## CHAPTER11

1. (a) $90.50 \%$ carbon; $9.50 \%$ hydrogen
(b) $\mathrm{C}_{4} \mathrm{H}_{5}$
2. $32.0 \%$ carbon; $5.4 \%$ hydrogen; $62.8 \%$ chlorine; $\mathrm{C}_{3} \mathrm{H}_{6} \mathrm{Cl}_{2}$
3. $\mathrm{C}_{2} \mathrm{H}_{5} \mathrm{NO}_{2}$
4. $180.2=$ molecular mass. Molecular formula is $\mathrm{C}_{9} \mathrm{H}_{8} \mathrm{O}_{4}$.
5. Equivalent weight $=52.3$
6. (a) 6
(b) 1
(c) 3
(d) 6
(e) 12
7. The index of hydrogen deficiency $=1$. There cannot be a triple bond, since the presence of a triple bond would require an index of hydrogen deficiency of at least 2 .
8. (a) $59.96 \%$ carbon; $5.75 \%$ hydrogen; $34.29 \%$ oxygen
(b) $\mathrm{C}_{7} \mathrm{H}_{8} \mathrm{O}_{3}$
(c) $\mathrm{C}_{21} \mathrm{H}_{24} \mathrm{O}_{9}$
(d) A maximum of two aromatic (benzenoid) rings
9. (a) $\mathrm{C}_{8} \mathrm{H}_{8} \mathrm{O}_{2}$
(b) $\mathrm{C}_{8} \mathrm{H}_{12} \mathrm{~N}_{2}$
(c) $\mathrm{C}_{7} \mathrm{H}_{8} \mathrm{~N}_{2} \mathrm{O}$
(d) $\mathrm{C}_{5} \mathrm{H}_{12} \mathrm{O}_{4}$
10. Molecular formula $=\mathrm{C}_{8} \mathrm{H}_{10} \mathrm{~N}_{4} \mathrm{O}_{2}$ Index of hydrogen deficiency $=6$
11. Molecular formula $=\mathrm{C}_{21} \mathrm{H}_{30} \mathrm{O}_{2}$

Index of hydrogen deficiency $=7$

## CHAPTER 2

1. (a) Propargyl chloride (3-chloropropyne)
(b) p-Cymene (4-isopropyltoluene)
(c) $m$-Toluidine (3-methylaniline)
(d) $o$-Cresol (2-methylphenol)
(e) N -Ethylaniline
(f) 2-Chlorotoluene
(g) 2-Chloropropanoic acid
(h) 3-Methyl-1-butanol
(i) 5-Hexen-2-one
(j) 1,2,3,4-Tetrahydronaphthalene
(k) 3-(Dimethylamino)propanenitrile
(1) 1,2-Epoxybutane
2. Citronellal
3. trans-Cinnamaldehyde (trans-3-phenyl-2-propenal)
4. Upper spectrum, trans-3-hexen-1-ol; Lower spectrum, cis-3-hexen-1-ol

## ANS-2 Answers to Selected Problems

5. (a) Structure B (ethyl cinnamate)
(b) Structure C (cyclobutanone)
(c) Structure D (2-ethylaniline)
(d) Structure A (propiophenone)
(e) Structure D (butanoic anhydride)
6. Poly(acrylonitrile-styrene); poly(methyl methacrylate); polyamide (nylon)

## CHAPTER 3

1. (a) $-1,0,+1$
(b) $-\frac{1}{2},+\frac{1}{2}$
(c) $-\frac{5}{2},-\frac{3}{2},-\frac{1}{2},+\frac{1}{2},+\frac{3}{2},+\frac{5}{2}$
(d) $-\frac{1}{2},+\frac{1}{2}$
2. $128 \mathrm{~Hz} / 60 \mathrm{MHz}=2.13 \mathrm{ppm}$
3. (a) $180 \mathrm{~Hz} \quad$ (b) 1.50 ppm
4. See Figures 3.22 and 3.23. The methyl protons are in a shielding region. Acetonitrile shows similar anisotropic behavior to acetylene.
5. o-Hydroxyacetophenone is intramolecularly hydrogen bonded. The proton is deshielded ( 12.05 ppm ). Changing concentration does not alter the extent of hydrogen bonding. Phenol is intermolecularly hydrogen bonded. The extent of hydrogen bonding depends upon concentration.
6. The methyl groups are in a shielding region of the double bonds. See Figure 3.23.
7. The carbonyl group deshields the ortho protons owing to anisotropy.
8. The methyl groups are in the shielding region of the double-bonded system. See Figure 3.24.
9. The spectrum will be similar to that in Figure 3.25, with some differences in chemical shifts. Spin arrangements: $\mathrm{H}_{\mathrm{A}}$ will be identical to the pattern in Figure 3.32 (triplet); $\mathrm{H}_{\mathrm{B}}$ will see one adjacent proton and will appear as a doublet ( $+\frac{1}{2}$ and $-\frac{1}{2}$ ).
10. The isopropyl group will appear as a septet for the $\alpha-\mathrm{H}$ (methine). From Pascal's triangle, the intensities are 1:6:15:20:15:6:1. The $\mathrm{CH}_{3}$ groups will be a doublet.
11. Downfield doublet, area $=2$, for the protons on carbon 1 and carbon 3 ; upfield triplet, area $=1$, for the proton on carbon 2 .
12. $\mathrm{X}-\mathrm{CH}_{2}-\mathrm{CH}_{2}-\mathrm{Y}$, where $\mathrm{X} \neq \mathrm{Y}$.
13. Upfield triplet for the $\mathrm{C}-3$ protons, are $=3$; intermediate sextet for the $\mathrm{C}-2$ protons, area $=2$; and downfield triplet for the C-1 protons, area $=2$
14. Ethyl acetate (ethyl ethanoate)
15. Isopropylbenzene
16. 2-Bromobutanoic acid
17. (a) Propyl acetate
(b) Isopropyl acetate
18. 1,3-Dibromopropane
19. 2,2-Dimethoxypropane
20. (a) Isobutyl propanoate
(b) $t$-Butyl propanoate
(c) Butyl propanoate
21. (a) 2-Chloropropanoic acid (b) 3-Chloropropanoic acid
22. (a) 2-Phenylbutane (sec-butylbenzene)
(b) 1-Phenylbutane (butylbenzene)
23. 2-Phenylethylamine

