmonised standards for packaging of medical devices may be considered in addition.

**LABELLING**

Reference may be made to the appropriate harmonised standards for the labelling of medical devices.

The details strictly necessary for the user to identify the product properly are indicated on or in each sachet (primary packaging) and on the protective cover (box) and include at least:

- gauge number,
- length in centimetres or metres,
- if appropriate, that the needle is detachable,
- name of the product,
- intended use (synthetic absorbable suture),
- if appropriate, that the suture is coloured,
- the structure (braided).

Ph Eur

**Sterile Synthetic Absorbable Monofilament Sutures**

(Ph. Eur. monograph 0666)

Ph Eur

**DEFINITION**

Sterile synthetic absorbable monofilament sutures consist of sutures prepared from a synthetic polymer, polymers or copolymers which, when introduced into a living organism, are absorbed by that organism and cause no undue tissue irritation. They consist of completely polymerised material. They occur as monofilament sutures. The sutures may be treated to facilitate handling and they may be coloured.

Appropriate harmonised standards may be considered when assessing compliance with respect to origin and processing of raw materials and with respect to biocompatibility.

Sterile synthetic absorbable monofilament sutures are wound-closure devices. Being absorbable they serve to approximate tissue during the healing period and subsequently lose tensile strength by hydrolysis.

#### PRODUCTION

The appropriate harmonised standards may apply with respect to appropriate validated methods of sterilisation, environmental control during manufacturing, labelling and packaging.

It is essential for the effectiveness and the performance characteristics during use and during the functional lifetime of these sutures that the following physical properties are specified: consistent diameter, sufficient initial strength and firm needle attachment.

The requirements below have been established, taking into account stresses which occur during normal conditions of use. These requirements can be used to demonstrate that individual production batches of these sutures are suitable for wound closure according to usual surgical techniques.

#### TESTS

Carry out the following tests on the sutures in the state in which they are removed from the sachet.

##### Length

Measure the length of the suture without applying more tension than is necessary to keep it straight. The length of each suture is not less than 95 per cent of the length stated on the label and does not exceed 400 cm.

##### Diameter

Unless otherwise prescribed, measure the diameter by the following method, using five sutures in the condition in which they are presented. Use a suitable instrument capable of measuring with an accuracy of at least 0.002 mm and having a circular pressor foot 10 mm to 15 mm in diameter. The pressor foot and the moving parts attached to it are weighted so as to apply a total load of  $100 \pm 10$  g to the suture being tested. When making the measurements, lower the pressor foot slowly to avoid crushing the suture. Measure the diameter at intervals of 30 cm over the whole length of the suture. For a suture less than 90 cm in length, measure at three points approximately evenly spaced along the suture. During the measurement, submit the sutures to a tension not greater than that required to keep them straight. The average of the measurements carried out on the sutures being tested and not less than two-thirds of the measurements taken on each suture are within the limits given in the columns under A in Table 0666.-1 for the gauge number concerned. None of the measurements is outside the limits given in the columns under B in Table 0666.-1 for the gauge number concerned.

Table 0666.-1. – *Diameters and breaking loads*

Gauge number	Diameter (millimetres)				Breaking load (newtons)	
	A		B		C	D
	min.	max.	min.	max.		
0.5	0.050	0.094	0.045	0.125	1.4	0.7
0.7	0.095	0.149	0.075	0.175	2.5	1.3
1	0.150	0.199	0.125	0.225	6.8	3.4
1.5	0.200	0.249	0.175	0.275	9.5	4.7
2	0.250	0.339	0.225	0.375	17.5	8.9
3	0.340	0.399	0.325	0.450	26.8	13.4
3.5	0.400	0.499	0.375	0.550	39.0	18.5
4	0.500	0.570	0.450	0.600	50.8	25.4
5	0.571	0.610	0.500	0.700	63.5	31.8

##### Minimum breaking load

The minimum breaking load is determined over a simple knot formed by placing one end of a suture held in the right hand over the other end held in the left hand, passing one end over the suture and through the loop so formed (see Figure 0666.-1) and pulling the knot tight.

