

ELEMENTS OF ELECTRICAL POWER STATION DESIGN

M. V. DESHPANDE

THIRD EDITION

*This work is respectfully dedicated
to the memory of my beloved father
Vinayakrao who is no more.*

Preface

The first edition of the book was published by Sir Isaac Pitman and Sons, London. The second and enlarged edition was published by A. H. Wheeler and Co Ltd. I am glad the book has been well received by the various university and engineering students and power organisations. There have been four reprints of the second edition. Considering the response, the book has been further revised and enlarged, and brought upto date in this third edition.

In this edition, three chapters are added: Chapter 14 discusses the modern trends in power station design and operation. This includes load forecasting, economic load dispatch, unit commitment problem, methods of scheduling stations, allocation control, system reliability and system security. Chapter 15 deals with the trends in power plant instrumentation and control. In this Chapter introduction to solid state relaying, overcurrent and differential type is done. Important problem of pollution control and performance standards of thermal stations is discussed. Application of computers in power systems is touched. Chapter 16 explains the need of using unconventional sources of energy and plants to save fossil fuels. Rural energy demands and methods of forecasting energy demands are discussed. Biogas plants, biomass plants and their applications are mentioned. Solar electric systems and wind electric systems are explained with their principle, applications and preliminary design.

I hope with these additions, the book will be covering these modern trends and bring these developments to the notice of the students and the readers. I am thankful to my engineer friends who have made useful suggestions to bring the book upto date.

Contents

PREFACE	vii
PRINCIPAL SYMBOLS AND ABBREVIATIONS	xix
INTRODUCTION	xxi
<i>Chapter 1 Prediction of load</i>	1
1.1 Electrical load development	
1.2 Definitions of terms	
1.3 Diversity factor	
1.4 Types of load	
1.5 Load requirements of an area	
1.6 Rural electrification	
1.7 Forecasting of loads and electrical energy requirements	
1.8 Methods of forecast of electrical energy used in India.	
<i>Chapter 2 Choice of power station and units</i>	28
2.1 Types of power station	
2.2 Choice of type of generation	
2.3 Choice of size of generator units and number of units	
2.4 Load duration curve	
2.5 Effect of variable load on power plant operation and design	
2.6 Cost of electrical energy	
2.7 Depreciation of plant	
2.8 Effect of load factor on cost per kilowatt-hour	
2.9 Tariff, or charge to consumer	

Chapter 3 Diesel-electric stations : preliminary design

68

- 3.1 Field of use
- 3.2 Diesel engines : principle of working
- 3.3 Choice of Diesel engine
- 3.4 Characteristics of Diesel engines
- 3.5 Fuel requirements of Diesel engines
- 3.6 Cooling-water requirements of Diesel engines
- 3.7 Main dimensions of Diesel engines
- 3.8 Main dimensions of Diesel-electric generators and their characteristics
- 3.9 Co-ordination of engine and generator characteristics
- 3.10 Sizes and dimensions of generating sets
- 3.11 Building dimensions and general layout
- 3.12 Costs of Diesel plant
- 3.13 Alternative source of power supply to industries under power shortage
- 3.14 Use of Diesel sets as alternative power plant

Chapter 4 Steam stations : preliminary design

112

- 4.1 Field of use
- 4.2 Main parts and working of a steam station
- 4.3 Types of boiler and their characteristics
- 4.4 Characteristics of steam turbines
- 4.5 Characteristics of turbo-alternators
- 4.6 Design of a steam power station : capacity of main equipment
- 4.7 Main dimensions of turbo-alternators
- 4.8 Economic considerations in selection of main equipment of steam station
- 4.9 Steam station auxiliaries
- 4.10 Steam station layout
- 4.11 Instrumentation and controls
- 4.12 Costs of steam stations
- 4.13 Superpressure steam stations

Chapter 5 Gas turbine stations and combined cycles	190
5.1 Field of use and advantages	
5.2 Main parts of gas turbine plant and principle of operation	
5.3 Characteristics of gas turbine plants	
5.4 Gas turbine power plant operation and control	
5.5 Plant layout	
5.6 Combined cycles	
5.7 Magneto hydrodynamics (MHD) generation	
5.8 MHD systems	
Chapter 6 Elements of nuclear power stations	210
6.1 Field of use and advantages	
6.2 Main parts of nuclear power station	
6.3 Principle of nuclear energy	
6.4 Main parts of reactor and reactor control	
6.5 Types of power reactor	
6.6 Location of nuclear power station	
6.7 Basic factors in design of reactors and choice of cycle of operation	
6.8 Main power plant and facilities	
6.9 Layout of a nuclear power station	
6.10 Reactor control	
6.11 Nuclear waste disposal	
6.12 Health physics	
6.13 Economics of nuclear power stations	
Chapter 7 Hydro-electric stations : preliminary design—I	246
7.1 Introduction	
7.2 Hydrology	
7.3 Stream flow : Hydrographs : flow duration curves	
7.4 Mass curve : storage	
7.5 Investigation of site	
7.6 Types of dam	
7.7 Arrangement and location of hydro-electric station	