## CHAPTER 4

1. Methyl acetate
2. 

(c) 7 peaks
(d) 3 peaks
(e) 5 peaks
(f) 10 peaks
(g) 10 peaks
(h) 4 peaks
(i) 5 peaks
(j) 6 peaks
(k) 8 peaks
3. (a) 2-Methyl-2-propanol
(b) 2-Butanol
(c) 2-Methyl-1-propanol
4. Methyl methacrylate (methyl 2-methyl-2-propenoate)
(a) 2-Bromo-2-methylpropane
(b) 2-Bromobutane
(c) 1-Bromobutane
(d) 1-Bromo-2-methylpropane
6. (a) 4-Heptanone
(b) 2,4-Dimethyl-3-pentanone
(c) 4,4-Dimethyl-2-pentanone
18. 2,3-Dimethyl-2-butene. A primary cation rearranges to a tertiary cation via a hydride shift. E1 elimination forms the tetrasubstituted alkene.
19. (a) Three equal-sized peaks for ${ }^{13} \mathrm{C}$ coupling to a single D atom; quintet for ${ }^{13} \mathrm{C}$ coupling to two D atoms.
(b) Fluoromethane: doublet for ${ }^{13} \mathrm{C}$ coupling to a single F atom $\left({ }^{1} J>180 \mathrm{~Hz}\right)$.

Trifluoromethane: quartet for ${ }^{13} \mathrm{C}$ coupling to three F atoms $\left({ }^{1} J>180 \mathrm{~Hz}\right)$.
1,1-Difluoro-2-chloroethane: triplet for carbon-1 coupling to two F atoms ( ${ }^{1} J>180 \mathrm{~Hz}$ ); triplet for carbon-2 coupling to two F atoms ( ${ }^{2} J \approx 40 \mathrm{~Hz}$ ).
1,1,1-trifluoro-2-chloroethane: quartet for carbon-1 coupling to three F atoms ( ${ }^{1} J>180 \mathrm{~Hz}$ ); quartet for carbon-2 coupling to three $F$ atoms ( ${ }^{2} J \approx 40 \mathrm{~Hz}$ ).
20. $\mathrm{C} 1=128.5+9.3=137.8 \mathrm{ppm} ; \mathrm{C} 2=128.5+0.7=129.2 \mathrm{ppm} ; \mathrm{C} 3=128.5-0.1=128.4 \mathrm{ppm}$; $\mathrm{C} 4=128.5-2.9=125.6 \mathrm{ppm}$.
21. All carbons are numbered according to IUPAC rules. The following information is given: the name of the compound, the number of the table used (A8.2-A8.7, Appendix 8), and, where needed, the name of the reference compound used (from A8.1, Appendix 8). If actual values are known, they are given in parentheses.
(a) Methyl vinyl ether, A8.2 (actual: $153.2,84.2 \mathrm{ppm}$ )
$\mathrm{C} 1=123.3+29.4=152.7 \quad \mathrm{C} 2=123.3-38.9=84.4$
(b) Cyclopentanol, A8.3-cyclopentane (actual: 73.3, $35.0,23.4 \mathrm{ppm}$ )
$\mathrm{C} 1=25.6+41=66.6 \quad \mathrm{C} 2=25.6+8=33.6 \quad \mathrm{C} 3=25.6-5=20.6$
(c) 2-Pentene, A8.5 (actual: $123.2,132.7 \mathrm{ppm})$
$\mathrm{C} 2=123.3+10.6-7.9-1.8=124.2 \quad \mathrm{C} 3=123.3+10.6+7.2-7.9=133.2$
Using Table A8.4:
$\mathrm{C} 2=123.3+12.9-9.7=126.5 \quad \mathrm{C} 3=123.3+17.2-7.4=133.1$

## ANS-4 Answers to Selected Problems

(d) ortho-Xylene, A8.7
$\mathrm{C} 1, \mathrm{C} 2=128.5+9.3+0.7=138.5$
$\mathrm{C} 3, \mathrm{C} 6=128.5+0.7-0.1=129.1$
$\mathrm{C} 4, \mathrm{C} 5=128.5-0.1-2.9=125.5$
meta-Xylene, A8.7 (actual: 137.6, 130.0, 126.2, 128.2 ppm )
$\mathrm{C} 1, \mathrm{C} 3=128.5+9.3-0.1=137.7$
$\mathrm{C} 2=128.5+0.7+0.7=129.9$
C4, C6 $=128.5+0.7-2.9=126.3$
$\mathrm{C} 5=128.5-0.1-0.1=128.3$
para-Xylene, T7
$\mathrm{C} 1, \mathrm{C} 4=128.5+9.3-2.9=134.9$
$\mathrm{C} 2, \mathrm{C} 3, \mathrm{C} 5, \mathrm{C} 6=128.5+0.7-0.1=129.1$
(e) 3-Pentanol, A8.3-pentane (actual: 9.8, 29.7, 73.8 ppm )
$\mathrm{C} 1, \mathrm{C} 5=13.9-5=8.9 \quad \mathrm{C} 2, \mathrm{C} 4=22.8+8=30.8 \quad \mathrm{C} 3=34.7+41=75.7$
(f) 2-Methylbutanoic acid, A8.3-butane

$$
\mathrm{C} 1=13.4+2=15.4 \quad \mathrm{C} 2=25.2+16=41.2 \quad \mathrm{C} 3=25.2+2=27.2 \quad \mathrm{C} 4=13.4-2+11.4
$$

(g) 1-Phenyl-1-propene, A8.4
$\mathrm{C} 1=123.3+12.5-7.4=128.4 \quad \mathrm{C} 2=123.3+12.9-11=125.2$
(h) 2,2-Dimethylbutane, A8.3 or A8.2 (actual: 29.1, 30.6, 36.9, 8.9 ppm )