Carry out the test on five sutures. Submit sutures of length greater than 75 cm to two measurements and shorter sutures to one measurement. Determine the breaking load using a suitable tensiometer. The apparatus has two clamps for holding the suture, one of which is mobile and is driven at a constant rate of 25 cm to 30 cm per minute. The clamps are designed so that the suture being tested can be attached without any possibility of slipping. At the beginning of the test the length of suture between the clamps is 12.5 cm to 20 cm and the knot is midway between the clamps. Set the mobile clamp in motion and note the force required to break the suture. If the suture breaks in a clamp or within 1 cm of it, the result is discarded and the test repeated on another suture. The average of all the results excluding those legitimately discarded is equal to or greater than the value given in column C in Table 0666.-1 and no individual result is less than that given in column D for the gauge number concerned.

Figure 0666.-1. – *Simple knot*

##### Needle attachment

If the suture is supplied with an eyeless needle attached that is not stated to be detachable, the attachment complies with the test for needle attachment. Carry out the test on five

sutures. Use a suitable tensiometer, such as that described for the determination of the minimum breaking load. Fix the needle and suture (without knot) in the clamps of the apparatus in such a way that the swaged part of the needle is completely free of the clamp and in line with the direction of pull on the suture. Set the mobile clamp in motion and note the force required to break the suture or to detach it from the needle. The average of the five determinations and all individual values are not less than the respective values given in Table 0666.-2 for the gauge number concerned. If not more than one individual value fails to meet the individual requirement, repeat the test on an additional ten sutures. The attachment complies with the test if none of the ten values is less than the individual value in Table 0666.-2 for the gauge number concerned.

Table 0666.-2. - Minimum strengths of needle attachment

Gauge number	Mean value (newtons)	Individual value (newtons)
0.5	0.80	0.40
0.7	1.7	0.80
1	2.3	1.1
1.5	4.5	2.3
2	6.8	3.4
2.5	9.0	4.5
3	11.0	4.5
3.5	15.0	4.5
4	18.0	6.0
5	18.0	7.0

#### STORAGE (PACKAGING)

Sterile synthetic absorbable monofilament sutures are presented in a suitable sachet that maintains sterility and allows the withdrawal and use of the sutures in aseptic conditions. The sutures must be stored dry.

They are intended to be used only on the occasion when the sachet is first opened.

Sutures in their individual sachets (primary packaging) are kept in a protective cover (box) which maintains the physical and mechanical properties until the time of use.

The application of appropriate harmonised standards for packaging of medical devices may be considered in addition.

#### LABELLING

Reference may be made to appropriate harmonised standards for the labelling of medical devices.

The details strictly necessary for the user to identify the product properly are indicated on or in each sachet (primary packaging) and on the protective cover (box) and include at least:

- gauge number,
- length in centimetres or metres,
- if appropriate, that the needle is detachable,
- name of the product,
- intended use (surgical absorbable suture),
- if appropriate, that the suture is coloured,
- the structure (monofilament).

## Sterile Non-absorbable Sutures

### Sterile Non-absorbable Ligatures

(Ph. Eur. monograph 0324)

NOTE: The name Nylon 6 as a synonym for Polyamide 6 and Nylon 6/6 as a synonym for Polyamide 6/6 may be used freely in many countries, including the United Kingdom, but exclusive proprietary rights in this name are claimed in certain other countries.

Ph Eur

#### DEFINITION

Sterile non-absorbable sutures are sutures that, when introduced into a living organism, are not metabolised by that organism. Sterile non-absorbable sutures vary in origin, which may be animal, vegetable, metallic or synthetic. They occur as cylindrical monofilaments or as multifilament sutures consisting of elementary fibres that are assembled by twisting, cabling or braiding; they may be sheathed; they may be treated to render them non-capillary; they may be coloured.

Appropriate harmonised standards may be considered when assessing compliance with respect to origin and processing of raw materials and with respect to biocompatibility.