7.8	Types of hydro-electric plant and their field of use	
7.9	Principle of working of a hydro-electric plant	
7.10	Bulb type turbine plants	
7.11	Tidal power plants	
Chapter 8	Hydro-electric stations : preliminary design—II	287
8.1	Power to be developed	
8.2	Size of plant and choice of units	
8.3	Types of turbine and their characteristics	
8.4	Design of main dimensions of turbines	
8.5	Draft tubes : types, setting and preliminary dimensions	
8.6	Scroll case	
8.7	Preliminary design of penstock	
8.8	Characteristics of generators	
8.9	Power station control	
8.10	Main dimensions of generators	
8.11	Power station structure and layout	
8.12	Costs of hydro-electric stations	
Chapter 9	Combination of hydro-electric and steam stations	34
9.1	Types of power station	
9.2	Advantages of combined working of different types of power station	
9.3	Need for co-ordination of different types of power station	
9.4	Run-off river plant in combination with steam plant : size of plant in each station	
9.5	Economics of run-off river plant in combination with steam plant	
9.6	Hydro-electric plants with ample storage in combination with steam plants	
9.7	Pumped storage plants in combination with ordinary hydro-electric plants	
9.8	Co-ordination of hydro-electric and gas-turbine power stations	
9.9	Co-ordination of hydro-electric and nuclear power stations	

- 9.10 Co-ordination of different types of power plant in power system

Chapter 10 Major electrical plant in power stations 370

- 10.1 Introduction
10.2 Generators and exciters
10.3 Earthing of a power system
10.4 Power transformers : Types and characteristics
10.5 Selection of transformers
10.6 Specifications of transformers
10.7 Principles of circuit interruption
10.8 Circuit-breakers : types and characteristics
10.9 Circuit-breakers : selection and specifications
10.10 Layout of electrical equipment
10.11 Current-limiting reactors : use and location
10.12 Short-circuit currents and sizes of reactor

Chapter 11 Power station control and interconnexion 426

- 11.1 Excitation systems
11.2 Excitation control
11.3 Field protection
11.4 Commissioning of alternators
11.5 Power/angle diagrams
11.6 System stability
11.7 Voltage regulation of transformers and transmission lines
11.8 Instrument transformers
11.9 Power supply for station auxiliaries
11.10 Power station control
11.11 Interconnexion

Chapter 12 Protective relaying for power stations 487

- 12.1 Principles and characteristics of protective relaying
12.2 Theory and classification of relays
12.3 Theory of application of relays
12.4 A. C. generator protection

12.5	Transformer protection	
12.6	Busbar protection	
Chapter 13	Economic loading of power stations	514
13.1	Introduction	
13.2	Methods of loading steam stations	
13.3	Distribution of load between generator units in a power station	
13.4	Effect of transmission loss	
13.5	Criteria for optimum loading of power plants	
13.6	Co-ordination of incremental fuel cost and incremental transmission loss	
13.7	Economic distribution of load between plants considering effect of transmission loss	
13.8	Methods of loading hydro-electric stations	
13.9	Economic loading of combined thermal and hydro-electric stations ; short range	
13.10	Economic loading of combined thermal and hydro-electric stations : long range	
13.11	Load dispatching	
13.12	General remarks	
Chapter 14	Modern Trends in Power Station Design and Operation	537
14.1	Load forecasting	
14.2	Economic load dispatch	
14.3	Economic load dispatch on units considering transmission network losses	
14.4	Unit commitment	
14.5	Loading of hydro units	
14.6	Hydro thermal scheduling	
14.7	Generation allocation control	
14.8	Generation system reliability	
14.9	Power system security	