Using Table A8.3: $\mathrm{C} 1=13.4+8+8=29.4 \quad \mathrm{C} 2=25.2+6+6=37.2$
$\mathrm{C} 3=25.2+8+8=41.2 \quad \mathrm{C} 4=13.4-2-2=9.4$
Using Table A8.2:
$\mathrm{C} 1=-2.3+[9.1(1)+9.4(3)-2.5(1)]+[(-3.4)]=29.1$
$\mathrm{C} 2=-2.3+[9.1(4)+9.4(1)]+[3(-1.5)+(-8.4)]=30.6$
$\mathrm{C} 3=-2.3+[9.1(2)+9.4(3)]+[(0)+(-7.5)]=36.6$
$\mathrm{C} 4=-2.3+[9.1(1)+9.4(1)-2.5(3)]+[(0)]=8.7$
(i) 2,3-Dimethyl-2-pentenoic acid, A8.6
$\mathrm{C} 2=123.3+4+10.6-7.9-7.9-1.8=120.3$
$\mathrm{C} 3=123.3+10.6+10.6+7.2+9-7.9=152.8$
(j) 4-Octene, A8.5, and assume trans geometry
$\mathrm{C} 4, \mathrm{C} 5=123.3+[10.6+7.2-1.5]-[7.9+1.8-1.5]=131.4$
To estimate cis, correct as follows: $131.4-1.1=130.3$
(k) 4-Aminobenzoic acid, A8.7
$\mathrm{C} 1=128.5+2.1-10.0=120.6 \quad \mathrm{C} 2=128.5+1.6+0.8=130.9$
$\mathrm{C} 3=128.5-13.4+0.1=115.2 \quad \mathrm{C} 4=128.5+18.2+5.2=151.9$
(1) 1-Pentyne, A8.3-propane
$\mathrm{C} 3=15.8+4.5=20.3 \quad \mathrm{C} 4=16.3+5.4=21.7 \quad \mathrm{C} 5=15.8-3.5=12.3$
(m) Methyl 2-methylpropanoate, A8.3-propane
$\mathrm{C} 2=16.3+17=33.3 \quad \mathrm{C} 3=15.8+2=17.8$
(n) 2-Pentanone, A8.3-propane
$\mathrm{C} 3=15.8+30=45.8 \quad \mathrm{C} 4=16.3+1=17.3 \quad \mathrm{C} 5=15.8-2=13.8$
(o) Bromocyclohexane, A8.3-cyclohexane
$\mathrm{C} 1=26.9+25=51.9 \quad \mathrm{C} 2=26.9+10=36.9 \quad \mathrm{C} 3=26.9-3=23.9$
$\mathrm{C} 4=26.9$ (no correction)
(p) 2-Methylpropanoic acid, A8.3-propane
$\mathrm{C} 1=15.8+2=17.8 \quad \mathrm{C} 2=16.3+16=32.3$
(q) 4-Nitroaniline, A8.7 (actual: 155.1, 112.8, 126.3, 136.9 ppm )

$$
\begin{aligned}
& \mathrm{C} 1=128.5+18.2+6.0=152.7 \quad \mathrm{C} 2=128.5-13.4+0.9=116.0 \\
& \mathrm{C} 3=128.5+0.8-4.9=124.4 \quad \mathrm{C} 4=128.5+19.6-10.0=138.1
\end{aligned}
$$

2-Nitroaniline, A8.7
$\mathrm{C} 1=128.5+18.2-4.9=141.8 \quad \mathrm{C} 2=128.5-13.4+19.6=134.7$
$\mathrm{C} 3=128.5-4.9+0.8=124.4 \quad \mathrm{C} 4=128.5+0.9-10.0=119.4$

(r) 1,3-Pentadiene, A8.4
$\mathrm{C} 3=123.3+13.6-13.6=129.5 \quad \mathrm{C} 4=123.3+12.9-7=129.2$
(s) Cyclohexene, A8.5 (actual: 127.3 ppm )
$\mathrm{C} 1, \mathrm{C} 2=123.3+[10.6+7.2-1.5]-[7.9+1.8-1.5]+[-1.1]=130.3$
(t) 4-Methyl-2-pentene, A8.5, and assume trans
$\mathrm{C} 2=123.3+[10.6(1)]-[7.9(1)+1.8(2)]=122.4$
$\mathrm{C} 3=123.3+[10.6(1)+7.2(2)]-[7.9(1)]+2.3=142.7$

## CHAPTER 5

1. Refer to Sections 5.6 and 5.9 for instructions on measuring coupling constants using the Hertz values that are printed above the expansions of the proton spectra.
(a) Vinyl acetate (Fig. 5.45): all vinyl protons are doublets of doublets.
$\mathrm{H}_{\mathrm{a}}=4.57 \mathrm{ppm},{ }^{3} \mathrm{~J}_{\mathrm{ac}}=6.25 \mathrm{~Hz}$ and ${ }^{2} \mathrm{~J}_{\mathrm{ab}}=1.47 \mathrm{~Hz}$.
$\mathrm{H}_{\mathrm{b}}=4.88 \mathrm{ppm}$. The coupling constants are not consistent; ${ }^{3} \mathbf{J}_{\mathrm{bc}}=13.98$ or 14.34 Hz from the spacing of the peaks. ${ }^{2} \mathrm{~J}_{\mathrm{ab}}=1.48$ or 1.84 Hz . It is often the case that the coupling constants are not consistent (see Section 5.9). More consistent coupling constants can be obtained from analysis of proton $\mathrm{H}_{\mathrm{c}}$.
$\mathrm{H}_{\mathrm{c}}=7.27 \mathrm{ppm},{ }^{3} \mathrm{~J}_{\mathrm{bc}}=13.97 \mathrm{~Hz}$ and ${ }^{3} \mathrm{~J}_{\mathrm{ac}}=6.25 \mathrm{~Hz}$ from the spacing of the peaks.
Summary of coupling constants from the analysis of the spectrum: ${ }^{3} \mathrm{~J}_{\mathrm{ac}}=6.25 \mathrm{~Hz}$, ${ }^{3} \mathrm{~J}_{\mathrm{bc}}=13.97 \mathrm{~Hz}$ and ${ }^{2} \mathrm{~J}_{\mathrm{ab}}=1.47 \mathrm{~Hz}$. They can be rounded off to: $6.3,14.0$ and 1.5 Hz , respectively.
(b) trans-Crotonic acid (Fig. 5.48).

$\mathrm{H}_{\mathrm{a}}=1.92 \mathrm{ppm}$ (methyl group at C-4). It appears as a doublet of doublets (dd) because it shows both ${ }^{3} \mathrm{~J}$ and ${ }^{4} \mathrm{~J}$ couplings; ${ }^{3} \mathrm{~J}_{\mathrm{ac}}=6.9 \mathrm{~Hz}$ and ${ }^{4} \mathrm{~J}_{\mathrm{ab}}$ allylic $=1.6 \mathrm{~Hz}$.
$\mathrm{H}_{\mathrm{b}}=5.86 \mathrm{ppm}$ (vinyl proton at C-2). It appears as a doublet of quartets (dq); ${ }^{3} \mathrm{~J}_{\mathrm{bc}}$ trans $=$ 15.6 Hz and ${ }^{4} \mathrm{~J}_{\mathrm{ab}}$ allylic $=1.6 \mathrm{~Hz}$.
$\mathrm{H}_{\mathrm{c}}=7.10 \mathrm{ppm}$ (vinyl proton at C-3). It appears as a doublet of quartets (dq), with some partial overlap of the quartets; ${ }^{3} \mathrm{~J}_{\mathrm{bc}}$ trans $=15.6 \mathrm{~Hz}$ and ${ }^{3} \mathrm{~J}_{\mathrm{ac}}=6.9 \mathrm{~Hz}$. Notice that $\mathrm{H}_{\mathrm{c}}$ is shifted further downfield than $\mathrm{H}_{\mathrm{b}}$ because of the resonance effect of the carboxyl group and also a through-space deshielding by the oxygen atom in the carbonyl group.