Sterile non-absorbable surgical sutures serve to approximate tissue during the healing period and provide continuing wound support.

The following materials are frequently used, as well as blends thereof, as blends of synthetic materials are common.

#### Silk (Filum bombycis)

Sterile braided silk suture is obtained by braiding a number of threads, according to the diameter required, of degummed silk obtained from the cocoons of the silkworm *Bombyx mori* L.

#### Linen (Filum lini)

Sterile linen thread consists of the pericyclic fibres of the stem of *Linum usitatissimum* L. The elementary fibres, 2.5-5 cm long, are assembled in bundles 30-80 cm long and spun into continuous lengths of suitable diameter.

#### Poly(ethylene terephthalate) (Filum ethyleni polyterephthalici)

Sterile poly(ethylene terephthalate) suture is obtained by drawing poly(ethylene terephthalate) through a suitable die. The suture is prepared by braiding very fine filaments in suitable numbers, depending on the gauge required.

#### Polyamide 6 (Filum polyamidicum-6)

Sterile polyamide 6 suture is obtained by drawing through a suitable die a synthetic plastic material formed by the polymerisation of  $\epsilon$ -caprolactam. It consists of smooth, cylindrical monofilaments or braided filaments, or lightly twisted sutures sheathed with the same material.

#### Polyamide 6/6 (Filum polyamidicum-6/6)

Sterile polyamide 6/6 suture is obtained by drawing through a suitable die a synthetic plastic material formed by the polycondensation of hexamethylenediamine and adipic acid. It consists of smooth, cylindrical monofilaments or braided filaments, or lightly twisted sutures sheathed with the same material.

#### Polypropylene (Filum polypropylenicum)

Polypropylene suture is obtained by drawing polypropylene through a suitable die. It consists of smooth cylindrical mono-filaments.

**Monofilament and multifilament stainless steel (*Filum aciei irrubiginibilis monofilamentum/multifilamentum*)**

Sterile stainless steel sutures have a chemical composition as specified in ISO 5832-1 - Metallic Materials for surgical implants - Part 1: Specification for wrought stainless steel, and comply with ISO 10334 - Implants for surgery - Malleable wires for use as sutures and other surgical applications.

Stainless steel sutures consist of smooth, cylindrical monofilaments or twisted filaments or braided filaments.

**Poly(vinylidene difluoride) (PVDF) (*Filum poly(vinylidene difluoridum)*)**

Sterile PVDF suture is obtained by drawing through a suitable die a synthetic plastic material formed by polymerisation of 1,1-difluoroethylene. It consists of smooth, cylindrical monofilaments.

**IDENTIFICATION**

Synthetic and natural materials may be identified by infrared spectrophotometry (2.2.24) using attenuated total reflection (ATR) or by differential scanning calorimetry. Additives and coatings of materials may lead to additional peaks. Natural materials may also be identified by microscopic examination of the morphology of the fibres.

**Identification of silk**

A. Dissect the end of a suture, using a needle or fine tweezers, to isolate a few individual fibres. The fibres are sometimes marked with very fine longitudinal striations parallel to the axis of the suture. Examined under a microscope, a cross-section is more or less triangular to semi-circular, with rounded edges and without a lumen.

B. Infrared absorption spectrophotometry (2.2.24). Examine by attenuated total reflection (ATR).

*Absorption maxima and intensities* 3280 ± 5 cm<sup>-1</sup> (strong); 2923 ± 15 cm<sup>-1</sup> (medium); 1622 ± 15 cm<sup>-1</sup> (strong); 1512 ± 5 cm<sup>-1</sup> (strong); 1444 ± 7 cm<sup>-1</sup> (medium); 1226 ± 10 cm<sup>-1</sup> (medium).

**Identification of linen**

A. Dissect the end of a suture, using a needle or fine tweezers, to isolate a few individual fibres. Examined under a microscope, the fibres are seen to be 12-31 µm wide and, along the greater part of their length, have thick walls, sometimes marked with fine longitudinal striations, and a narrow lumen. The fibres gradually narrow to a long, fine point. Sometimes there are unilateral swellings with transverse lines.