Chapter 15	Modern Trends in Power Plant Instrumentation and Control	558
15.1	Solid state relaying	
15.2	Overcurrent relays	
15.3	Differential relays	
15.4	Trends in power plant instrumentation and control	
15.5	Pollution control	
15.6	Performance standards	
15.7	Applications of computers in power systems	
Chapter 16	Unconventional Sources of Energy and Plants	578
16.1	Need for search of unconventional sources of energy and plants	
16.2	Energy supply options	
16.3	Methods of forecasting energy demands	
16.4	Rural energy demand	
16.5	Biogas plants and applications	
16.6	Biomass plants and applications	
16.7	Solar-electric system : Principle and applications	
16.8	Solar electric system : Preliminary design	
16.9	Wind electric system : Principle and applications	
16.10	Wind electric system : Preliminary design	
Appendix A	Thermal Units, 30 MW and above, installed in India since 1950	615
Appendix B	Nuclear power stations in India under construction and in operation	618
Appendix C	Hydro power stations in India (4 MW and above) as on 1-3-1978 (statewise)	619
Appendix D	The hydro-electric potential in India	624
Index		625

Principal Symbols and Abbreviations Used in this Book

Symbols for quantities are in *italic* type, and abbreviations for the names of units are in ordinary type.

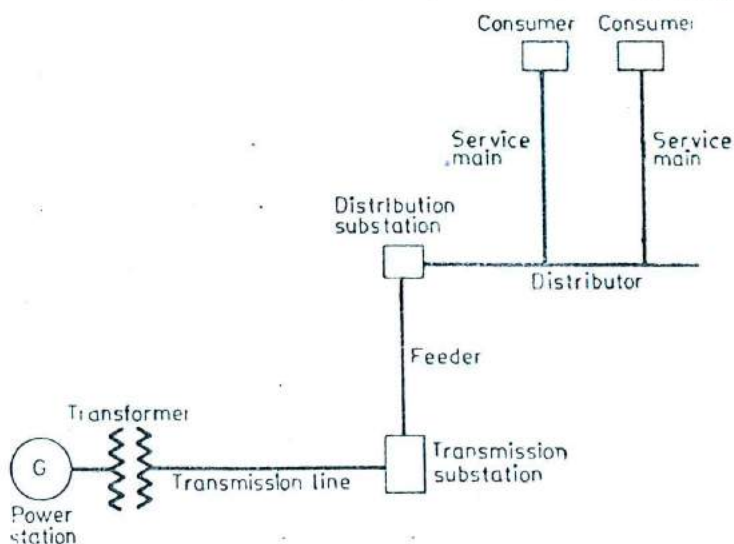

<i>A</i>	ampere	<i>I</i>	electric current
<i>A</i>	mass number	<i>J</i>	moment of inertia
a. c.	alternating current	<i>K</i>	cyclic irregularity stroke/bore ratio
<i>a_c</i>	number of ampere- conductors per centimetre	<i>k</i>	multiplication constant radius of gyration
amu	atomic mass unit	kcal	kilocalorie
<i>B</i>	magnetic flux density	kg	kilogramme
<i>C</i>	coulomb	kg/cm ²	kilogramme per square centimetre
<i>C</i>	capacitance	kg/m ³	kilogramme per cubic metre
<i>C_s</i>	speed factor	kg-m/s	kilogramme-metre per second
<i>c</i>	speed of light	km	kilometre
cm	centimetre	kV	kilovolt
cm Hg	centimetre of mercury	kVA	kilovolt-ampere
cm/sec	centimetre per second	kVAR	kilovar (reactive kilovolt ampere)
c/s	cycle per second	kW	kilowatt
<i>D</i>	diameter	kWh	kilowatt-hour
<i>d</i>	cylinder bore	<i>L</i>	inductance
d.c.	direct current	<i>l</i>	length stroke
<i>E</i>	electromotive force	MeV	mega-electron-volt
eV	electron-volt	MVA	megavolt-ampere
F	farad	MW	megawatt
<i>f</i>	frequency	m	metre
<i>g</i>	acceleration due to gravity		
H	henry		
h	hour		
ha	hectare		
hp	horsepower		

m	mass	V	volt
	model ratio	V	voltage
min	minute		volume
mm Hg	millimetre of mercury	v	velocity
N	number of turns	W	watt
n	rotational speed	W	energy
P	power		weight
p	number of poles	Wb	weber
p. a.	per annum (per year)	w	weight density
Q	electric charge	X	reactance
	reactive power	Y	admittance
	volume rate of flow	Z	atomic number
			impedance
R	cut-off-ratio		
	resistance	γ	ratio of specific heats
r	compression ratio	ϵ	percentage regulation
rev/min	revolution per minute	ϵ_x	percentage reactance
rev/sec	revolution per second		voltage
S	apparent power; rating	η	efficiency
	in kVA or MVA	μF	microfarad
s, sec	second	σ	cavitation coefficient
T	time-constant	ϕ	magnetic flux
	torque	Ω	ohm

Note : The prices are rising. The present prices should be checked and used for economic studies.