## ANS-6 Answers to Selected Problems

$\mathrm{H}_{\mathrm{d}}=12.2 \mathrm{ppm}$ (singlet, acid proton on carboxyl group).
(c) 2-Nitrophenol (Fig. 5.64). $\mathrm{H}_{\mathrm{a}}$ and $\mathrm{H}_{\mathrm{b}}$ are shielded by the electron releasing effect of the hydroxyl group caused by the non-bonded electrons on the oxygen atom being involved in resonance. They can be differentiated by their appearance: $\mathrm{H}_{\mathrm{a}}$ is a triplet with some fine structure and $\mathrm{H}_{\mathrm{b}}$ is a doublet with fine structure. $\mathrm{H}_{\mathrm{d}}$ is deshielded by the electron withdrawing effect and by the anisotropy of the nitro group. Notice that the pattern is a doublet with some fine structure. $\mathrm{H}_{\mathrm{c}}$ is assigned by a process of elimination. It lacks any of the above effects that shields or deshields that proton. It appears as a triplet with some fine structure.
$\mathrm{H}_{\mathrm{a}}=7.00 \mathrm{ppm}(\mathrm{ddd}) ;{ }^{3} \mathrm{~J}_{\mathrm{ac}} \cong{ }^{3} \mathrm{~J}_{\mathrm{ad}}=8.5 \mathrm{~Hz}$ and ${ }^{4} \mathrm{~J}_{\mathrm{ab}}=1.5 \mathrm{~Hz} . \mathrm{H}_{\mathrm{a}}$ could also be described as a triplet of doublets (td) since ${ }^{3} \mathbf{J a c}_{\mathrm{ac}}$ and ${ }^{3} \mathbf{J}_{\mathrm{ad}}$ are nearly equal.
$\mathrm{H}_{\mathrm{b}}=7.16 \mathrm{ppm}(\mathrm{dd}) ;{ }^{3} \mathrm{~J}_{\mathrm{bc}}=8.5 \mathrm{~Hz}$ and ${ }^{4} \mathrm{~J}_{\mathrm{ab}}=1.5 \mathrm{~Hz}$.
$\mathrm{H}_{\mathrm{c}}=7.60 \mathrm{ppm}\left(\mathrm{ddd}\right.$ or td); ${ }^{3} \mathrm{~J}_{\mathrm{ac}} \cong{ }^{3} \mathrm{~J}_{\mathrm{bc}}=8.5 \mathrm{~Hz}$ and ${ }^{4} \mathrm{~J}_{\mathrm{cd}}=1.5 \mathrm{~Hz}$.
$\mathrm{H}_{\mathrm{d}}=8.12 \mathrm{ppm}(\mathrm{dd}) ;{ }^{3} \mathrm{~J}_{\mathrm{ad}}=8.5 \mathrm{~Hz}$ and ${ }^{4} \mathrm{~J}_{\mathrm{cd}}=1.5 \mathrm{~Hz} ;{ }^{5} \mathrm{~J}_{\mathrm{bd}}=0$.
The OH group is not shown in the spectrum.
(d) 3-Nitrobenzoic acid (Fig. 5.65). $\mathrm{H}_{\mathrm{d}}$ is significantly deshielded by the anisotropy of both the nitro and carboxyl groups and appears furthest downfield. It appears as a narrowly spaced triplet. This proton only shows ${ }^{4} \mathrm{~J}$ couplings. $\mathrm{H}_{\mathrm{b}}$ is ortho to a carboxyl group while $\mathrm{H}_{\mathrm{c}}$ is ortho to a nitro group. Both protons are deshielded, but the nitro group shifts a proton further downfield than for a proton next to a carboxyl group (see Appendix 6). Both $\mathrm{H}_{\mathrm{b}}$ and $\mathrm{H}_{\mathrm{c}}$ are doublets with fine structure consistent with their positions on the aromatic ring. $\mathrm{H}_{\mathrm{a}}$ is relatively shielded and appears upfield as a widely spaced triplet. This proton does not experience any anisotropy effect because of its distance away from the attached groups. $\mathrm{H}_{\mathrm{a}}$ has only ${ }^{3} \mathrm{~J}$ couplings $\left({ }^{5} \mathrm{~J}_{\mathrm{ad}}=0\right)$.
$\mathrm{H}_{\mathrm{a}}=7.72 \mathrm{ppm}$ (dd); ${ }^{3} \mathrm{~J}_{\mathrm{ac}}=8.1 \mathrm{~Hz}$ and ${ }^{3} \mathbf{J}_{\mathrm{ab}}=7.7 \mathrm{~Hz}$ (these values come from analysis of $\mathrm{H}_{\mathrm{b}}$ and $\mathrm{H}_{\mathrm{c}}$, below). Since the coupling constants are similar, the pattern appears as an accidental triplet.
$\mathrm{H}_{\mathrm{b}}=8.45 \mathrm{ppm}$ (ddd or dt); ${ }^{3} \mathrm{~J}_{\mathrm{ab}}=7.7 \mathrm{~Hz} ;{ }^{4} \mathrm{~J}_{\mathrm{bd}} \simeq{ }^{4} \mathrm{~J}_{\mathrm{bc}}=1.5 \mathrm{~Hz}$. The pattern is an accidental doublet of triplets.
$\mathrm{H}_{\mathrm{c}}=8.50 \mathrm{ppm}$ (ddd); ${ }^{3} \mathbf{J}_{\mathrm{ac}}=8.1 \mathrm{~Hz}$ and ${ }^{4} \mathrm{~J}_{\mathrm{cd}} \neq{ }^{4} \mathrm{~J}_{\mathrm{bc}}$.
$\mathrm{H}_{\mathrm{d}}=8.96 \mathrm{ppm}(\mathrm{dd})$. The pattern appears to be a narrowly spaced triplet, but is actually an accidental triplet since ${ }^{4} \mathrm{~J}_{\mathrm{bd}} \not{ }^{4} \mathbf{J}_{\mathrm{cd}}$.
The carboxyl proton is not shown in the spectrum.
(e) Furfuryl alcohol (Fig. 5.66). The chemical shift values and coupling constants for a furanoid ring are given in Appendix 4 and 5.
$\mathrm{H}_{\mathrm{a}}=6.24 \mathrm{ppm}$ (doublet of quartets); ${ }^{3} \mathrm{~J}_{\mathrm{ab}}=3.2 \mathrm{~Hz}$ and ${ }^{4} \mathrm{~J}_{\mathrm{ac}}=0.9 \mathrm{~Hz}$. The quartet pattern results from a nearly equal ${ }^{4} \mathrm{~J}$ coupling of $\mathrm{H}_{\mathrm{a}}$ to the two methylene protons in the $\mathrm{CH}_{2} \mathrm{OH}$ group and the ${ }^{4} \mathrm{~J}$ coupling of $\mathrm{H}_{\mathrm{a}}$ to $\mathrm{H}_{\mathrm{c}}$ ( $\mathrm{n}+1$ rule, three protons plus one equals four, a quartet).
$\mathrm{H}_{\mathrm{b}}=6.31 \mathrm{ppm}(\mathrm{dd}) ;{ }^{3} \mathrm{~J}_{\mathrm{ab}}=3.2 \mathrm{~Hz}$ and ${ }^{3} \mathrm{~J}_{\mathrm{bc}}=1.9 \mathrm{~Hz}$.
$\mathrm{H}_{\mathrm{c}}=7.36 \mathrm{ppm}(\mathrm{dd}) ;{ }^{3} \mathrm{~J}_{\mathrm{bc}}=1.9 \mathrm{~Hz}$ and ${ }^{4} \mathrm{~J}_{\mathrm{ac}}=0.9 \mathrm{~Hz}$.
The $\mathrm{CH}_{2}$ and OH groups are not shown in the spectrum.
(f) 2-Methylpyridine (Fig. 5.67). Typical chemical shift values and coupling constants for a pyridine ring are given in Appendix 4 and 5.
$\mathrm{H}_{\mathrm{a}}=7.08 \mathrm{ppm}(\mathrm{dd}) ;{ }^{3} \mathrm{~J}_{\mathrm{ac}}=7.4 \mathrm{~Hz}$ and ${ }^{3} \mathrm{~J}_{\mathrm{ad}}=4.8 \mathrm{~Hz}$.
$\mathrm{H}_{\mathrm{b}}=7.14 \mathrm{ppm}(\mathrm{d}) ;{ }^{3} \mathrm{~J}_{\mathrm{bc}}=7.7 \mathrm{~Hz}$ and ${ }^{4} \mathrm{~J}_{\mathrm{ab}} \cong 0 \mathrm{~Hz}$.
$\mathrm{H}_{\mathrm{c}}=7.56 \mathrm{ppm}$ (ddd or td). This pattern is a likely accidental triplet of doublets because ${ }^{3} \mathbf{J}_{\mathrm{ac}} \cong{ }^{3} \mathbf{J}_{\mathrm{bc}}$ and ${ }^{4} \mathrm{~J}_{\mathrm{cd}}=1.8 \mathrm{~Hz}$.
$\mathrm{H}_{\mathrm{d}}=8.49 \mathrm{ppm}$ ("doublet"). Because of the broadened peaks in this pattern, it is impossible to extract the coupling constants. We expect a doublet of doublets, but ${ }^{4} \mathrm{~J}_{\mathrm{cd}}$ is not resolved from ${ }^{3} \mathrm{~J}_{\mathrm{ad}}$. The adjacent nitrogen atom may be responsible for the broadened peaks.
2. (a) $J_{\mathrm{ab}}=0 \mathrm{~Hz}$
(b) $J_{\mathrm{ab}} \sim 10 \mathrm{~Hz}$
(c) $J_{\mathrm{ab}}=0 \mathrm{~Hz}$
(d) $J_{\mathrm{ab}} \sim 1 \mathrm{~Hz}$
(e) $J_{\mathrm{ab}}=0 \mathrm{~Hz}$
(f) $J_{\mathrm{ab}} \sim 10 \mathrm{~Hz}$
(g) $J_{\mathrm{ab}}=0 \mathrm{~Hz}$
(h) $J_{\mathrm{ab}}=0 \mathrm{~Hz}$
(i) $J_{\mathrm{ab}} \sim 10 \mathrm{~Hz} ; J_{\mathrm{ac}} \sim 16 \mathrm{~Hz} ; J_{\mathrm{bc}} \sim 1 \mathrm{~Hz}$
3.