B. Infrared absorption spectrophotometry (2.2.24). Examine by attenuated total reflection (ATR).

*Absorption maxima and intensities* 3326 ± 10 cm<sup>-1</sup> (medium); 2911 ± 12 cm<sup>-1</sup> (medium); 1645 ± 10 cm<sup>-1</sup> (weak); 1426 ± 5 cm<sup>-1</sup> (medium); 1315 ± 3 cm<sup>-1</sup> (medium); 1154 ± 7 cm<sup>-1</sup> (medium); 1104 ± 5 cm<sup>-1</sup> (medium); 1050 ± 5 cm<sup>-1</sup> (strong); 1026 ± 7 cm<sup>-1</sup> (strong).

**Identification of poly(ethylene terephthalate)**

It is attacked by strongly alkaline solutions. It is incompatible with phenols.

Infrared absorption spectrophotometry (2.2.24). Examine by attenuated total reflection (ATR).

*Absorption maxima and intensities* 1712.5 ± 5 cm<sup>-1</sup> (strong); 1408 ± 5 cm<sup>-1</sup> (medium); 1338 ± 5 cm<sup>-1</sup> (medium); 1243 ± 12 cm<sup>-1</sup> (strong); 1093 ± 5 cm<sup>-1</sup> (strong); 1017 ± 5 cm<sup>-1</sup> (medium); 872 ± 5 cm<sup>-1</sup> (medium); 722 ± 2 cm<sup>-1</sup> (strong).

**Identification of polyamide 6, polyamide 6/6 and blends thereof**

They are not attacked by dilute alkaline solutions (for example a 100 g/L solution of *sodium hydroxide R*) but are attacked by dilute mineral acids (for example a 20 g/L solution of *sulfuric acid R*) and by hot *glacial acetic acid R*.

Infrared absorption spectrophotometry (2.2.24). Examine by attenuated total reflection (ATR).

*Absorption maxima and intensities* 3296 ± 10 cm<sup>-1</sup> (medium); 2930 ± 15 cm<sup>-1</sup> (medium); 2862 ± 15 cm<sup>-1</sup> (medium); 1635 ± 5 cm<sup>-1</sup> (strong); 1539 ± 12 cm<sup>-1</sup> (strong); 1462 ± 10 cm<sup>-1</sup> (medium); 1262 ± 12 cm<sup>-1</sup> (medium).

**Identification of polypropylene**

Polypropylene is soluble in decahydronaphthalene, in 1-chloronaphthalene and in trichloroethylene. It is insoluble in ethanol (96 per cent) and in cyclohexanone.

Infrared absorption spectrophotometry (2.2.24). Examine by attenuated total reflection (ATR).

*Absorption maxima and intensities* 2950 ± 5 cm<sup>-1</sup> (strong); 2916 ± 5 cm<sup>-1</sup> (strong); 2870 ± 5 cm<sup>-1</sup> (medium); 2838 ± 5 cm<sup>-1</sup> (medium); 1456 ± 5 cm<sup>-1</sup> (medium); 1376 ± 5 cm<sup>-1</sup> (medium).

**Identification of stainless steel**

Stainless steel sutures are identified by confirming that the composition is in accordance with ISO 5832 Part 1.

**Identification of poly(vinylidene difluoride)**

It is soluble in warm dimethylformamide. It is insoluble in anhydrous ethanol, in hot and cold isopropyl alcohol, in ethyl acetate and in tetrachloroethylene.

Infrared absorption spectrophotometry (2.2.24). Examine by attenuated total reflection (ATR).

*Absorption maxima and intensities* 1399 ± 5 cm<sup>-1</sup> (medium); 1275 ± 2 cm<sup>-1</sup> (medium); 1165 ± 10 cm<sup>-1</sup> (strong); 1070 ± 5 cm<sup>-1</sup> (medium); 873 ± 3 cm<sup>-1</sup> (strong); 838 ± 2 cm<sup>-1</sup> (strong).