Introduction

Electricity provides a very convenient form of power for lighting, motive power for driving various types of load and power for a number of utilization applications. Generally it is economical to use this form of power. Its other advantages are cleanliness and ease of control. The annual consumption of electrical energy has been increasing rapidly throughout the world. The standard of living in a country is related, to a certain extent, to the consumption of electricity in that country. Rapid industrialisation becomes

Main parts of a power system.

possible when cheap electric power is available. With industrialisation, the standard of living improves. In India, there has recently been considerable power development under various five-year plans. Methods of producing and distributing electric power economically are being studied and developed rapidly all over the world.

The main parts of an electric power system are power stations, transmission systems, and distribution networks. These are shown in the single-line diagram.

Power stations. An electric power station is a factory in which energy is converted from one form or another into electrical energy. In a conventional thermal station, the energy is first in the form of heat in the fuel, which may be coal, gas or oil. This heat is liberated by combustion in the boiler furnace and is then used to convert water into steam. The energy in the steam is converted to the mechanical energy of a rotating shaft by some form of steam engine, either reciprocating or turbine, and this energy is converted into electrical energy by means of a generator. In a nuclear or atomic station, the energy from the splitting of the atomic fuel is released in the form of heat in the reactor, and the heat is used to convert water into steam. From this point onwards, the station is similar to a conventional thermal station, i.e., a nuclear station is similar to any other thermal station except that it is equipped with a reactor instead of a boiler. With gas or oil as the initial source of energy an alternative means of conversion is provided by the use of internal-combustion engines. In a hydro-electric station, the potential energy of water stored at a height is converted into mechanical energy by the use of a water turbine, and a generator coupled to the water turbine converts this energy into electrical energy.

The three-phase alternating-current system is almost universal. In India and in Britain the standard frequency is 50 c/s; in the United States of America it is 60 c/s. The a.c. system has the advantage that voltages can easily be stepped up or down by the use of transformers only, and no rotating machinery is required for this change-over. This facilitates the transmission and distribution of power.

Transmission and distribution. When a large bulk of power is to be transmitted over a long distance, it is economical to transmit it at a voltage higher than the distribution voltage. The most suitable voltage for the transmission of power over a certain distance should be chosen to give the best transmission efficiency,

regulation and economy. The high-voltage transmission line is the second important part of a power system. A transformer to step up the generation voltage to the transmission-line voltage forms an important link between generation and transmission. The function of the transmission line is to transmit power from the sending end to the receiving end, from which the power will be distributed.

The power is received at the transmission sub-station, where transformers step down the high voltage of transmission to medium voltage to supply the feeders at the required voltage of the primary distribution network. Feeders are conductors which carry power from the transmission sub-station to various distribution sub-stations. Feeders are not tapped for direct power consumption.

The distribution sub-stations have transformers to step down the voltage of the primary network—the feeder system—to the low voltage of the distribution network. Distributors form a network of conductors from which power is distributed to the consumers at distribution voltage. The distribution network is normally 3-phase 4-wire, and the standard voltage in India is 415/240 V. Three-phase balanced loads of industrial motors, etc., are connected across the three phases, and the lighting load, with other single-phase loads, is divided into three parts, each connected between a phase and neutral. The three parts should be made nearly equal, so that the imbalance in the network is a minimum. Distributors are conductors which are tapped and which deliver power to consumers' premises through service mains.

In practice, a system is quite complicated and has a number of power stations of different types interconnected by a system of transmission lines and distribution networks to supply different types of load to various consumers. In the above discussion we have considered the main parts of the power system and their functions. In studying the design aspects of the power system we have to start from the requirements of the consumers. A number of questions crop up:

What are the various types of load? How are they to be supplied by the distributors?

- What are the various methods of distributing power?
- How are the sizes of the distributors determined?
- How are the sizes of transformers in sub-stations and the locations of substations chosen?
- How are the voltage and size of transmission-line conductors to transmit a certain power over a certain distance determined?
- What are the various types of power stations?
- How should the type of power station be chosen?
- How are sizes of generators and prime movers selected?
- How much power is to be obtained from the power stations?
- What space will be required for a particular size and type of power station?
- How can power be obtained and distributed economically?
- How can the load be shared economically between various power stations in the power system?

The questions are numerous and the details of design which they evoke are complicated. In this book, and in a companion volume on *Electrical Power System Design*, the author aims at giving the reader the elements of power-system design and tries to answer some of the questions in a simple and logical way chapter by chapter.

Let us begin with the consumers, their requirements of power and how they affect the total power required in the system.