$\mathrm{H}_{\mathrm{a}}=2.80 \mathrm{ppm}\left(\right.$ singlet, $\left.\mathrm{CH}_{3}\right)$.
$\mathrm{H}_{\mathrm{b}}=5.98 \mathrm{ppm}$ (doublet); ${ }^{3} \mathrm{~J}_{\mathrm{bd}}=9.9 \mathrm{~Hz}$ and ${ }^{2} \mathrm{~J}_{\mathrm{bc}}=0 \mathrm{~Hz}$.
$\mathrm{H}_{\mathrm{c}}=6.23 \mathrm{ppm}$ (doublet); ${ }^{3} \mathrm{~J}_{\mathrm{cd}}=16.6 \mathrm{~Hz}$ and ${ }^{2} \mathrm{~J}_{\mathrm{bc}}=0 \mathrm{~Hz}$.
$\mathrm{H}_{\mathrm{d}}=6.61 \mathrm{ppm}$ (doublet of doublets); ${ }^{3} \mathrm{~J}_{\mathrm{cd}}=16.6 \mathrm{~Hz}$ and ${ }^{3} \mathrm{~J}_{\mathrm{bd}}=9.9 \mathrm{~Hz}$.
4.

$\mathrm{H}_{\mathrm{a}}=0.88 \mathrm{ppm}$ (triplet, $\mathrm{CH}_{3}$ ); ${ }^{3} \mathrm{~J}_{\mathrm{ac}}=7.4 \mathrm{~Hz}$.
$\mathrm{H}_{\mathrm{c}}=2.36 \mathrm{ppm}$ (quartet, $\mathrm{CH}_{2} ;{ }^{3} \mathrm{~J}_{\mathrm{ac}}=7.4 \mathrm{~Hz}$.
$\mathrm{H}_{\mathrm{b}}=1.70 \mathrm{ppm}$ (doublet of doublets, $\mathrm{CH}_{3}$ ); ${ }^{3} \mathrm{~J}_{\mathrm{be}}=6.8 \mathrm{~Hz}$ and ${ }^{4} \mathrm{~J}_{\mathrm{bd}}=1.6 \mathrm{~Hz}$.
$\mathrm{H}_{\mathrm{d}}=5.92 \mathrm{ppm}$ (doublet of quartets, vinyl proton). The quartets are narrowly spaced, suggesting a four bond coupling, ${ }^{4}$ J; ${ }^{3} \mathbf{J}_{\text {de }}=15.7 \mathrm{~Hz}$ and ${ }^{4} \mathbf{J}_{\mathrm{bd}}=1.6 \mathrm{~Hz}$.
$\mathrm{H}_{\mathrm{e}}=6.66 \mathrm{ppm}$ (doublet of quartets, vinyl proton). The quartets are widely spaced, suggesting a three bond coupling, ${ }^{3}$; ${ }^{3} \mathrm{~J}_{\mathrm{de}}=15.7 \mathrm{~Hz}$ and ${ }^{3} \mathrm{~J}_{\mathrm{be}}=6.8 \mathrm{~Hz} . \mathrm{H}_{\mathrm{e}}$ appears further downfield than $\mathrm{H}_{\mathrm{d}}$ (see the answer to problem 1 b for an explanation).
5.