**PRODUCTION**

The appropriate harmonised standards apply with respect to appropriate validated methods of sterilisation, environmental control during manufacturing, labelling and packaging.

It is essential for the effectiveness and the performance characteristics during use and during the functional lifetime of these sutures that the following physical properties are specified: consistent diameter, sufficient initial strength and firm needle attachment.

The requirements below have been established, taking into account stresses which occur during normal conditions of use. These requirements can be used to demonstrate that individual production batches of these sutures are suitable for wound closure in accordance with usual surgical techniques.

**TESTS**

*Remove the sutures from the sachet and measure promptly and in succession the length, diameter and minimum load.*

If linen is tested the sutures are conditioned as follows: if stored in the dry state, expose to an atmosphere with a relative humidity of 65 ± 5 per cent at 20 ± 2 °C for 4 h immediately before measuring the diameter and for the determination of minimum breaking load, immerse in *water R* at room temperature for 30 min immediately before carrying out the test.

Table 0324.-1. - *Diameters and minimum breaking loads*

Gauge number	Diameter (millimetres)				Minimum breaking load (newtons)					
	A		B		Linen thread		All other non-absorbable strands		Stainless steel	
	min.	max.	min.	max.	C	D	C	D	C	D
0.05	0.005	0.009	0.003	0.012	-	-	0.01	-	-	-
0.1	0.010	0.019	0.005	0.025	-	-	0.03	-	-	-

10	1.000	1.099	0.950	1.150	-	-	-	-	178.5	133.9

**Length**

Measure the length without applying more tension than is necessary to keep them straight. The length of the suture is not less than 95 per cent of the length stated on the label and does not exceed 400 cm.

**Diameter**

Unless otherwise prescribed, measure the diameter by the following method using 5 sutures. Use a suitable mechanical instrument capable of measuring with an accuracy of at least 0.002 mm and having a circular pressor foot 10-15 mm in diameter. The pressor foot and the moving parts attached to it are weighted so as to apply a total load of  $100 \pm 10$  g to the suture being tested. When making the measurements, lower the pressor foot slowly to avoid crushing the suture. Measure the diameter at intervals of 30 cm over the whole length of the suture. For a suture less than 90 cm in length, measure at 3 points approximately evenly spaced along the suture. During the measurement submit monofilament sutures to a tension not greater than that required to keep them straight. Submit multifilament sutures to a tension not greater than one-fifth of the minimum breaking load shown in column C of Table 0324.-1 appropriate to the gauge number and type of material concerned or 10 N whichever is less. Stainless steel sutures do not require tension to be applied during the measurement of diameter.

For multifilament sutures of gauge number above 1.5 make 2 measurements at each point, the second measurement being made after rotating the suture through 90°.

The diameter of that point is the average of the 2 measurements. The average of the measurements carried out on the sutures being tested and not less than two-thirds of the measurements taken on each suture are within the limits given in the column under A in Table 0324.-1 for the gauge number concerned. None of the measurements are outside the limits given in the columns under B in Table 0324.-1 for the gauge number concerned.

**Minimum breaking load**

Unless otherwise prescribed, determine the minimum breaking load by the following method using sutures in the condition in which they are presented. The minimum breaking load is determined over a simple knot formed by placing one end of a suture held in the right hand over the other end held in the left hand, passing one end over the suture and through the loop so formed (see Figure 0324.-1) and pulling the knot tight. For stainless steel sutures gauges 3.5 and above, the minimum breaking load is determined on a straight pull. Carry out the test on 5 sutures. Submit sutures of length greater than 75 cm to 2 measurements and shorter sutures to 1 measurement. Determine the breaking load using a suitable tensiometer. The apparatus has 2 clamps for holding the suture, 1 of which is mobile and is driven at a constant rate of 30 cm/min. The clamps are designed so that the suture being tested can be attached without any possibility of slipping. At the beginning of the test the length of suture between the clamps is 12.5-20 cm and the knot is midway between the clamps. Set the mobile clamp in motion and note the force required to break the suture. If the suture breaks in a clamp or within 1 cm of it, the result is discarded and the test repeated on another suture. The average of all the results, excluding those legitimately discarded, is equal to or greater than the value given in column C in Table 0324.-1 and no value is less than that given in column D for the gauge number and type of material concerned.