## ANS-8 Answers to Selected Problems

$\mathrm{H}_{\mathrm{a}}=0.96 \mathrm{ppm}$ (triplet, $\mathrm{CH}_{3}$ ); ${ }^{3} \mathrm{~J}_{\mathrm{ab}}=7.4 \mathrm{~Hz}$.
$\mathrm{H}_{\mathrm{d}}=6.78 \mathrm{ppm}$ (doublet of triplets, vinyl proton). The triplets are widely spaced suggesting a three bond coupling, ${ }^{3}$ J; ${ }^{3} \mathrm{~J}_{\mathrm{cd}}=15.4 \mathrm{~Hz}$ and ${ }^{3} \mathrm{~J}_{\mathrm{bd}}=6.3 \mathrm{~Hz}$. $\mathrm{H}_{\mathrm{d}}$ appears further downfield than $\mathrm{H}_{\mathrm{c}}$ (see the answer to problem 1 b for an explanation).
$\mathrm{H}_{\mathrm{b}}=2.21 \mathrm{ppm}$ (quartet of doublets of doublets, $\mathrm{CH}_{2}$ ) resembles a quintet with fine structure. ${ }^{3} \mathrm{~J}_{\mathrm{ab}}=7.4 \mathrm{~Hz}$ and ${ }^{3} \mathrm{~J}_{\mathrm{bd}}=6.3 \mathrm{~Hz}$ are derived from the $\mathrm{H}_{\mathrm{a}}$ and $\mathrm{H}_{\mathrm{d}}$ patterns while ${ }^{4} \mathrm{~J}_{\mathrm{bc}}=1.5 \mathrm{~Hz}$ is obtained from the $\mathrm{H}_{\mathrm{b}}$ pattern (left hand doublet at 2.26 ppm ) or from the $\mathrm{H}_{\mathrm{c}}$ pattern.
$\mathrm{H}_{\mathrm{c}}=5.95 \mathrm{ppm}$ (doublet of doublets of triplets, vinyl proton). The triplets are narrowly spaced, suggesting a four bond coupling, ${ }^{4} \mathbf{J} ;{ }^{3} \mathbf{J}_{\mathrm{cd}}=15.4 \mathrm{~Hz},{ }^{3} \mathbf{J}_{\mathrm{ce}}=7.7 \mathrm{~Hz}$ and ${ }^{4} \mathbf{J}_{\mathrm{bc}}=1.5 \mathrm{~Hz}$.
$\mathrm{H}_{\mathrm{e}}=9.35 \mathrm{ppm}$ (doublet, aldehyde proton); ${ }^{3} \mathbf{J}_{\mathrm{ce}}=7.7 \mathrm{~Hz}$.
6. Structure $\mathbf{A}$ would show allylic coupling. The $\mathbf{C}-\mathrm{H}$ bond orbital is parallel to the $\pi$ system of the double bond leading to more overlap. A stronger coupling of the two protons results.
14. 3-Bromoacetophenone. The aromatic region of the proton spectrum shows one singlet, two doublets and one triplet consistent with a 1,3-disubstituted (meta) pattern. Each carbon atom in the aromatic ring is unique leading to the observed six peaks in the carbon spectrum. The downfield peak at near 197 ppm is consistent with a ketone $\mathrm{C}=\mathrm{O}$. The integral value (3H) in the proton spectrum and the chemical shift value ( 2.6 ppm ) indicates that a methyl group is present. The most likely possibility is that there is an acetyl group attached to the aromatic ring. A bromine atom is the other substituent on the ring.
15. Valeraldehyde (pentanal). The aldehyde peak on carbon 1 appears at 9.8 ppm . It is split into a triplet by the two methylene protons on carbon $2\left({ }^{3} J=1.9 \mathrm{~Hz}\right)$. Aldehyde protons often have smaller three-bond (vicinal) coupling constants than typically found. The pattern at 2.4 ppm (triplet of doublets) is formed from coupling with the two protons on carbon $3\left({ }^{3} J=7.4 \mathrm{~Hz}\right)$ and with the single aldehyde proton on carbon $1\left({ }^{3} J=1.9 \mathrm{~Hz}\right)$.
16. The DEPT spectral results indicate that the peak at 15 ppm is a $\mathrm{CH}_{3}$ group; 40 and 63 ppm peaks are $\mathrm{CH}_{2}$ groups; 115 and 130 ppm peaks are CH groups; 125 and 158 ppm peaks are quaternary (ipsi carbons). The 179 ppm peak in the carbon spectrum is a $\mathrm{C}=\mathrm{O}$ group at a value typical for esters and carboxylic acids. A carboxylic acid is indicated since a broad peak appears at 12.5 ppm in the proton spectrum. The value for the chemical shift of the methylene carbon peak at 63 ppm indicates an attached oxygen atom. Confirmation of this is seen in the proton spectrum ( 4 ppm , a quartet), leading to the conclusion that the compound has an ethoxy group (triplet at 1.4 ppm for the $\mathrm{CH}_{3}$ group). A para disubstituted aromatic ring is indicated with the carbon spectrum (two $\mathrm{C}-\mathrm{H}$ and two C with no protons). This substitution pattern is also indicated in the proton spectrum (two doublets at 6.8 and 7.2 ppm ). The remaining methylene group at 40 ppm in the carbon spectrum is a singlet in the proton spectrum indicating no adjacent protons. The compound is 4-ethoxyphenylacetic acid.
25. (a) In the proton NMR , one fluorine atom splits the $\mathrm{CH}_{2}\left({ }^{2} J_{\mathrm{HF}}\right)$ into a doublet. This doublet is shifted downfield because of the influence of the electronegative fluorine atom. The $\mathrm{CH}_{3}$ group is too far away from the fluorine atom and thus appears upfield as a singlet.
(b) Now the operating frequency of the NMR is changed so that only fluorine atoms are observed. The fluorine NMR would show a triplet for the single fluorine atom because of the two adjacent protons ( $n+1$ Rule). This would be the only pattern observed in the spectrum. Thus, we do not see protons directly in a fluorine spectrum because the spectrometer is operating at a different frequency. We do see, however, the influence of the protons on the fluorine spectrum. The $J$ values would be the same as those obtained from the proton NMR.
26. The aromatic proton spectral data indicates a 1,3-disubstituted (meta substituted) ring. One attached substituent is a methyl group ( 2.35 ppm , integrating for 3 H ). Since the ring is disubstituted, the remaining substituent would be an oxygen atom attached to the remaining two carbon atoms with one proton and four fluorine atoms in the "ethoxy" group. This substituent would most likely be a 1,1,2,2-tetrafluoroethoxy group. The most interesting pattern is the widely spaced triplet of triplets centering on $5.85 \mathrm{ppm} ;{ }^{2} \mathrm{~J}_{\mathrm{HF}}=53.1 \mathrm{~Hz}$ for the proton on carbon 2 of the ethoxy group coupled to two adjacent fluorine atoms (two bond, ${ }^{2} \mathrm{~J}$ ) and ${ }^{3} \mathrm{~J}_{\mathrm{HF}}=2.9 \mathrm{~Hz}$ for this same proton on carbon 2 coupled to the remaining two fluorine atoms on carbon 1 (three bond, ${ }^{3} \mathbf{J}$ ) from this proton. The compound is 1-methyl-3-(1,1,2,2-tetrafluoroethoxy)benzene.
28. In the proton NMR, the attached deuterium, which has a spin $=1$, splits the methylene protons into a triplet (equal intensity for each peak, a $1: 1: 1$ pattern). The methyl group is too far removed from deuterium to have any influence, and it will be a singlet. Now change the frequency of the NMR to a value where only deuterium undergoes resonance. Deuterium will see two adjacent protons on the methylene group, splitting it into a triplet ( $1: 2: 1$ pattern). No other peaks will be observed since, at this NMR frequency, the only atom observed is deuterium. Compare the results to the answers in Problem 25.
29. Two singlets will appear in the proton NMR spectrum: a downfield $\mathrm{CH}_{2}$ and an upfield $\mathrm{CH}_{3}$ group. Compare this result to the answer in problem 25a.
30. Phosphorus has a spin of $\frac{1}{2}$. The two methoxy groups, appearing at about 3.7 ppm in the proton NMR, are split into a doublet by the phosphorus atom ( ${ }^{3} J_{\mathrm{HP}} \cong 8 \mathrm{~Hz}$ ). Since there are two equivalent methoxy groups, the protons integrate for 6 H . The methyl group directly attached to the same phosphorus atom appears at about 1.5 ppm (integrates for 3 H ). This group is split by phosphorus into a doublet ( ${ }^{2} J_{\mathrm{HP}} \cong 13 \mathrm{~Hz}$ ). Phosphorus coupling constants are provided in Appendix 5.

## CHAPTER 6

1. The methylene group is a quartet of doublets. Draw a tree diagram where the quartet has spacings of 7 Hz . This represents the ${ }^{3} \mathrm{~J}$ (three bond coupling) to the $\mathrm{CH}_{3}$ group from the methylene protons. Now split each leg of the quartet into doublets ( 5 Hz ). This represents the ${ }^{3} \mathrm{~J}$ (three bond coupling) of the methylene protons to the $\mathrm{O}-\mathrm{H}$ group. The pattern can also be interpreted as a doublet of quartets, where the doublet $(5 \mathrm{~Hz})$ is constructed first, followed by splitting each leg of the doublet into quartets ( 7 Hz spacings).
2. 2-Methyl-3-buten-2-ol. $\mathrm{H}_{\mathrm{a}}=1.3 \mathrm{ppm} ; \mathrm{H}_{\mathrm{b}}=1.9 \mathrm{ppm} ; \mathrm{H}_{\mathrm{c}}=5.0 \mathrm{ppm}$ (doublet of doublets, ${ }^{3} J_{\mathrm{ce}}=10.7 \mathrm{~Hz}($ cis $)$ and ${ }^{2} J_{\mathrm{cd}}=0.9 \mathrm{~Hz}$ (geminal) ); $\mathrm{H}_{\mathrm{d}}=5.2 \mathrm{ppm}$ (doublet of doublets, ${ }^{3} J_{\mathrm{de}}=$ 17.4 Hz (trans) and ${ }^{2} J_{\mathrm{cd}}=0.9 \mathrm{~Hz}$ (geminal)); $\mathrm{H}_{\mathrm{e}}=6.0 \mathrm{ppm}$ (doublet of doublets, ${ }^{3} J_{\mathrm{de}}=17.4 \mathrm{~Hz}$ and ${ }^{3} J_{\mathrm{ce}}=10.7 \mathrm{~Hz}$.

3. 2-Bromophenol. The unexpanded spectrum shows two doublets and two triplets, consistent with a 1,2-disubstituted (ortho) pattern. Each shows fine structure in the expansions ( $\left.{ }^{4} \mathrm{~J}\right)$. Assignments can be made by assuming that the two upfield protons (shielded) are ortho and para with respect to the electron-releasing OH group. The other two patterns can be assigned by a process of elimination.
4. The two structures shown here are the ones that can be derived from 2-methylphenol. The infrared spectrum shows a significantly shifted conjugated carbonyl group which suggests that the OH group is releasing electrons and providing single bond character to the $\mathrm{C}=\mathrm{O}$ group, consistent with 4-hydroxy-3-methylacetophenone (the other compound would not have as significant a shift in the $\mathrm{C}=\mathrm{O}$ ). The $3136 \mathrm{~cm}^{-1}$ peak is an OH group, also seen in the NMR spectrum as a solvent-dependent peak. Both structures shown would be expected to show a singlet and two doublets in the aromatic region of the NMR spectrum. The positions of the downfield singlet and doublet in the spectrum fit the calculated values from Appendix 6 for 4-hydroxy-3-methylacetophenone more closely than for 3-hydroxy-4-methylacetophenone (calculated values are shown on each structure). The other doublet appearing at 6.9 ppm is a reasonable fit to the calculated value of 6.79 ppm . It is interesting to note that the two ortho protons in 3-hydroxy-4-methylacetophenone are deshielded by the $\mathrm{C}=\mathrm{O}$ group and shielded by the OH group leading to little shift from the base value of 7.27 (Appendix 6). In conclusion, the NMR spectrum and calculated values best fit 4-hydroxy-3-methylacetophenone.
7.60
6.79

4-hydroxy-3-methylacetophenone

3-hydroxy-4-methylacetophenone
5. All of the compounds would have a singlet and two doublets in the aromatic portion of the NMR spectrum. When comparing the calculated values to the observed chemical shifts, it is important to compare the relative positions of each proton (positions of doublet, singlet, and doublet). Don't be concerned with slight differences (about $\pm 0.10 \mathrm{~Hz}$ ) in the calculated vs observed values. The calculated values for third compound fits the observed spectral data better than the first two.