Figure 0324.-1 . - Simple knot

**Needle attachment**

If the sutures are supplied with an eyeless needle attached that is not stated to be detachable, they comply with the test for needle attachment. Carry out the test on 5 sutures. Use a suitable tensiometer, such as that described for the determination of the minimum breaking load. Fix the needle and suture (without knot) in the clamps of the apparatus in such a way that the swaged part of the needle is completely free of the clamp and in line with the direction of pull on the suture. Set the mobile clamp in motion and note the force required to break the suture or to detach it from the needle. The average of the 5 determinations and all individual values are not less than the respective values given in Table 0324.-2 for the gauge number concerned. If not more than 1 individual value fails to meet the individual requirement, repeat the test on an additional 10 sutures. The attachment complies with the test if none of these 10 values is less than the individual value in Table 0324.-2 for the gauge number concerned.

Table 0324.-2. - Minimum strengths of needle attachment

Gauge number	Mean value (newtons)	Individual value (newtons)
0.4	0.50	0.25
0.5	0.80	0.40
0.7	1.7	0.80
1	2.3	1.1
1.5	4.5	2.3
2	6.8	3.4
2.5	9.0	4.5
3	11.0	4.5
3.5	15.0	4.5
4	18.0	6.0
5	18.0	7.0
6	25.0	12.5
7	25.0	12.5
8	50.0	25
9	50.0	25
10	75.0	37.5

**Extractable colour**

Sutures that are dyed and intended to remain so during use comply with the test for extractable colour. Place 0.25 g of the suture to be examined in a conical flask, add 25.0 mL of water R and cover the mouth of the flask with a short-stemmed funnel. Boil for 15 min, cool and adjust to the original volume with water R. Depending on the colour of the suture, prepare the appropriate reference solution as described in Table 0324.-3 using the primary colour solutions (2.2.2).

Table 0324.-3. - Colour reference solutions

Colour of strand	Composition of reference solution (parts by volume)			
	Red primary solution	Yellow primary solution	Blue primary solution	Water R
Yellow-brown	0.2	1.2	-	8.6
Pink-red	1.0	-	-	9.0
Green-blue	-	-	2.0	8.0
Violet	1.6	-	8.4	-

The test solution is not more intensely coloured than the appropriate reference solution.

**Monomer and oligomers**

Maximum 2 per cent for the polyamide 6 suture.

In a continuous-extraction apparatus, treat 1.00 g with 30 mL of methanol R at a rate of at least 3 extractions per hour for 7 h. Evaporate the extract to dryness, dry the residue at 110 °C for 10 min, allow to cool in a desiccator and weigh. The residue weighs a maximum of 20 mg.

**STORAGE (PACKAGING)**

Sterile non-absorbable sutures are presented in a suitable sachet that maintains sterility and allows the withdrawal and use of a suture in aseptic conditions. They may be stored dry or in a preserving liquid to which an antimicrobial agent but no antibiotic may be added.

Sterile non-absorbable sutures are intended to be used only on the occasion when the sachet is first opened.

Sutures in their individual sachets (primary packaging) are kept in a protective cover (box) which maintains the physical and mechanical properties until the time of use.

The application of appropriate harmonised standards for packaging of medical devices shall be considered in addition.

**LABELLING**

Reference may be made to the appropriate harmonised standards for the labelling of medical devices.

The details strictly necessary for the user to identify the product properly are indicated on or in each sachet (primary packaging) and on the protective cover (box) and include at least:

- gauge number;
- length, in centimetres or metres;
- if appropriate, that the needle is detachable;
- name of the product;
- intended use (surgical suture, non-absorbable);
- if appropriate, that the suture is coloured;
- if appropriate, the structure (braided, monofilament, sheathed).