6. 3-Methyl-3-buten-1-ol. The DEPT spectral results show a $\mathrm{CH}_{3}$ group at 22 ppm , two $\mathrm{CH}_{2}$ groups at 41 and 60 ppm . The peaks at $112 \mathrm{ppm}\left(\mathrm{CH}_{2}\right)$ and 142 ppm ( C with no attached H ) are part of a vinyl group. The peaks at 4.78 and 4.86 ppm in the proton spectrum are the

## ANS-12 Answers to Selected Problems

protons on the terminal double bond. The 4.78 ppm pattern (fine structure) shows long range coupling $\left({ }^{4} \mathrm{~J}\right)$ to the methyl and methylene groups. The methylene group at 2.29 ppm is broadened because of non-resolved ${ }^{4} \mathrm{~J}$ coupling.
9. 4-Butylaniline
10. 2,6-Dibromoaniline
12. 2,4-Dichloroaniline. The broad peak at about 4 ppm is assigned to the $-\mathrm{NH}_{2}$ group. The doublet at 7.23 ppm is assigned to the proton on carbon 3 (it appears as a near singlet in the upper trace). Proton 3 is coupled, long range, to the proton on carbon $5\left({ }^{4} J=2.3 \mathrm{~Hz}\right)$. The doublet of doublets centering on 7.02 ppm is assigned to the proton on carbon 5. It is coupled to the proton on carbon $6\left({ }^{3} J=8.6 \mathrm{~Hz}\right)$ and also to proton $3\left({ }^{4} J=2.3 \mathrm{~Hz}\right)$. Finally, the doublet at 6.65 ppm is assigned to the proton on carbon $6\left({ }^{3} J=8.6 \mathrm{~Hz}\right)$, which arises from coupling to the proton on carbon 5 . There is no sign of ${ }^{5} J$ coupling in this compound.

13. Alanine
21. Rapid equilibration at room temperature between chair conformations leads to one peak. As one lowers the temperature, the interconversion is slowed down until, at temperatures below $-66.7^{\circ} \mathrm{C}$, peaks due to the axial and equatorial hydrogens are observed. Axial and equatorial hydrogens have different chemical shifts under these conditions.
22. The $t$-butyl-substituted rings are conformationally locked. The hydrogen at C 4 has different chemical shifts, depending upon whether it is axial or equatorial. 4-Bromocyclohexanes are conformationally mobile. No difference between axial and equatorial hydrogens is observed until the rate of chair-chair interconversion is decreased by lowering the temperature.

15. Ethyl 2-bromopropionate (ethyl 2-bromopropanoate); ethyl 3-bromopropionate (ethyl 3-bromopropanoate)
16. Ethyl 4-cyanobenzoate
17. 3-Chloropropiophenone (3-chloro-1-phenyl-1-propanone)

## CHAPTER10

1. 

Proton \#1: 1.5 ppm
Carbon \#1: 24 ppm
Proton \#2: 4.0 ppm
Carbon \#2: 60 ppm
Proton \#3: 1.7 ppm
Carbon \#3: 33 ppm (inverted peak indicates $\mathrm{CH}_{2}$ )
Proton \#4: 1.0 ppm
Carbon \#4: 11 ppm
3.

Carbon \#1: 68 ppm
Carbon \#2: 35.2 ppm
Carbon \#3: 35.3 ppm
Carbon \#4: 20 ppm
Carbon \#5: 14 ppm
Carbon \#6: 16 ppm
3-Methyl-1-pentanol and 4-methyl-1-pentanol would be expected to give similar DEPT spectra. They are also acceptable answers based on the information provided.
4.

| Proton \#1: | 3.8 ppm | Carbon \#1: 61 ppm |
| :--- | :--- | :--- |
| Proton \#2: | 1.4 and 1.6 ppm | Carbon \#2: 40 ppm |
| Proton \#3: | 1.6 ppm | Carbon \#3: 30 ppm |
| Proton \#4: | 1.2 and 1.3 ppm | Carbon \#4: 37 ppm |
| Proton \#5: | 2.0 ppm | Carbon \#5: 25 ppm |
| Proton \#6: 5.2 ppm | Carbon \#6: 125 ppm |  |
| Proton \#7: | - | Carbon \#7: 131 ppm |
| Proton \#8: | 1.6 ppm | Carbon \#8: 17 ppm |
| Proton \#9: | 1.7 ppm | Carbon \#9: 25 ppm |
| Proton \#10: 0.9 ppm | Carbon \#10: 19 ppm |  |

5. Proton \#1: 4.1 ppm Carbon \#1: 59 ppm

Proton \#2: 5.4 ppm
Carbon \#2: 124 ppm
Proton \#3: -
Carbon \#3: -
Proton \#4: 2.1 ppm
Proton \#5: 2.2 ppm
Proton \#6: 5.1 ppm
Proton \#7: -
Carbon \#4: 39 ppm
Carbon \#5: 26 ppm

Proton \#8: $\overline{1.6} \mathrm{ppm}$
Carbon \#6: 124.5 ppm
Carbon \#7: -

Proton \#9: 1.7 ppm
Carbon \#8: 18 ppm

Proton \#10: 1.7 ppm
Carbon \#9: 16 or 25 ppm
Carbon \#10: 16 or 25 ppm
6.

Proton \#3: 6.95 ppm
Carbon \#3: 117 ppm
Proton \#4: 7.40 ppm Carbon \#4: 136 ppm
Proton \#5: 6.82 ppm Carbon \#5: 119 ppm Proton \#6: $7.75 \mathrm{ppm} \quad$ Carbon \#6: 130 ppm
$J_{3,4}=8 \mathrm{~Hz} \quad J_{3,5}=1 \mathrm{~Hz} \quad J_{3,6} \sim 0 \mathrm{~Hz}$
$J_{4,5}=7 \mathrm{~Hz} \quad J_{4,6}=2 \mathrm{~Hz} \quad J_{5,6}=8 \mathrm{~Hz}$
